

The (almost really) Complete Works
of
Lewis Carroll
(C. L. Dodgson)

Collected by Schnark

Contents

1	Preface	18
1.1	Introduction	18
1.2	Contents by Source	35
2	Novels and Stories	101
2.1	Alice's Adventures in Wonderland	101
	Chapter I. Down the Rabbit-Hole	101
	Chapter II. The Pool of Tears	105
	Chapter III. A Caucus-Race and a Long Tale	110
	Chapter IV. The Rabbit Sends in a Little Bill	115
	Chapter V. Advice from a Caterpillar	121
	Chapter VI. Pig and Pepper	128
	Chapter VII. A Mad Tea-Party	136
	Chapter VIII. The Queen's Croquet Ground	143
	Chapter IX. The Mock Turtle's Story	149
	Chapter X. The Lobster-Quadrille	156
	Chapter XI. Who Stole the Tarts?	162
	Chapter XII. Alice's Evidence	168
2.2	Through the Looking-Glass, and What Alice Found There . .	176
	Chapter I. Looking-Glass House	176
	Chapter II. The Garden of Live Flowers	186
	Chapter III. Looking-Glass Insects	193
	Chapter IV. Tweedledum and Tweedledee	201
	Chapter V. Wool and Water	210
	Chapter VI. Humpty Dumpty	219
	Chapter VII. The Lion and the Unicorn	228
	Chapter VIII. "It's my own Invention"	234
	Chapter IX. Queen Alice	246
	Chapter X. Shaking	258
	Chapter XI. Waking	259
	Chapter XII. Which Dreamed It?	259
2.3	Alice's Adventures under Ground	262
	Chapter I	262
	Chapter II	270
	Chapter III	280
	Chapter IV	289
2.4	The Nursery "Alice"	302
	I. The White Rabbit	302
	II. How Alice Grew Tall	303

	III. The Pool of Tears	306
	IV. The Caucus-Race	307
	V. Bill, the Lizard	307
	VI. The Dear Little Puppy	309
	VII. The Blue Caterpillar	311
	VIII. The Pig-Baby	313
	IX. The Cheshire-Cat	313
	X. The Mad Tea-Party	316
	XI. The Queen's Garden	317
	XII. The Lobster-Quadrille	319
	XIII. Who Stole the Tarts?	322
	XIV. The Shower of Cards	325
2.5	Sylvie and Bruno	327
	Chapter I. Less Bread! More Taxes!	327
	Chapter II. L'Amie Inconnue	332
	Chapter III. Birthday-Presents	337
	Chapter IV. A Cunning Conspiracy	341
	Chapter V. A Beggar's Palace	346
	Chapter VI. The Magic Locket	352
	Chapter VII. The Baron's Embassy	358
	Chapter VIII. A Ride On A Lion	363
	Chapter IX. A Jester And A Bear	367
	Chapter X. The Other Professor	373
	Chapter XI. Peter and Paul	378
	Chapter XII. A Musical Gardener	385
	Chapter XIII. A Visit to Dogland	390
	Chapter XIV. Fairy-Sylvie	395
	Chapter XV. Bruno's Revenge	401
	Chapter XVI. A Changed Crocodile	406
	Chapter XVII. The Three Badgers	410
	Chapter XVIII. Queer Street, Number Forty	417
	Chapter XIX. How to Make a Phlizz.	423
	Chapter XX. Light Come, Light Go	429
	Chapter XXI. Through the Ivory Door	434
	Chapter XXII. Crossing The Line.	442
	Chapter XXIII. An Outlandish Watch.	448
	Chapter XXIV. The Frogs' Birthday-Treat.	453
	Chapter XXV. Looking Eastward.	461
2.6	Sylvie and Bruno Concluded	467
	Chapter I. Bruno's Lessons.	467
	Chapter II. Love's Curfew.	473
	Chapter III. Streaks of Dawn.	478
	Chapter IV. The Dog-King.	484
	Chapter V. Matilda Jane.	488
	Chapter VI. Willie's Wife.	493
	Chapter VII. Mein Herr.	498
	Chapter VIII. In a Shady Place.	503
	Chapter IX. The Farewell-Party.	508
	Chapter X. Jabbering and Jam.	514
	Chapter XI. The Man in the Moon.	518

	Chapter XII. Fairy-Music.	523
	Chapter XIII. What Tottles Meant.	529
	Chapter XIV. Bruno's Picnic.	535
	Chapter XV. The Little Foxes.	542
	Chapter XVI. Beyond These Voices.	547
	Chapter XVII. To the Rescue!	551
	Chapter XVIII. A Newspaper-Cutting.	560
	Chapter XIX. A Fairy-Duet.	561
	Chapter XX. Gammon and Spinach.	569
	Chapter XXI. The Professor's Lecture.	576
	Chapter XXII. The Banquet.	581
	Chapter XXIII. The Pig-Tale.	587
	Chapter XXIV. The Beggar's Return.	597
	Chapter XXV. Life out of Death.	604
3	Short Stories	609
3.1	Sidney Hamilton	609
	Ch. 1	609
	Ch. 2	610
	Ch. 3	611
	Ch. 4	612
	Ch. 5	612
	Ch. 6	613
	Ch. 7	614
	Ch. 8	614
	Ch. 9	615
3.2	Crundle Castle	617
	Ch. 1	617
	Ch. 2	617
	Ch. 3	618
	Ch. 4	619
	Ch. 5	619
	Ch. 6	620
	Ch. 7	620
	Ch. 8	621
	Ch. 9	622
3.3	The Village School	623
3.4	The Walking-Stick of Destiny	624
	Ch. 1	624
	Ch. 2	625
	Ch. 3	627
	Ch. 4	628
	Ch. 5	631
	Ch. 6	633
	Ch. 7	634
	Ch. 8 and last	636
3.5	The Christ-Church Commoner	637
3.6	Wilhelm von Schmitz	638
	Chapter I.	638
	Chapter II.	639

	Chapter III.	641
	Chapter IV.	644
3.7	Photography Extraordinary	649
3.8	Novelty and Romancement	652
3.9	The Legend of “Scotland”	658
3.10	A Photographer’s Day Out	663
3.11	Bruno’s Revenge	667
3.12	The Wasp in a Wig	678
3.13	Isa’s Visit to Oxford. 1888.	681
4	Geometrical Texts	686
4.1	A Syllabus of Plane Algebraical Geometry	686
4.2	Notes on the First Two Books of Euclid	691
4.3	The Formulæ of Plane Trigonometry	696
4.4	Euclid and His Modern Rivals	708
4.5	Supplement to “Euclid and his Modern Rivals”	822
4.6	Euclid. Books I, II	837
4.7	Euclid’s Theory of Parallels	841
4.8	A New Theory of Parallels (Curiosa Mathematica. Part I)	842
5	Texts about Voting	893
5.1	A Discussion of the Various Methods of . . . Elections	893
5.2	Suggestions As to the Best Method of Taking Votes	899
5.3	A Method of Taking Votes on More Than Two Issues	901
5.4	The Purity of Election	909
5.5	Proportionate Representation	912
	May 15, 1884	912
	May 19, 1884	912
	May 27, 1884	913
	June 5, 1884	915
5.6	Parliamentary Elections	916
5.7	Notes	919
5.8	Redistribution	920
	October 11, 1884	920
	October 22, 1884	923
5.9	The Principles of Parliamentary Representation	924
	Supplement	941
	Postscript to Supplement	943
5.10	Election Gains and Losses	945
6	Logical Texts	946
6.1	First Paper on Logic	946
6.2	Fourth Paper on Logic	948
6.3	The Game of Logic	951
6.4	Fifth Paper on Logic	998
6.5	Sixth Paper on Logic	1002
6.6	Questions in Logic	1006
6.7	A Challenge to Logicians	1009
6.8	Eighth Paper on Logic	1010
6.9	Ninth Paper on Logic	1012

6.10	Eighth and Ninth Paper on Logic. Notes	1016
6.11	A Disputed Point in Logic (April 1894)	1019
6.12	A Disputed Point in Logic. A Concrete Example.	1020
6.13	A Disputed Point in Logic (May 1894)	1021
6.14	A Theorem in Logic	1022
6.15	A Logical Paradox	1023
6.16	A Logical Puzzle	1027
6.17	Questions for Solution: 14122	1031
6.18	Symbolic Logic. Specimen-Syllogisms. Premisses	1032
6.19	Symbolic Logic. Specimen-Syllogisms. (2nd Ed.) Conclusions	1034
6.20	Symbolic Logic. Questions. I	1035
6.21	Symbolic Logic. Questions. II	1036
6.22	What the Tortoise Said to Achilles	1037
6.23	Logical Nomenclature	1040
	Variant I	1040
	Variant II	1041
6.24	Symbolic Logic. Part I: Elementary	1043
6.25	Symbolic Logic. Part II	1176
7	Alternative Methods of Computation	1220
7.1	Condensation of Determinants	1220
7.2	Practical Hints on Teaching	1227
7.3	Divisibility by Seven	1229
7.4	Brief Method of Dividing a Given Number by 9 or 11	1231
7.5	Abridged Long Division	1233
7.6	Curiosa Mathematica. Part III	1239
8	Collections of Formulæ	1253
8.1	Algebraical Formulæ	1253
8.2	Formulæ in Algebra	1255
8.3	Algebraical Formulæ and Rules	1259
8.4	Arithmetical Formulæ and Rules	1262
8.5	Formulæ	1266
8.6	Formulæ (Group C)	1267
9	Other Mathematical Texts	1269
9.1	Notes on the First Part of Algebra	1269
9.2	A Guide to the Mathematical Student	1272
9.3	The Science of Betting	1287
	November 19, 1866	1287
	November 20, 1866	1288
	November 21, 1866	1288
9.4	An Elementary Treatise on Determinants	1289
9.5	The Fifth Book of Euclid Treated Algebraically	1381
9.6	Euclid, Book V.	1382
9.7	An Inconceivable Conversation	1385
9.8	Algebra (13)	1387
9.9	The Cats and Rats Again	1388
9.10	A Tangled Tale	1390
	Knot I. Excelsior	1390

	Knot II. Eligible Apartments	1392
	Knot III. Mad Mathesis	1396
	Knot IV. The Dead Reckoning	1398
	Knot V. Oughts and Crosses	1401
	Knot VI. Her Radiancy	1403
	Knot VII. Petty Cash	1407
	Knot VIII. De Omnibus Rebus	1411
	Knot IX. A Serpent with Corners	1413
	Knot X. Chelsea Buns	1415
	Appendix	1420
9.11	To Find the Day of the Week for Any Given Date	1454
9.12	Note on Question 7695	1456
9.13	Infinitesimal or Zero?	1458
9.14	“Something or Nothing?”	1459
9.15	Questions for Solution: 9588	1460
9.16	Questions for Solution: 9636	1461
9.17	Questions for Solution: 9995	1462
9.18	Questions for Solution: 11530	1463
9.19	Questions for Solution: 12650	1464
9.20	Questions for Solution: 13614	1465
9.21	Pillow-Problems (Curiosa Mathematica. Part II)	1466
9.22	Number-guessing	1543
9.23	A Mysterious Number	1544
10	Games	1545
10.1	Rules for Court Circular (1860)	1545
10.2	Rules for Court Circular (1862)	1548
10.3	Croquêt Castles	1550
10.4	Castle Croquet (1863?)	1552
10.5	Castle Croquet (1866)	1554
10.6	Word-Links (cyclostyled)	1557
10.7	Word-Links (printed)	1560
10.8	Doublets. A Word-Puzzle	1562
10.9	Doublets (1879–1881)	1576
10.10	New Method of Scoring	1585
10.11	Lanrick (Jan. 1879)	1586
10.12	Lanrick (Feb./Mar. 1879)	1587
10.13	Lanrick (Oct. 1880)	1589
10.14	Lanrick (Dec. 1880)	1590
	Notices to Correspondents. Acknowledgements	1591
	Remarks (March)	1591
	Remarks (June)	1592
10.15	Lanrick (1881)	1593
10.16	Lanrick. A Game for Two Players	1595
10.17	Mischmasch (1881)	1601
10.18	Mischmasch (1882, Monthly Packet)	1602
10.19	Mischmasch (1882)	1604
10.20	Mischmasch (1886)	1605
10.21	Lawn Tennis Tournaments (1882)	1606
10.22	The Fallacies of Lawn Tennis Tournaments	1608

10.23	Lawn Tennis: Reply to “Cavendish”	1612
10.24	Lawn Tennis	1614
10.25	Lawn Tennis Tournaments (1883)	1615
10.26	Circular Billiards (Variant A)	1622
10.27	Circular Billiards (Variant B)	1624
10.28	Arithmetical Croquet	1626
10.29	Syzygies	1627
	July 23, 1891	1627
	July 30, 1891	1629
	August 6, 1891	1629
	August 13, 1891	1629
	August 20, 1891	1630
	August 27, 1891	1632
	September 3, 1891	1633
	September 10, 1891	1633
	September 17, 1891	1637
	September 24, 1891	1639
	October 1, 1891	1642
	October 8, 1891	1646
	October 15, 1891	1648
	October 22, 1891	1650
	October 29, 1891	1652
	November 26, 1891	1652
	December 3, 1891	1654
	December 10, 1891	1656
	December 17, 1891	1660
	December 31, 1891	1661
	January 7, 1892	1662
	January 14, 1892	1667
	January 21, 1892	1668
	January 28, 1892	1668
	February 4, 1892	1669
	February 11, 1892	1669
	February 18, 1892	1670
	February 25, 1892	1672
	March 3, 1892	1674
	March 10, 1892	1675
	March 17, 1892	1677
	March 24, 1892	1679
	March 31, 1892	1682
	April 7, 1892	1683
	April 14, 1892	1684
	April 21, 1892	1685
	April 28, 1892	1687
	May 5, 1892	1688
	May 12, 1892	1689
	May 19, 1892	1691
	May 26, 1892	1692
	June 2, 1892	1694
10.30	Syzygies. A Word-Puzzle	1696

11 Texts on Religion and Morality	1706
11.1 To All Child-Readers of “Alice’s Adventures in Wonderland” .	1706
11.2 An Easter Greeting	1707
11.3 “The Priest in Absolution”	1709
11.4 Marriage Service	1711
11.5 Traitors in the Camp	1713
11.6 “Whoso Shall Offend One of These Little Ones—”	1716
11.7 “An Oxford Scandal”	1718
11.8 Eternal Punishment	1720
11.9 Address by the Rev. C. L. Dodgson	1726
12 Texts concerning Oxford	1729
12.1 “Endowment of the Greek Professorship”	1729
12.2 The New Examination Statute	1731
12.3 American Telegrams (Summary)	1733
12.4 The New Method of Evaluation as Applied to π	1734
12.5 The Dynamics of a Parti-cle	1738
12.6 The Offer of the Clarendon Trustees	1744
12.7 Reform at Christ Church	1747
12.8 Suggestions for Committee	1748
12.9 The New Belfry of Christ Church, Oxford	1750
12.10 The Vision of the Three T’s. A Threnody	1757
12.11 Objections, Submitted to the Governing Body	1768
12.12 The Blank Cheque, a Fable	1772
12.13 Architecture in Oxford	1776
November 3, 1874	1776
November 5, 1874	1777
12.14 The Professorship of Comparative Philology	1778
February 4, 1876	1778
February 12, 1876	1779
February 14, 1876	1780
12.15 Responsions, Hilary Term, 1877	1782
12.16 Natural Science at Oxford	1783
12.17 Clerical Fellowships	1786
12.18 Christ Church, Oxford	1787
12.19 Oxford Responsions	1789
12.20 An Analysis of Responsions Lists	1791
12.21 Twelve Months in a Curatorship	1793
12.22 The Proposed Procuratorial Cycle	1810
Postscript	1811
12.23 The Proctorial Cycle	1814
12.24 Suggestions as to Election of Proctors	1817
12.25 Suggestions as to the Election of Proctors	1822
12.26 Three Years in a Curatorship	1828
12.27 Remarks on Report of Finance Committee	1836
12.28 Curiosissima Curatoria	1842
12.29 Resident Women-Students	1858
13 Texts concerning Vivisection	1860
13.1 Vivisection as a Sign of the Times	1860

13.2	Vivisection	1863
13.3	Some Popular Fallacies about Vivisection	1864
13.4	Vivisection Vivisected	1871
14	Texts concerning Theatres	1874
14.1	The Guildford Gazette Extraordinary	1874
14.2	Misleading Playbills	1879
14.3	Education for the Stage	1880
	February 27, 1882	1880
	March 6, 1882	1882
14.4	“Alice” on the Stage	1883
14.5	Children in Theatres	1888
14.6	The Stage and the Spirit of Reverence	1890
14.7	Mrs. Fawcett and the Stage Children	1897
14.8	Stage Children	1898
15	Texts about Letters, Post, etc.	1902
15.1	The Telegraph-Cipher	1902
15.2	The Alphabet-Cipher	1903
15.3	Letter from Mabel	1905
15.4	A Complete Postage Guide	1906
15.5	What to Call a “Telephone-Message”	1907
15.6	Eight or Nine Wise Words About Letter-Writing	1908
15.7	A Postal Problem. June, 1891	1919
	Supplement	1920
15.8	A Postal Problem	1921
16	Other Texts	1922
16.1	Railway Rules	1922
16.2	“Love’s” Railway Guide	1923
16.3	Answers to Correspondents	1924
	Part 1	1924
	Part 2	1924
	Part 3	1924
	Part 4	1924
	Part 5	1925
	Part 6	1925
	Part 7	1925
	Part 8	1925
16.4	Reviews	1926
16.5	Moans from the Miserable	1927
16.6	Zoological Papers	1928
	No. 1. Pixies	1928
	No. 2. The Lory	1928
	No. 3. Fishs	1929
	No. 4: The One-Winged Dove	1930
16.7	Representative Men	1934
	Lecture 1st. “On the Uses of Little Men”	1934
	Lecture 2nd. “Cuffey, or the Chartist”	1934
	Lecture 3d. “Jack Sprat, or the Epicure”	1935

16.8	Difficulties	1936
	No. 1	1936
	No. 2	1937
16.9	Hints for Etiquette; or Dining out Made Easy	1938
16.10	Life of Richard Hakluyt	1940
16.11	Where Does the Day Begin?	1945
16.12	Photographic Exhibition	1946
16.13	Feeding the Mind	1949
16.14	Enigma	1953
	Explication of the Enigma	1953
16.15	The Organization of Charity	1954
16.16	Woodstock Election	1956
16.17	Original Research	1958
16.18	Memoria Technica (1877)	1960
16.19	Specific Gravities of Metals, &c.	1961
16.20	Logs of Nos.	1963
16.21	Various Memoria Technica Verses	1965
16.22	Memoria Technica (1888)	1967
16.23	The Electric Pen	1969
16.24	Testimonial	1970
16.25	Is it Well to have Children Vaccinated?	1971
	August 18, 1877	1971
	September 8, 1877	1971
	September 22, 1877	1972
16.26	Notices to Correspondents (January 1882)	1974
16.27	Notes	1975
16.28	Aunt Judy's Correspondence	1976
	April	1976
	May	1976
16.29	Notices to Correspondents (April 1882)	1977
16.30	Note about "Shakespeare for Girls"	1978
16.31	The Profits of Authorship	1979
16.32	Mr. Gladstone's New Book	1980
16.33	Too Many Dogs	1983
16.34	Hydrophobia Curable	1984
16.35	'Game of Logic'	1986
16.36	Tristan d'Acunha	1987
16.37	Authors of Epigrams Wanted	1988
16.38	"Life on a Lonely Isle of the Sea."	1989
16.39	The Fasting Man	1990
16.40	Eight Hours Movement	1991
16.41	The Cab-Runner Nuisance	1992
16.42	Nyctograph	1993
17	Images	1996
17.1	The Vernon Gallery	1996
	"The Scanty Meal"	1997
	"The Woodland Gait"	1998
	"The First Earring"	1999
	"The Wooden Bridge"	2000

	“High Life and Low Life”	2001
	“The Duett”	2002
17.2	Other Images in <i>The Rectory Umbrella</i>	2003

Part 1

Preface

1.1 Introduction

This is (or rather: should be) a complete edition of all texts by Lewis Carroll.¹ Well, of course it isn't. But it is the most complete collection I know of, and according to the scope (which I think is a very reasonable one) only a few texts are missing in it.

It started as a personal project to collect some texts, but then grew more and more until it reached its current state. Originally I only planned a PDF file generated from a L^AT_EX source, but then decided to also produce HTML files. Both versions should have the same content, similar formatting, and only differ in the presentation.

The Scope of This Collection

The most difficult thing in creating a collection is to decide on the scope. No matter how you decide, once you try to follow your plan, you will end up adding more and more works, because if you added *this*, then you also have to add *that*, and so on. One example: You might try to limit the collection to all *literary* works by Lewis Carroll. This will exclude *Euclid and his Modern Rivals*. Sure, this is a mathematical book by C. L. Dodgson. But it also is a literary work with Carrollian humour. So you just *have* to add it, as the collection would be incomplete otherwise. But once you added that, you no longer have a real reason to exclude other mathematical books (after all, some of them contain literary portions, too), so you will add those, and so on.

I first tried to limit myself to published works. This seemed to work well, but there were a few unpublished works I wanted to add, too. And the few works soon became more and more, until I could hardly declare them as a few exceptions. So I decided to give up on a restrictive limit of the scope.

On the other hand, there are a few problems with adding *all* works. Even in electronic form they take away space. And it takes time to add them properly.

¹In this preface I will use the name "Lewis Carroll" throughout, even in cases where "C. L. Dodgson" (pronounced, by the way, with a silent G like "Dodson") might seem more appropriate. There is no longer the danger that anybody who wanted to see the famous Lewis Carroll would come to C. L. Dodgson and disturb him in his privacy, so this strict separation is no longer necessary, and it is easier to use just one name instead of two.

The current rules about which works are included into this collection and which aren't are these:

Carroll wrote almost 50 books (including some larger pamphlets, which make about half that number). All these are at least listed. Some “uninteresting” mathematical books are only very partially included, and some not at all. “Uninteresting” is of course very subjective, but means that more or less nobody would even think about looking at that book if it had a different author. Also parts by other authors are omitted, this also applies to translations of Euclid. Some parts like the table of contents and advertisements have been omitted for all books.

Carroll also contributed several hundreds (the number depends very much on whether and how you count all the “Doublets” columns, and will be either about 200 or about 300) of articles and letters to almost 50 magazines and newspapers. These are all included. But given that this collection is the only one (at least the only one I know of) to mention and reprint “*The Priest in Absolution*” from the *Pall Mall Gazette* and *Mr. Gladstone’s New Book* from the *St. James’s Gazette* (well, this actually is mentioned in the *Lewis Carroll Handbook*, but without proper citation),² there sure are still some unknown articles waiting hidden in some archives to be found.

Offprints and reprints from contributions to magazines and newspapers are in most cases just mentioned, but even in case of small changes not included additionally. Many of these reprints are actually nowhere listed, *Lewis Carroll and the Press* mentions some, but searching digitized newspaper archives will give many more.

In a few cases magazines published letters Carroll sent to the editor, but probably didn't intend to have them published. These are not included in this collection.

Carroll also had hundreds of pamphlets (again the number depends on how you count, and will be something up to 200) printed, or (since 1877) produced them himself with an electric pen or similar devices, or (a few since 1888) with a typewriter. These, too, are included. The exceptions are the offprints mentioned above (though in some cases the border between an offprint and a separate pamphlet is hard to draw), circular letters (including most of what he had printed as Curator of Common Room), works he only compiled, and some other strange stuff. For these omitted pamphlets sources are given, so you can find them if you want to read them.

Carroll left some unpublished galley proofs, either because at some point stopped working on them, or because he died before he could finish them. Of these a few are also included into this collection, for legal reasons only if they have been published long enough ago. Galley proofs of books he did publish are not included.

The most difficult part are the lots of manuscripts: It is almost impossible to draw the line between manuscripts that deserve inclusion among his works and those that are mere scribbles on note-sheets. I took the *Lewis Carroll Handbook* and the *Pamphlets* series as rough guidelines as to which of them to include. I excluded all manuscripts not in English, that is, the two known poems in Latin, the first one from 1844, quoted by Collingwood (*Life and Letters*, p. 23), the

²When I started this collection, and the last volume of the *Pamphlets* series hadn't been published yet, this list was much longer.

second from 1882 in a scrapbook of Thomas Verse Bayne (<https://digital.bodleian.ox.ac.uk/objects/179a125e-2800-4d02-982c-a019bc761392/surfaces/88c913e4-fe5a-4991-b794-c27774965183/>). Again, for legal reasons only those published long enough ago are included. In the section with missing manuscripts I listed more manuscripts that still exist, but still excluded several papers that don't seem worth for listing there. Most of these are mentioned and some reprinted in the notes to the published diaries.

Among the works out of scope of this collection are his diaries, including the *Russian Journal* from 1867.

Also excluded are his letters, but there is one exception: Poems from letters (or inscribed into book presents, etc.) are treated like manuscripts, that is, most are included, especially if they are reprinted in traditional "complete" collections. A few of these poems were printed by him with minor variations, in most cases these are not included additionally. Also note that in some cases the only known source is not the final poem, but only a draft version Carroll kept for himself.

Also missing in this collection are Carroll's photographs and drawings (except for a few exceptions).

Of course most of his sermons are missing, in fact, only one sermon was published. But at least a list of all known (from his diaries, note that the diary for the time of his first sermons is missing, and he might not have recorded all his sermons) sermons is given here, as the choice of topics is very interesting and much neglected until now. (Very interesting: While working on liar problems in logic, he preached on "All men are liars.") Unless otherwise noted the date is always an "ordinary" sunday. Where Carroll gives quotes for the text, I took them unchanged (and in a few cases corrected the verse number), where he only gave a verse number, I added the quote (hoping the verse is correct). When he preached on the same text more than one time, the quote is only given for the first time (which allows you to quickly identify such repetitions).

Date	Topic
Jun 8, 1862 (Whitsunday)	2 Cor 13:14 ["The grace of the Lord Jesus Christ, and the love of God, and the communion of the Holy Ghost, be with you all."]
Dec 28, 1862	2 Pet 3:4 "Where is the promise of his coming, for since the fathers fell asleep, all things continue as they were until now"
Feb 18, 1863 (Ash Wednesday)	Ps 95:4 "In his hand are all the corners of the earth"
Mar 8, 1863	Rev 4:8 "And they rest not day or night, saying, Holy, Holy, Holy, Lord God Almighty"
Mar 19, 1863 (St. Joseph)	Rev 3:20 ["Behold, I stand at the door, and knock: if any man hear my voice, and open the door, I will come in to him, and will sup with him, and he with me."]
Aug 9, 1863	2 Cor 11:14 "Satan himself is transformed into an angel of light"
Aug 16, 1863	Deut 4:40 "Thou shalt keep therefore his statutes and his commandments, which I command thee this day, that it may go well with thee", Eccl 12:13 "Fear God, and keep his commandments, for this is the whole duty of man", 1 Joh 5:3 "This is the love of God, that we keep his commandments"

Sep 6, 1863	John 4:13–14 “Jesus answered and said unto her, whosoever drinketh of this water shall thirst again; but whosoever drinketh of the water that I shall give him shall be in him a well of water, springing up unto everlasting life”
Nov 1, 1863	Luke 15:18–19 “I will arise and go to my Father . . .” [“. . . and will say unto him, Father, I have sinned against heaven, and before thee, and am no more worthy to be called thy son: make me as one of thy hired servants.”]
Mar 20, 1864 (Palm Sunday)	Matt 6:21 “where your treasure is, there will your heart be also”
Mar 27, 1864 (Easter Sunday)	Col 3:1 [“If ye then be risen with Christ, seek those things which are above, where Christ sitteth on the right hand of God.”]
Apr 24, 1864	Matt 28:20 “Lo, I am with you alway, even unto the end of the world”
May 29, 1864	Phil 1:21 “to die is gain”
Nov 6, 1864	1 Cor 10:31 “Whether therefore ye eat or drink, or whatever ye do, do all to the glory of God.”
Feb 19, 1865	Gen 3:4 “The serpent said unto the woman, ye shall not surely die”, Luke 2:11 “Unto you is born this day in the city of David a Saviour.”
Mar 5, 1865	Gen 3:4, Luke 2:11
Mar 12, 1865	Ps 66:18 “If I incline unto wickedness in my heart, the Lord will not hear me”
Mar 26, 1865	Ps 64:1 “Hear my voice, oh God” (same sermon as above)
Apr 2, 1865	1 Joh 2:15 “Love not the world, neither the things of the world. If any man love the world, the love of the Father is not in him.”
Apr 16, 1865 (Easter Sunday)	Col 3:1
Apr 23, 1865	1 Joh 5:4 “This is the victory that overcometh the world, even our faith.”
May 14, 1865	Luke 16:10 “He that is unjust in the least . . .” [“. . . is unjust also in much.”]
Jun 4, 1865 (Whitsunday)	Acts 2:38–39 “Ye shall receive the Holy Ghost, for the promise is unto you and to your children.”
Jun 18, 1865 (Dedication Church)	2 Kgs 19:14 “And Hezekiah received the letter of the hand of the messenger, and read it: Hezekiah went up into the house of the Lord.”
Jun 18, 1865	Ps 100:4 “Oh go your way into his gates with thanksgiving, and into his courts with praise.” (same sermon without referring to dedication)
Jul 2, 1865	Ps 100:4
Aug 6, 1865	1 Joh 3:16 “Hereby perceive we the love of God, because he laid down his life for us, and we ought to lay down our lives for the brethren.”
Aug 20, 1865	Matt 25:35 “I was an hungred, and ye gave me meat: I was thirsty, and ye gave me drink.”

Sep 3, 1865	Eccl 8:14 ["There is a vanity which is done upon the earth; that there be just men, unto whom it happeneth according to the work of the wicked; again, there be wicked men, to whom it happeneth according to the work of the righteous: I said that this also is vanity."]
Sep 10, 1865	Eccl 8:14
Oct 1, 1865	Rom 7:22-23 ["For I delight in the law of God after the inward man: but I see another law in my members, warring against the law of my mind, and bringing me into captivity to the law of sin which is in my members."]
Oct 8, 1865	John 10:16 ["And other sheep I have, which are not of this fold: them also I must bring, and they shall hear my voice; and there shall be one fold, and one shepherd."]
Oct 15, 1865	Rom 7:22-23
Oct 29, 1865	Rom 7:22-23
Dec 24, 1865	Matt 6:14 ["For if ye forgive men their trespasses, your heavenly Father will also forgive you."]
Dec 25, 1865 (Christmas)	John 1:10 ["He was in the world, and the world was made by him, and the world knew him not."]
Dec 31, 1865	Eccl 9:10 ["Whatsoever thy hand findeth to do, do it with thy might; for there is no work, nor device, nor knowledge, nor wisdom, in the grave, whither thou goest."]
Apr 1, 1866 (Easter Sunday)	Rom 6:10-11 ["For in that he died, he died unto sin once: but in that he liveth, he liveth unto God. Likewise reckon ye also yourselves to be dead indeed unto sin, but alive unto God through Jesus Christ our Lord."]
Mar 10, 1867	Amos 5:15 "Hate the evil, and love the good"
Jan 2, 1887	Mark 10:51 ["And Jesus answered and said unto him, What wilt thou that I should do unto thee? The blind man said unto him, Lord, that I might receive my sight."]
Apr 17, 1887	Eccl 5:2 ["Be not rash with thy mouth, and let not thine heart be hasty to utter any thing before God: for God is in heaven, and thou upon earth: therefore let thy words be few."]
Jul 3, 1887	Is 6:8 "Here am I; send me."
Jan 15, 1888	Is 6:8
Nov 25, 1888	Rom 13:8 ["Owe no man any thing, but to love one another: for he that loveth another hath fulfilled the law."]
Dec 30, 1888	Matt 20:6 ["And about the eleventh hour he went out, and found others standing idle, and saith unto them, Why stand ye here all the day idle?"]
Jan 6, 1889	Luke 2:11 ["For unto you is born this day in the city of David a Saviour, which is Christ the Lord."]
May 19, 1889	Eph 4:25 "We are members one of another."
Jan 19, 1890	Phil 3:13 ["forgetting those things which are behind"]
Jan 26, 1890	Phil 3:13 "reaching forth unto those things which are before"
May 11, 1890	John 20:29 ["Jesus saith unto him, Thomas, because thou hast seen me, thou hast believed: blessed are they that have not seen, and yet have believed."]

Nov 9, 1890	Mark 16:7 “Go your way, tell his disciples, and Peter, that he goeth before you into Galilee: there shall ye see him.”
Jan 4, 1891	Eccl 1:9 [“The thing that hath been, it is that which shall be; and that which is done is that which shall be done: and there is no new thing under the sun.”]
Jan 25, 1891 (Conversion St. Paul)	Acts 9:6 [“And he trembling and astonished said, Lord, of what wilt thou have me to do? And the Lord said unto him, Arise, and go into the city, and it shall be told thee what thou must do.”]
Feb 1, 1891	Rom 8:28 [“And we know that all things work together for good to them that love God, to them who are the called according to his purpose.”]
Apr 3, 1892	Rev 3:1 [“I know thy works, that thou hast a name that thou livest, and art dead.”]
Apr 24, 1892	Rev 3:1
Jun 12, 1892	John 17:26 [“And I have declared unto them thy name, and will declare it: that the love wherewith thou hast loved me may be in them, and I in them.”]
Jul 3, 1892	John 17:26
Nov 13, 1892	Luke 11:4 “Lead us not into temptation.”
Nov 20, 1892	Jas 1:2 “My brethren, count it all joy, when ye fall into divers temptations.”
Jan 8, 1893	Luke 11:4
Apr 16, 1893	Luke 11:4
May 14, 1893	Luke 11:4
May 28, 1893	Jas 1:2
Sep 10, 1893	Luke 11:4
Sep 17, 1893	Jas 1:2
Nov 19, 1893	Matt 12:34–35 “Out of the abundance . . .” [“. . . of the heart the mouth speaketh. A good man out of the good treasure of the heart bringeth forth good things: and an evil man out of the evil treasure bringeth forth evil things.”]
Dec 31, 1893	Luke 6:45 [“A good man out of the good treasure of his heart bringeth forth that which is good; and an evil man out of the evil treasure of his heart bringeth forth that which is evil: for of the abundance of the heart his mouth speaketh.”] (same sermon as above)
Feb 11, 1894	Luke 11:4
Oct 7, 1894	Luke 10:29 [“But he, willing to justify himself, said unto Jesus, And who is my neighbour?”]
Sep 29, 1895 (Harvest Festival)	Ps 116:11 [“I said in my haste, All men are liars.”]
Dec 6, 1896	Mark 9:24 [“And straightway the father of the child cried out, and said with tears, Lord, I believe; help thou mine unbelief.”]

Jan 3, 1897	John 8:10–11 [“When Jesus had lifted up himself, and saw none but the woman, he said unto her, Woman, where are those thine accusers? hath no man condemned thee? She said, No man, Lord. And Jesus said unto her, Neither do I condemn thee: go, and sin no more.”]
Jan 24, 1897	John 8:10–11
Mar 7, 1897	Job 28:28 “And unto man he said, The fear of the Lord, that is wisdom”, prayer “Give us an heart to love and dread thee”
Aug 22, 1897	“Victor and Arnion”, part 1 (Children’s Service)
Aug 29, 1897	“Victor and Arnion”, part 2 (Children’s Service)
Sep 19, 1897	“Victor and Arnion”, part 1 (Children’s Service)
Sep 26, 1897	Stories for Harvest Festival (Children’s Service)
Oct 3, 1897	Stories for Harvest Festival (Children’s Service) (same sermon as above with some addition) → 11.9, p. 1726
Oct 24, 1897	Ps 103:11–12 [“For as the heaven is high above the earth, so great is his mercy toward them that fear him. As far as the east is from the west, so far hath he removed our transgressions from us.”]

And of course the riddles and stories he told many times, but never wrote down, are missing here, too.

Some of these missing contents you can find in other books, there are some lists in the section on *Further Reading*.

The Contents of This Collection

While the previous section gave you a rather technical overview about what kinds of text you will find in this collection, this section will tell you more about its contents.

Of course, you will find the *Alice* books which made Carroll famous. There’s not much to say about them except for the fact that much *can* be said about them. But there are many books that do so, first of all Martin Gardner’s annotated editions, and they do this much better than I could do it.

Among the novels there are also the two volumes of *Sylvie and Bruno*. This sometimes is viewed as a difficult work, and—indeed—it is not easy. I had to read it several times before I could really understand and appreciate the book, but it is a book you not only *can* read several times, but which you *should* read several times.

You will also find a lot of texts dealing with some Oxford matters. Many of them a hard to understand today, because they allude to people and events long forgotten. The *Picture Book* has some introductions and the *Oxford Pamphlets* extensive notes that will help you. Again, these books do a much better job than I could do.

Since Carroll was a mathematician, this collection also contains many mathematical books. The early ones deal with geometry, with Euclidian geometry, to be precise, because non-Euclidian geometry was still very young in these days, and Carroll rejected these new ideas like many others on more or less philosophical grounds.

Starting with voting on university matters Carroll wrote about mathematical voting theory, later turning his interests to parliamentary elections. You will find many interesting ideas among these texts, some which are a matter of course today, some that are as new today as they were then.

Some of his mathematical texts deal with infinitesimals. At that time they were just a shadowy idea not clearly understood. A strict foundation of Analysis without infinitesimals was developed only since the 1870s, which now forms the usual basis of mathematics. But in 1961 Robinson developed a strict theory of infinitesimals, which formalizes the intuitive ideas of Carroll and his contemporaries.

Take for example Carroll's view in the Note on Question 7695 (\rightarrow 9.12, p. 1456). Most modern mathematicians will agree with Simmons, but in Non-standard Analysis Carroll's view can be formalized: Choose some infinite non-standard natural number, and let the players play for that many rounds at most. Then the infinite sum will become a *-finite one. To be precise: Let $\omega \in \mathbb{N}^* \setminus \mathbb{N}$. Then A's chance is $k \sum_{i=0}^{\omega} ((1-k)(1-l))^i = k \cdot \frac{1 - ((1-k)(1-l))^{\omega+1}}{1 - (1-k)(1-l)} = \frac{k}{k+l-kl} \cdot (1 - ((1-k)(1-l))^{\omega+1})$. Similarly B's chance is $\frac{(1-k)l}{k+l-kl} \cdot (1 - ((1-k)(1-l))^{\omega+1})$. The probability of a draw is what remains to 1, i. e. $((1-k)(1-l))^{\omega+1}$. This actually means that the ratio, of A's expectation to B's, is exactly $\frac{k}{(1-k)l}$, but there is still an infinitesimal chance of a draw, the ratio being $k : (1-k)l : (k+l-kl) \cdot \frac{((1-k)(1-l))^{\omega+1}}{1 - ((1-k)(1-l))^{\omega+1}}$.

Some other treatment of probabilities can be explained by its state at that time. To properly understand in which cases probabilities are additive, it is necessary to understand the different kinds of infinity. This theory was developed by Cantor in the late 1870s, and only accepted some time later. The consequences for probability theory were first really understood by Kolmogorov in the 1930s.

The question 9588 (\rightarrow 9.15, p. 1460) can be interpreted in two different ways: Modern mathematicians will again agree with Simmons, on the ground that there are countably many rational points, but uncountably many irrational ones. But is this the interpretation Carroll had in mind? Can a point be randomly selected that can't be constructed? If you use as base only constructible points, the paradox appears as stated by Carroll, since there are only countably many constructible points. The solution is that there isn't a natural random distribution: Any random distribution on the set of all constructible points must give to some points a positive chance of being selected, and different points can have different chances. Without an explicit distribution the question can't be answered if thus interpreted.

Pillow-Problem 45 (\rightarrow 9.21, p. 1478) suffers from a similar difficulty, neither do we know how the random breaking is done, nor how many "an infinite number" really is. Also problem 58 (\rightarrow 9.21, p. 1480) lacks an explicit random distribution, and allows for different solutions with different results, being similar to the Bertrand paradox.

On the other hand, the famous Pillow-Problem 72 (\rightarrow 9.21, p. 1482) isn't a problem in probability theory, but in "Transcendental Probabilities". That is, it is a clever paradox, the real problem is to detect the fallacy in the solution.

In his later years Carroll turned to logic. As I understand it, he tried to formalize the natural language and its reasoning. This is different from modern

logic which has given up in trying to adapt to “normal reasoning”, and therefore is sometimes regarded as strange. The most difficult part is to formalize “if a then b ”. Modern logic uses two different symbols in different situations, $a \rightarrow b$ and $a \vdash b$. That two different symbols are necessary can be seen in *What the Tortoise Said to Achilles* (\rightarrow 6.22, p. 1037). But why shouldn’t there be a third? “If the moon were made of cheese, it would taste like chocolate” is true in modern logic, but Carroll would say it is false. It would taste like cheese, not like chocolate. (You can find a more mathematical example in *Euclid and His Modern Rivals*, \rightarrow 4.4, p. 798.) Note the tight connection to existential import: “All moons made of cheese taste like chocolate” is a similar or even equivalent variant. Unfortunately, we ca’n’t know what kind of formalization Carroll would have invented had he lived long enough to complete his studies, but perhaps it would have been similar to Hugh MacColl’s ideas.

But not only late works are included, you will also find very early works in this collection, including *La Guida di Bragia* (\rightarrow 18.144, p. 2306), which really deserves more attention than it got by only reprinting the prologue. Also included are his family magazines and other early manuscripts.

You will even find some books that never were published. Carroll listed his literary plans in his diary on March 29, 1885:

- (1) Supplement to “Euclid and Modern Rivals,” now being set up in pages. This will contain the review of Henrici and extracts from reviews of “E. & M. R.” with my remarks on them. I think of printing 250.
- (2) 2nd Edition of “Euc. and Mod. Rivals,” this I am correcting for press, and shall embody above in it.
- (3) A book of Math. curiosities, which I think of calling “Pillow Problems, and other Math. Trifles.” This will contain Problems worked out in the dark, Logarithms without Tables, Sines and angles do., a paper I am now writing, on “Infinities and Infinitesimals,” condensed Long Multiplication, and perhaps others.
- (4) “Euclid V,” treating Incommensurables by a method of Limits, which I have nearly completed.
- (5) “Plain Facts for Circle-Squarers,” which is nearly complete, and gives actual proof of limits 3.14158, 3.14160.
- (6) A symbolical Logic, treated by my algebraic method.
- (7) “A Tangled Tale,” with answers, and perhaps illustrated by Mr. Frost.
- (8) A collection of Games and Puzzles of my devising, with fairy pictures by Miss E. G. Thomson. This might also contain my “Mem. Tech.” for dates &c., my “Cipher-writing,” scheme for Letter-registration, &c., &c.
- (9) Nursery “Alice,” for which 20 pictures are now being coloured by Mr. Tenniel.
- (10) Serious poems in “Phantasmagoria.” I think of calling it “Reason and Rhyme,” and hope to get Mr. Furniss to draw for it.
- (11) “Alice’s Adventures Underground,” a facsimile of the MS. book, lent me by “Alice” (Mrs. Hargreaves). I am now in correspondence with Dalziel about it.
- (12) “Girl’s Own Shakespeare.” I have begun on “Tempest.”

(13) New edition of “Parliamentary Representation,” embodying supplement &c.

(14) New edition of “Euc. I., II,” for which I am now correcting edition 4.

(15) The new child’s book, which Mr. Furniss is to illustrate: he has now “Peter and Paul” to begin on. I have settled on no name as yet, but it will perhaps be “Sylvie and Bruno.”

I have other shadowy ideas, e. g., a Geometry for Boys, a vol. of Essays on theological points freely and plainly treated, and a drama on “Alice” (for which Mr. Mackenzie would write music) [...]

What became of these? (1), (2), (7), (9), (11), (14) and (15) were published as planned, (10) under the title “Three Sunsets and Other Poems” and without drawings by Mr. Furniss. (3) was published with less content than planned, but you will find some parts of the omitted content in the fragments of *Curiosa Mathematica. Part III* (→ 7.6, p. 1239). Carroll started publishing (6) with *The Game of Logic* (→ 6.3, p. 951), which can be called “volume zero” of the series, and also the real volume one (→ 6.24, p. 1043). The rest exists in some galley proofs and manuscripts, some of them included in this collection (→ 6.25, p. 1176). Some content of (5) survives, you will find the preface in this collection (→ 19.22, p. 2505). Most of the content of (8) exists, the fairy pictures made it into *Three Sunsets and Other Poems* (→ 19.18, p. 2493), the scheme for letter-registration into *Eight or Nine Wise Words About Letter-Writing* (→ 15.6, p. 1908), and many games had been published separately and will be found in their own section in this collection. One essay on theological points exists, *Eternal Punishment* (→ 11.8, p. 1720). The dramatization of “Alice” was done by H. Savile Clarke, with music by Walter Slaughter. Carroll’s additions are added to the poems in the poem section.

Speaking of poems, the poem section will give you not only the popular and often reprinted poems, but also early variants of them, as well as some not so widely spread ones.

This collection also contains some texts where it is not clear whether Lewis Carroll really is the author. These texts all have a note mentioning this fact. On the other hand, I excluded several poems found in other collections, because they are most certainly not by Carroll. The poem *Who Killed Cock Robin?* appeared anonymously since mid-1881 in many newspapers. The first appearance I could find is from June 4, 1881 in the *Rothesay Chronicle* (<https://www.britishnewspaperarchive.co.uk/viewer/bl/0001909/18810604/062/0004>), titled *The Transvaal Muddle*. This first variant has one additional verse and some other variations. Since then it was reprinted frequently and with modifications. Apparently Carroll just copied the poem. The poem starting “I have wandered” from *A New Theory of Parallels* appeared as *The Fate of Genius* in *Punch’s Pocket Book for 1861*. The poem “He took a second-story flat” from a letter written Feb. 28, 1890 is actually quoted (though not very accurately) from *Beauty and the Beast* by Albert Smith. And then there are lots of poems he wrote next to his photographs. These are often (sometimes explicitly, sometimes implicitly) attributed to him, and in most cases erroneously so. These poems are: *To a Child* (“O child! O new-born denizen”) by Henry Wadsworth Longfellow, *Children on the Shore* (“We are building little homes on the sands”) by Menella Smedley, *The Daisy* (“No sooner does the sun appear”) by Edwin Lee

(in his book *The Botanical Looker-out Among the Wild Flowers*), *My Daughters on the Beach* (“Pretty little legs”, though it is actually “Pretty rosy legs”) by John Richard Green, *The Vision of Sin* (“You are bones, and what of that?”) by Alfred Tennyson, *The May Queen* (“There’s many a black, black eye”) by Alfred Tennyson, *A Lay of the Early Rose* (“A rose once grew within”) by Elizabeth Barrett Browning, some lines from *The Lady of the Lake* (“Come one, come all! This rock shall fly”) by Walter Scott and from *Twelfth Night* (“My father had a daughter loved a man”) by William Shakespeare. The only of these verses that I can’t find a source for are the other “daisy” verses (“Sweet, all sweets above”, https://figgy.princeton.edu/viewer?manifest=https://figgy.princeton.edu/concern/scanned_resources/a744c172-b7f7-4f17-8a0b-2768f654153f/manifest&c=&m=&s=&cv=18&xywh=-3758%2C-687%2C17985%2C13708). This might be by Carroll, it could even be part of his acrostic on “Daisy Whiteside” (July 15, 1875),³ but even if it is I do not think these four lines worth for inclusion among the poems.

Typography and Changes to the Texts

The texts have been transcribed at different times and (when I didn’t had access to the original text, but only to modern reprints) by different transcribers. Sometimes I wanted to recreate the original look as closely as possible, sometimes I wanted to standardize it, and sometimes I was just lazy. So while the texts should look quite similar to the originals, they may deviate more or less from them.

Also the PDF and the HTML version might differ, especially for things that can’t be reproduced properly in HTML (for texts with math you should use Firefox to view them, or some other browser with proper MathML support), though in some other cases the format of the HTML is better than the PDF.

The most important changes to the typography are the following: The format of the headlines (also note that in some cases the date or some other distinguishing text has been added for works with the same title) and first words of a chapter or poem have been standardized, as well as signatures. Numbering of stanzas is omitted. Underlining in handwriting has been reproduced as italics in most cases, the symbol for “and” (which could be a “&”, or a “+”, or even a Tironian Et) usually as “&”. Dashes are usually reproduced as they are, but in some cases they are changed to follow the convention to use the very long ones for interrupted speech. Separating rules are usually reproduced by just a larger vertical skip in the PDF, while the HTML version uses different rules. References to other pages etc. have been substituted (with a few exceptions) for the correct reference inside this collection (in the PDF version, the HTML version keeps the original text with a link to the correct place). This also includes some textual changes, like from “previous page” to “this page above” etc. In all cases the reference has been kept as closely as possible to the original. Where the referenced text is not part of this collection, the original reference is kept.

In many cases Carroll published his texts in several variants. The main variant given in this collection is usually the latest version. How the other versions are treated depends on circumstances: For some mathematical books,

³The only reason why “love” should be “deep” instead of “strong as death” is to let the line start with “D”, but I have nothing else to support my conjecture.

they are simply omitted. For manuscript poems that were later published with differences, these differences are just mentioned in the header of the text. This is also done where there are only differences in punctuation or similar minor details. Otherwise the changes are marked ‘like this’ and given in footnotes (if there are more versions, the footnotes will say to which of them they apply, unless they apply to all). In the HTML version the notes appear on click, for this and similar functions you must have JavaScript enabled. In some cases with many changes over a longer time only the differences to the first version are mentioned, not the ones in between. Finally for cases where the differences are too large to present them in footnotes all variants have been included, usually directly after each other, or else with a note where the other versions can be found. In the HTML version these other variants are linked.

In some cases, parts of the works have been omitted if it is some long table or similar text with no real interest. Also some parts of books like the advertisements have not been reproduced here.

Most books aren’t presented in their original form, but have their contents split into several sections, i. e. the preface is in the section with prefaces (unless it is in the same style as the text, in which case it is kept there), any dedication poem is with the other poems, the frontispiece is with the main content, the list of illustrations is omitted, but the entries used a image captions, etc. If you want to read them completely, you should refer to the next section, which lists the original order for all these books, and links to a complete source. If the cover contains images (in most cases these are circular illustrations in gold, which are a bit difficult to reproduce in print), they are with the preface, the front cover image at the start, the backcover image at the end.

Most mathematical drawings have been redrawn. In some books images are repeated several times on following pages, this hasn’t been reproduced here. In some cases (especially in manuscripts) the illustrations are carefully embedded into the text. This hasn’t been possible to reproduce in all cases, so sometimes such images are placed outside the text or combined with other images or such minor changes.

Some strange spellings, that could be seen as mistakes have been reproduced as they are, in early works “it’s” is always spelled this way, even if it normally should be spelled “its” (but you use an apostrophe in any other genitive form, so why not here, too?), in later works he writes “ca’n’t” etc., as explained in the preface to *Sylvie and Bruno Concluded* (→ 19.14, p. 2479). Also note that in early works every line starts with a quotation mark when inside a spoken part. Sometimes a single quote is used as continued quotation. This has only been reproduced in poems. Later works only repeat the quotation mark on the start of a paragraph, or not at all.

Quotes and parodies are annotated in the margin (for whole texts in the header, and in HTML only after a click). A few other remarks are given in footnotes, to distinguish them from the footnotes in the original works, these editorial footnotes start with “Remark:”. In HTML the remarks are shown after a click. Solutions to puzzles and acrostichons are given in the footer.

Of course this collection ca’n’t be better than its sources. As far as possible I used scans of the original texts rather than reprints. Where only reprints are available, in a few cases I had access to different reprints, so I could correct some errors in one reprint by looking at another. These alternative sources are not always mentioned.

All texts have been proofread at least a bit, but due to the large extent, there sure are mistakes. (Even the last volume of the *Pamphlets* series, which without doubt has been very carefully prepared, has errors. If you don't believe it, then compare the penultimate line of *Richard Hakluyt* with the original.) If in doubt, compare with the cited source. In some cases mistakes in the original have been corrected here, sometimes (especially for obvious typesetter errors and punctuation) without note.

How this Book should be read

In Science—in fact, in most things—it is usually best *to begin at the beginning*. So you might expect the advice: “Begin at the beginning and go on till you come to the end: then stop.” This certainly *is* one way in reading this book, but depending on *why* you read it, it might not be the *best* way.

If you are interested in a list of all works by Lewis Carroll, but don't have access to the *Lewis Carroll Handbook* or other bibliographical lists, or for some reason don't want to use those, you should look at the next section. It contains several lists, together they contain almost all the works by Lewis Carroll, even those not included in this collection. While not really intended as bibliography, it certainly can be used as such.

If you are interested in one specific work, you should look for it in the next section. If it is included in this book, you should find both an external source for it and the place in this book (or several places, if it has several different parts) where you can find it. Even if it is not included, an external source might be listed. Alternatively, you can look for it in the table of contents.

If you are interested in all texts of a certain type or topic, you should go to that section and just start reading. In most sections, the works are ordered chronologically, with a few exceptions to keep similar texts next to each other. The poems are in alphabetical order, the prefaces in the order in which the books are listed in the list of works, with additional texts inserted where it makes most sense to insert them.

If you are interested in poetry, you should go to the chapter with all poems. This chapter contains even those poems published as part of a story (except for the images), with the exception of other author's poems that appear as quote and very short rhymes.

Among them there are 23 Acrostics: *A boat, beneath a sunny sky* (→ 18.1, p. 2010), *A Nursery Darling* (→ 18.4, p. 2014), *Alice dear, will you join me in hunting the Snark?* (→ 18.7, p. 2018), *Alice dreamed one night* (→ 18.8, p. 2019), *Are you deaf, Father William?* (→ 18.14, p. 2030), *Around my lonely hearth, to-night* (→ 18.15, p. 2031), *To My Pupil* (→ 18.22, p. 2040), *Dear Dolly, since I do not know* (→ 18.27, p. 2047), *Dreams, that elude the Waker's frenzied grasp* (→ 18.31, p. 2054), *Even while the blinding bandage lies* (→ 18.33, p. 2056), *From the air do they come?* (→ 18.44, p. 2082), *Girlie to whom in perennial bloom* (→ 18.46, p. 2084), *Girt with a Boyish Garb* (→ 18.47, p. 2085), *To my Child-Friend* (→ 18.64, p. 2136), *Is All Our Life* (→ 18.89, p. 2174), *Lines* (→ 18.100, p. 2209), *Love-lighted eyes* (→ 18.102, p. 2211), *Maiden, though thy heart may quail* (→ 18.104, p. 2213), *Maidens, if a maid you meet* (→ 18.105, p. 2214), *Maidens! If you love the tale* (→ 18.106, p. 2215), *Puck Lost and Found* (→ 18.137, p. 2297), *Round the wondrous globe* (→ 18.139, p. 2299), *Love among the Roses* (→ 18.143, p. 2305)

You will also find 9 Double Acrostics: *Four Riddles. No. II* (→ 18.32, p. 2055), *I saw a child: even if blind* (→ 18.75, p. 2151), *Double Acrostic* (Argles) (→ 18.76, p. 2152), *Near Albury, so runs my lay* (→ 18.121, p. 2234), *Double Acrostic* (Kerr) (→ 18.151, p. 2331), *Four Riddles. No. I* (→ 18.170, p. 2373), *Three Children* (→ 18.176, p. 2387), *Double Acrostic* (Bremer) (→ 18.185, p. 2407), *Double Acrostic* (Hughes) (→ 18.186, p. 2408)

And 11 Charades: *Dedicated to a tea-tea. Why? Oh, when?* (→ 18.48, p. 2086), *Charade* (Amy Hughes) (→ 18.78, p. 2156), *My First has no beard* (→ 18.112, p. 2224), *My First heads all atrocity heartrending* (→ 18.113, p. 2225), *My First is a berry* (→ 18.114, p. 2226), *Four Riddles. No. IV* (→ 18.115, p. 2227), *A Riddle* (→ 18.116, p. 2229), *My First we call her when her belt is on* (→ 18.117, p. 2230), *My First's a drink resembling wine* (→ 18.118, p. 2231), *Four Riddles. No. III* (→ 18.152, p. 2332), *They both make a roaring* (→ 18.173, p. 2383)

And finally 8 other riddle poems: *Examination Statute* (→ 18.2, p. 2012), *A Monument* (→ 18.3, p. 2013), *Anagrammatic Sonnet* (→ 18.18, p. 2034), *Puzzles from Wonderland* (→ 18.30, p. 2051), *First, the fish must be caught* (→ 18.35, p. 2061), *The Lyceum* (→ 18.92, p. 2178), *Tell me truly, Maidens three* (→ 18.150, p. 2330), *Puzzle* (→ 18.197, p. 2422)

If you think you already read almost everything (in this case I assume you read the complete *Pamphlets* series and all well-known books), you will want to read *The Priest in Absolution* (→ 11.3, p. 1709) and *Mr. Gladstone's New Book* (→ 16.32, p. 1980). Perhaps you also missed the first version of *Memoria Technica* (→ 16.18, p. 1960). Are you aware of all the many variants of *Lanrick* (→ 10.11, p. 1586 and following)? You might also want to check the list of mathematical books, and the manuscript poems. For example, did you ever read the complete version of *Maggie's Visit to Oxford* (→ 18.196, p. 2418)?

If you want to read everything you can start reading from beginning to the end, but even then it could be better to read the texts in some random order for more variety.

Copyright

Most works by Lewis Carroll are no longer protected by copyright, even if we apply the much longer terms of modern copyright: In most countries today copyright expires 70 years after the death of the author. Since Carroll died in 1898, this is long past. This also applies to the illustrations: E. Gertrude Thomson, the illustrator who lived longest, died in 1929, so her works, too, are no longer protected.

The only exception to this is with originally unpublished material. These texts may still be protected by copyright, depending on the date of publication and the laws you want or have to follow. For this reason I state the date of the earliest publication for these items, or at least the earliest publication I know of, even if I took it from some later source. Since I am German, I will follow German laws, which grant such texts a protection for 25 years after the first publication. I also assume that most printed works have been published by Carroll himself, especially those listed by Collingwood in his bibliography, but since even rare works where it is questionable whether they were published originally have been reprinted quite early, these should all have been published long enough ago anyway.

If your country protects originally unpublished works for a longer period, you will have to remove the respective texts before redistributing this collection. For your convenience the following list contains all texts published within the last 50 years for the first time (but note that in some countries the protection may last even longer):

- 1974: *An Inconceivable Conversation; A Disputed Point in Logic. A Concrete Example; Life of Richard Hakluyt; Marriage Service; Number-Guessing; Logs of Nos.; Verses for Christmas Cards; Near Albury, so runs my lay; Square Poem*
- 1975: *Sidney Hamilton, Answers to Correspondents, The Village School, and Woes from The Rectory Magazine*
- 1977: *Symbolic Logic. Part II* (parts already 1972); *The Wasp in a Wig*
- 1979: *A Russian's Day in England; To "Hallie"; My dear Christie; No, no! I cannot write a line; My First we call her when her belt is on; Alice dreamed one night; My first is a drink resembling wine; some of the Memoria Technica Verses*
- 1981: *Double Acrostic* (for Agnes and Emily Hughes); *O come to me at two today; If Ruth & you*
- 1982: *Charade* (for Amy Hughes)
- 1994: some of the *Memoria Technica Verses*
- 1995: *Little Red Riding Hood*
- 1998: *Dear Dolly, since I do not know*

These dates are the earliest publication dates known to me, but it is likely that many texts have been published earlier, even much earlier. Take the *Lig-niad* as an example: Most bibliographies will tell you it was first published in 1973, some in 1976. But if you dig a bit deeper, you will find several auction catalogues from earlier years, which reprint parts of the poem, and since each one reprints other parts, almost the whole poem had been published before. And if you dig really deep, you will come across an obscure magazine *Eastbourne* which had in its issue of Aug. 2, 1897 an article titled *An Early MS. of Dodgson's, and Entirely Unpublished* which reprints the poem completely. This article was published on the death of Woodhouse, and I think it likely that similar articles appeared—more or less unnoticed—for other recipients of Carroll's manuscript poems. The same is true for auction catalogues: They often reprint short manuscripts, sometimes even in facsimile, but aren't recorded in bibliographies. So several of the above works are probably no longer protected even in countries with longer periods of protection.

The only part that *is* protected by copyright is this preface as well as the code used to generate the different files. You are allowed to distribute or otherwise use these (and thus the whole collection) under the license CC BY-SA (<https://creativecommons.org/licenses/by-sa/4.0/>). If you want to re-use parts of the L^AT_EX code you may alternatively do so according to the terms of the usual LPPL (<https://www.latex-project.org/lppl/>). The code to build the files may also be used alternatively according to the terms of the MPL (<https://mozilla.org/MPL/2.0/>).

All code and data is available from Github: <https://github.com/Schnark/lewis-carroll>

Biographical Overview

- 1832 Born at Daresbury, Cheshire (January 27), as eldest son (third of eleven children) of Charles Dodgson, Perpetual Curate of Daresbury, and Frances Jane (born Lutwidge)
- 1843 Father became Rector of Croft, Yorkshire, and family moved there
- 1844–5 At Richmond School, Yorkshire (from August 1, 1844)
- 1845 First publication (*The Unknown One*) in school magazine
- 1846–9 At Rugby School (from January 27, 1846)
- 1850 Matriculated at Christ Church, Oxford (May 23)
- 1851 Took up residence at Christ Church (January 24)
Mother died (January 26)
- 1852 Student of Christ Church (December)
- 1854 B.A. (1st Class Honours in Mathematics; 2nd Class in Classics)
- 1855 Sub-Librarian, Christ Church (until 1857)
Mathematical Lecturer (until 1881)
- 1856 First publication under the pseudonym Lewis Carroll
Began photographing (until 1880)
- 1857 M.A.
- 1860 *A Syllabus of Plane Algebraical Geometry* published
- 1861 Ordained deacon (December 22)
- 1862 Told the story of Alice’s adventures to the Liddell sisters on a boat trip (July 4)
- 1865 *Alice’s Adventures in Wonderland* published (July, December)
- 1867 Journey on the continent with H. P. Liddon (July 12–September 14)
An Elementary Treatise on Determinants published
- 1868 Father died (June 21)
Moved his family to Guildford (September)
- 1869 *Phantasmagoria* published (January)
- 1871 *Through the Looking-Glass* published (December)
- 1874 *Notes by an Oxford Chiel* published (June)
- 1876 *The Hunting of the Snark* published (March)
- 1879 *Euclid and His Modern Rivals* published (March)
- 1880 Gave up photographing
- 1881 Resigned Mathematical Lectureship
- 1882 Curator of Common Room (December 1882 to February 1892)
- 1883 *Rhyme? and Reason?* published (December)
- 1885 *A Tangled Tale* published (December)
- 1886 *Alice’s Adventures Under Ground* published (December)
- 1887 *The Game of Logic* published (February)
- 1888 *A New Theory of Parallels* published
- 1889 *Sylvie and Bruno* published (December)
- 1890 *The Nursery “Alice”* published (March)
- 1892 Resigned Curatorship of Common Room (February)
- 1893 *Pillow-Problems* published (July)
Sylvie and Bruno Concluded published (December)
- 1896 *Symbolic Logic, Part I* published (February)
- 1898 Died at Guildford (January 14) and buried there
Three Sunsets and Other Poems published (February)

Note how perfectly birth, publication of *Alice* and death are spread over the cen-

ture. Every 16 or 17 years you can celebrate a round (divisible by 50) anniversary!

About the Editor

Like many others I first came across Lewis Carroll when I read *Alice's Adventures in Wonderland* as a child (in the German translation by Christian Enzensberger). When I was learning English I read it again, this time the original, together with the other works in the so-called "Complete Works". (By the way, did it help me in learning English? Well, I now speaks English almost as goodly as Bruno, and I'm among the few who get the apostrophes right in words like "ca'n't".) Several years later I decided that I wanted to read everything by Lewis Carroll, and started collecting texts I found online and offline. This collection is the result.

The name I use online, "Schnark", is of course derived from *The Hunting of the Snark*. (For those who don't know how to pronounce German, the "Sch" is like the English "sh".) You might think that in this case I must be able to explain what the Snark really is. If so, I must disappoint you, because I ca'n't, either. I actually don't think the Snark is important at all. It isn't even clear whether there are any real Snarks except Boojums. I think that the only important fact is the friendship between Butcher and Beaver.

1.2 Contents by Source

All texts name their source. This is either the the complete story (for “extracted”), which can be found in some other chapter, or the book, magazine, etc. the text comes from. The best available source is listed and described here. Note that in some cases the description is from the *Lewis Carroll Handbook*. This list also includes the works not included in this book.

As far as possible the sources give links to freely available scans from the Internet Archive, but in some cases scans are only available on other sites, not always with free access. For some scans from Google Books you might need to use a proxy located in the US to access them, these are marked thus.^{US-proxy}

Some texts are only available in modern reprints. In some cases (and for many books listed in the section on “Further Reading”) they can be borrowed from the Internet Archive, but you need a free account to do so.

Novels and Stories

Alice’s Adventures in Wonderland

By Lewis Carroll, first published 1866 (printed 1865), several unnumbered editions; illustrations by John Tenniel
scans from <https://archive.org/details/alicesadventur00carr> (1866)
and <https://archive.org/details/alicesadventure00tenngoog> (1898),
text of preface from 1886 from the *Lewis Carroll Handbook*

Mathematical Books

A Syllabus of Plane Algebraical Geometry

Systematically Arranged, with Formal Definitions, Postulates, and Axioms.

Part I. Containing Points, Right Lines, Rectilinear Figures, Pencils, and Circles.

By Charles Lutwidge Dodgson, published 1860

scan from <https://books.google.de/books?id=HndaAAAAcAAJ>

- Title
- Introduction (→ 4.1, p. 686)
- Table of Contents
- Main content (still missing)
- Errata

The book presents analytical geometry in seven books, mainly the presentation and manipulation of points, lines, and circles in different coordinate systems. The main text only gives definitions, axioms, and propositions without proofs, some explanations and proofs are given in the appendix.

The exact contents are: Three preliminary sections on general definitions, algebra, and plane geometry. These are followed by seven books: I. Representation of magnitude only, II. Representation of direction only, III. Representation of magnitude and direction, i. e. trigonometry, IV.

Representation of position (with chapters I. Cartesian system, II. Polar system,

III. Distantial system (with sections I. Bilinear system, II. Trilinear system, III. Multilinear system)), V. Discussion of points, right lines, rectilinear figures, and pencils, VI. Investigation of loci, VII. The circle. The work concludes with a section with formulæ and the appendix.

The Formulæ of Plane Trigonometry

Printed with Symbols (Instead of Words) to Express the “Goniometrical Ratios.”

By Charles Lutwidge Dodgson, published 1861

text from *Mathematical Pamphlets*, item 5

- Title
- Main content (→ 4.3, p. 696)

General List of Subjects

Published 1863

- Title
- Main content (following directly, → 9.2, p. 1272)

Proof sheets from 1862 are available as item 42 in *Mathematical Pamphlets*. The published work is described to be exactly the same as *A Guide to the Mathematical Student*, except for the preface.

The Enunciations of Euclid I, II

The Enunciations of the Propositions and Corollaries, together with Questions on the Definitions, Postulates, Axioms, &c. in Euclid, Books I. and II.

Anonymous, published 1863

text available from *Mathematical Pamphlets*, item 2

- Title
- Main content (still missing)

The work contains questions (more or less a list of all defined terms, and the topics of the postulates and axioms), and the enunciations (i. e., the propositions without the proofs) of the first two books of Euclid.

A Guide to the Mathematical Student

in Reading, Reviewing, and Working Examples. Part I: Pure Mathematics

By Charles Lutwidge Dodgson, published 1864

The Enunciations of Euclid I–VI

Together with Questions on the Definitions, Postulates, Axioms, &c.

Anonymous, published 1873

scans available from <https://books.google.de/books?id=XD1bAAAAQAAJ>

(early proof) and <https://books.google.de/books?id=Dokvy91Z31AC>

- Title
- Main content (still missing)

The work is both in style and content very similar to *The Enunciations of Euclid I, II*, but also includes the books III–VI.

Euclid, Book V.

Proved Algebraically so far as it relates to Commensurable Magnitudes to which is prefixed a Summary of all the necessary algebraical operations.

By Charles L. Dodgson, published 1874

scan from <https://archive.org/details/euclidbookvprov00carrgoog>

- Title
- Preface (moved to content)
- Table of Contents
- Main content (still partially missing, → 9.6, p. 1382)

The missing main content starts with a chapter “Preliminary Algebra”, containing basic algebraical formulæ in two columns. The chapter “Propositions” contains the propositions, first as given by Euclid, then stated algebraically with algebraical proof. The chapter “Enunciations” lists all enunciations in algebraical form, again in two columns. The next chapters contain Euclid’s Definitions and Axioms.

Euclid and his Modern Rivals

By Charles L. Dodgson, first published 1879, two editions (second 1885)
scans from

<https://babel.hathitrust.org/cgi/pt?id=mdp.39015017351969> (first edition, not reproduced here) and

<https://archive.org/details/euclidhismodernr00carr> (second edition)

- Frontispiece (moved to content)
- Title (motto moved to preface)
- Dedication (“Dedicated to the memory of Euclid”)
- Preface (→ 19.19, p. 2501)
- Table of Contents
- Main content (→ 4.4, p. 708)
- Appendices
 - Appendix I (by Mr. Todhunter)
 - Appendix II (by Mr. De Morgan)
 - Appendix III (moved to content)
 - Appendix IV (omitted)

Appendix I contains an extract from Mr. Todhunter’s essay on ‘Elementary Geometry,’ included in ‘The Conflict of Studies, &c.’ Appendix II contains an extract from Mr. De Morgan’s review of Mr. Wilson’s Geometry, in the ‘Athenæum’ for July 18, 1868. Appendix IV contains a list of Propositions of Euc. I, II, with references to their occurrence in the manuals of his Modern Rivals.

The first edition had two more appendices, which is why the Supplement contains an “Appendix VII”.

Supplement to “Euclid and his Modern Rivals”

Containing a Notice of Henrici’s Geometry, together with a Selection from the Reviews

Anonymous (author given in preface), published 1885

scan from <https://books.google.com/books?id=J8szaQAAMAAJ>^{US-proxy}

- Title
- Preface (→ 19.20, p. 2503)
- Act II. Scene VI. Henrici (→ 4.4, p. 742)
- Appendix VII (→ 4.5, p. 822)¹

Euclid. Books I, II

By Charles L. Dodgson, first published 1882, seven editions (private edition 1875, second 1883, third and fourth 1885, fifth 1886, sixth 1888)

scan from <https://archive.org/details/euclidbooksiii00euclrich>
(second edition from 1883)

- Frontispiece (same as in *Euclid and his Modern Rivals*)
- Title
- Introduction (→ 4.6, p. 837)
- Main content (still missing)
- Appendix A (still missing)
- Appendix B (still missing)
- Appendix C (still missing)

The main content is a slightly modified translation of Euclid I and II.² Appendix A contains some explanatory notes to some of the axioms and propositions. Appendix B contains additional definitions, given in Euclid, but not needed in Books I, II. Appendix C contains additional definitions, not given in Euclid.

¹This has nothing to do with Carroll, but I ca’n’t resist to mention that *Euclid and his Modern Rivals* is a collection of reviews, so reviews on that book are meta-reviews, which makes this appendix a meta-meta-review. Unfortunately, the short notice in *Nature* (June 25, 1885, <https://www.nature.com/articles/032171a0>, neither can I find any other reviews) ca’n’t be called “review”, otherwise it were a meta-meta-meta-review, and I could discuss it here in a meta-meta-meta-meta-review.

²Note that Heiberg’s text of Euclid’s *Elements* was only published 1883 (English translation 1908), during Carroll’s time the edition by Simson was most commonly used.

The Principles of Parliamentary Representation

By Charles L. Dodgson, first published 1884, two public editions (second 1885), additionally Supplement (1885) and Postscript to Supplement (1885) scans from <https://archive.org/details/principlesofparl00carr> (first edition from 1884, including Supplement and Postscript, but with missing preface) and <https://books.google.de/books?id=ZCovAAAAAYAAJ> (first edition from 1884, without Supplement and Postscript)

- After Three Days (July 1861, → 18.77, p. 2153)

The Oxford Magazine and Church Advocate

scan from the *Scrapbook*

- Feeding the Mind (December 1861, → 16.13, p. 1949)

A later variant was published posthumously, see
<https://archive.org/details/feedingmind00carruoft>.

The Morning Post

scan from <https://www.britishnewspaperarchive.co.uk/search/results/1864-03-04/1864-03-04?newspapertitle=morning%2bpost> (very poor
quality), text from *Oxford Pamphlets*, item 3

- The New Examination Statute (March 1864, → 12.2, p. 1731)

Pall Mall Gazette

scans from <http://www.britishnewspaperarchive.co.uk/search/results?exactsearch=false&newspapertitle=pall%2bmall%2bgazette>, “The Organization of Charity” also included in the *Scrapbook*

- The Science of Betting (November 1866, → 9.3, p. 1287, → 9.3, p. 1288)
- The Organization of Charity (January 1867, → 16.15, p. 1954)
- Original Research (October 1874, → 16.17, p. 1958)
- Architecture in Oxford (November 1874, → 12.13, p. 1776, → 12.13, p. 1777)
- Vivisection as a Sign of the Times (February 1875, → 13.1, p. 1860)
- Vivisection (February 1875, → 13.2, p. 1863)
- Natural Science at Oxford (May 1877, → 12.16, p. 1783)
- Clerical Fellowships (June 1877, → 12.17, p. 1786)
- “The Priest in Absolution” (July 1877, → 11.3, p. 1709)

The Times

scans from

<https://www.thetimes.co.uk/archive/article/1866-11-21/10/5.html>,
<https://www.thetimes.co.uk/archive/article/1883-09-01/7/5.html>,
<https://www.thetimes.co.uk/archive/page/1893-12-02/1.html>,
<https://www.thetimes.co.uk/archive/page/1894-03-06/1.html>, “The Science of Betting” also included in the *Scrapbook*

- The Science of Betting (November 1866, → 9.3, p. 1288)
- A Complete Postage Guide (September 1883, → 15.4, p. 1906)
- Through the Looking-Glass (December 1893/March 1894, → 19.5, p. 2461, → 19.5, p. 2461)

Proceedings of the Royal Society of London

scan from

<https://royalsocietypublishing.org/doi/10.1098/rspl.1866.0037>

- Condensation of determinants, being a new and brief method for computing their arithmetical values (1866/1867, → 7.1, p. 1220)

This was also published as an offprint.

Punch

scan from <https://archive.org/details/punch52a53lemouoft>

- Atalanta in Camden Town (July 1867, → 18.20, p. 2036)

Most bibliographies also include an anecdote Carroll contributed, published on January 3, 1874. But the published version differs so much from his, that I do not think it should count as a work by him. Therefore I did not include it here.

Aunt Judy's Magazine

scans from <https://babel.hathitrust.org/cgi/pt?id=uc1.a0003938263;view=1up;seq=255>,

<https://babel.hathitrust.org/cgi/pt?id=uc1.a0003938271;view=1up;seq=80>,

<https://books.google.com/books?id=60AsAAAAYAAJ>,

<https://books.google.com/books?id=pVMoAQAAMAAJ>

- Castle Croquet (August 1867, → 10.5, p. 1554)
- Bruno's Revenge (December 1867, → 3.11, p. 667)
- Puzzles from Wonderland (December 1870, → 18.30, p. 2051; the solutions published in January 1871 are probably not by Carroll, but he might have seen, approved, and perhaps improved them)
- Aunt Judy's Correspondence (April/May 1882, → 16.28, p. 1976, → 16.28, p. 1976)
- Dreamland (July 1882, → 18.198, p. 2423)

Oxford University Herald

scan from <http://www.britishnewspaperarchive.co.uk/search/results/1868-11-28?NewspaperTitle=Oxford%2BUniversity%2Bband%2BCity%2BHerald&IssueId=BL%2F0000994%2F18681128%2F&County=Oxfordshire%2C%20England>,

also included in the *Scrapbook*

- Woodstock Election (November 1868, → 16.16, p. 1956)

The Oxford Undergraduate's Journal

scan from the *Scrapbook*

- Reform at Christ Church (February 1869, → 12.7, p. 1747)

Authorship and date are not entirely certain.

The Fortnightly Review

scan from <https://babel.hathitrust.org/cgi/pt?id=njp.32101026757201>

- Some Popular Fallacies about Vivisection (June 1875, → 13.3, p. 1864)

The Eastbourne Chronicle

scans from

<https://www.britishnewspaperarchive.co.uk/search/results/1877-08-18/1877-09-22?newspapertitle=eastbourne%2bchronicle>,
partially also
<https://www.informedparent.co.uk/wp-content/uploads/2017/10/1877-EASTBOURNE-CHRONICLE-debate-with-Lewis-Carroll-C-Dodgson.pdf>

- Is it Well to have Children Vaccinated? (August/September 1877, → 16.25, p. 1971, → 16.25, p. 1971, → 16.25, p. 1972)

Vanity Fair

scans from <https://books.google.de/books?id=yfFHAQAAMAAJ>,
https://books.google.de/books?id=-_FHAQAAMAAJ,
<https://books.google.de/books?id=KfJHAQAAMAAJ>,

- Romantic Problems; A Tangled Tale. Knot II. Mad Mathesis (July 1880, → 9.10, p. 1396)
- Answers to “Romantic Problems. Knot II” (September 1880, → 9.10, p. 1426)
- A Tangled Tale. Knot III. The Dead Reckoning (October 1880, → 9.10, p. 1398)
- A Tangled Tale. Answers to Knot III (December 1880, → 9.10, p. 1429), including:
 - Lanrick (→ 10.14, p. 1590)
- A Tangled Tale. Knot IV. Oughts and Crosses (January 1881, → 9.10, p. 1401)
- Notices to Correspondents. Acknowledgements (February 1881, → 10.14, p. 1591)
- A Tangled Tale. Answers to Knot IV (March 1881, → 9.10, p. 1432), including:
 - Untitled remarks about “Lanrick” (→ 10.14, p. 1591)
- A Tangled Tale. Knot V. Eligible Apartments (April 1881, → 9.10, p. 1392)
- A Tangled Tale. Answers to Knot V (June 1881, → 9.10, p. 1423), including:
 - Untitled remarks about “Lanrick” (→ 10.14, p. 1592)
- Mischmasch (June 1881, → 10.17, p. 1601)
- A Tangled Tale. Knot VI. Her Radiance (July 1881, → 9.10, p. 1403)
- Lanrick (August 1881, → 10.15, p. 1593)
- A Tangled Tale. Answers to Knot VI (September 1881, → 9.10, p. 1434, including a short note on “Mischmasch”)
- A Tangled Tale. Answers to Correspondents (November 1881, → 9.10, p. 1442)
- Lanrick (November 1881, → 10.15, p. 1593)
- Notices to Correspondents (January 1882, → 16.26, p. 1974)
- A Tangled Tale. Knot VII. Petty Cash (April 1882, → 9.10, p. 1407)

- Notices to Correspondents (April 1882, → 16.29, p. 1977)
- A Tangled Tale. Answers to Knot VII (June 1882, → 9.10, p. 1437), including:
 - Untitled note about “Shakespeare for Girls” (June 1882, → 16.30, p. 1978)
- Mischmasch (November 1882, → 10.18, p. 1602)
- A Tangled Tale. Knot VIII. A Serpent with Corners (January 1883, → 9.10, p. 1413)
- A Tangled Tale. Answers to Knot VIII (April 1883, → 9.10, p. 1446)
- A Tangled Tale. Knot IX. De Omnibus Rebus (August 1883, → 9.10, p. 1411)
- A Tangled Tale. Answers to Knot IX (November 1883, → 9.10, p. 1445)
- A Tangled Tale. Knot X and Last. Chelsea Buns (November 1884, → 9.10, p. 1415)
- A Tangled Tale. Answers to Knot X. (March 1885, → 9.10, p. 1449)
- A Tangled Tale. Answers to Knot X. (May 1885, → 9.10, p. 1450)

Most, if not all, Knots, as well as several solutions, *Lanrick* of August 1881 and the note about “Shakespeare for Girls” were also published as offprints.

St. James’s Gazette

scans from <http://www.britishnewspaperarchive.co.uk/search/results?exactsearch=false&newspapertitle=st%20james%27s%20gazette> (doesn’t include 1881), text of “The Purity of Election” from *Political Pamphlets*, item 14, text of “Traitors in the Camp” from *Pamphlets: A Miscellany*, item 28

- The Purity of Election (May 1881, → 5.4, p. 909)
- Traitors in the Camp (December 1881, → 11.5, p. 1713)
- Education for the Stage (February/March 1882, → 14.3, p. 1880, → 14.3, p. 1882)
- Notes (March 1882, → 16.27, p. 1975)
- Lawn Tennis Tournaments (August 1882, → 10.21, p. 1606)
- The Fallacies of Lawn Tennis Tournaments (August 1883, → 10.22, p. 1608)
- Lawn Tennis: Reply to “Cavendish” (August 1883, → 10.23, p. 1612)
- Lawn Tennis (August 1883, → 10.24, p. 1614)
- Proportionate Representation (May/June 1884, → 5.5, p. 912, → 5.5, p. 912, → 5.5, p. 913, → 5.5, p. 915)

- Parliamentary Elections (July 1884, → 5.6, p. 916)
- Notes (August 1884, → 5.7, p. 919)
- Redistribution (October 1884, → 5.8, p. 920, → 5.8, p. 923)
- Vivisection Vivisected (March 1885, → 13.4, p. 1871)
- Mr. Gladstone's New Book (March 1885, → 16.32, p. 1980; authorship not entirely certain)
- "Whoso Shall Offend One of These Little Ones—" (July 1885, → 11.6, p. 1716)
- Hydrophobia Curable (October 1885, → 16.34, p. 1984)
- Election Gains and Losses (December 1885, → 5.10, p. 945)
- Children in Theatres (July 1887, → 14.5, p. 1888)
- To All Readers of "Alice's Adventures Under Ground" (December 1887, → 19.8, p. 2467)
- Tristan d'Acunha (April 1888, → 16.36, p. 1987)
- To All Readers of "Alice's Adventures Under Ground" (December 1888, → 19.8, p. 2467)
- What to Call a "Telephone-Message" (January 1889, → 15.5, p. 1907)
- Mrs. Fawcett and the Stage Children (July 1889, → 14.7, p. 1897)
- "Life on a Lonely Isle of the Sea." (November 1889, → 16.38, p. 1989)
- To All Readers of "Alice's Adventures Under Ground" (December 1889, → 19.8, p. 2467)
- Sylvie and Bruno (January 1890, → 19.13, p. 2478)
- The Fasting Man (April 1890, → 16.39, p. 1990)
- "An Oxford Scandal" (December 1890, → 11.7, p. 1718)

About half of the contributions were reprinted (in a few cases with minor changes) in the weekly *St. James's Budget*. *The Purity of Election*, *Parliamentary Elections*, and *Children in Theatres* were also published as offprints.

The Observer

text from *Life and Letters*, pp. 214–216

- Christ Church, Oxford (June 1881, → 12.18, p. 1787)

Supplement to the Guardian

text from *Oxford Pamphlets*, item 19 (introduction)

- Oxford Responsions (February 1882, → 12.19, p. 1789)

Knowledge

scan from <https://books.google.de/books?id=K3dIAQAAMAAJ>

- Divisibility by Seven (July 1884, → 7.3, p. 1229)
- Euclid's Theory of Parallels (November 1884, → 4.7, p. 841)

The Court Circular

text from *Pamphlets: Games*, item 8c

- Mischmasch (December 1886, → 10.20, p. 1605)

Nature

scans from

<http://www.nature.com/nature/journal/v35/n909/pdf/035517a0.pdf>,

https://archive.org/details/paper-doi-10_1038_057269a0)

- To Find the Day of the Week for Any Given Date (March 1887, → 9.11, p. 1454)
- Brief Method of Dividing a Given Number by 9 or 11 (October 1897, → 7.4, p. 1231)
- Abridged Long Division (January 1898, → 7.5, p. 1233)

The Theatre

scans from <http://search.proquest.com/docview/7869458/fulltextPDF/63A94482ACB34EACPQ/9>, <http://search.proquest.com/docview/7849356/fulltextPDF/AB3CF7F82A4444CBPQ/15>, <http://search.proquest.com/docview/7868966/fulltextPDF/FC9BCE5018F24AA4PQ/5>

- "Alice" on the Stage (April 1887, → 14.4, p. 1883)
- The Stage and the Spirit of Reverence (June 1888, → 14.6, p. 1890)
- Stage Children (reprint, September 1889, → 14.8, p. 1898)

Ad Lucem

text from *Logic Pamphlets*, item 22

- 'Game of Logic' (July 1887, → 16.35, p. 1986)

Nineteenth Century

scan from <https://archive.org/details/in.ernet.dli.2015.21431>

- To the Editor (November 1887, → 19.2, p. 2456)

The Jabberwock

text from *Life and Letters*, pp. 276–277

- A Lesson in Latin (June 1888, → 18.134, p. 2289)

The editors also published two letters, but I don't think they were actually meant to be published (unlike the poem), so I do not include them in this collection. You can find them in *Life and Letters*.

Notes and Queries

scan from

<https://academic.oup.com/nq/article/s7-VIII/187/67/4440666>

- Authors of Epigrams Wanted (July 1889, → 16.37, p. 1988)

The Sunday Times

text from reprint in *The Theatre*, also *Pamphlets: A Miscellany*, item 15

- Stage Children (August 1889, → 14.8, p. 1898)

The Lady

text from *Pamphlets: Games*, item 15 (reprint with some omissions), scan of first issue (as an offprint) in *The Universe in a Handkerchief*, pp. 145–147, for detailed description see also *Lewis Carroll and the Press*

- Syzygies (July 1891–June 1892, → 10.29, p. 1627), also including:
 - Nyctograph (October 1891, → 16.42, p. 1993)
 - A Postal Problem (December 1891, → 15.8, p. 1921)
 - For All Lovers of Children (March–May 1892, → 19.10, p. 2470)
 - For All Writers of Letters (March–May 1892, → 19.11, p. 2471)

The first two *Syzygy* issues were also published as offprints.

The Daily News

scan from <https://www.britishnewspaperarchive.co.uk/search/results/1894-03-06/1894-03-06?NewspaperTitle=London%2BDaily%2BNews&IssueId=BL%2F0000051%2F18940306%2F&County=London%2C%20England>

- Through the Looking-Glass (March 1894, → 19.5, p. 2461)

Mind

scans from <https://academic.oup.com/mind/article/III/11/436/992008/A-LOGICAL-PARADOX>, <https://academic.oup.com/mind/article/IV/14/278/1046872/WHAT-THE-TORTOISE-SAID-TO-ACHILLES>

- A Logical Paradox (July 1894, → 6.15, p. 1023)
- What the Tortoise Said to Achilles (April 1895, → 6.22, p. 1037)

Both articles were also published as offprints.

Chatterbox

scan from <https://babel.hathitrust.org/cgi/pt?id=uc1.b2860916;view=thumb;seq=10>

- A Mysterious Number (February 1897, → 9.23, p. 1544)

This text might not be by Carroll, though a very similar manuscript by him exists, see the *Picture Book*, p. 269.

St. Mary Magdalen Church Magazine

text from the *Picture Book*, pp. 340–344

- Address by the Rev. C. L. Dodgson (November 1897, → 11.9, p. 1726)

Pamphlets, Leaflets, etc.

Note that larger pamphlets in most cases are treated as books, so this list only includes the smaller ones.

- Rules for Court Circular, 1860 (scan from *The Universe in a Handkerchief*, pp. 124–126, → 10.1, p. 1545)
- “Endowment of the Greek Professorship”, 1861 (scan from *Scrapbook*, → 12.1, p. 1729)
- Rules for Court Circular, 1862 (text from *Pamphlets: Games*, item 1b/http://serg.spb.ru/literature/Lewis_Carroll/The_hunting_of_the_snark/p8-ogp.html, → 10.2, p. 1548)
- Croquet Castles, 1863 (scan from *The Universe in a Handkerchief*, pp. 127–129, → 10.3, p. 1550)
- Castle Croquet, 1863? (text from *Picture Book*, pp. 271–274, → 10.4, p. 1552)
- Examination Statute, 1864 (scan from *Scrapbook*, → 18.2, p. 2012)
- The New Examination Statute, 1864 (text from *Oxford Pamphlets*, item 3, → 12.2, p. 1731)

- American Telegrams, 1865 (scan from *Christ Church and Reform*, pp. 112b–112c, → 12.3, p. 1733)

Unpublished Galley Proofs

Some works were meant for publication, but still weren't published when Lewis Carroll died. The surviving galley proofs or preprints of these are listed here, see the next section for manuscripts.

- The Wasp in a Wig, 1870 (first published 1977, scan from https://archive.org/details/waspinwigsuppres0000carr_m8q0, → 3.12, p. 678)
- A Method of Taking Votes on More Than Two Issues, 1876 (first published 1958, scan from <https://digital.bodleian.ox.ac.uk/objects/d5ce1de6-d037-4ab4-9aeb-8e0f10a532be/>, → 5.3, p. 901)
- Symbolic Logic. Part II, 1887–1897 (first published 1977, text (and a few scans) from *Lewis Carroll's Symbolic Logic* by W. W. Bartley, → 6.25, p. 1176)
- Eternal Punishment, 1895/1897 (first published 1899, text from the *Picture Book*, pp. 345–355, → 11.8, p. 1720)
- Curiosa Mathematica Part III, 1897 (first published 1899, text from the *Picture Book*, pp. 240–263, → 7.6, p. 1239)

For a detailed analysis of the authenticity of *The Wasp in a Wig* see <https://archive.org/details/knightletterno7202lewi/page/14>.

Manuscripts

Useful and Instructive Poetry

Written about 1845, first published 1954, text from <http://www.kursivom.ru/%d1%80%d1%83%d0%ba%d0%be%d0%bf%d0%b8%d1%81%d0%bd%d1%8b%d0%b5-%d0%b6%d1%83%d1%80%d0%bd%d0%b0%d0%bb%d1%8b-%d0%bb%d1%8c%d1%8e%d0%b8%d1%81%d0%b0-%d0%ba%d1%8d%d1%80%d1%80%d0%be%d0%bb%d0%bb%d0%b0/> (most of the content, including some images), <https://books.google.com/books?id=GXyiAAAAQBAJ&pg=PA469> (A quotation from Shakespeare with slight improvements)

- Maggie’s Visit to Oxford, 1889 (for Maggie Bowman, first published 1899, text from *The Story of Lewis Carroll*, pp. 97–104, → 18.196, p. 2418)
- Arithmetical Croquet, 1889 (first published 1953, text from *The Universe in a Handkerchief*, pp. 39, 42, → 10.28, p. 1626)
- A Disputed Point in Logic. A Concrete Example, 1894 (first published 1974, scan from <https://digital.bodleian.ox.ac.uk/inquire/p/f5fa07c3-9776-46e6-9dbb-f7c1aa1402ac>, → 6.12, p. 1020)
- Number-Guessing, 1896 (first published 1974, scan from *Mathematical Pamphlets*, item 31, → 9.22, p. 1543)

For *Alice’s Adventures under Ground* see above among the printed books.

Poems from Letters, Inscriptions, etc.

- The year when boilers froze, 1855? (for Samuel Courthorpe Bosanquet?, first published 1966, text from *Jabberwocky and Other Poems*, → 18.162, p. 2357)
- Little Red Riding Hood, 1858 (for Agnes Grace Weld, first published 1995, text from *Jabberwocky and Other Poems*, → 18.88, p. 2173)
- Lines, 1861 (for Lorina, Alice and Edith Liddell, first published 1928, scan from *Letters*, p. 51, → 18.100, p. 2209)
- To M. A. B., 1866 (for Marion Terry, first published 1931, text from *Humorous Verse*, p. 325, → 18.160, p. 2353)
- To “Hallie”, 1868 (for Clara Halyburton Cunyngname, first published 1979, scan from *Letters*, pp. 110–112, → 18.127, p. 2242)
- Dear Maggie,—I found that the friend, 1868 (for Margaret Cunyngname, first published 1898, text from *Life and Letters*, pp. 423–425, → 18.28, p. 2048)
- “Will you trot a little quicker?”, 1868 (for Edith and Dolly Argles, first published 1933, text from *Letters to Child-Friends*, pp. 53–55, → 18.202, p. 2430)

- I saw a child: even if blind, 1868? (for Edith and Dolly Argles, first published 1933, text from *Letters to Child-Friends*, p. 56, → 18.75, p. 2151)
- To Three Puzzled Little Girls, From the Author, 1869 (for the three Misses Drury, first published 1898, scan from *Strand Magazine*, April 1898, <https://archive.org/stream/TheStrandMagazineAnIllustratedMonthly/TheStrandMagazine1898aVol.XvJan-jun#page/n425/mode/2up>, → 18.177, p. 2389)
- Double Acrostic, 1869? (for Agnes and Emily Hughes, first published 1981, scan from <https://www.themorgan.org/exhibitions/online/alice/23> or *Lewis Carroll and Alice, 1832–1982*, p. 67, → 18.186, p. 2408)
- Double Acrostic, 1869 (for E. M. Argles, first published 1932, text from *Humorous Verse*, pp. 313–314, → 18.76, p. 2152)
- My dear Christie, 1869? (for E. M. Argles, first published 1979, text from *Letters*, p. 141, → 18.111, p. 2223)
- Puzzle, 1869 (for Mary, Ina and Harriet Watson, first published 1924, text from *Humorous Verse*, p. 316, → 18.197, p. 2422)
- Double Acrostic, 1870 (for Trina and Freda Bremer, first published 1898, text from *Life and Letters*, pp. 372–373, → 18.185, p. 2407)
- Tell me truly, Maidens three, 1870 (for Mary, Ina and Harriet Watson, first published 1924, scan from *The Magic of Lewis Carroll*, p. 53, → 18.150, p. 2330)
- “No mind!” the little maiden cried, 1870 (for Janet Merriman, first published 1933, text from *Letters to Child-Friends*, p. 81, → 18.122, p. 2235)
- Charade, 1871? (for Amy Hughes, first published 1982, scan from *Lewis Carroll and Alice, 1832–1982*, pp. 69–70/text from *Jabberwocky*, 1988, pp. 17, 18, <https://books.google.de/books?id=FaLyAAAAMAAJ>, → 18.78, p. 2156)
- No, no! I cannot write a line, 1871 (for Margaret Cunnynghame, first published 1979, text from *Letters*, p. 163, → 18.123, p. 2236)
- Three Children, 1871 (for Mary, Ina and Harriet Watson, first published 1924, scan from *Lewis Carroll and Alice, 1832–1982*, pp. 68–69/text from *Humorous Verse*, pp. 317–318, → 18.176, p. 2387)
- Double Acrostic, 1871 (for Mabel and Emily Kerr, first published 1933, scan from *Lewis Carroll and Alice, 1832–1982*, p. 68/text from *Letters to Child-Friends*, pp. 82–83, → 18.151, p. 2331)

- Near Albury, so runs my lay, 1871 (for Alice Pares, first published 1974, text from *Jabberwocky*, 1990, pp. 7, 8, <https://books.google.de/books?id=MaLyAAAAAAAJ>, → 18.121, p. 2234)
- Two Thieves, 1872 (for the three Misses Drury, first published 1929, text from *Humorous Verse*, p. 319, → 18.187, p. 2409)
- O come to me at two today, 1872 (for August Harcourt, first published 1981, scan <https://digital.bodleian.ox.ac.uk/objects/44e7c0f9-920d-4078-bacb-cc486d3e0cc9/surfaces/d2d7539f-ae99-41e0-bcf5-2cd9ea90fb49/>, → 18.125, p. 2238)
- Three Little Maids, 1873 (for the three Misses Drury, first published 1898, text from *Life and Letters*, p. 419, → 18.178, p. 2390)
- My First we call her when her belt is on, 1875? (for Gertrude Chataway, first published 1979, text from *Letters*, p. 232, → 18.117, p. 2230)
- Maidens! If you love the tale, 1876 (for the three Misses Drury, first published 1929, scan from <https://historical.ha.com/itm/books/children-s-books/lewis-carroll-the-hunting-of-the-snark-an-agony-in-eight-fits-london-macmillan-and-co/6234-45149.s>, → 18.106, p. 2215)
- Alice dear, will you join me in hunting the Snark?, 1876 (for Alice Crompton, first published 1936, text from *Letters*, pp. 247–248, → 18.7, p. 2018)
- Alice dreamed one night, 1876 (for Alice Pratt, first published 1979, text from *Letters*, p. 248, → 18.8, p. 2019)
- Dear Dolly, since I do not know, 1876 (for Dolly Draper, first published 1998, scan from *Yours very sincerely C. L. Dodgson*, p. 21, → 18.27, p. 2047)
- Are you deaf, Father William?, 1876 (for Adelaide Paine, first published 1898, text from *Life and Letters*, p. 374–375, → 18.14, p. 2030)
- Love-lighted eyes, 1876 (for Laura Plomer, first published 1899, text from *Picture Book*, p. 209, → 18.102, p. 2211)
- Maiden, though thy heart may quail, 1876 (for Marion Terry, first published 1930, text from *Letters to Child-Friends*, p. 112, → 18.104, p. 2213)
- Even while the blinding bandage lies, 1876 (for Edith Denman, first published 1953, text from *Diaries*, p. 351, → 18.33, p. 2056)
- From the air do they come?, 1876 (for Florence Louise Beaton, first published 1932, text from *Jabberwocky and Other Poems*, → 18.44, p. 2082)
- Round the wondrous globe, 1877 (for Ruth Dymes, first published 1898, text from *Life and Letters*, p. 408, → 18.139, p. 2299)

- Maidens, if a maid you meet, 1877 (for Margaret Dymes, first published 1898, text from *Life and Letters*, p. 408, → 18.105, p. 2214)
- They both make a roaring, 1877 (for Agnes Hull, first published 1924, text from *Letters to Child-Friends*, pp. 133–134, → 18.173, p. 2383)
- Anagrammatic Sonnet, 1877 (for Maud Standen, first published 1924, text from *Letters to Child-Friends*, pp. 73–74, → 18.18, p. 2034)
- Madrigal, 1877 (for May Forshall, first published 1932, text from *Letters to Child-Friends*, p. 121, → 18.52, p. 2096)
- Love among the Roses, 1878 (for Sarah Sinclair, first published 1899, *Picture Book*, p. 204, → 18.143, p. 2305)
- Around my lonely hearth, to-night, 1878 (for Agnes Georgina Hull, first published 1898, text from *Life and Letters*, p. 364, → 18.15, p. 2031)
- If Ruth & you, 1879? (for Effie Mayhew, first published 1981, text from <https://www.nytimes.com/1981/12/20/magazine/christmas-with-lewis-carroll.html>/<https://www.themorgan.org/literary-historical/413276>, → 18.79, p. 2158)
- My First's a drink resembling wine, 1880 (for Alexandra Kitchin, first published 1979, text from *Letters*, p. 384, → 18.118, p. 2231)
- My First has no beard, 1880? (for Alexandra Kitchin, first published 1968, text from *Letters*, p. 384, → 18.112, p. 2224)
- My First heads all atrocity heartrending, 1880 (for Alice Maud Kitchin/Atty Owen, first published 1946, scan from *Yours very sincerely C. L. Dodgson*, p. 71, → 18.113, p. 2225)
- Dedicated to a tea-tea. Why? Oh, when?, 1880 (for Atty Owen, first published 1968, partially visible scan from *Rare Books and Manuscripts*, p. 7, <https://books.google.de/books?id=q7MzAQAAIAAJ>/text from *Jabberwocky and Other Poems*, → 18.48, p. 2086)
- A Riddle, 1880 (for Gaynor Simpson, first published 1898, text from *Humorous Verse*, p. 337, → 18.116, p. 2229)
- Oh pudgy podgy pup, 1880 (for C. H. O. Daniel, first published 1931, scan from https://findingaids.princeton.edu/catalog/C0171_c00187, → 18.129, p. 2245)
- Something fails, 1881 (for Edith Blakemore, first published 1933, text from *Letters to Child-Friends*, p. 159, → 18.148, p. 2328)
- The Lyceum, 1881 (for Agnes Hull, first published 1899, scan from *Letters to Child-Friends*, p. 146b, → 18.92, p. 2178)
- Rhyme? and Reason?, 1883 (for Emmie Drury, first published 1929, text from *Humorous Verse*, p. 337, → 18.83, p. 2163)

- A Limerick, 1888? (for Vera Beringer, first published 1898, text from *Life and Letters*, p. 407, → 18.169, p. 2372)
- Dear Violet,—I’m glad to hear, 1889 (for Violet Dodgson, first published 1933, text from *Letters to Child-Friends*, p. 204–205, → 18.29, p. 2050)
- Maggie B—, 1891 (for Maggie Bowman, first published 1931, text from *Humorous Verse*, p. 344, → 18.208, p. 2448)
- My First is a berry, 1892 (for Olive, Ruth, and Violet Butler, first published 1933, text from *Letters to Child-Friends*, p. 229, → 18.114, p. 2226)
- Girlie to whom in perennial bloom, 1895? (for Gladys Baly, first published 1932, text from *Diaries*, p. 487, → 18.46, p. 2084)
- Square Poem (for the brother of Lady Ure, first published 1974, text from *The Universe in a Handkerchief*, p. 20, → 18.73, p. 2149; authorship not certain)

Some poems from letters Carroll published himself. These are not listed above and their differences are not reproduced in the poems, but noted where available. These poems are *Girt with a Boyish Garb* (for Gertrude Chataway), *A Charade (Four Riddles. No. III, for Marion Terry)*, *Matilda Jane* (for Catherine Holiday), *A Game of Fives*, and *Puck Lost and Found*. The first of the *Puzzles from Wonderland* can be found in his letters, too, but without changes. The poem *Lines* was published by Carroll, too, but since the manuscript variant is more prominent than the printed one, it is included above. *Disillusionized*, too, has such a variant, though it is not clear where it comes from.

Missing Works

The following texts are not included into this collection, either because I don’t know a source, or because they are out of scope, or because I just hadn’t have the time yet to add them.

Books

The following books are missing partially or completely, most of them because they are “uninteresting” mathematical works or by other authors:

- *A Syllabus of Plane Algebraical Geometry*: Main part missing, “uninteresting” mathematical work
- *Notes on the First Part of Algebra*: Main part mostly missing, “uninteresting” mathematical work
- *The Enunciations of Euclid I, II*: Completely missing, more or less a translation of Euclid
- *The Fifth Book of Euclid Treated Algebraically*: Main part missing, partially a translation of Euclid, partially an “uninteresting” mathematical work

- *The Enunciations of Euclid I–VI*: Completely missing, more or less a translation of Euclid
- *Euclid, Book V*: Main part missing, partially a translation of Euclid, partially an “uninteresting” mathematical work
- *Euclid. Books I, II*: Main part missing, translation of Euclid
- *An Index to “In Memoriam”*: Main part missing, really uninteresting listing, mainly compiled by his sisters

From the following books some minor parts are missing:

- *A Guide to the Mathematical Student*: cycle
- *An Elementary Treatise on Determinants*: some tables with formulæ extracted from main content
- *Euclid and his Modern Rivals*: three appendices (two of them by other authors)
- *Symbolic Logic. Part I*: one chapter with solutions
- *Doubles. A Word-Puzzle*: glossary
- *Twelve Months in a Curatorship*: several tables
- *Three Years in a Curatorship*: one table
- *Curiosissima Curatoria*: several tables

From all books the table of contents, the index, the advertisements, and similar parts are missing.

Also some books have more than one edition, but not all are reproduced here. These books are: *Euclid and his Modern Rivals*, *Euclid. Books I, II*, *The Principels of Parliamentary Representation*, *A New Theory of Parallels*, *Pillow-Problems*, *Symbolic Logic. Part I*, *Doublets. A Word-Puzzle*

Magazines, etc.

All known contributions to magazines and newspapers are included. From the *Doublets* and the *Syzygies* some parts are missing, as well as some reprints with minor variations.

Pamphlets, etc.

From *The Guildford Gazette Extraordinary* several texts are omitted, from *The Profits of Authorship* only one paragraph is known.

The following pamphlets are missing completely:

- Acland’s Tunny, 1860 (scan in the *Scrapbook* and at <https://digital.bodleian.ox.ac.uk/objects/179a125e-2800-4d02-982c-a019bc761392/surfaces/a1496623-b7a3-4497-a9a9-1615ff5c4d11/>)

- Photographs, 1860 (*Pamphlets: A Miscellany*, item 70; partial scan in *Lewis Carroll: Photographer*, p. 46)
- Arithmetic, 1863? (*Mathematical Pamphlets*, item 25)
- Arithmetic I, 1863? (scan at <http://digitallibrary.usc.edu/cdm/compoundobject/collection/p15799coll185/id/565/rec/8>)
- Arithmetic II, 1863? (*Mathematical Pamphlets*, item 24)
- Examples in Arithmetic, 1874 (*Mathematical Pamphlets*, item 22)
- On Catching Cold, 1881 (scan at <https://digitallibrary.usc.edu/Share/gw0qp8kr54iw28ogr1wh4yk6il34xtow>)
- Royal Cowper Theatre, 1891 (*Pamphlets: A Miscellany*, item 16)

Acland's Tunny was written by Carroll, but refined by others. Apart from the introduction it is in Latin.

Photographs is a list of 159 photographs Carroll took, sorted alphabetically in three sections: *Portraits, Size 6 by 5* (87, including 3 groups), *Portraits, Size 7 $\frac{1}{4}$ by 6 $\frac{1}{4}$* (19, including 11 groups), and *Miscellaneous, Size 7 $\frac{1}{4}$ by 6 $\frac{1}{4}$* (53 items, mostly buildings, also sculptures, skeletons, artistic portraits, and other photographs)

The three *Arithmetic* pamphlets are templates for arithmetical problems for examinations.

Examples in Arithmetic is a collection of arithmetical problems for examinations, compiled, but most probably not authored by Carroll.

On Catching Cold reprints three extracts from medical books.

Royal Cowper Theatre is the programme for a private theatrical by the Bowmans printed with much ornament and probably partially written by Carroll.

There are also some unrecorded and unprinted cyclostyled collections of formulæ missing, as well as several examination papers (and many more lost).

Circulars

- Circulars about proof sheets:
 - Circular to Mathematical Friends about “General List of Subjects”, 1862 (*Mathematical Pamphlets*, item 41)
 - Circular about Frontispiece for “Through the Looking-Glass, and What Alice Found There”, 1871 (*Pamphlets: A Miscellany*, item 50)
 - Circular about “A Method of Taking Votes on More Than Two Issues”, 1877 (cyclostyled; *Political Pamphlets*, item 3a)
- Circular about Senior Student’s Biographies, 1880 (cyclostyled; *Pamphlets: A Miscellany*, item 59)
- Circular about the “Dramatic School of Art”, 1882 (*Pamphlets: A Miscellany*, item 3)
- Circular about Shakespeare for Girls, 1882 (*Pamphlets: A Miscellany*, item 8)

- Circulars on behalf of friends and relatives:
 - Circular about the Dymes Family, 1883 (*Pamphlets: A Miscellany*, item 60)
 - Circular about a house, 1885 (*Pamphlets: A Miscellany*, item 61)
 - Circular about Governesses, 1886 (*Pamphlets: A Miscellany*, item 62)
 - Circular about W. M. Wilcox, 1888 (cyclostyled; *Pamphlets: A Miscellany*, item 63)
 - Circular about C. S. Collingwood, 1888 (*Pamphlets: A Miscellany*, item 64)
 - Circular about Appointments, 1889 (*Pamphlets: A Miscellany*, item 65)
- Various Common Room Circulars, Agenda Papers, etc., 1883–1892 (*Oxford Pamphlets*, items 20–64, with exceptions, 37 items), especially including:
 - Supplement and Postscript to “Twelve Months in a Curatorship”, 1884 (*Oxford Pamphlets*, items 23, 24)
 - Remarks on Mr. Sampson’s Proposal, 1886 (*Oxford Pamphlets*, item 40)
 - Observations, 1886 (*Oxford Pamphlets*, item 43)
 - Circular to Members of the Governing Body, 1891 (*Oxford Pamphlets*, item 61)
 - Circular about Resignation, 1892 (*Oxford Pamphlets*, item 63)
- Circular about Counters, 1886 (*Logic Pamphlets*, item 1)
- Stranger Circular, 1890 (*Pamphlets: A Miscellany*, item 66)
- Circulars offering copies of books:
 - Circular to Hospitals, including “List of Institutions”, 1890 (*Pamphlets: A Miscellany*, items 53, 54)
 - Circular offering copies of *Through the Looking-Glass*, 1894 (*Pamphlets: A Miscellany*, item 57)
- Circular about Stationers, 1890 (*Pamphlets: A Miscellany*, item 67)
- Second-Hand Books, 1893 (*Pamphlets: A Miscellany*, item 68)

The circulars about proof sheets were sent together with these proofs, and ask for comments.

The circular about Senior Student’s biographies asked for details for a planned publication *Senior Students*.

The circular about the “Dramatic School of Art” was similar to the public *Education for the Stage* (→ 14.3, p. 1880).

The circular about Shakespeare for Girls was similar to the public requests on that topic (→ 16.28, p. 1976 and following).

Carroll sent several circulars on behalf of friends and relatives, to help them in various matters.

Most of the Common Room Circulars invite to meetings and give their agenda. Many of the agenda items are listed in *Curiosissima Curatoria* (→ 12.28, p. 1842).

The circular about counters asks for suggestions for the colours of the counters in the *Game of Logic*.

Several circulars offered copies of Carroll's books to hospitals, etc. See also the announcement in the *Times* (→ 19.5, p. 2461), and the offer at the end of *A Fascinating Mental Recreation* (→ 19.24, p. 2508). Some earlier such circulars are lost.

The *Stranger Circular* is a letter (in two variants) intended to be sent to those who addressed C. L. Dodgson about books written by Lewis Carroll, protesting against this.

The circular about stationers asked about stationers who would sell the *Wonderland Stamp-Case*.

Second-Hand Books was sent to booksellers, asking them to send catalogues only once a year, and a list of books Carroll wanted to purchase.

Unpublished Galley Proofs

From *Symbolic Logic. Part II* some parts are omitted. The following galley proofs are missing completely:

- Limits of Circle-Squaring, 1882? (first published 1994, scan available from *Mathematical Pamphlets*, item 8)
- Rule for Finding Easter-Day, 1892?/1897? (first published 1994, text available from *Mathematical Pamphlets*, item 35)

Both these proof sheets have many corrections by hand, which is why I don't include them here.

For *Limits of Circle-Squaring* see the notes to the manuscript introduction (→ 19.22, p. 2505).

The *Rule for Finding Easter-Day* is based on Gauss's, but modified to be calculated mentally, with hints on how to do so. It was intended for *Original Games and Puzzles*.

Manuscripts

From the *Rectory Magazine* and *Mischmasch* the contributions by other authors are omitted. From the manuscripts missing completely, the following are the most notable:

- Ways and Means
- Problem: To trisect a right angle, 1844 (first published 1939, partial scan available from <https://www.maths.ox.ac.uk/system/files/attachments/Lewis%20Carroll.pdf>)
- Papers read in Hall

- Formosa facies muta commendatio est, 1851 (first published 1995, *Pamphlets: A Miscellany*, item 84)
- Nil prodest quod non laedere potest idem, 1852 (first published 1995, *Pamphlets: A Miscellany*, item 85)
- Contempta fama contemni virtutes, 1853? (first published 1995, *Pamphlets: A Miscellany*, item 86)
- (Untitled: On Aristotle's Ethics), 1854 (first published 1995, *Pamphlets: A Miscellany*, item 87)
- On the Population of the World, 1853
- Oxford Limericks, 1856? (first published 2022, text available from *Four limericks and a carving* by Mark Davies in the *Times Literary Supplement*, July 1, 2022, <https://morrisoxford.co.uk/wp-content/uploads/10.-St-Frideswides-Door-PDF.pdf>)
- Algebraic Geometry, 1858
- Harmonic Pencils, 1859
- Anharmonic Ratio, 1859
- On the introduction of a 4th co-ordinate into Algebraic Geometry, 1859 (first published 2020, *Pamphlets: A Miscellany*, item 36)
- (Untitled: Notes on Salmon's *Conic Sections*), 1859
- Theorem of Tangents, 1860 (first published 1994, scan available from *Mathematical Pamphlets*)
- Notes on Salmon, 1860
- On the Continuity of Daylight, 1860 (first published 2020, *Pamphlets: A Miscellany*, item 37)
- Rectification of Curves. Parabola, 1860
- Rectification of Curves. Ellipse, 1861
- Asymptotes, 1861
- Equivalent Algebraical Expressions, 1861
- Differential Calculus (from Price), 1861
- Solid Geometry, 1861
- General Equation of Second Degree: Asymptote, 1861
- (Untitled: Solutions to Examination Papers), 1862
- The Rev. C. L. Dodgson's Will, 1871 (text available from the *Lewis Carroll Handbook*, p. 303)
- Directions regarding my Funeral, &c., 1873 (first published 1954, text available from biography by Derek Hudson, pp. 4–5)

- Various Memoria Technica Verses, 1875–1897 (first published 2001/2005/2018, text available from *Diaries, Vol. 6*, pp. 433–436, *Diaries, Vol. 9*, pp. 177–178, *Rare Verses*, pp. 82–95)
- Problem. Given 2 fractions: to find one between them, whose denominator shall be the least possible, 1882
- Dress, 1885 (first published 1974, *Pamphlets: A Miscellany*, item 10)
- Direction-Theory, as applied to Pairs of Lines, 1891
- Circle-Squaring, 1893

Ways and Means is a game played with specially created cards based on auctions and requiring buying and selling using counters, and is principally a word game involving strategy. A photograph of the cards is available at <https://lewiscarrollssociety.org.uk/cld/wp-content/uploads/2021/07/P1170053-1536x756.jpeg> on

<https://lewiscarrollssociety.org.uk/v-a/>.

The first three *Papers read in Hall* are short essays (some considerably edited) on a Latin theme that have been read publicly. A fourth text, *An prodesse plus quam nocere videntur Satirarum scripturae*, from 1855 is probably lost. The last one is in Latin, and has been read publicly, too.

Most of the following texts are minor mathematical manuscripts.

On the introduction of a 4th co-ordinate into Algebraic Geometry and *On the Continuity of Daylight* are the manuscripts for speeches before the Ashmolean Society given on November 21, 1859, and November 26, 1860. The first one discusses briefly equations in 4-dimensional space (with some awkward method, but the correct result that two 3-dimensional spaces intersect in a plane, unless they are parallel; Carroll also suggests using the 4th dimension to analyse polarized light), the second one on the recurrent topic of “Where does the Day begin?” (→ 16.8, p. 1936 and similar texts).

In his last will Carroll divides all his possessions among his brothers and sisters into equal shares. If any of them had died before him, his share would have been divided among his children. Executors were his brothers Wilfred and Edwin, witnesses T. Vere Bayne and A. Vernon Harcourt.

In the directions for his funeral Carroll asks for a simple and inexpensive funeral, without anything just for show. This also applies to the grave, he prefers a small plain head-stone.

Dress is a draft for an essay, probably intended for publication in *The Theatre*, on the decency or sinfulness of dress, especially concerning its amount.

Carroll distinguishes between the intention of the dramatist and the actor and the effect on the spectator. I did not include it, because in some places it still is a very rough draft.

Direction-Theory, as applied to Pairs of Lines is the manuscript for an almost finished book, which could have become part 3 in the *Curiosa Mathematica* series.

Poems from Letters, Inscriptions, etc.

- A Day in the Country, 1866 (for Henry Wall, first published 2010, text available from *Jabberwocky and Other Poems*)⁴
- Just half a world to travel o'er, 1875 (for Jessie Howard Clark, first published 2017, scan available from <https://www.finebooksmagazine.com/news/original-lewis-carroll-poem-signed-inside-alice-be-auctioned>)
- Mabel! Are you longing sadly, 1876 (for Mabel Blackett, first published 2016, scan available from <https://digitallibrary.usc.edu/CS.aspx?VP3=DamView&VBID=2A3BXZSP93YRD&SMLS=1&RW=1280&RH=854#/DamView&VBID=2A3BXZSP93YRD&PN=3&WS=SearchResults>)
- Joyous fancy, light as air, 1878 (for Jessie Josephine Scrivener, first published 2005, scan available from <http://www.sothebys.com/en/auctions/ecatalogue/2005/english-literature-history-105407/lot.365.html>)
- Breathes there the man with soul so dead, 1880 (for Arthur Lewis, first published 2003, scan available from <https://www.bonhams.com/auctions/20922/lot/126/>)
- Take not amiss this missile dread, 1884 (for Elizabeth “Bessie” Hussey, first published 2012, scan available from <https://www.theatlantic.com/entertainment/archive/2013/04/tiny-verses-on-envelopes-the-handwritten-poems-of-famous-authors/274784/>)
- Ode addressed to a Young Lady, 1884 (for Albina “Lily” Falle, first published 2004, text available from *Jabberwocky and Other Poems*)
- Joy was what we hoped to meet, 1884 (for Joa Pollack, first published 2016, scan available from <https://www.peterharrington.co.uk/blog/wp-content/uploads/2016/09/119-LewisCarroll.pdf>)
- She gave it both some bread & milk (first published 2010, scan available from <https://www.lewiscarroll.org/2010/11/16/first-editions-and-part-of-a-poem-about-bats-under-the-hammer/>; part only)

All these are available, but have only recently been published for the first time, so are probably still protected by copyright.

Lost Works

The works in this list might be lost, but as you never can know whether a long lost text is suddenly found, they are included here. Not all such works are included here, there are more mentioned in the diaries.

⁴As far as I know the complete solution to this Double Acrostic has never been published. Here is my suggestion which I'm sure that it is correct with one exception: portmanteau, photography; pump, ostrich, Romeo, talent, motto, awning, Niebuhr (?), tea, eggcup, Aldrich, ugly

Richmond School Magazine

- The Unknown One (1845)

The Oxonian Advertiser

- Two poems (summer 1854)

Copies of that newspaper still exist, but the poems are not identifiable.

Pamphlets, etc.

- Symbols, &c., to be Used in Euclid, 1866?/1872?
- Number of Propositions in Euclid, 1872
- Anonymous pamphlet printed at Cambridge, 1872
- Song for Puss in Boots, 1876
- The Profits of Authorship, 1884 (one paragraph survived)
- Second Paper on Logic, 1886
- Third Paper on Logic, 1886
- Seventh Paper on Logic, 1887?

Manuscripts

- The Comet, 1849?

There also were three more similar family magazines: *The Rosebud*, *The Star*, and *The Will-O'-The-Wisp*.

Further Reading

This section lists books and other resources for further reading. Partially these are sources for some of the texts, either the ones I used or alternative sources, partially they cover topics outside the scope of this collection, and partially they are listed just because they are easily available.

It is always worth to look for new additions to the Internet Archive:
<https://archive.org/search?query=creator%3A%28lewis+carroll%29+OR+creator%3A%28charles+dodgson%29+OR+title%3A%28lewis+carroll%29&sort=-adddate>

Collections

- *The Lewis Carroll Picture Book* edited by STUART DODGSON COLLINGWOOD (1899):
<https://archive.org/details/lewiscarrollpict00carruoft>
- *Further Nonsense Verse and Prose* edited by LANGFORD REED (1926):
<https://archive.org/details/further-nonsense-verse-and-prose>

- *Humorous Verse of Lewis Carroll* (1960, this is a reprint of *Collected Verse* from 1932):
<https://archive.org/details/humorousverseofl00carr>
- *The Complete Works of Lewis Carroll* (1939, this is what the *Lewis Carroll Handbook* calls the *Nonesuch* collection):
<https://archive.org/details/completeworksofl1920carr>
- *The Works of Lewis Carroll* edited by ROGER LANCELYN GREEN (1965):
https://archive.org/details/worksoflewiscarr0000unse_n2y9
- *The Complete Stories of Lewis Carroll* (1993):
<https://archive.org/details/completestorieso0000carr>
- *The Pamphlets of Lewis Carroll*
 - *The Oxford Pamphlets, Leaflets, and Circulars of Charles Lutwidge Dodgson* edited by EDWARD WAKELING (1993):
<https://archive.org/details/oxfordpamphlets10000dodg>
 - *The Mathematical Pamphlets of Charles Lutwidge Dodgson and Related Pieces* edited by FRANCINE F. ABELES (1994)
 - *The Political Pamphlets and Letters of Charles Lutwidge Dodgson and Related Pieces* edited by FRANCINE F. ABELES (2001)
 - *The Logic Pamphlets of Charles Lutwidge Dodgson and Related Pieces* edited by FRANCINE F. ABELES (2010)
 - *Games, Puzzles & Related Pieces* edited by CHRISTOPHER MORGAN (2015)
 - *A Miscellany of Works on Alice, Theatre, Religion, Science, and More* edited by CHARLIE LOVETT (2020)
- *Jabberwocky and Other Nonsense Collected Poems* edited by GILLIAN BEER (2012): <https://books.google.de/books?id=2h010chZZRoC> (partial view)
- *Rare, Uncollected, Unpublished, & Nonexistent Verse of Lewis Carroll* edited by AUGUST A. IMHOLTZ, JR. and EDWARD WAKELING (2018, detailed list of contents at <http://www.isfdb.org/cgi-bin/pl.cgi?668434>)

I can especially recommend the *Pamphlets* series, which is a great resource.

Biographies

- *The Life and Letters of Lewis Carroll* by STUART DODGSON COLLINGWOOD (1898):
<https://archive.org/details/lifelettersofcar00colluoft>
- *The Story of Lewis Carroll* by ISA BOWMAN (1899):
<https://archive.org/details/storyoflewiscarr00bowmrich>
- *Lewis Carroll in Wonderland and at Home* by BELLE MOSES (1910):
<https://archive.org/details/lewiscarrollinwo00mose>

- *Lewis Carroll* by WALTER DE LA MARE (1932):
<https://archive.org/details/in.ernet.dli.2015.260764>
- *The Life of Lewis Carroll* by LANGFORD REED (1932, reprint 1974):
<https://archive.org/details/lifeoflewisarro0000reed>
- *Lewis Carroll* by FLORENCE BECKER LENNON (1947):
<https://archive.org/details/in.ernet.dli.2015.100291>
- *Lewis Carroll* by DEREK HUDSON (1954):
<https://archive.org/details/lewiscarroll0000unse>
- *Lewis Carroll and his World* by JOHN PUDNEY (1976):
<https://archive.org/details/lewiscarrollhisw00pudn>
- *Lewis Carroll, a Biography* by ANNE CLARK AMOR (1979):
<https://archive.org/details/lewiscarrollbiog0000anne>
- *Lewis Carroll: A Biography* by MORTON N. COHEN (1995):
https://archive.org/details/lewiscarrollbiog0000cohe_f9y0
- *In the Shadow of the Dreamchild* by KAROLINE LEACH (1999, revised 2009, reprint 2015): <https://archive.org/details/in-the-shadow-of-the-dreamchild-karoline-leach>
- *Lewis Carroll in Numberland* by ROBIN J. WILSON (2009):
https://archive.org/details/lewiscarrollinnu0000wils_f1u9
- *The Mystery of Lewis Carroll* by JENNY WOOLF (2010):
<https://archive.org/details/mysteryoflewisca0000wool>

Many biographies reprint some works of Carroll, even if I didn't mention them above as a source. Since there are so many biographies, I cannot compare them all and list only the best, so do not interpret the inclusion or exclusion of a biography as a strong recommendation, with one exception: I *do* recommend *The Mystery of Lewis Carroll*.

Bibliographies

- *Lewis Carroll Handbook* by SIDNEY HERBERT WILLIAMS et al. (1979):
https://archive.org/details/lewiscarrollhand00will_0
- *Lewis Carroll: an Annotated International Bibliography* by EDWARD GUILIANO (1980):
<https://archive.org/details/lewiscarrollanno0000guil>
- *Lewis Carroll: a Reference Guide* by RACHEL FORDYCE (1988):
<https://archive.org/details/lewiscarroll00rach>
- *Lewis Carroll and the Press* by CHARLES LOVETT (1999)

Apparently a new complete bibliography is currently being prepared, and drafts of the first part are available at https://community.adobe.com/havfw69955/attachments/havfw69955/indesign/571214/2/Section%20A%20Copyedited%2012_27.docx and

<https://community.adobe.com/havfw69955/attachments/havfw69955/indesign/576161/1/Section%20A.rtf>. While the file format might not be what you prefer, the high quality contents will be a compensation for that.

Letters and Diaries

- *A Selection from the Letters of Lewis Carroll to his Child-Friends* edited by EVELYN M. HATCH (1933):
<https://archive.org/details/in.ernet.dli.2015.470274>
- *The Diaries of Lewis Carroll* edited by ROGER LANCELYN GREEN (2 volumes; 1971):
<https://archive.org/details/diariesoflewisca0000lewi>,
<https://archive.org/details/diariesoflewisca0002lewi>
- *The Letters of Lewis Carroll* edited by MORTON N. COHEN (2 volumes, and a one-volume-selection in *The Selected Letters of Lewis Carroll*; 1979): <https://archive.org/details/dli.ernet.65641>,
<https://archive.org/details/selectedletterso00carr>
- *Lewis Carroll and the House of Macmillan* edited by MORTON N. COHEN and ANITA GANDOLFO (1987):
https://archive.org/details/isbn_052125602
- *Looking-Glass Letters* edited by THOMAS HINDE (1991):
<https://archive.org/details/lookingglasslett0000carr>
- *Lewis Carroll & His Illustrators* edited by MORTON N. COHEN and EDWARD WAKELING (2003):
<https://archive.org/details/lewiscarrollhisi00unse>
- *Lewis Carroll's Diaries* edited by EDWARD WAKELING (10 volumes; 1993–2007)

When you are reading the diaries edited by Edward Wakeling, note that the errata are in volumes 9 and 10, so it is a good idea to have them ready from the beginning. See also

<https://lewiscarrollsociety.org.uk/volume-by-volume/> for a detailed overview.

Puzzles and Games

- *The Snark Puzzle Book* by MARTIN GARDNER (1973):
<https://archive.org/details/snarkpuzzlebook00gard>
- *The Magic of Lewis Carroll* by JOHN FISHER (1973):
https://archive.org/details/lccn_67121604x
- *Lewis Carroll's Games and Puzzles* edited by EDWARD WAKELING (1992): <https://archive.org/details/lewiscarrollsgam0000carr>
- *Rediscovered Lewis Carroll Puzzles* edited by EDWARD WAKELING (1995): <https://archive.org/details/rediscoveredlewi00carr>

- *Alice in Wonderland Puzzle and Game Book* edited by EDWARD WAKELING (1996):
https://archive.org/details/isbn_9781572810068
- *The Universe in a Handkerchief* by MARTIN GARDNER (1996):
<https://archive.org/details/universeinhandke0000mart>

The Universe in a Handkerchief deserves a special mention for the many texts reprinted from the original source.

Photography

- *Lewis Carroll, Photographer* by HELMUT GERNESHEIM (1969):
<https://archive.org/details/lewiscarrollphot00gern>
- *Reflections in a Looking Glass* by MORTON N. COHEN (1998):
<https://archive.org/details/reflectionsinloo0000cohe>
- *Lewis Carroll* by COLIN FORD (1998):
<https://archive.org/details/lewiscarroll175ph00001ewi>
- *Lewis Carroll: Photographer* by ROGER TAYLOR and EDWARD WAKELING (2002):
<https://archive.org/details/lewiscarrollphot00unse>
- *The Photographs of Lewis Carroll: A Catalogue Raisonné* by EDWARD WAKELING (2015)

Wakeling's list of Carroll's photographs is also available at
<https://web.archive.org/web/20221206032347/https://www.thereallewiscarroll.com/Pages/Photographs.html>.

Adaptions

- *Alice and Other Fairy Plays for Children* by KATE FREILIGRATH-KROEKER (1881):
<https://archive.org/details/aliceotherfairyp00freiiala>
- *The Game of Alice in Wonderland*, published by SELCHOW & RIGHTER (trick-taking card game, 1882):
https://web.archive.org/web/20180831022450/http://thealicegame.com/?page_id=26
- *Alice's Wonderland Birthday Book*, compiled by E. STANLEY LEATHES (1884): <https://digital.bodleian.ox.ac.uk/objects/f2748080-9f09-4fe3-aea4-683dd6f7a2b3/>
- *Alice in Wonderland. A Dream Play for Children* by H. SAVILE CLARKE (1886): <https://lewiscarrollresources.net/savileclarke/documents/Script86Final.pdf>, together with other material from <https://lewiscarrollresources.net/savileclarke/index.html>
- *Alice in Wonderland: a Play* by EMILY PRIME DELAFIELD (1898):
<https://archive.org/details/aliceinwonderlan00dela>

- *Alice in Wonderland: a Play for Children in Three Acts* by BURTON HARRISON (1898):
<https://babel.hathitrust.org/cgi/pt?id=hvd.hxb2y4&seq=7>
- *Alice in Wonderland* cards, published by THOMAS DE LA RUE (card game with 48 cards, similar to Quartets/Happy Families, based on Tenniels images coloured by E. Gertrude Thomson, about 1900):
<https://www.wopc.co.uk/delarue/alice-in-wonderland>,
<https://collections.tepapa.govt.nz/object/1565514>
- *The Story of Sylvie and Bruno*, compiled by EDWIN H. DODGSON (1904, reprint 1922): <https://archive.org/details/storyofsylviebrucarr>
- *Alice in Wonderland: a Musical Play in Three Acts* by HARRIETTE A. GAUL and HARVEY B. GAUL (1912): <https://babel.hathitrust.org/cgi/pt?id=pst.000045166716&seq=1>
- *Alice in Wonderland; a Dramatization of Lewis Carroll's "Alice's Adventures in Wonderland" and "Through the looking glass"* by ALICE GERSTENBERG (1915):
<https://babel.hathitrust.org/cgi/pt?id=loc.ark:/13960/t98631c09&seq=11>
- *Songs from Alice in Wonderland and Through the Looking-Glass* by LUCY ETHELDRED BROADWOOD (1921):
<https://archive.org/details/songsfromalicein00broa>
- *Lewis Carroll's Bedside Book* (1979):
<https://archive.org/details/lewiscarrollsbed00carr>
- *The Annotated Alice in Nurseryland* by BYRON W. SEWELL (2016):
<https://archive.org/details/annotatedalicein0000sewe>

Depending on which works about Lewis Carroll you already read, you might as well read *Alice in Nurseryland*, the annotations contain at least as much truth as some other books. And while you are at it, Sewell wrote some more books, and Evertype published many more. And if your are interested in more *Alice* games, see

<https://archive.org/details/knightletterno109309lewi/page/n33>.

German Translations

- *Alice's Abenteuer im Wunderland*, translated by ANTONIE ZIMMERMANN (1869, reprint 1901):
<https://archive.org/details/alicesabenteueri00carr>,
https://de.wikisource.org/wiki/Alice_im_Wunderland
- *Liese im Wunderland*, translated by HELEN SCHEU-RIESZ, illustrated by MARIA HOFRICHTER (1912):
<https://archive.org/details/lieseimwunderland>
- *Alice im Wunderland*, translated by R. G. L. BARRETT, illustrated by F. W. ROTH (1922):
https://archive.org/details/wunderland_barrett

- *Alice im Spiegelland*, translated by HELEN SCHEU-RIESZ, illustrated by URIEL BIRNBAUM (1923):
<https://archive.org/details/aliceimspiegella00carrrich>
- *Alice im Wunderland*, translated by CHRISTIAN ENZENSBERGER (1963, reprint 2006):
<https://archive.org/details/aliceimwunderlan0000carr>
- *Alice hinter den Spiegeln*, translated by CHRISTIAN ENZENSBERGER (1963)
- *Die kleine Alice*, translated by WALTER E. RICHARTZ (1977):
<https://archive.org/details/diekleinealice001ewi>
- *Geschichten mit Knoten*, translated by WALTER E. RICHARTZ (1978)
- *Phantasmagorie*, translated by DIETER H. STÜNDEL (1980):
<https://archive.org/details/phantasmagorie0000carr>
- *Sylvie & Bruno: die Geschichte einer Liebe*, translated by DIETER H. STÜNDEL (1994)
- *Misch & Masch: Erzählungen und Gedichte*, translated by DIETER H. STÜNDEL (1996)

If you prefer Latin, then you can also find two translations by CLIVE HARCOURT CARRUTHERS: *Alicia in Terra Mirabili* (1964, https://archive.org/details/bwb_KR-547-031) and *Aliciae per Speculum Transitus* (1966, <https://archive.org/details/aliciae-per-speculum-transitus-through-the-looking-glass-and-what-alice-found-th>).

Chapter I. Down the Rabbit-Hole

Alice was beginning to get very tired of sitting by her sister on the bank, and of having nothing to do: once or twice she had peeped into the book her

sister was reading, but it had no pictures or conversations in it, “and what is the use of a book,” thought Alice “without pictures or conversations?”

So she was considering, in her own mind (as well as she could, for the hot day made her feel very sleepy and stupid), whether the pleasure of making a daisy-chain would be worth the trouble of getting up and picking the daisies, when suddenly a White Rabbit with pink eyes ran close by her.

There was nothing so *very* remarkable in that; nor did Alice think it so *very* much out of the way to hear the Rabbit say to itself “Oh dear! Oh dear! I shall be too late!” (when she thought it over afterwards, it occurred to her that she ought to have wondered at this, but at the time it all seemed quite natural); but when the Rabbit actually *took a watch out of its waistcoat-pocket*, and looked at it, and then hurried on, Alice started to her feet, for it flashed across her mind that she had never before seen a rabbit with either a waistcoat-pocket, or a watch to take out of it, and, burning with curiosity, she ran across the field after it, and was just in time to see it pop down a large rabbit-hole under the hedge.

In another moment down went Alice after it, never once considering how in the world she was to get out again.

The rabbit-hole went straight on like a tunnel for some way, and then dipped suddenly down, so suddenly that Alice had not a moment to think about stopping herself before she found herself falling down what seemed to be a very deep well.

Either the well was very deep, or she fell very slowly, for she had plenty of time as she went down to look about her, and to wonder what was going to happen next. First, she tried to look down and make out what she was coming to, but it was too dark to see anything: then she looked at the sides of the well, and noticed that they were filled with cupboards and book-shelves: here and there she saw maps and pictures hung upon pegs. She took down a jar from one of the shelves as she passed: it was labelled “ORANGE MARMALADE,” but to her great disappointment it was empty: she did not like to drop the jar for fear of killing somebody underneath, so managed to put it into one of the cupboards as she fell past it.

“Well!” thought Alice to herself. “After such a fall as this, I shall think nothing of tumbling down-stairs! How brave they’ll all think me at home! Why, I wouldn’t say anything about it, even if I fell off the top of the house!” (Which was very likely true.)

Down, down, down. Would the fall *never* come to an end! “I wonder how many miles I’ve fallen by this time?” she said aloud. “I must be getting somewhere near the centre of the earth. Let me see: that would be four thousand miles down, I think—” (for, you see, Alice had learnt several things of this sort in her lessons in the school-room, and though this was not a *very* good opportunity for showing off her knowledge, as there was no one to listen to her, still it was good practice to say it over) “—yes, that’s about the right distance—but then I wonder what Latitude or Longitude I’ve got to?” (Alice had not the slightest idea what Latitude was, or Longitude either, but she thought they were nice grand words to say.)

Presently she began again. “I wonder if I shall fall right *through* the earth! How funny it’ll seem to come out among the people that walk with their heads downward! The antipathies, I think—” (she was rather glad there *was* no one listening, this time, as it didn’t sound at all the right word) “—but I shall have

to ask them what the name of the country is, you know. Please, Ma'am, is this New Zealand? Or Australia?" (and she tried to curtsy as she spoke—fancy, *curtseying* as you're falling through the air! Do you think you could manage it?) "And what an ignorant little girl she'll think me for asking! No, it'll never do to ask: perhaps I shall see it written up somewhere."

Down, down, down. There was nothing else to do, so Alice soon began talking again. "Dinah'll miss me very much to-night, I should think!" (Dinah was the cat.) "I hope they'll remember her saucer of milk at tea-time. Dinah, my dear! I wish you were down here with me! There are no mice in the air, I'm afraid, but you might catch a bat, and that's very like a mouse, you know. But do cats eat bats, I wonder?" And here Alice began to get rather sleepy, and went on saying to herself, in a dreamy sort of way, "Do cats eat bats? Do cats eat bats?" and sometimes "Do bats eat cats?", for, you see, as she couldn't answer either question, it didn't much matter which way she put it. She felt that she was dozing off, and had just begun to dream that she was walking hand in hand with Dinah, and was saying to her, very earnestly, "Now, Dinah, tell me the truth: did you ever eat a bat?", when suddenly, thump! thump! down she came upon a heap of sticks and dry leaves, and the fall was over.

Alice was not a bit hurt, and she jumped up on to her feet in a moment: she looked up, but it was all dark overhead: before her was another long passage, and the White Rabbit was still in sight, hurrying down it. There was not a moment to be lost: away went Alice like the wind, and was just in time to hear it say, as it turned a corner, "Oh my ears and whiskers, how late it's getting!" She was close behind it when she turned the corner, but the Rabbit was no longer to be seen: she found herself in a long, low hall, which was lit up by a row of lamps hanging from the roof.

There were doors all round the hall, but they were all locked; and when Alice had been all the way down one side and up the other, trying every door, she walked sadly down the middle, wondering how she was ever to get out again.

Suddenly she came upon a little three-legged table, all made of solid glass: there was nothing on it but a tiny golden key, and Alice's first idea was that this might belong to one of the doors of the hall; but, alas! either the locks were too large, or the key was too small, but at any rate it would not open any of them. However, on the second time round, she came upon a low curtain she had not noticed before, and behind it was a little door about fifteen inches high: she tried the little golden key in the lock, and to her great delight it fitted!

Alice opened the door and found that it led into a small passage, not much larger than a rat-hole: she knelt down and looked along the passage into the loveliest garden you ever saw. How she longed to get out of that dark hall, and wander about among those beds of bright flowers and those cool fountains, but she could not even get her head through the doorway; "and even if my head *would* go through," thought poor Alice, "it would be of very little use without my shoulders. Oh, how I wish I could shut up like a telescope! I think I could, if I only knew how to begin." For, you see, so many out-of-the-way things had happened lately, that Alice had begun to think that very few things indeed were really impossible.

There seemed to be no use in waiting by the little door, so she went back to

the table, half hoping she might find another key on it, or at any rate a book of rules for shutting people up like telescopes: this time she found a little bottle on it (“which certainly was not here before,” said Alice), and tied round the neck of the bottle was a paper label, with the words “DRINK ME” beautifully printed on it in large letters.

It was all very well to say “Drink me,” but the wise little Alice was not going to do *that* in a hurry. “No, I’ll look first,” she said, “and see whether it’s marked ‘poison’ or not”; for she had read several nice little stories about children who had got burnt, and eaten up by wild beasts, and other unpleasant things, all because they *would* not remember the simple rules their friends had taught them: such as, that a red-hot poker will burn you if you hold it too long; and that, if you cut your finger *very* deeply with a knife, it usually bleeds; and she had never forgotten that, if you drink much from a bottle marked “poison,” it is almost certain to disagree with you, sooner or later.

However, this bottle was *not* marked “poison,” so Alice ventured to taste it, and, finding it very nice (it had, in fact, a sort of mixed flavour of cherry-tart, custard, pine-apple, roast turkey, toffy, and hot buttered toast), she very soon finished it off.

* * * *
 * * *
 * * * *

“What a curious feeling!” said Alice; “I must be shutting up like a telescope!”

And so it was indeed: she was now only ten inches high, and her face brightened up at the thought that she was now the right size for going through the little door into that lovely garden. First, however, she waited for a few minutes to see if she was going to shrink any further: she felt a little nervous about this; “for it might end, you know,” said Alice to herself, “in my going out altogether, like a candle. I wonder what I should be like then?” And she tried to fancy what the flame of a candle looks like after the candle is blown out, for she could not remember ever having seen such a thing.

After a while, finding that nothing more happened, she decided on going into the garden at once; but, alas for poor Alice! when she got to the door, she found she had forgotten the little golden key, and when she went back to the table for it, she found she could not possibly reach it: she could see it quite plainly through the glass, and she tried her best to climb up one of the legs of the table, but it was too slippery; and when she had tired herself out with trying, the poor little thing sat down and cried.

“Come, there’s no use in crying like that!” said Alice to herself rather sharply. “I advise you to leave off this minute!” She generally gave herself very good advice (though she very seldom followed it), and sometimes she scolded herself so severely as to bring tears into her eyes; and once she remembered trying to box her own ears for having cheated herself in a game of croquet she was playing against herself, for this curious child was very fond of pretending to be two people. “But it’s no use now,” thought poor Alice, “to pretend to be two people! Why, there’s hardly enough of me left to make *one* respectable person!”

Soon her eye fell on a little glass box that was lying under the table: she opened it, and found in it a very small cake, on which the words "EAT ME" were beautifully marked in currants. "Well, I'll eat it," said Alice, "and if it makes me grow larger, I can reach the key; and if it makes me grow smaller, I can creep under the door; so either way I'll get into the garden, and I don't care which happens!"

She ate a little bit, and said anxiously to herself "Which way? Which way?", holding her hand on the top of her head to feel which way it was growing; and she was quite surprised to find that she remained the same size. To be sure, this generally happens when one eats cake; but Alice had got so much into the way of expecting nothing but out-of-the-way things to happen, that it seemed quite dull and stupid for life to go on in the common way.

So she set to work, and very soon finished off the cake.

Chapter II. The Pool of Tears

"Curiouser and curiouser!" cried Alice (she was so much surprised, that for the moment she quite forgot how to speak good English). "Now I'm opening out like the largest telescope that ever was! Good-bye, feet!" (for when she looked down at her feet, they seemed to be almost out of sight, they were getting so far off). "Oh, my poor little feet, I wonder who will put on your shoes and stockings for you now, dears? I'm sure *I* sha'n't be able! I shall be a great deal too far off to trouble myself about you: you must manage the best way you can;—but I must be kind to them," thought Alice, "or perhaps they wo'n't walk the way I want to go! Let me see. I'll give them a new pair of boots every Christmas."

And she went on planning to herself how she would manage it. "They must go by the carrier," she thought; "and how funny it'll seem, sending presents to one's own feet! And how odd the directions will look!

Alice's Right Foot, Esq.
Hearthrug,
near the Fender,
(with Alice's love).

Oh dear, what nonsense I'm talking!"

Just then her head struck against the roof of the hall: in fact she was now more than nine feet high, and she at once took up the little golden key and hurried off to the garden door.

Poor Alice! It was as much as she could do, lying down on one side, to look through into the garden with one eye; but to get through was more hopeless than ever: she sat down and began to cry again.

“You ought to be ashamed of yourself,” said Alice, “a great girl like you,” (she might well say this), “to go on crying in this way! Stop this moment, I tell you!” But she went on all the same, shedding gallons of tears, until there was a large pool all round her, about four inches deep, and reaching half down the hall.

After a time she heard a little pattering of feet in the distance, and she hastily dried her eyes to see what was coming. It was the White Rabbit returning, splendidly dressed, with a pair of white kid-gloves in one hand and a large fan in the other: he came trotting along in a great hurry, muttering to himself as he came, “Oh! The Duchess, the Duchess! Oh! *Wo’n’t* she be savage if I’ve kept her waiting!” Alice felt so desperate that she was ready to ask help of any one: so, when the Rabbit came near her, she began, in a low, timid voice, “If you please, Sir——” The Rabbit started violently, dropped the white kid-gloves and

the fan, and skurried away into the darkness as hard as he could go.

Alice took up the fan and gloves, and, as the hall was very hot, she kept fanning herself all the time she went on talking: "Dear, dear! How queer everything is to-day! And yesterday things went on just as usual. I wonder if I've been changed in the night? Let me think: *was* I the same when I got up this morning? I almost think I can remember feeling a little different. But if I'm not the same, the next question is 'Who in the world am I?' Ah, *that's* the great puzzle!" And she began thinking over all the children she knew that were of the same age as herself, to see if she could have been changed for any of them.

"I'm sure I'm not Ada," she said, "for her hair goes in such long ringlets, and mine doesn't go in ringlets at all; and I'm sure I ca'n't be Mabel, for I know all sorts of things, and she, oh, she knows such a very little! Besides, *she's* she, and *I'm* I, and—oh dear, how puzzling it all is! I'll try if I know all the things I used to know. Let me see: four times five is twelve, and four times six is thirteen, and four times seven is—oh dear! I shall never get to twenty at that rate! However, the Multiplication-Table doesn't signify: let's try Geography. London is the capital of Paris, and Paris is the capital of Rome, and Rome—no, *that's* all wrong, I'm certain! I must have been changed for Mabel! I'll try and say '*How doth the little—*'," and she crossed her hands on her lap, as if she were saying lessons, and began to repeat it, but her voice sounded hoarse and strange, and the words did not come the same as they used to do:—

*"How doth the little crocodile
Improve his shining tail,
And pour the waters of the Nile
On every golden scale!*

*"How cheerfully he seems to grin,
How neatly spreads his claws,
And welcome little fishes in,
With gently smiling jaws!"*

Parody on *How Doth
the Little Busy Bee*
by Isaac Watts

"I'm sure those are not the right words," said poor Alice, and her eyes filled with tears again as she went on, "I must be Mabel after all, and I shall have to go and live in that poky little house, and have next to no toys to play with, and oh, ever so many lessons to learn! No, I've made up my mind about it: if I'm Mabel, I'll stay down here! It'll be no use their putting their heads down and saying 'Come up again, dear!' I shall only look up and say 'Who am I, then? Tell me that first, and then, if I like being that person, I'll come up: if not, I'll stay down here till I'm somebody else'—but, oh dear!" cried Alice, with a sudden burst of tears, "I do wish they *would* put their heads down! I am so *very* tired of being all alone here!"

As she said this she looked down at her hands, and was surprised to see that she had put on one of the Rabbit's little white kid-gloves while she was talking. "How *can* I have done that?" she thought. "I must be growing small again." She got up and went to the table to measure herself by it, and found that, as nearly as she could guess, she was now about two feet high, and was going on shrinking rapidly: she soon found out that the cause of this was the fan she was holding, and she dropped it hastily, just in time to avoid shrinking away altogether.

"That *was* a narrow escape!" said Alice, a good deal frightened at the sudden change, but very glad to find herself still in existence. "And now for the garden!"

And she ran with all speed back to the little door; but, alas! the little door was shut again, and the little golden key was lying on the glass table as before, “and things are worse than ever,” thought the poor child, “for I never was so small as this before, never! And I declare it’s too bad, that it is!”

As she said these words her foot slipped, and in another moment, splash! she was up to her chin in salt-water. Her first idea was that she had somehow fallen into the sea, “and in that case I can go back by railway,” she said to herself. (Alice had been to the seaside once in her life, and had come to the general conclusion that, wherever you go to on the English coast, you find a number of bathing-machines in the sea, some children digging in the sand with wooden spades, then a row of lodging-houses, and behind them a railway-station.) However, she soon made out that she was in the pool of tears which she had wept when she was nine feet high.

“I wish I hadn’t cried so much!” said Alice, as she swam about, trying to find her way out. “I shall be punished for it now, I suppose, by being drowned in my own tears! That *will* be a queer thing, to be sure! However, everything is queer to-day.”

Just then she heard something splashing about in the pool a little way off, and she swam nearer to make out what it was: at first she thought it must be a walrus or hippopotamus, but then she remembered how small she was now, and she soon made out that it was only a mouse, that had slipped in like herself.

“Would it be of any use, now,” thought Alice, “to speak to this mouse? Everything is so out-of-the-way down here, that I should think very likely it can talk: at any rate, there’s no harm in trying.” So she began: “O Mouse, do you know the way out of this pool? I am very tired of swimming about here, O

Mouse!” (Alice thought this must be the right way of speaking to a mouse: she had never done such a thing before, but she remembered having seen, in her brother’s Latin Grammar, “A mouse—of a mouse—to a mouse—a mouse—O mouse!”) The mouse looked at her rather inquisitively, and seemed to her to wink with one of its little eyes, but it said nothing.

“Perhaps it doesn’t understand English,” thought Alice. “I daresay it’s a French mouse, come over with William the Conqueror.” (For, with all her knowledge of history, Alice had no very clear notion how long ago anything had happened.) So she began again: “Où est ma chatte?”, which was the first sentence in her French lesson-book. The Mouse gave a sudden leap out of the water, and seemed to quiver all over with fright. “Oh, I beg your pardon!” cried Alice hastily, afraid that she had hurt the poor animal’s feelings. “I quite forgot you didn’t like cats.”

“Not like cats!” cried the Mouse in a shrill, passionate voice. “Would *you* like cats, if you were me?”

Quoted from *La Bagatelle*: Intended to introduce children of three or four years old to some knowledge of the French language

“Well, perhaps not,” said Alice in a soothing tone: “don’t be angry about it. And yet I wish I could show you our cat Dinah. I think you’d take a fancy to cats, if you could only see her. She is such a dear quiet thing,” Alice went on, half to herself, as she swam lazily about in the pool, “and she sits purring so nicely by the fire, licking her paws and washing her face—and she is such a nice soft thing to nurse—and she’s such a capital one for catching mice——oh, I beg your pardon!” cried Alice again, for this time the Mouse was bristling all over, and she felt certain it must be really offended. “We wo’n’t talk about her any more, if you’d rather not.”

“We, indeed!” cried the Mouse, who was trembling down to the end of ^{his} tail. “As if *I* would talk on such a subject! Our family always *hated* cats: nasty, low, vulgar things! Don’t let me hear the name again!”

¹his

“I wo’n’t indeed!” said Alice, in a great hurry to change the subject of conversation. “Are you—are you fond—of—of dogs?” The Mouse did not answer, so Alice went on eagerly: “There is such a nice little dog, near our house, I should like to show you! A little bright-eyed terrier, you know, with oh, such long curly brown hair! And it’ll fetch things when you throw them, and it’ll sit up and beg for its dinner, and all sorts of things—I ca’n’t remember half of them—and it belongs to a farmer, you know, and he says it’s so useful, it’s worth a hundred pounds! He says it kills all the rats and—oh dear!” cried Alice in a sorrowful tone, “I’m afraid I’ve offended it again!” For the Mouse was swimming away from her as hard as it could go, and making quite a commotion in the pool as it went.

So she called softly after it, “Mouse dear! Do come back again, and we wo’n’t talk about cats or dogs either, if you don’t like them!” When the Mouse heard this, it turned round and swam slowly back to her: its face was quite pale (with passion, Alice thought), and it said, in a low trembling voice, “Let us get to the shore, and then I’ll tell you my history, and you’ll understand why it is I hate cats and dogs.”

It was high time to go, for the pool was getting quite crowded with the birds and animals that had fallen into it: there ^{were}² a Duck and a Dodo, a Lory and an Eaglet, and several other curious creatures. Alice led the way, and the whole party swam to the shore.

Chapter III. A Caucus-Race and a Long Tale

They were indeed a queer-looking party that assembled on the bank—the birds with draggled feathers, the animals with their fur clinging close to them, and all dripping wet, cross, and uncomfortable.

The first question of course was, how to get dry again: they had a consultation about this, and after a few minutes it seemed quite natural to Alice to find herself talking familiarly with them, as if she had known them all her life. Indeed, she had quite a long argument with the Lory, who at last turned sulky, and would only say “I’m³ older than you, and must know better.” And this Alice would not allow, without knowing how old it was, and, as the Lory positively refused to tell its age, there was no more to be said.

At last the Mouse, who seemed to be a person of authority among them, called out “Sit down, all of you, and listen to me! *I’ll* soon make you dry enough!” They all sat down at once, in a large ring, with the Mouse in the middle. Alice kept her eyes anxiously fixed on it, for she felt sure she would catch a bad cold if she did not get dry very soon.

“Ahem!” said the Mouse with an important air. “Are you all ready? This is the driest thing I know. Silence all round, if you please! ‘William the Conqueror, whose cause was favoured by the pope, was soon submitted to by the English, who wanted leaders, and had been of late much accustomed to usurpation and conquest. Edwin and Morcar, the earls of Mercia and Northumbria——’”

“Ugh!” said the Lory, with a shiver.

“I beg your pardon!” said the Mouse, frowning, but very politely. “Did you speak?”

²was

³I am

Quoted from *Short Course of History* by Haviland Chepmell

“Not I!” said the Lory, hastily.

“I thought you did,” said the Mouse. “I proceed. ‘Edwin and Morcar, the earls of Mercia and Northumbria, declared for him; and even Stigand, the patriotic archbishop of Canterbury, found it advisable——’”

“Found *what?*” said the Duck.

“Found *it,*” the Mouse replied rather crossly: “of course you know what ‘it’ means.”

“I know what ‘it’ means well enough, when *I* find a thing,” said the Duck: “it’s generally a frog or a worm. The question is, what did the archbishop find?”

The Mouse did not notice this question, but hurriedly went on, “‘——found it advisable to go with Edgar Atheling to meet William and offer him the crown. William’s conduct at first was moderate. But the insolence of his Normans——’ How are you getting on now, my dear?” it continued, turning to Alice as it spoke.

“As wet as ever,” said Alice in a melancholy tone: “it doesn’t seem to dry me at all.”

“In that case,” said the Dodo solemnly, rising to its feet, “I move that the meeting adjourn, for the immediate adoption of more energetic remedies——”

“Speak English!” said the Eaglet. “I don’t know the meaning of half those long words, and, what’s more, I don’t believe you do either!” And the Eaglet bent down its head to hide a smile: some of the other birds tittered audibly.

“What I was going to say,” said the Dodo in an offended tone, “was, that the best thing to get us dry would be a Caucus-race.”

“What *is* a Caucus-race?” said Alice; not that she _{much}wanted⁴ to know, but the Dodo had paused as if it thought that *somebody* ought to speak, and no one else seemed inclined to say anything.

“Why,” said the Dodo, “the best way to explain it is to do it.” (And, as you might like to try the thing yourself, some winter-day, I will tell you how the Dodo managed it.)

First it marked out a race-course, in a sort of circle, (“the exact shape doesn’t matter,” it said,) and then all the party were placed along the course, here and there. There was no “One, two, three, and away!”, but they began running when they liked, and left off when they liked, so that it was not easy to know when the race was over. However, when they had been running half an hour or so, and were quite dry again, the Dodo suddenly called out “The race is over!”, and they all crowded round it, panting, and asking “But who has won?”

This question the Dodo could not answer without a great deal of thought, and it stood for a long time with one finger pressed upon its forehead (the position in which you usually see Shakespeare, in the pictures of him), while the rest waited in silence. At last the Dodo said, “*everybody* has won, and *all* must have prizes.”

“But who is to give the prizes?” quite a chorus of voices asked.

“Why, *she*, of course,” said the Dodo, pointing to Alice with one finger; and the whole party at once crowded round her, calling out in a confused way, “Prizes! Prizes!”

Alice had no idea what to do, and in despair she put her hand in her pocket, and pulled out a box of comfits (luckily the salt water had not got into it), and handed them round as prizes. There was exactly one a-piece, all round.

⁴wanted much

“But she must have a prize herself, you know,” said the Mouse.

“Of course,” the Dodo replied very gravely. “What else have you got in your pocket?” ^{it}⁵ went on, turning to Alice.

“Only a thimble,” said Alice sadly.

“Hand it over here,” said the Dodo.

Then they all crowded round her once more, while the Dodo solemnly presented the thimble, saying “We beg your acceptance of this elegant thimble”; and, when it had finished this short speech, they all cheered.

Alice thought the whole thing very absurd, but they all looked so grave that she did not dare to laugh; and, as she could not think of anything to say, she simply bowed, and took the thimble, looking as solemn as she could.

The next thing was to eat the comfits: this caused some noise and confusion, as the large birds complained that they could not taste theirs, and the small ones choked and had to be patted on the back. However, it was over at last, and they sat down again in a ring, and begged the Mouse to tell them something more.

“You promised to tell me your history, you know,” said Alice, “and why it is you hate—C and D,” she added in a whisper, half afraid that it would be offended again.

“Mine is a long and a sad tale!” said the Mouse, turning to Alice, and sighing.

“It *is* a long tail, certainly,” said Alice, looking down with wonder at the Mouse’s tail; “but why do you call it sad?” And she kept on puzzling about it while the Mouse was speaking, so that her idea of the tale was something like this:—

⁵he

“Fury said to
 a mouse, That
 he met in the
 house, ‘Let
 us both go
 to law: *I*
 will prose-
 cute *you*.—
 Come, I’ll
 take no de-
 nial; We
 must have
 the⁶ trial:
 For really
 this morn-
 ing I’ve
 nothing
 to do.’
 Said the
 mouse to
 the cur,
 ‘Such a
 trial, dear
 Sir, With
 no jury
 or judge,
 would
 be wast-
 ing our
 breath.’
 ‘I’ll be
 judge,
 I’ll be
 jury,’
 Said
 cun-
 ning
 old
 Fury:
 ‘I’ll
 try
 the
 whole
 cause,
 and
 con-
 demn
 you to
 death.’”

“You are not attending!” said the Mouse to Alice, severely. “What are you thinking of?”

“I beg your pardon,” said Alice very humbly: “you had got to the fifth bend, I think?”

“I had *not!*” cried the Mouse, sharply and very angrily.

⁶a

“A knot!” said Alice, always ready to make herself useful, and looking anxiously about her “Oh, do let me help to undo it!”

“I shall do nothing of the sort,” said the Mouse, getting up and walking away. “You insult me by talking such nonsense!”

“I didn’t mean it!” pleaded poor Alice. “But you’re so easily offended, you know!”

The Mouse only growled in reply.

“Please come back, and finish your story!” Alice called after it. And the others all joined in chorus “Yes, please do!” But the Mouse only shook its head impatiently, and walked a little quicker.

“What a pity it wouldn’t stay!” sighed the Lory, as soon as it was quite out of sight. And an old Crab took the opportunity of saying to her daughter “Ah, my dear! Let this be a lesson to you never to lose *your* temper!” “Hold your tongue, Ma!” said the young Crab, a little snappishly. “You’re enough to try the patience of an oyster!”

“I wish I had our Dinah here, I know I do!” said Alice aloud, addressing nobody in particular. “*She’d* soon fetch it back!”

“And who is Dinah, if I might venture to ask the question?” said the Lory.

Alice replied eagerly, for she was always ready to talk about her pet: “Dinah’s our cat. And she’s such a capital one for catching mice, you ca’n’t think! And oh, I wish you could see her after the birds! Why, she’ll eat a little bird as soon as look at it!”

This speech caused a remarkable sensation among the party. Some of the birds hurried off at once: one old Magpie began wrapping itself up very carefully, remarking “I really must be getting home: the night-air doesn’t suit my throat!” And a Canary called out in a trembling voice, to its children, “Come away, my dears! It’s high time you were all in bed!” On various pretexts they all moved off, and Alice was soon left alone.

“I wish I hadn’t mentioned Dinah!” she said to herself in a melancholy tone. “Nobody seems to like her, down here, and I’m sure she’s the best cat in the world! Oh, my dear Dinah! I wonder if I shall ever see you any more!” And here poor Alice began to cry again, for she felt very lonely and low-spirited. In a little while, however, she again heard a little pattering of footsteps in the distance, and she looked up eagerly, half hoping that the Mouse had changed his mind, and was coming back to finish his story.

Chapter IV. The Rabbit Sends in a Little Bill

It was the White Rabbit, trotting slowly back again, and looking anxiously about as it went, as if it had lost something; and she heard it muttering to itself, “The Duchess! The Duchess! Oh my dear paws! Oh my fur and whiskers! She’ll get me executed, as sure as ferrets are ferrets! Where *can* I have dropped them, I wonder?” Alice guessed in a moment that it was looking for the fan and the pair of white kid-gloves, and she very good-naturedly began hunting about for them, but they were nowhere to be seen—everything seemed to have changed since her swim in the pool; and the great hall, with the glass table and the little door, had vanished completely.

Very soon the Rabbit noticed Alice, as she went hunting about, and called out to her in an angry tone, “Why, Mary Ann, what *are* you doing out here? Run home this moment, and fetch me a pair of gloves and a fan! Quick, now!”

And Alice was so much frightened that she ran off at once in the direction it pointed to, without trying to explain the mistake it had made.

“He took me for his housemaid,” she said to herself as she ran. “How surprised he’ll be when he finds out who I am! But I’d better take him his fan and gloves—that is, if I can find them.” As she said this, she came upon a neat little house, on the door of which was a bright brass plate with the name “W. RABBIT” engraved upon it. She went in without knocking, and hurried upstairs, in great fear lest she should meet the real Mary Ann, and be turned out of the house before she had found the fan and gloves.

“How queer it seems,” Alice said to herself, “to be going messages for a rabbit! I suppose Dinah’ll be sending me on messages next!” And she began fancying the sort of thing that would happen: “‘Miss Alice! Come here directly, and get ready for your walk!’ ‘Coming in a minute, nurse! But I’ve got to see that the mouse doesn’t get out.’ Only I don’t think,” Alice went on, “that they’d let Dinah stop in the house if it began ordering people about like that!”

By this time she had found her way into a tidy little room with a table in the window, and on it (as she had hoped) a fan and two or three pairs of tiny white kid-gloves: she took up the fan and a pair of the gloves, and was just going to leave the room, when her eye fell upon a little bottle that stood near the looking-glass. There was no label this time with the words “DRINK ME,” but nevertheless she uncorked it and put it to her lips. “I know *something* interesting is sure to happen,” she said to herself, “whenever I eat or drink anything: so I’ll just see what this bottle does. I do hope it’ll make me grow large again, for really I’m quite tired of being such a tiny little thing!”

It did so indeed, and much sooner than she had expected: before she had drunk half the bottle, she found her head pressing against the ceiling, and had to stoop to save her neck from being broken. She hastily put down the bottle, saying to herself “That’s quite enough—I hope I sha’n’t grow any more—As it is, I ca’n’t get out at the door—I do wish I hadn’t drunk quite so much!”

Alas! it was too late to wish that! She went on growing, and growing, and very soon had to kneel down on the floor: in another minute there was not even room for this, and she tried the effect of lying down with one elbow against the door, and the other arm curled round her head. Still she went on growing, and, as a last resource, she put one arm out of the window, and one foot up the chimney, and said to herself “Now I can do no more, whatever happens. What *will* become of me?”

Luckily for Alice, the little magic bottle had now had its full effect, and she grew no larger: still it was very uncomfortable, and, as there seemed to be no sort of chance of her ever getting out of the room again, no wonder she felt unhappy.

“It was much pleasanter at home,” thought poor Alice, “when one wasn’t always growing larger and smaller, and being ordered about by mice and rabbits. I almost wish I hadn’t gone down that rabbit-hole—and yet—and yet—it’s rather curious, you know, this sort of life! I do wonder what *can* have happened to me! When I used to read fairy tales, I fancied that kind of thing never happened, and now here I am in the middle of one! There ought to be a book written about me, that there ought! And when I grow up, I’ll write one—but I’m grown up now,” she added in a sorrowful tone: “at least there’s no room to grow up any more *here*.”

“But then,” thought Alice, “shall I *never* get any older than I am now?”

That'll be a comfort, one way—never to be an old woman—but then—always to have lessons to learn! Oh, I shouldn't like *that!*"

"Oh, you foolish Alice!" she answered herself. "How can you learn lessons in here? Why, there's hardly room for *you*, and no room at all for any lesson-books!"

And so she went on, taking first one side and then the other, and making quite a conversation of it altogether; but after a few minutes she heard a voice outside, and stopped to listen.

"Mary Ann! Mary Ann!" said the voice. "Fetch me my gloves this moment!" Then came a little pattering of feet on the stairs. Alice knew it was the Rabbit coming to look for her, and she trembled till she shook the house, quite forgetting that she was now about a thousand times as large as the Rabbit, and had no reason to be afraid of it.

Presently the Rabbit came up to the door, and tried to open it; but, as the door opened inwards, and Alice's elbow was pressed hard against it, that attempt proved a failure. Alice heard it say to itself "Then I'll go round and get in at the window."

"*That* you wo'n't!" thought Alice, and, after waiting till she fancied she heard the Rabbit just under the window, she suddenly spread out her hand, and made a snatch in the air. She did not get hold of anything, but she heard a little shriek and a fall, and a crash of broken glass, from which she concluded that it was just possible it had fallen into a cucumber-frame, or something of the sort.

Next came an angry voice—the Rabbit's—"Pat! Pat! Where are you?" And then a voice she had never heard before, "Sure then I'm here! Digging for apples, yer honour!"

"Digging for apples, indeed!" said the Rabbit angrily. "Here! Come and help me out of *this!*" (Sounds of more broken glass.)

"Now tell me, Pat, what's that in the window?"

“Sure, it’s an arm, yer honour!” (He pronounced it “arrum.”)

“An arm, you goose! Who ever saw one that size? Why, it fills the whole window!”

“Sure, it does, yer honour: but it’s an arm for all that.”

“Well, it’s got no business there, at any rate: go and take it away!”

There was a long silence after this, and Alice could only hear whispers now and then; such as “Sure, I don’t like it, yer honour, at all, at all!” “Do as I tell you, you coward!”, and at last she spread out her hand again, and made another snatch in the air. This time there were *two* little shrieks, and more sounds of broken glass. “What a number of cucumber-frames there must be!” thought Alice. “I wonder what they’ll do next! As for pulling me out of the window, I only wish they *could*! I’m sure *I* don’t want to stay in here any longer!”

She waited for some time without hearing anything more: at last came a rumbling of little cart-wheels, and the sound of a good many voices all talking together: she made out the words: “Where’s the other ladder?—Why, I hadn’t to bring but one. Bill’s got the other—Bill! Fetch it here, lad!—Here, put ’em up at this corner—No, tie ’em together first—they don’t reach half high enough yet—Oh! they’ll do well enough; don’t be particular—Here, Bill! Catch hold of this rope—Will the roof bear?—Mind that loose slate—Oh, it’s coming down! Heads below!” (a loud crash)—“Now, who did that?—It was Bill, I fancy—Who’s to go down the chimney?—Nay, *I* sha’n’t! *You* do it!—*That* I wo’n’t, then!—Bill’s got to go down—Here, Bill! The master says you’ve got to go down the chimney!”

“Oh! So Bill’s got to come down the chimney, has he?” said Alice to herself. “Why, they seem to put everything upon Bill! I wouldn’t be in Bill’s place for a good deal: this fireplace is narrow, to be sure; but I *think* I can kick a little!”

She drew her foot as far down the chimney as she could, and waited till she heard a little animal (she couldn’t guess of what sort it was) scratching and scrambling about in the chimney close above her: then, saying to herself “This is Bill”, she gave one sharp kick, and waited to see what would happen next.

The first thing she heard was a general chorus of “There goes Bill!” then

the Rabbit's voice along—"Catch him, you by the hedge!" then silence, and then another confusion of voices—"Hold up his head—Brandy now—Don't choke him—How was it, old fellow? What happened to you? Tell us all about it!"

Last came a little feeble, squeaking voice ("That's Bill," thought Alice), "Well, I hardly know—No more, thank ye; I'm better now—but I'm a deal too flustered to tell you—all I know is, something comes at me like a Jack-in-the-box, and up I goes like a sky-rocket!"

"So you did, old fellow!" said the others.

"We must burn the house down!" said the Rabbit's voice. And Alice called out, as loud as she could, "If you do, I'll set Dinah at you!"

There was a dead silence instantly, and Alice thought to herself "I wonder what they *will* do next! If they had any sense, they'd take the roof off." After a minute or two, they began moving about again, and Alice heard the Rabbit say "A barrowful will do, to begin with."

"A barrowful of *what?*" thought Alice. But she had not long to doubt, for the next moment a shower of little pebbles came rattling in at the window, and some of them hit her in the face. "I'll put a stop to this," she said to herself, and shouted out "You'd better not do that again!", which produced another dead silence.

Alice noticed, with some surprise, that the pebbles were all turning into little cakes as they lay on the floor, and a bright idea came into her head. "If I eat one of these cakes," she thought, "it's sure to make *some* change in my size; and, as it ca'n't possibly make me larger, it must make me smaller, I suppose."

So she swallowed one of the cakes, and was delighted to find that she began shrinking directly. As soon as she was small enough to get through the door, she ran out of the house, and found quite a crowd of little animals and birds waiting outside. The poor little Lizard, Bill, was in the middle, being held up by two guinea-pigs, who were giving it something out of a bottle. They all made a rush at Alice the moment she appeared; but she ran off as hard as she could, and soon found herself safe in a thick wood.

"The first thing I've got to do," said Alice to herself, as she wandered about in the wood, "is to grow to my right size again; and the second thing is to find my way into that lovely garden. I think that will be the best plan."

It sounded an excellent plan, no doubt, and very neatly and simply arranged; the only difficulty was, that she had not the smallest idea how to set about it; and, while she was peering about anxiously among the trees, a little sharp bark just over her head made her look up in a great hurry.

An enormous puppy was looking down at her with large round eyes, and feebly stretching out one paw, trying to touch her. "Poor little thing!" said Alice, in a coaxing tone, and she tried hard to whistle to it; but she was terribly frightened all the time at the thought that it might be hungry, in which case it would be very likely to eat her up in spite of all her coaxing.

Hardly knowing what she did, she picked up a little bit of stick, and held it out to the puppy: whereupon the puppy jumped into the air off all its feet at once, with a yelp of delight, and rushed at the stick, and made believe to worry it: then Alice dodged behind a great thistle, to keep herself from being run over; and, the moment she appeared on the other side, the puppy made another rush at the stick, and tumbled head over heels in its hurry to get hold of it: then Alice, thinking it was very like having a game of play with a cart-horse, and expecting every moment to be trampled under its feet, ran round the thistle again: then the puppy began a series of short charges at the stick, running a very little way forwards each time and a long way back, and barking hoarsely all the while, till at last it sat down a good way off, panting, with its tongue hanging out of its mouth, and its great eyes half shut.

This seemed to Alice a good opportunity for making her escape: so she set off at once, and ran till she was quite tired and out of breath, and till the puppy's bark sounded quite faint in the distance.

"And yet what a dear little puppy it was!" said Alice, as she leant against a buttercup to rest herself, and fanned herself with one of the leaves. "I should have liked teaching it tricks very much, if—if I'd only been the right size to do it! Oh dear! I'd nearly forgotten that I've got to grow up again! Let me see—how *is* it to be managed? I suppose I ought to eat or drink something or other; but the great question is 'What?'"

The great question certainly was "What?". Alice looked all round her at the flowers and the blades of grass, but she did not see anything that looked like the right thing to eat or drink under the circumstances. There was a large mushroom growing near her, about the same height as herself; and, when she had looked under it, and on both sides of it, and behind it, it occurred to her that she might as well look and see what was on the top of it.

She stretched herself up on tiptoe, and peeped over the edge of the mushroom, and her eyes immediately met those of a large blue caterpillar, that was sitting on the top with its arms folded, quietly smoking a long hookah, and taking not the smallest notice of her or of anything else.

Chapter V. Advice from a Caterpillar

The Caterpillar and Alice looked at each other for some time in silence: at last the Caterpillar took the hookah out of its mouth, and addressed her in a languid, sleepy voice.

"Who are *you?*" said the Caterpillar.

This was not an encouraging opening for a conversation. Alice replied, rather shyly, "I—I hardly know, Sir, just at present—at least I know who I *was* when I got up this morning, but I think I must have been changed several times since then."

"What do you mean by that?" said the Caterpillar, sternly. "Explain yourself!"

"I ca'n't explain *myself*, I'm afraid, Sir," said Alice, "because I'm not myself, you see."

"I don't see," said the Caterpillar.

"I'm afraid I ca'n't put it more clearly," Alice replied, very politely, "for I ca'n't understand it myself, to begin with; and being so many different sizes in a day is very confusing."

"It isn't," said the Caterpillar.

"Well, perhaps you haven't found it so yet," said Alice; "but when you have to turn into a chrysalis—you will some day, you know—and then after that into a butterfly, I should think you'll feel it a little queer, wo'n't you?"

"Not a bit," said the Caterpillar.

"Well, perhaps *your* feelings may be different," said Alice: "all I know is, it would feel very queer to *me*."

"You!" said the Caterpillar contemptuously. "Who are *you*?"

Which brought them back again to the beginning of the conversation. Alice felt a little irritated at the Caterpillar's making such *very* short remarks, and she drew herself up and said, very gravely, "I think, you ought to tell me who *you* are, first."

"Why?" said the Caterpillar.

Here was another puzzling question; and, as Alice could not think of any good reason, and⁷ the Caterpillar seemed to be in a *very* unpleasant state of mind, she turned away.

"Come back!" the Caterpillar called after her. "I've something important to say!"

This sounded promising, certainly. Alice turned and came back again.

"Keep your temper," said the Caterpillar.

"Is that all?" said Alice, swallowing down her anger as well as she could.

"No," said the Caterpillar.

Alice thought she might as well wait, as she had nothing else to do, and perhaps after all it might tell her something worth hearing. For some minutes it puffed away without speaking; but at last it unfolded its arms, took the hookah out of its mouth again, and said "So you think you're changed, do you?"

"I'm afraid I am, Sir," said Alice. "I ca'n't remember things as I used—and I don't keep the same size for ten minutes together!"

"Ca'n't remember *what* things?" said the Caterpillar.

"Well, I've tried to say '*How doth the little busy bee,*' but it all came different!" Alice replied in a very melancholy voice.

"Repeat '*You are old, Father William,*'" said the Caterpillar.

Alice folded her hands, and began:—

"You are old, Father William," the young man said,

"And your hair has become very white;

And yet you incessantly stand on your head—

Do you think, at your age, it is right?"

"In my youth," Father William replied to his son,

"I feared it might injure the brain;

But, now that I'm perfectly sure I have none,

Why, I do it again and again."

"You are old," said the youth, "as I mentioned before,

And have grown most uncommonly fat;

Yet you turned a back-somersault in at the door—

Pray, what is the reason of that?"

"In my youth," said the sage, as he shook his grey locks,

Parody on *The Old Man's Comforts and How He Gained Them*
by Robert Southey

⁷and as

*"I kept all my limbs very supple
By the use of this ointment—one shilling the box—
Allow me to sell you a couple?"*

*"You are old," said the youth, "and your jaws are too weak
For anything tougher than suet;
Yet you finished the goose, with the bones and the beak—
Pray how did you manage to do it?"*

*"In my youth," said his father, "I took to the law,
And argued each case with my wife;
And the muscular strength, which it gave to my jaw,
Has lasted the rest of my life."*

*"You are old," said the youth, "one would hardly suppose
That your eye was as steady as ever;
Yet you balanced an eel on the end of your nose—
What made you so awfully clever?"*

*"I have answered three questions, and that is enough,"
Said his father. "Don't give yourself airs!
Do you think I can listen all day to such stuff?
Be off, or I'll kick you down-stairs!"*

"That is not said right," said the Caterpillar.

"Not quite right, I'm afraid," said Alice, timidly: "some of the words have got altered."

"It is wrong from beginning to end," said the Caterpillar, decidedly; and there was silence for some minutes.

The Caterpillar was the first to speak.

“What size do you want to be?” it asked.

“Oh, I’m not particular as to size,” Alice hastily replied; “only one doesn’t like changing so often, you know.”

“I *don’t* know,” said the Caterpillar.

Alice said nothing: she had never been so much contradicted in her life before, and she felt that she was losing her temper.

“Are you content now?” said the Caterpillar.

“Well, I should like to be a *little* larger, Sir, if you wouldn’t mind,” said Alice: “three inches is such a wretched height to be.”

“It is a very good height indeed!” said the Caterpillar angrily, rearing itself upright as it spoke (it was exactly three inches high).

“But I’m not used to it!” pleaded poor Alice in a piteous tone. And she thought of herself “I wish the creatures wouldn’t be so easily offended!”

“You’ll get used to it in time,” said the Caterpillar; and it put the hookah into its mouth and began smoking again.

This time Alice waited patiently until it chose to speak again. In a minute or two the Caterpillar took the hookah out of its mouth, and yawned once or twice, and shook itself. Then it got down off the mushroom, and crawled away into the grass, merely remarking, as it went, “One side will make you grow taller, and the other side will make you grow shorter.”

“One side of *what?* The other side of *what?*” thought Alice to herself.

“Of the mushroom,” said the Caterpillar, just as if she had asked it aloud; and in another moment it was out of sight.

Alice remained looking thoughtfully at the mushroom for a minute, trying to make out which were the two sides of it; and, as it was perfectly round, she

found this a very difficult question. However, at last she stretched her arms round it as far as they would go, and broke off a bit of the edge with each hand.

“And now which is which?” she said to herself, and nibbled a little of the right-hand bit to try the effect. The next moment she felt a violent blow underneath her chin: it had struck her foot!

She was a good deal frightened by this very sudden change, but she felt that there was no time to be lost, as she was shrinking rapidly: so she set to work at once to eat some of the other bit. Her chin was pressed so closely against her foot, that there was hardly room to open her mouth; but she did it at last, and managed to swallow a morsel of the left-hand bit.

* * * *
 * * *
* * * *

“Come, my head’s free at last!” said Alice in a tone of delight, which changed into alarm in another moment, when she found that her shoulders were nowhere to be found: all she could see, when she looked down, was an immense length of neck, which seemed to rise like a stalk out of a sea of green leaves that lay far below her.

“What *can* all that green stuff be?” said Alice. “And where *have* my shoulders got to? And oh, my poor hands, how is it I ca’n’t see you?” She was moving them about, as she spoke, but no result seemed to follow, except a little shaking among the distant green leaves.

As there seemed to be no chance of getting her hands up to her head, she tried to get her head down to *them*, and was delighted to find that her neck would bend about easily in any direction, like a serpent. She had just succeeded in curving it down into a graceful zigzag, and was going to dive in among the leaves, which she found to be nothing but the tops of the trees under which she had been wandering, when a sharp hiss made her draw back in a hurry: a large pigeon had flown into her face, and was beating her violently with its wings.

“Serpent!” screamed the Pigeon.

“I’m *not* a serpent!” said Alice indignantly. “Let me alone!”

“Serpent, I say again!” repeated the Pigeon, but in a more subdued tone, and added, with a kind of sob, “I’ve tried every way, ⁸but nothing seems to suit them!”

“I haven’t the least idea what you’re talking about,” said Alice.

“I’ve tried the roots of trees, and I’ve tried banks, and I’ve tried hedges,” the Pigeon went on, without attending to her; “but those serpents! There’s no pleasing them!”

Alice was more and more puzzled, but she thought there was no use in saying anything more till the Pigeon had finished.

“As if it wasn’t trouble enough hatching the eggs,” said the Pigeon; “but I must be on the look-out for serpents night and day! Why, I haven’t had a wink of sleep these three weeks!”

“I’m very sorry you’ve been annoyed,” said Alice, who was beginning to see its meaning.

⁸and

“And just as I’d taken the highest tree in the wood,” continued the Pigeon, raising its voice to a shriek, “and just as I was thinking I should be free of them at last, they must needs come wriggling down from the sky! Ugh, Serpent!”

“But I’m *not* a serpent, I tell you!” said Alice. “I’m a——I’m a——”

“Well! *What* are you?” said the Pigeon. “I can see you’re trying to invent something!”

“I—I’m a little girl,” said Alice, rather doubtfully, as she remembered the number of changes she had gone through, that day.

“A likely story indeed!” said the Pigeon, in a tone of the deepest contempt. “I’ve seen a good many little girls in my time, but never *one* with such a neck as that! No, no! You’re a serpent; and there’s no use denying it. I suppose you’ll be telling me next that you never tasted an egg!”

“I *have* tasted eggs, certainly,” said Alice, who was a very truthful child; “but little girls eat eggs quite as much as serpents do, you know.”

“I don’t believe it,” said the Pigeon; “but if they do, why, then they’re a kind of serpent: that’s all I can say.”

This was such a new idea to Alice, that she was quite silent for a minute or two, which gave the Pigeon the opportunity of adding “You’re looking for eggs, I know *that* well enough; and what does it matter to me whether you’re a little girl or a serpent?”

“It matters a good deal to *me*,” said Alice hastily; “but I’m not looking for eggs, as it happens; and if I was, I shouldn’t want *yours*: I don’t like them raw.”

“Well, be off, then!” said the Pigeon in a sulky tone, as it settled down again into its nest. Alice crouched down among the trees as well as she could, for her neck kept getting entangled among the branches, and every now and then she had to stop and untwist it. After a while she remembered that she still held the pieces of mushroom in her hands, and she set to work very carefully, nibbling first at one and then at the other, and growing sometimes taller, and sometimes shorter, until she had succeeded in bringing herself down to her usual height.

It was so long since she had been anything near the right size, that it felt quite strange at first; but she got used to it in a few minutes, and began talking to herself, as usual, “Come, there’s half my plan done now! How puzzling all these changes are! I’m never sure what I’m going to be, from one minute to another! However, I’ve got back to my right size: the next thing is, to get into that beautiful garden—how *is* that to be done, I wonder?” As she said this, she came suddenly upon an open place, with a little house in it about four feet high. “Whoever lives there,” thought Alice, “it’ll never do to come upon them *this* size: why, I should frighten them out of their wits!” So she began nibbling at the right-hand bit again, and did not venture to go near the house till she had brought herself down to nine inches high.

Chapter VI. Pig and Pepper

For a minute or two she stood looking at the house, and wondering what to do next, when suddenly a footman in livery came running out of the wood—(she considered him to be a footman because he was in livery: otherwise, judging by his face only, she would have called him a fish)—and rapped loudly at the door with his knuckles. It was opened by another footman in livery, with a round face, and large eyes like a frog; and both footmen, Alice noticed, had powdered

hair that curled all over their heads. She felt very curious to know what it was all about, and crept a little way out of the wood to listen.

The Fish-Footman began by producing from under his arm a great letter, nearly as large as himself, and this he handed over to the other, saying, in a solemn tone, "For the Duchess. An invitation from the Queen to play croquet." The Frog-Footman repeated, in the same solemn tone, only changing the order of the words a little, "From the Queen. An invitation for the Duchess to play croquet."

Then they both bowed low, and their curls got entangled together.

Alice laughed so much at this, that she had to run back into the wood for fear of their hearing her; and, when she next peeped out, the Fish-Footman was gone, and the other was sitting on the ground near the door, staring stupidly up into the sky.

Alice went timidly up to the door, and knocked.

“There’s no sort of use in knocking,” said the Footman, “and that for two reasons. First, because I’m on the same side of the door as you are; secondly, because they’re making such a noise inside, no one could possibly hear you.” And certainly there *was* a most extraordinary noise going on within—a constant howling and sneezing, and every now and then a great crash, as if a dish or kettle had been broken to pieces.

“Please, then,” said Alice, “how am I to get in?”

“There might be some sense in your knocking,” the Footman went on, without attending to her, “if we had the door between us. For instance, if you were *inside*, you might knock, and I could let you out, you know.” He was looking up into the sky all the time he was speaking, and this Alice thought decidedly uncivil. “But perhaps he ca’n’t help it,” she said to herself; “his eyes are so *very* nearly at the top of his head. But at any rate he might answer questions.—How am I to get in?” she repeated, aloud.

“I shall sit here,” the Footman remarked, “till to-morrow——”

At this moment the door of the house opened, and a large plate came skimming out, straight at the Footman’s head: it just grazed his nose, and broke to pieces against one of the trees behind him.

“——or next day, maybe,” the Footman continued in the same tone, exactly as if nothing had happened.

“How am I to get in?” asked Alice again, in a louder tone.

“*Are* you to get in at all?” said the Footman. “That’s the first question, you know.”

It was, no doubt: only Alice did not like to be told so. “It’s really dreadful,” she muttered to herself, “the way all the creatures argue. It’s enough to drive one crazy!”

The Footman seemed to think this a good opportunity for repeating his remark, with variations. “I shall sit here,” he said, “on and off, for days and days.”

“But what am *I* to do?” said Alice.

“Anything you like,” said the Footman, and began whistling.

“Oh, there’s no use in talking to him,” said Alice desperately: “he’s perfectly idiotic!” And she opened the door and went in.

The door led right into a large kitchen, which was full of smoke from one end to the other: the Duchess was sitting on a three-legged stool in the middle, nursing a baby: the cook was leaning over the fire, stirring a large cauldron which seemed to be full of soup.

“There’s certainly too much pepper in that soup!” Alice said to herself, as well as she could for sneezing.

There was certainly too much of it in the *air*. Even the Duchess sneezed occasionally; and as for the baby, it was sneezing and howling alternately without a moment’s pause. The only two creatures in the kitchen, that did *not* sneeze, were the cook, and a large cat, which was ⁹lying on the hearth and grinning from ear to ear.

“Please would you tell me,” said Alice, a little timidly, for she was not quite sure whether it was good manners for her to speak first, “why your cat grins like that?”

⁹sitting

“It’s a Cheshire-Cat,” said the Duchess, “and that’s why. Pig!”

She said the last word with such sudden violence that Alice quite jumped; but she saw in another moment that it was addressed to the baby, and not to her, so she took courage, and went on again:—

“I didn’t know that Cheshire-Cats always grinned; in fact, I didn’t know that cats *could* grin.”

“They all can,” said the Duchess; “and most of ’em do.”

“I don’t know of any that do,” Alice said very politely, feeling quite pleased to have got into a conversation.

“You don’t know much,” said the Duchess; “and that’s a fact.”

Alice did not at all like the tone of this remark, and thought it would be as well to introduce some other subject of conversation. While she was trying to fix on one, the cook took the cauldron of soup off the fire, and at once set to work throwing everything within her reach at the Duchess and the baby—the fire-irons came first; then followed a shower of saucepans, plates, and dishes. The Duchess took no notice of them even when they hit her; and the baby was howling so much already, that it was quite impossible to say whether the blows hurt it or not.

“Oh, *please* mind what you’re doing!” cried Alice, jumping up and down in an agony of terror. “Oh, there goes his *precious* nose!”, as an unusually large saucepan flew close by it, and very nearly carried it off.

“If everybody minded their own business,” the Duchess said, in a hoarse growl, “the world would go round a deal faster than it does.”

“Which would *not* be an advantage,” said Alice, who felt very glad to get an

opportunity of showing off a little of her knowledge. "Just think of what work it would make with the day and night! You see the earth takes twenty-four hours to turn round on its axis——"

"Talking of axes," said the Duchess, "chop off her head!"

Alice glanced rather anxiously at the cook, to see if she meant to take the hint; but the cook was busily stirring the soup, and seemed not to be listening, so she went on again: "Twenty-four hours, I *think*; or is it twelve? I——"

"Oh, don't bother *me!*" said the Duchess. "I never could abide figures!" And with that she began nursing her child again, singing a sort of lullaby to it as she did so, and giving it a violent shake at the end of every line:—

*"Speak roughly to your little boy,
And beat him when he sneezes:
He only does it to annoy,
Because he knows it teases."*

Parody on *Speak
Gently* by David Bates

Chorus

(in which the cook and the baby joined):—

"Wow! wow! wow!"

While the Duchess sang the second verse of the song, she kept tossing the baby violently up and down, and the poor little thing howled so, that Alice could hardly hear the words:—

*"I speak severely to my boy,
I beat him when he sneezes;
For he can thoroughly enjoy
The pepper when he pleases!"*

Chorus

"Wow! wow! wow!"

"Here! You may nurse it a bit, if you like!" the Duchess said to Alice, flinging the baby at her as she spoke. "I must go and get ready to play croquet with the Queen," and she hurried out of the room. The cook threw a frying-pan after her as she went, but it just missed her.

Alice caught the baby with some difficulty, as it was a queer-shaped little creature, and held out its arms and legs in all directions, "just like a star-fish," thought Alice. The poor little thing was snorting like a steam-engine when she caught it, and kept doubling itself up and straightening itself out again, so that altogether, for the first minute or two, it was as much as she could do to hold it.

As soon as she had made out the proper way of nursing it (which was to twist it up into a sort of knot, and then keep tight hold of its right ear and left foot, so as to prevent its undoing itself), she carried it out into the open air. "If I don't take this child away with me," thought Alice, "they're sure to kill it in a day or two. Wouldn't it be murder to leave it behind?" She said the last words out loud, and the little thing grunted in reply (it had left off sneezing by this

time). “Don’t grunt,” said Alice; “that’s not at all a proper way of expressing yourself.”

The baby grunted again, and Alice looked very anxiously into its face to see what was the matter with it. There could be no doubt that it had a *very* turn-up nose, much more like a snout than a real nose: also its eyes were getting extremely small for a baby: altogether Alice did not like the look of the thing at all. “But perhaps it was only sobbing,” she thought, and looked into its eyes again, to see if there were any tears.

No, there were no tears. “If you’re going to turn into a pig, my dear,” said Alice, seriously, “I’ll have nothing more to do with you. Mind now!” The poor little thing sobbed again (or grunted, it was impossible to say which), and they went on for some while in silence.

Alice was just beginning to think to herself, “Now, what am I to do with this creature, when I get it home?” when it grunted again, so violently, that she looked down into its face in some alarm. This time there could be *no* mistake about it: it was neither more nor less than a pig, and she felt that it would be quite absurd for her to carry it any further.

So she set the little creature down, and felt quite relieved to see it trot away quietly into the wood. “If it had grown up,” she said to herself, “it would have made a dreadfully ugly child: but it makes rather a handsome pig, I think.” And she began thinking over other children she knew, who might do very well as pigs, and was just saying to herself “if one only knew the right way to change them——” when she was a little startled by seeing the Cheshire-Cat sitting on a bough of a tree a few yards off.

The Cat only grinned when it saw Alice. It looked good-natured, she thought: still it had *very* long claws and a great many teeth, so she felt that it ought to be treated with respect.

“Cheshire-Puss,” she began, rather timidly, as she did not at all know whether it would like the name: however, it only grinned a little wider. “Come, it’s pleased so far,” thought Alice, and she went on. “Would you tell me, please, which way I ought to go from here?”

“That depends a good deal on where you want to get to,” said the Cat.

“I don’t much care where——” said Alice.

“Then it doesn’t matter which way you go,” said the Cat.

“——so long as I get *somewhere*,” Alice added as an explanation.

“Oh, you’re sure to do that,” said the Cat, “if you only walk long enough.”

Alice felt that this could not be denied, so she tried another question. “What sort of people live about here?”

“In *that* direction,” the Cat said, waving its right paw round, “lives a Hatter: and in *that* direction,” waving the other paw, “lives a March Hare. Visit either you like: they’re both mad.”

“But I don’t want to go among mad people,” Alice remarked.

“Oh, you can’t help that,” said the Cat: “we’re all mad here. I’m mad. You’re mad.”

“How do you know I’m mad?” said Alice.

“You must be,” said the Cat, “or you wouldn’t have come here.”

Alice didn’t think that proved it at all: however, she went on: “And how do you know that you’re mad?”

“To begin with,” said the Cat, “a dog’s not mad. You grant that?”

“I suppose so,” said Alice.

“Well, then,” the Cat went on, “you see, a dog growls when it’s angry, and wags its tail when it’s pleased. Now *I* growl when I’m pleased, and wag my tail when I’m angry. Therefore I’m mad.”

“I call it purring, not growling,” said Alice.

“Call it what you like,” said the Cat. “Do you play croquet with the Queen to-day?”

“I should like it very much,” said Alice, “but I haven’t been invited yet.”

“You’ll see me there,” said the Cat, and vanished.

Alice was not much surprised at this, she was getting so used to queer things happening. While she was looking at the place where it had been, it suddenly appeared again.

“By-the-bye, what became of the baby?” said the Cat. “I’d nearly forgotten to ask.”

“It turned into a pig,” Alice answered very quietly, just as if it had come back in a natural way.

“I thought it would,” said the Cat, and vanished again.

Alice waited a little, half expecting to see it again, but it did not appear, and after a minute or two she walked on in the direction in which the March Hare was said to live. “I’ve seen hatters before,” she said to herself: “the March Hare will be much the most interesting, and perhaps, as this is May, it wo’n’t be raving mad—at least not so mad as it was in March.” As she said this, she looked up, and there was the Cat again, sitting on a branch of a tree.

“Did you say ‘pig’, or ‘fig’?” said the Cat.

“I said ‘pig’,” replied Alice; “and I wish you wouldn’t keep appearing and vanishing so suddenly: you make one quite giddy!”

“All right,” said the Cat; and this time it vanished quite slowly, beginning with the end of the tail, and ending with the grin, which remained some time after the rest of it had gone.

“Well! I’ve often seen a cat without a grin,” thought Alice; “but a grin without a cat! It’s the most curious thing I ever saw in my life!”

She had not gone much farther before she came in sight of the house of the March Hare: she thought it must be the right house, because the chimneys were shaped like ears and the roof was thatched with fur. It was so large a house, that she did not like to go nearer till she had nibbled some more of the left-hand bit of mushroom, and raised herself to about two feet high: even then she walked up towards it rather timidly, saying to herself “Suppose it should be raving mad after all! I almost wish I’d gone to see the Hatter instead!”

Chapter VII. A Mad Tea-Party

There was a table set out under a tree in front of the house, and the March Hare and the Hatter were having tea at it: a Dormouse was sitting between them, fast asleep, and the other two were using it as a cushion, resting their elbows on it, and talking over its head. “Very uncomfortable for the Dormouse,” thought Alice; “only, as it’s asleep, I suppose it doesn’t mind.”

The table was a large one, but the three were all crowded together at one corner of it. “No room! No room!” they cried out when they saw Alice coming. “There’s *plenty* of room!” said Alice indignantly, and she sat down in a large arm-chair at one end of the table.

“Have some wine,” the March Hare said in an encouraging tone.

Alice looked all round the table, but there was nothing on it but tea. “I don’t see any wine,” she remarked.

“There isn’t any,” said the March Hare.

“Then it wasn’t very civil of you to offer it,” said Alice angrily.

“It wasn’t very civil of you to sit down without being invited,” said the March Hare.

“I didn’t know it was *your* table,” said Alice: “it’s laid for a great many more than three.”

“Your hair wants cutting,” said the Hatter. He had been looking at Alice for some time with great curiosity, and this was his first speech.

“You should learn not to make personal remarks,” Alice said with some severity: “it’s very rude.”

The Hatter opened his eyes very wide on hearing this; but all he *said* was, “Why is a raven like a writing-desk?”

“Come, we shall have some fun now!” thought Alice. “I’m glad they’ve begun asking riddles—I believe I can guess that,” she added aloud.

“Do you mean that you think you can find out the answer to it?” said the March Hare.

“Exactly so,” said Alice.

“Then you should say what you mean,” the March Hare went on.

“I do,” Alice hastily replied; “at least—at least I mean what I say—that’s the same thing, you know.”

“Not the same thing a bit!” said the Hatter. “Why, you might just as well say that ‘I see what I eat’ is the same thing as ‘I eat what I see’!”

“You might just as well say,” added the March Hare, “that ‘I like what I get’ is the same thing as ‘I get what I like’!”

“You might just as well say,” added the Dormouse, ¹⁰which seemed to be talking in ¹¹its sleep, “that ‘I breathe when I sleep’ is the same thing as ‘I sleep

¹⁰who

¹¹his

when I breathe'!"

"It *is* the same thing with you," said the Hatter, and here the conversation dropped, and the party sat silent for a minute, while Alice thought over all she could remember about ravens and writing-desks, which wasn't much.

The Hatter was the first to break the silence. "What day of the month is it?" he said, turning to Alice: he had taken his watch out of his pocket, and was looking at it uneasily, shaking it every now and then, and holding it to his ear.

Alice considered a little, and then said¹² "The fourth."

"Two days wrong!" sighed the Hatter. "I told you butter wouldn't suit the works!" he added, looking angrily at the March Hare.

"It was the *best* butter," the March Hare meekly replied.

"Yes, but some crumbs must have got in as well," the Hatter grumbled: "you shouldn't have put it in with the bread-knife."

The March Hare took the watch and looked at it gloomily: then he dipped it into his cup of tea, and looked at it again: but he could think of nothing better to say than his first remark, "It was the *best* butter, you know."

Alice had been looking over his shoulder with some curiosity. "What a funny watch!" she remarked. "It tells the day of the month, and doesn't tell what o'clock it is!"

"Why should it?" muttered the Hatter. "Does *your* watch tell you what year it is?"

"Of course not," Alice replied very readily: "but that's because it stays the same year for such a long time together."

"Which is just the case with *mine*," said the Hatter.

Alice felt dreadfully puzzled. The Hatter's remark seemed to have no sort of meaning in it, and yet it was certainly English. "I don't quite understand you," she said, as politely as she could.

"The Dormouse is asleep again," said the Hatter, and he poured a little hot tea upon¹³ its nose.

The Dormouse shook its head impatiently, and said, without opening its eyes, "Of course, of course: just what I was going to remark myself."

"Have you guessed the riddle yet?" the Hatter said, turning to Alice again.

"No, I give it up," Alice replied. "What's the answer?"

"I haven't the slightest idea," said the Hatter.

"Nor I," said the March Hare.

Alice sighed wearily. "I think you might do something better with the time," she said, "than waste it in asking riddles that have no answers."

"If you knew Time as well as I do," said the Hatter, "you wouldn't talk about wasting *it*. It's *him*."

"I don't know what you mean," said Alice.

"Of course you don't!" the Hatter said, tossing his head contemptuously. "I dare say you never even spoke to Time!"

"Perhaps not," Alice cautiously replied; "but I know I have to beat time when I learn music."

"Ah! That accounts for it," said the Hatter. "He wo'n't stand beating. Now, if you only kept on good terms with him, he'd do almost anything you liked with the clock. For instance, suppose it were nine o'clock in the morning, just

¹²and said

¹³on

time to begin lessons: you'd only have to whisper a hint to Time, and round goes the clock in a twinkling! Half-past one, time for dinner!"

("I only wish it was," the March Hare said to itself in a whisper.)

"That would be grand, certainly," said Alice thoughtfully; "but then—I shouldn't be hungry for it, you know."

"Not at first, perhaps," said the Hatter: "but you could keep it to half-past one as long as you liked."

"Is that the way *you* manage?" Alice asked.

The Hatter shook his head mournfully. "Not I!" he replied. "We quarrelled last March—just before *he* went mad, you know——" (pointing with his teaspoon at the March Hare,) "——it was at the great concert given by the Queen of Hearts, and I had to sing

*'Twinkle, twinkle, little bat!
How I wonder what you're at!'*

Parody on *The Star*
by Jane Taylor

You know the song, perhaps?"

"I've heard something like it," said Alice.

"It goes on, you know," the Hatter continued, "in this way:—

*'Up above the world you fly,
Like a tea-tray in the sky.
Twinkle, twinkle——'*

Here the Dormouse shook itself, and began singing in its sleep "*Twinkle, twinkle, twinkle, twinkle——*" and went on so long that they had to pinch it to make it stop.

"Well, I'd hardly finished the first verse," said the Hatter, "when the Queen bawled out, 'He's murdering the time! Off with his head!'"

"How dreadfully savage!" exclaimed Alice.

"And ever since that," the Hatter went on in a mournful tone, "he wo'n't do a thing I ask! It's always six o'clock now."

A bright idea came into Alice's head. "Is that the reason so many tea-things are put out here?" she asked.

"Yes, that's it," said the Hatter with a sigh: "it's always tea-time, and we've no time to wash the things between whiles."

"Then you keep moving round, I suppose?" said Alice.

"Exactly so," said the Hatter: "as the things get used up."

"But what happens when you come to the beginning again?"¹⁴ Alice ventured to ask.

"Suppose we change the subject," the March Hare interrupted, yawning. "I'm getting tired of this. I vote the young lady tells us a story."

"I'm afraid I don't know one," said Alice, rather alarmed at the proposal.

"Then the Dormouse shall!" they both cried. "Wake up, Dormouse!" And they pinched it on both sides at once.

The Dormouse slowly opened his eyes. "I wasn't asleep," it said in a hoarse, feeble voice, "I heard every word you fellows were saying."

"Tell us a story!" said the March Hare.

"Yes, please do!" pleaded Alice.

"And be quick about it," added the Hatter, "or you'll be asleep again before it's done."

"Once upon a time there were three little sisters," the Dormouse began in a great hurry; "and their names were Elsie, Lacie, and Tillie; and they lived at the bottom of a well——"

"What did they live on?" said Alice, who always took a great interest in questions of eating and drinking.

"They lived on treacle," said the Dormouse, after thinking a minute or two.

"They couldn't have done that, you know," Alice gently remarked. "They'd have been ill."

"So they were," said the Dormouse; "*very* ill."

Alice tried to fancy to herself what such an extraordinary way of living would be like, but it puzzled her too much: so she went on: "But why did they live at the bottom of a well?"

"Take some more tea," the March Hare said to Alice, very earnestly.

"I've had nothing yet," Alice replied in an offended tone: "so I ca'n't take more."

"You mean you ca'n't take *less*," said the Hatter: "it's very easy to take *more* than nothing."

"Nobody asked *your* opinion," said Alice.

"Who's making personal remarks now?" the Hatter asked triumphantly.

Alice did not quite know what to say to this: so she helped herself to some tea and bread-and-butter, and then turned to the Dormouse, and repeated her question. "Why did they live at the bottom of a well?"

The Dormouse again took a minute or two to think about it, and then said "It was a treacle-well."

"There's no such thing!" Alice was beginning very angrily, but the Hatter and the March Hare went "Sh! sh!" and the Dormouse sulkily remarked "If you ca'n't be civil, you'd better finish the story for yourself."

"No, please go on!" Alice said very humbly. "I wo'n't interrupt again. I dare say there may be *one*."

¹⁴"But when do you come to the beginning again?"

“One, indeed!” said the Dormouse indignantly. However, he consented to go on. “And so these three little sisters—they were learning to draw, you know—

—”

“What did they draw?” said Alice, quite forgetting her promise.

“Treacle,” said the Dormouse, without considering at all, this time.

“I want a clean cup,” interrupted the Hatter: “let’s all move one place on.”

He moved on as he spoke, and the Dormouse followed him: the March Hare moved into the Dormouse’s place, and Alice rather unwillingly took the place of the March Hare. The Hatter was the only one who got any advantage from the change; and Alice was a good deal worse off than before, as the March Hare had just upset the milk-jug into his plate.

Alice did not wish to offend the Dormouse again, so she began very cautiously: “But I don’t understand. Where did they draw the treacle from?”

“You can draw water out of a water-well,” said the Hatter; “so I should think you could draw treacle out of a treacle-well—eh, stupid?”

“But they were *in* the well,” Alice said to the Dormouse, not choosing to notice this last remark.

“Of course they were,” said the Dormouse: “well in.”

This answer so confused poor Alice, that she let the Dormouse go on for some time without interrupting it.

“They were learning to draw,” the Dormouse went on, yawning and rubbing its eyes, for it was getting very sleepy; “and they drew all manner of things—everything that begins with an M——”

“Why with an M?” said Alice.

“Why not?” said the March Hare.

Alice was silent.

The Dormouse had closed its eyes by this time, and was going off into a doze; but, on being pinched by the Hatter, it woke up again with a little shriek, and went on: “——that begins with an M, such as mouse-traps, and the moon, and memory, and muchness—you know you say things are ‘much of a muchness’—did you ever see such a thing as a drawing of a muchness?”

“Really, now you ask me,” said Alice, very much confused, “I don’t think——”

“Then you shouldn’t talk,” said the Hatter.

This piece of rudeness was more than Alice could bear: she got up in great disgust, and walked off: the Dormouse fell asleep instantly, and neither of the others took the least notice of her going, though she looked back once or twice, half hoping that they would call after her: the last time she saw them, they were trying to put the Dormouse into the teapot.

“At any rate I’ll never go *there* again!” said Alice as she picked her way through the wood. “It’s the stupidest tea-party I ever was at in all my life!”

Just as she said this, she noticed that one of the trees had a door leading right into it. “That’s very curious!” she thought. “But everything’s curious today. I think I may as well go in at once.” And in she went.

Once more she found herself in the long hall, and close to the little glass table. “Now, I’ll manage better this time,” she said to herself, and began by taking the little golden key, and unlocking the door that led into the garden. Then she went to work nibbling at the mushroom (she had kept a piece of it in her pocket) till she was about a foot high: then she walked down the little passage: and *then*—she found herself at last in the beautiful garden, among the bright flower-beds and the cool fountains.

Chapter VIII. The Queen's Croquet Ground

A large rose-tree stood near the entrance of the garden: the roses growing on it were white, but there were three gardeners at it, busily painting them red. Alice thought this a very curious thing, and she went nearer to watch them, and, just as she came up to them, she heard one of them say "Look out now, Five! Don't go splashing paint over me like that!"

"I couldn't help it," said Five, in a sulky tone. "Seven jogged my elbow."

On which Seven looked up and said "That's right, Five! Always lay the blame on others!"

"*You'd* better not talk!" said Five. "I heard the Queen say only yesterday you deserved to be beheaded."

"What for?" said the one who had spoken first.

"That's none of *your* business, Two!" said Seven.

"Yes, it *is* his business!" said Five. "And I'll tell him—it was for bringing the cook tulip-roots instead of onions."

Seven flung down his brush, and had just begun "Well, of all the unjust things—" when his eye chanced to fall upon Alice, as she stood watching them, and he checked himself suddenly: the others looked round also, and all of them bowed low.

"Would you tell me, please," said Alice, a little timidly, "why you are painting those roses?"

Five and Seven said nothing, but looked at Two. Two began, in a low voice, "Why, the fact is, you see, Miss, this here ought to have been a *red* rose-tree, and we put a white one in by mistake; and, if the Queen was to find it out, we should all have our heads cut off, you know. So you see, Miss, we're doing our best, afore she comes, to—" At this moment, Five, who had been anxiously looking across the garden, called out "The Queen! The Queen!", and the three

gardeners instantly threw themselves flat upon their faces. There was a sound of many footsteps, and Alice looked round, eager to see the Queen.

First came ten soldiers carrying clubs: these were all shaped like the three gardeners, oblong and flat, with their hands and feet at the corners: next the ten courtiers: these were ornamented all over with diamonds, and walked two and two, as the soldiers did. After these came the royal children: there were ten of them, and the little dears came jumping merrily along, hand in hand, in couples: they were all ornamented with hearts. Next came the guests, mostly Kings and Queens, and among them Alice recognised the White Rabbit: it was talking in a hurried nervous manner, smiling at everything that was said, and went by without noticing her. Then followed the Knave of Hearts, carrying the King's crown on a crimson velvet cushion; and, last of all this grand procession, came THE KING AND THE QUEEN¹⁵ OF HEARTS.

Alice was rather doubtful whether she ought not to lie down on her face like the three gardeners, but she could not remember ever having heard of such a rule at processions; "and besides, what would be the use of a procession," thought she, "if people had all to lie down on their faces, so that they couldn't see it?" So she stood where she was, and waited.

When the procession came opposite to Alice, they all stopped and looked at her, and the Queen said, severely, "Who is this?". She said it to the Knave of Hearts, who only bowed and smiled in reply.

"Idiot!" said the Queen, tossing her head impatiently; and, turning to Alice, she went on: "What's your name, child?"

"My name is Alice, so please your Majesty," said Alice very politely; but she added, to herself, "Why, they're only a pack of cards, after all. I needn't be afraid of them!"

"And who are *these*?" said the Queen, pointing to the three gardeners who were lying round the rose-tree; for, you see, as they were lying on their faces, and the pattern on their backs¹⁶ was the same as the rest of the pack, she could not tell whether they were gardeners, or soldiers, or courtiers, or three of her own children.

"How should *I* know?" said Alice, surprised at her own courage. "It's no business of *mine*."

The Queen turned crimson with fury, and, after glaring at her for a moment like a wild beast, began screaming "Off with her head! Off with¹⁷——"

"Nonsense!" said Alice, very loudly and decidedly, and the Queen was silent.

The King laid his hand upon her arm, and timidly said "Consider, my dear: she is only a child!"

The Queen turned angrily away from him, and said to the Knave "Turn them over!"

The Knave did so, very carefully, with one foot.

"Get up!" said the Queen in a shrill, loud voice, and the three gardeners instantly jumped up, and began bowing to the King, the Queen, the royal children, and everybody else.

"Leave off that!" screamed the Queen. "You make me giddy." And then, turning to the rose-tree, she went on "What *have* you been doing here?"

¹⁵AND QUEEN

¹⁶back

¹⁷Off

“May it please your Majesty,” said Two, in a very humble tone, going down on one knee as he spoke, “we were trying—”

“*I see!*” said the Queen, who had meanwhile been examining the roses. “Off with their heads!” and the procession moved on, three of the soldiers remaining behind to execute the unfortunate gardeners, who ran to Alice for protection.

“You sha’n’t be beheaded!” said Alice, and she put them into a large flower-pot that stood near. The three soldiers wandered about for a minute or two, looking for them, and then quietly marched off after the others.

“Are their heads off?” shouted the Queen.

“Their heads are gone, if it please your Majesty!” the soldiers shouted in reply.

“That’s right!” shouted the Queen. “Can you play croquet?”

The soldiers were silent, and looked at Alice, as the question was evidently meant for her.

“Yes!” shouted Alice.

“Come on, then!” roared the Queen, and Alice joined the procession, wondering very much what would happen next.

“It’s—it’s a very fine day!” said a timid voice at her side. She was walking by the White Rabbit, who was peeping anxiously into her face.

“Very,” said Alice. “Where’s the Duchess?”

“Hush! Hush!” said the Rabbit in a low hurried tone. He looked anxiously over his shoulder as he spoke, and then raised himself upon tiptoe, put his mouth close to her ear, and whispered “She’s under sentence of execution.”

“What for?” said Alice.

“Did you say ‘What a pity!’?” the Rabbit asked.

“No, I didn’t,” said Alice. “I don’t think it’s at all a pity. I said ‘What for?’”

“She boxed the Queen’s ears—” the Rabbit began. Alice gave a little scream of laughter. “Oh, hush!” the Rabbit whispered in a frightened tone. “The Queen will hear you! You see, she came rather late, and the Queen said—”

“Get to your places!” shouted the Queen in a voice of thunder, and people began running about in all directions, tumbling up against each other; however, they got settled down in a minute or two, and the game began.

Alice thought she had never seen such a curious croquet-ground in her life: it was all ridges and furrows: the croquet balls were live hedgehogs, and the mallets live flamingoes, and the soldiers had to double themselves up and to stand on their hands and feet, to make the arches.

The chief difficulty Alice found at first was in managing her flamingo: she succeeded in getting its body tucked away, comfortably enough, under her arm, with its legs hanging down, but generally, just as she had got its neck nicely straightened out, and was going to give the hedgehog a blow with its head, it *would* twist itself round and look up in her face, with such a puzzled expression that she could not help bursting out laughing; and, when she had got its head down, and was going to begin again, it was very provoking to find that the hedgehog had unrolled itself, and was in the act of crawling away: besides all this, there was generally a ridge or a furrow in the way wherever she wanted to send the hedgehog to, and, as the doubled-up soldiers were always getting up and walking off to other parts of the ground, Alice soon came to the conclusion that it was a very difficult game indeed.

The players all played at once, without waiting for turns, quarrelling all the while, and fighting for the hedgehogs; and in a very short time the Queen was in a furious passion, and went stamping about, and shouting "Off with his head!" or "Off with her head!" about once in a minute.

Alice began to feel very uneasy: to be sure, she had not as yet had any dispute with the Queen, but she knew that it might happen any minute, "and then," thought she, "what would become of me? They're dreadfully fond of beheading people here: the great wonder is, that there's any one left alive!"

She was looking about for some way of escape, and wondering whether she could get away without being seen, when she noticed a curious appearance in the air: it puzzled her very much at first, but after watching it a minute or two she made it out to be a grin, and she said to herself "It's the Cheshire-Cat: now

I shall have somebody to talk to.”

“How are you getting on?” said the Cat, as soon as there was mouth enough for it to speak with.

Alice waited till the eyes appeared, and then nodded. “It’s no use speaking to it,” she thought, “till its ears have come, or at least one of them.” In another minute the whole head appeared, and then Alice put down her flamingo, and began an account of the game, feeling very glad she had someone to listen to her. The Cat seemed to think that there was enough of it now in sight, and no more of it appeared.

“I don’t think they play at all fairly,” Alice began, in rather a complaining tone, “and they all quarrel so dreadfully one ca’n’t hear oneself¹⁸ speak—and they don’t seem to have any rules in particular: at least, if there are, nobody attends to them—and you’ve no idea how confusing it is all the things being alive: for instance, there’s the arch I’ve got to go through next walking about at the other end of the ground—and I should have croqueted the Queen’s hedgehog just now, only it ran away when it saw mine coming!”

“How do you like the Queen?” said the Cat in a low voice.

“Not at all,” said Alice: “she’s so extremely—” Just then she noticed that the Queen was close behind her, listening: so she went on “—likely to win, that it’s hardly worth while finishing the game.”

The Queen smiled and passed on.

“Who *are* you talking to?” said the King, coming up to Alice, and looking at the Cat’s head with great curiosity.

“It’s a friend of mine—a Cheshire-Cat,” said Alice: “allow me to introduce it.”

“I don’t like the look of it at all,” said the King: “however, it may kiss my hand, if it likes.”

“I’d rather not,” the Cat remarked.

“Don’t be impertinent,” said the King, “and don’t look at me like that!” He got behind Alice as he spoke.

“A cat may look at a king,” said Alice. “I’ve read that in some book, but I don’t remember where.”

“Well, it must be removed,” said the King very decidedly; and he called to the Queen, who was passing at the moment, “My dear! I wish you would have this cat removed!”

The Queen had only one way of settling all difficulties, great or small. “Off with his head!” she said without even looking round.

“I’ll fetch the executioner myself,” said the King eagerly, and he hurried off.

Alice thought she might as well go back and see how the game was going on, as she heard the Queen’s voice in the distance, screaming with passion. She had already heard her sentence three of the players to be executed for having missed their turns, and she did not like the look of things at all, as the game was in such confusion that she never knew whether it was her turn or not. So she went in search of her hedgehog.

The hedgehog was engaged in a fight with another hedgehog, which seemed to Alice an excellent opportunity for croqueting one of them with the other: the only difficulty was, that her flamingo was gone across to the other side of the

¹⁸one’s-self

garden, where Alice could see it trying in a helpless sort of way to fly up into a tree.

By the time she had caught the flamingo and brought it back, the fight was over, and both the hedgehogs were out of sight: “but it doesn’t matter much,” thought Alice, “as all the arches are gone from this side of the ground.” So she tucked it away under her arm, that it might not escape again, and went back for a little more conversation with her friend.

When she got back to the Cheshire-Cat, she was surprised to find quite a large crowd collected round it: there was a dispute going on between the executioner, the King, and the Queen, who were all talking at once, while all the rest were quite silent, and looked very uncomfortable.

The moment Alice appeared, she was appealed to by all three to settle the question, and they repeated their arguments to her, though, as they all spoke at once, she found it very hard to make out exactly what they said.

The executioner’s argument was, that you couldn’t cut off a head unless there was a body to cut it off from: that he had never had to do such a thing before, and he wasn’t going to begin at *his* time of life.

The King’s argument was that anything that had a head could be beheaded, and that you weren’t to talk nonsense.

The Queen’s argument was that, if something wasn’t done about it in less than no time, she’d have everybody executed, all round. (It was this last remark that had made the whole party look so grave and anxious.)

Alice could think of nothing else to say but “It belongs to the Duchess: you’d better ask *her* about it.”

“She’s in prison,” the Queen said to the executioner: “fetch her here.” And the executioner went off like an arrow.

The Cat’s head began fading away the moment he was gone, and, by the time he had come back with the Duchess, it had entirely disappeared; so the King and the executioner ran wildly up and down, looking for it, while the rest of the party went back to the game.

Chapter IX. The Mock Turtle’s Story

“You ca’n’t think how glad I am to see you again, you dear old thing!” said the Duchess, as she tucked her arm affectionately into Alice’s, and they walked off together.

Alice was very glad to find her in such a pleasant temper, and thought to herself that perhaps it was only the pepper that had made her so savage when they met in the kitchen.

“When *I’m* a Duchess,” she said to herself (not in a very hopeful tone, though), “I wo’n’t have any pepper in my kitchen *at all*. Soup does very well without—Maybe it’s always pepper that makes people hot-tempered,” she went on, very much pleased at having found out a new kind of rule, “and vinegar that makes them sour—and camomile that makes them bitter—and—and barley-sugar and such things that make children sweet-tempered. I only wish people knew *that*: then they wouldn’t be so stingy about it, you know—”

She had quite forgotten the Duchess by this time, and was a little startled when she heard her voice close to her ear. “You’re thinking about something, my dear, and that makes you forget to talk. I ca’n’t tell you just now what the moral of that is, but I shall remember it in a bit.”

"Perhaps it hasn't one," Alice ventured to remark.

"Tut, tut, child!" said the Duchess. "Every thing's got a moral, if only you can find it." And she squeezed herself up closer to Alice's side as she spoke.

Alice did not much like keeping so close to her: first, because the Duchess was *very* ugly; and secondly, because she was exactly the right height to rest her chin upon Alice's shoulder, and it was an uncomfortably sharp chin. However, she did not like to be rude: so she bore it as well as she could.

"The game's going on rather better now," she said, by way of keeping up the conversation a little.

"'Tis so," said the Duchess: "and the moral of that is—'Oh, 'tis love, 'tis love, that makes the world go round!'"

"Somebody said," Alice whispered, "that it's done by everybody minding their own business!"

"Ah, well! It means much the same thing," said the Duchess, digging her sharp little chin into Alice's shoulder as she added "and the moral of *that* is—'Take care of the sense, and the sounds will take care of themselves.'"

"How fond she is of finding morals in things!" Alice thought to herself.

"I dare say you're wondering why I don't put my arm round your waist," the Duchess said after a pause: "the reason is, that I'm doubtful about the temper of your flamingo. Shall I try the experiment?"

"He might bite," Alice cautiously replied, not feeling at all anxious to have the experiment tried.

"Very true," said the Duchess: "flamingoes and mustard both bite. And the moral of that is—'Birds of a feather flock together.'"

"Only mustard isn't a bird," Alice remarked.

"Right, as usual," said the Duchess: "what a clear way you have of putting things!"

"It's a mineral, I *think*," said Alice.

"Of course it is," said the Duchess, who seemed ready to agree to everything that Alice said: "there's a large mustard-mine near here. And the moral of that is—'The more there is of mine, the less there is of yours.'"

"Oh, I know!" exclaimed Alice, who had not attended to this last remark. "It's a vegetable. It doesn't look like one, but it is."

"I quite agree with you," said the Duchess; "and the moral of that is—'Be what you would seem to be'—or, if you'd like it put more simply—'Never imagine yourself not to be otherwise than what it might appear to others that what you were or might have been was not otherwise than what you had been would have appeared to them to be otherwise.'"

"I think I should understand that better," Alice said very politely, "if I had it written down: but I ca'n't quite follow it as you say it."

"That's nothing to what I could say if I chose," the Duchess replied, in a pleased tone.

"Pray don't trouble yourself to say it any longer than that," said Alice.

"Oh, don't talk about trouble!" said the Duchess. "I make you a present of everything I've said as yet."

"A cheap sort of present!" thought Alice. "I'm glad \perp people¹⁹ don't give birthday-presents like that!" But she did not venture to say it out loud.

"Thinking again?" the Duchess asked, with another dig of her sharp little chin.

"I've a right to think," said Alice sharply, for she was beginning to feel a little worried.

"Just about as much right," said the Duchess, "as pigs have to fly; and the m——"

But here, to Alice's great surprise, the Duchess's voice died away, even in the middle of her favourite word 'moral,' and the arm that was linked into hers began to tremble. Alice looked up, and there stood the Queen in front of them, with her arms folded, frowning like a thunderstorm.

"A fine day, your Majesty!" the Duchess began in a low, weak voice.

"Now, I give you fair warning," shouted the Queen, stamping on the ground as she spoke; "either you or your head must be off, and that in about half no time! Take your choice!"

The Duchess took her choice, and was gone in a moment.

"Let's go on with the game," the Queen said to Alice; and Alice was too much frightened to say a word, but slowly followed her back to the croquet-ground.

The other guests had taken advantage of the Queen's absence, and were resting in the shade: however, the moment they saw her, they hurried back to the game, the Queen merely remarking that a moment's delay would cost them their lives.

All the time they were playing the Queen never left off quarrelling with the other players, and shouting "Off with his head!" or "Off with her head!" Those whom she sentenced were taken into custody by the soldiers, who of course had to leave off being arches to do this, so that, by the end of half an hour or so, there were no arches left, and all the players, except the King, the Queen, and Alice, were in custody and under sentence of execution.

¹⁹they

Then the Queen left off, quite out of breath, and said to Alice "Have you seen the Mock Turtle yet?"

"No," said Alice. "I don't even know what a Mock Turtle is."

"It's the thing Mock Turtle Soup is made from," said the Queen.

"I never saw one, or heard of one," said Alice.

"Come on, then," said the Queen, "and he shall tell you his history,"

As they walked off together, Alice heard the King say in a low voice, to the company generally, "You are all pardoned." "Come, *that's* a good thing!" she said to herself, for she had felt quite unhappy at the number of executions the Queen had ordered.

They very soon came upon a Gryphon, lying fast asleep in the sun. (If you don't know what a Gryphon is, look at the picture.) "Up, lazy thing!" said the Queen, "and take this young lady to see the Mock Turtle, and to hear his history. I must go back and see after some executions I have ordered;" and she walked off, leaving Alice alone with the Gryphon. Alice did not quite like the look of the creature, but on the whole she thought it would be quite as safe to stay with it as to go after that savage Queen: so she waited.

The Gryphon sat up and rubbed its eyes: then it watched the Queen till she was out of sight: then it chuckled. "What fun!" said the Gryphon, half to itself, half to Alice.

"What *is* the fun?" said Alice.

"Why, *she*," said the Gryphon. "It's all her fancy, that: they never executes nobody, you know. Come on!"

"Everybody says 'come on!' here," thought Alice, as she went slowly after it: "I never was so ordered about before, in all my life, never!"

They had not gone far before they saw the Mock Turtle in the distance, sitting sad and lonely on a little ledge of rock, and, as they came nearer, Alice could hear him sighing as if his heart would break. She pitied him deeply. "What

is his sorrow?" she asked the Gryphon. And the Gryphon answered, very nearly in the same words as before, "It's all his fancy, that: he hasn't got no sorrow, you know. Come on!"

So they went up to the Mock Turtle, who looked at them with large eyes full of tears, but said nothing.

"This here young lady," said the Gryphon, "she wants for to know your history, she do."

"I'll tell it her," said the Mock Turtle in a deep, hollow tone. "Sit down, both of you, and don't speak a word till I've finished."

So they sat down, and nobody spoke for some minutes. Alice thought to herself "I don't see how he can *even* finish, if he doesn't begin." But she waited patiently.

"Once," said the Mock Turtle at last, with a deep sigh, "I was a real Turtle."

These words were followed by a very long silence, broken only by an occasional exclamation of "Hjckrrh!" from the Gryphon, and the constant heavy sobbing of the Mock Turtle. Alice was very nearly getting up and saying "Thank you, Sir, for your interesting story," but she could not help thinking there *must* be more to come, so she sat still and said nothing.

"When we were little," the Mock Turtle went on at last, more calmly, though still sobbing a little now and then, "we went to school in the sea. The master was an old Turtle—we used to call him Tortoise——"

"Why did you call him Tortoise, if he wasn't one?" Alice asked.

"We called him Tortoise because he taught us," said the Mock Turtle angrily. "Really you are very dull!"

"You ought to be ashamed of yourself for asking such a simple question," added the Gryphon; and then they both sat silent and looked at poor Alice, who felt ready to sink into the earth. At last the Gryphon said to the Mock Turtle "Drive on, old fellow! Don't be all day about it!", and he went on in these words:—

"Yes, we went to school in the sea, though you mayn't believe it——"

"I never said I didn't!" interrupted Alice.

"You did," said the Mock Turtle.

"Hold your tongue!" added the Gryphon, before Alice could speak again. The Mock Turtle went on.

"We had the best of educations—in fact, we went to school every day——"

"*I've* been to a day-school, too," said Alice. "You needn't be so proud as all that."

"With extras?" asked the Mock Turtle, a little anxiously.

"Yes," said Alice: "we learned French and music."

"And washing?" said the Mock Turtle.

"Certainly not!" said Alice indignantly.

"Ah! Then yours wasn't a really good school," said the Mock Turtle in a tone of great relief. "Now, at *ours*, they had, at the end of the bill, 'French, music, and *washing*—extra.'"

"You couldn't have wanted it much," said Alice; "living at the bottom of the sea."

"I couldn't afford to learn it," said the Mock Turtle with a sigh. "I only took the regular course."

"What was that?" inquired Alice.

“Reeling and Writhing, of course, to begin with,” the Mock Turtle replied; “and then the different branches of Arithmetic—Ambition, Distraction, Uglification, and Derision.”

“I never heard of ‘Uglification,’” Alice ventured to say. “What is it?”

The Gryphon lifted up both its paws in surprise. “Never heard of uglifying!” it exclaimed. “You know what to beautify is, I suppose?”

“Yes,” said Alice doubtfully: “it means—to—make—anything—prettier.”

“Well, then,” the Gryphon went on, “if you don’t know what to uglify is, you *are* a simpleton.”

Alice did not feel encouraged to ask any more questions about it: so she turned to the Mock Turtle, and said “What else had you to learn?”

“Well, there was Mystery,” the Mock Turtle replied, counting off the subjects on his flappers,—“Mystery, ancient and modern, with Seaography: then Drawling—the Drawling-master was an old conger-eel, that used to come once a week: *he* taught us Drawling, Stretching, and Fainting in Coils.”

“What was *that* like?” said Alice.

“Well, I ca’n’t show it you, myself,” the Mock Turtle said: “I’m too stiff. And the Gryphon never learnt it.”

“Hadn’t time,” said the Gryphon: “I went to the Classics master, though. He was an old crab, *he* was.”

“I never went to him,” the Mock Turtle said with a sigh. “He taught Laughing and Grief, they used to say.”

“So he did, so he did,” said the Gryphon, sighing in his turn; and both creatures hid their faces in their paws.

“And how many hours a day did you do lessons?” said Alice, in a hurry to change the subject.

“Ten hours the first day,” said the Mock Turtle: “nine the next, and so on.”

“What a curious plan!” exclaimed Alice.

“That’s the reason they’re called lessons,” the Gryphon remarked: “because they lessen from day to day.”

This was quite a new idea to Alice, and she thought it over a little before she made her next remark. “Then the eleventh day must have been a holiday?”

“Of course it was,” said the Mock Turtle.

“And how did you manage on the twelfth?” Alice went on eagerly.

“That’s enough about lessons,” the Gryphon interrupted in a very decided tone. “Tell her something about the games now.”

Chapter X. The Lobster-Quadrille

The Mock Turtle sighed deeply, and drew the back of one flapper across his eyes. He looked at Alice and tried to speak, but, for a minute or two, sobs choked his voice. “Same as if he had a bone in his throat,” said the Gryphon; and it set to work shaking him and punching him in the back. At last the Mock Turtle recovered his voice, and, with tears running down his cheeks, he went on again:—

“You may not have lived much under the sea—” (“I haven’t,” said Alice)—“and perhaps you were never even introduced to a lobster—” (Alice began to say “I once tasted—” but checked herself hastily, and said “No, never”) “—so you can have no idea what a delightful thing a Lobster-Quadrille is!”

“No, indeed,” said Alice. “What sort of a dance is it?”

“Why,” said the Gryphon, “you first form into a line along the sea-shore——”
 “Two lines!” cried the Mock Turtle. “Seals, turtles, salmon, and so on: then, when you’ve cleared all the jelly-fish out of the way——”
 “*That* generally takes some time,” interrupted the Gryphon.
 “—you advance twice——”
 “Each with a lobster as a partner!” cried the Gryphon.
 “Of course,” the Mock Turtle said: “advance twice, set to partners——”
 “—change lobsters, and retire in same order,” continued the Gryphon.
 “Then, you know,” the Mock Turtle went on, “you throw the——”
 “The lobsters!” shouted the Gryphon, with a bound into the air.
 “—as far out to sea as you can——”
 “Swim after them!” screamed the Gryphon.
 “Turn a somersault in the sea!” cried the Mock Turtle, capering wildly about.
 “Change lobsters again!” yelled the Gryphon at the top of its voice.
 “Back to land again, and—that’s all the first figure,” said the Mock Turtle, suddenly dropping his voice; and the two creatures, who had been jumping about like mad things all this time, sat down again very sadly and quietly, and looked at Alice.

“It must be a very pretty dance,” said Alice timidly.

“Would you like to see a little of it?” said the Mock Turtle.

“Very much indeed,” said Alice.

“Come, let’s try the first figure!” said the Mock Turtle to the Gryphon. “We can do without lobsters, you know. Which shall sing?”

“Oh, *you* sing,” said the Gryphon. “I’ve forgotten the words.”

So they began solemnly dancing round and round Alice, every now and then treading on her toes when they passed too close, and waving their fore-paws to mark the time, while the Mock Turtle sang this, very slowly and sadly:—

*“Will you walk a little faster?” said a whiting to a snail,
 “There’s a porpoise close behind us, and he’s treading on my tail.
 See how eagerly the lobsters and the turtles all advance!
 They are waiting on the shingle—will you come and join the dance?
 Will you, wo’n’t you, will you, wo’n’t you, will you join the dance?
 Will you, wo’n’t you, will you, wo’n’t you, wo’n’t you join the
 dance?”*

*“You can really have no notion how delightful it will be
 When they take us up and throw us, with the lobsters, out to sea!”
 But the snail replied “Too far, too far!”, and gave a look askance—
 Said he thanked the whiting kindly, but he would not join the dance.
 Would not, could not, would not, could not, would not join the
 dance.
 Would not, could not, would not, could not, could not join the
 dance.*

*“What matters it how far we go?” his scaly friend replied.
 “There is another shore, you know, upon the other side.
 The further off from England the nearer is to France—
 Then turn not pale, beloved snail, but come and join the dance.
 Will you, wo’n’t you, will you, wo’n’t you, will you join the dance?
 Will you, wo’n’t you, will you, wo’n’t you, wo’n’t you join the
 dance?”*

Parody on *The Spider and the Fly* by Mary Howitt

“Thank you, it’s a very interesting dance to watch,” said Alice, feeling very glad that it was over at last: “and I do so like that curious song about the whiting!”

“Oh, as to the whiting,” said the Mock Turtle, “they—you’ve seen them, of course?”

“Yes,” said Alice, “I’ve often seen them at dinn——” she checked herself hastily.

“I don’t know where Dinn may be,” said the Mock Turtle; “but if you’ve seen them so often, of course you know what they’re like?”

“I believe so,” Alice replied thoughtfully. “They have their tails in their mouths—and they’re all over crumbs.”

“You’re wrong about the crumbs,” said the Mock Turtle: “crumbs would all wash off in the sea. But they *have* their tails in their mouths; and the reason is—” here the Mock Turtle yawned and shut his eyes. “Tell her about the reason and all that,” he said to the Gryphon.

“The reason is,” said the Gryphon, “that they *would* go with the lobsters to the dance. So they got thrown out to sea. So they had to fall a long way. So they got their tails fast in their mouths. So they couldn’t get them out again. That’s all.”

“Thank you,” said Alice, “it’s very interesting. I never knew so much about a whiting before.”

“I can tell you more than that, if you like,” said the Gryphon. “Do you know why it’s called a whiting?”

“I never thought about it,” said Alice. “Why?”

“*It does the boots and shoes,*” the Gryphon replied very solemnly.

Alice was thoroughly puzzled. “Does the boots and shoes!” she repeated in a wondering tone.

“Why, what are *your* shoes done with?” said the Gryphon. “I mean, what makes them so shiny?”

Alice looked down at them, and considered a little before she gave her answer. “They’re done with blacking, I believe.”

“Boots and shoes under the sea,” the Gryphon went on in a deep voice, “are done with a whiting. Now you know.”

“And what are they made of?” Alice asked in a tone of great curiosity.

“Soles and eels, of course,” the Gryphon replied, rather impatiently: “any shrimp could have told you that.”

“If I’d been the whiting,” said Alice, whose thoughts were still running on the song, “I’d have said to the porpoise ‘Keep back, please! We don’t want *you* with us!’”

“They were obliged to have him with them,” the Mock Turtle said. “No wise fish would go anywhere without a porpoise.”

“Wouldn’t it, really?” said Alice, in a tone of great surprise.

“Of course not,” said the Mock Turtle. “why, if a fish came to *me*, and told me he was going a journey, I should say ‘With what porpoise?’”

“Don’t you mean ‘purpose’?” said Alice.

“I mean what I say,” the Mock Turtle replied, in an offended tone. And the Gryphon added “Come, let’s hear some of *your* adventures.”

“I could tell you my adventures—beginning from this morning,” said Alice a little timidly; “but it’s no use going back to yesterday, because I was a different person then.”

"Explain all that," said the Mock Turtle.

"No, no! The adventures first," said the Gryphon in an impatient tone: "explanations take such a dreadful time."

So Alice began telling them her adventures from the time when she first saw the White Rabbit. She was a little nervous about it, just at first, the two creatures got so close to her, one on each side, and opened their eyes and mouths so *very* wide; but she gained courage as she went on. Her listeners were perfectly quiet till she got to the part about her repeating "*You are old, Father William,*" to the Caterpillar, and the words all coming different, and then the Mock Turtle drew a long breath, and said "That's very curious!"

"It's all about as curious as it can be," said the Gryphon.

"It all came different!" the Mock Turtle repeated thoughtfully. "I should like to hear her try and repeat something now. Tell her to begin." He looked at the Gryphon as if he thought it had some kind of authority over Alice.

"Stand up and repeat '*'Tis the voice of the sluggard,*'" said the Gryphon.

"How the creatures order one about, and make one repeat lessons!" thought Alice. "I might as well be at school at once." However, she got up, and began to repeat it, but her head was so full of the Lobster-Quadrille, that she hardly knew what she was saying; and the words came very queer indeed:—

*"'Tis the voice of the Lobster: I heard him declare
'You have baked me too brown, I must sugar my hair.'
As a duck with its eyelids, so he with his nose*

Parody on *The Sluggard* by Isaac Watts

*Trims his belt and his buttons, and turns out his toes.*²⁰
When the sands are all dry, he is gay as a lark,
And will talk in contemptuous tones of the Shark:
But, when the tide rises and sharks are around,
His voice has a timid and tremulous sound."

"That's different from what *I* used to say when I was a child," said the Gryphon.

"Well, *I* never heard it before," said the Mock Turtle; "but it sounds uncommon nonsense."

Alice said nothing; she had sat down²¹ with her face in her hands, wondering if anything would *ever* happen in a natural way again.

"I should like to have it explained," said the Mock Turtle.

"She ca'n't explain it," said the Gryphon hastily. "Go on with the next verse."

"But about his toes?" the Mock Turtle persisted. "How *could* he turn them out with his nose, you know?"

"It's the first position in dancing," Alice said; but was dreadfully puzzled by the whole thing, and longed to change the subject.

"Go on with the next verse," the Gryphon repeated²²: "it begins '*I passed by his garden.*'"

Alice did not dare to disobey, though she felt sure it would all come wrong, and she went on in a trembling voice:—

"I passed by his garden, and marked, with one eye,
How the Owl and the Panther²³ were sharing a pie.²⁴
The Panther took pie-crust, and gravy, and meat,
While the Owl had the dish as its share of the treat.
When the pie was all finished, the Owl, as a boon,
Was kindly permitted to pocket the spoon:
While the Panther received knife and fork with a growl,
And concluded the banquet by——"

"What *is* the use of repeating all that stuff?" the Mock Turtle interrupted, "if you don't explain it as you go on? It's by far the most confusing thing *I* ever heard!"

"Yes, I think you'd better leave off," said the Gryphon, and Alice was only too glad to do so.

"Shall we try another figure of the Lobster-Quadrille?" the Gryphon went on. "Or would you like the Mock Turtle to sing you another²⁵ song?"

"Oh, a song, please, if the Mock Turtle would be so kind," Alice replied, so eagerly that the Gryphon said, in a rather offended tone, "Hm! No accounting for tastes! Sing her '*Turtle Soup,*' will you, old fellow?"

The Mock Turtle sighed deeply, and began, in a voice choked²⁶ with sobs, to sing this:—

"Beautiful Soup, so rich and green,

²⁰First version ends here.

²¹down again

²²repeated impatiently

²³oyster

²⁴first version ends here

²⁵a

²⁶sometimes choked

Waiting in a hot tureen!
Who for such dainties would not stoop?
Soup of the evening, beautiful Soup!
Soup of the evening, beautiful Soup!
Beau—ootiful Soo—oop!
Beau—ootiful Soo—oop!
Soo—oop of the e—e—evening,
Beautiful, beautiful Soup!
“Beautiful Soup! Who cares for fish,
Game, or any other dish?
Who would not give all else for two p
ennyworth only of beautiful Soup?
Pennyworth only of beautiful Soup?
Beau—ootiful Soo—oop!
Beau—ootiful Soo—oop!
Soo—oop of the e—e—evening,
Beautiful, beauti—FUL SOUP!”

“Chorus again!” cried the Gryphon, and the Mock Turtle had just begun to repeat it, when a cry of “The trial’s beginning!” was heard in the distance.

“Come on!” cried the Gryphon, and, taking Alice by the hand, it hurried off, without waiting for the end of the song.

“What trial is it?” Alice panted as she ran; but the Gryphon only answered “Come on!” and ran the faster, while more and more faintly came, carried on the breeze that followed them, the melancholy words:—

“Soo—oop of the e—e—evening,
Beautiful, beautiful Soup!”

Chapter XI. Who Stole the Tarts?

The King and Queen of Hearts were seated on their throne when they arrived, with a great crowd assembled about them—all sorts of little birds and beasts, as well as the whole pack of cards: the Knave was standing before them, in chains, with a soldier on each side to guard him; and near the King was the White Rabbit, with a trumpet in one hand, and a scroll of parchment in the other. In the very middle of the court was a table, with a large dish of tarts upon it: they looked so good, that it made Alice quite hungry to look at them—“I wish they’d get the trial done,” she thought, “and hand round the refreshments!” But there seemed to be no chance of this; so she began looking at everything about her to pass away the time.

Alice had never been in a court of justice before, but she had read about them in books, and she was quite pleased to find that she knew the name of nearly everything there. “That’s the judge,” she said to herself, “because of his great wig.”

The judge, by the way, was the King; and, as he wore his crown over the wig (look at the frontispiece if you want to see how he did it), he did not look at all comfortable, and it was certainly not becoming.

“And that’s the jury-box,” thought Alice; “and those twelve creatures,” (she was obliged to say “creatures,” you see, because some of them were animals, and

(Frontispiece)

some were birds,) "I suppose they are the jurors." She said this last word two or three times over to herself, being rather proud of it: for she thought, and rightly too, that very few little girls of her age knew the meaning of it at all. However, "jury-men" would have done just as well.

The twelve jurors were all writing very busily on slates. "What are they doing?" Alice whispered to the Gryphon. "They ca'n't have anything to put down yet, before the trial's begun."

"They're putting down their names," the Gryphon whispered in reply, "for fear they should forget them before the end of the trial."

"Stupid things!" Alice began in a loud indignant voice; but she stopped hastily, for the White Rabbit cried out "Silence in the court!", and the King put on his spectacles and looked anxiously round, to make out who was talking.

Alice could see, as well as if she were looking over their shoulders, that all the jurors were writing down "Stupid things!" on their slates, and she could even make out that one of them didn't know how to spell "stupid," and that he had to ask his neighbour to tell him. "A nice muddle their slates'll be in, before the trial's over!" thought Alice.

One of the jurors had a pencil that squeaked. This of course, Alice could *not* stand, and she went round the court and got behind him, and very soon found an opportunity of taking it away. She did it so quickly that the poor little juror (it was Bill, the Lizard) could not make out at all what had become of it; so, after hunting all about for it, he was obliged to write with one finger for the rest of the day; and this was of very little use, as it left no mark on the slate.

"Herald, read the accusation!" said the King.

On this the White Rabbit blew three blasts on the trumpet, and then unrolled the parchment-scroll, and read as follows:—

*“The Queen of Hearts, she made some tarts,
All on a summer day:
The Knave of Hearts, he stole those tarts
And took them quite away!”*

Quoted from nursery
rhyme

“Consider your verdict,” the King said to the jury.

“Not yet, not yet!” the Rabbit hastily interrupted. “There’s a great deal to come before that!”

“Call the first witness,” said the King; and the White Rabbit blew three blasts on the trumpet, and called out “First witness!”

The first witness was the Hatter. He came in with a teacup in one hand and a piece of bread-and-butter in the other. “I beg pardon, your Majesty,” he began, “for bringing these in; but I hadn’t quite finished my tea when I was sent for.”

“You ought to have finished,” said the King. “When did you begin?”

The Hatter looked at the March Hare, who had followed him into the court, arm-in-arm with the Dormouse. “Fourteenth of March, I *think* it was,” he said.

“Fifteenth,” said the March Hare.

“Sixteenth,” said²⁷ the Dormouse.

“Write that down,” the King said to the jury; and the jury eagerly wrote down all three dates on their slates, and then added them up, and reduced the answer to shillings and pence.

“Take off your hat,” the King said to the Hatter.

“It isn’t mine,” said the Hatter.

“*Stolen!*” the King exclaimed, turning to the jury, who instantly made a memorandum of the fact.

“I keep them to sell,” the Hatter added as an explanation. “I’ve none of my own. I’m a hatter.”

Here the Queen put on her spectacles, and began staring hard at the Hatter, who turned pale and fidgeted.

“Give your evidence,” said the King; “and don’t be nervous, or I’ll have you executed on the spot.”

This did not seem to encourage the witness at all: he kept shifting from one foot to the other, looking uneasily at the Queen, and in his confusion he bit a large piece out of his teacup instead of the bread-and-butter.

Just at this moment Alice felt a very curious sensation, which puzzled her a good deal until she made out what it was: she was beginning to grow larger again, and she thought at first she would get up and leave the court; but on second thoughts she decided to remain where she was as long as there was room for her.

“I wish you wouldn’t squeeze so.” said the Dormouse, who was sitting next to her. “I can hardly breathe.”

“I ca’n’t help it,” said Alice very meekly: “I’m growing.”

“You’ve no right to grow *here*,” said the Dormouse.

“Don’t talk nonsense,” said Alice more boldly: “you know you’re growing too.”

“Yes, but *I* grow at a reasonable pace,” said the Dormouse: “not in that ridiculous fashion.” And he got up very sulkily and crossed over to the other side of the court.

²⁷added

All this time the Queen had never left off staring at the Hatter, and, just as the Dormouse crossed the court, she said to one of the officers of the court, "Bring me the list of the singers in the last concert!" on which the wretched Hatter trembled so, that he shook off both his shoes²⁸.

"Give your evidence," the King repeated angrily, "or I'll have you executed, whether you're nervous or not."

"I'm a poor man, your Majesty," the Hatter began, in a trembling voice, "and I hadn't begun my tea—not above a week or so—and what with the bread-and-butter getting so thin—and the twinkling of the tea——"

"The twinkling of the *what?*" said the King.

"It *began* with the tea," the Hatter replied.

"Of course twinkling *begins* with a T!" said the King sharply. "Do you take me for a dunce? Go on!"

"I'm a poor man," the Hatter went on, "and most things twinkled after that—only the March Hare said——"

"I didn't!" the March Hare interrupted in a great hurry.

"You did!" said the Hatter.

"I deny it!" said the March Hare.

"He denies it," said the King: "leave out that part."

"Well, at any rate, the Dormouse said——" the Hatter went on, looking anxiously round to see if he would deny it too; but the Dormouse denied nothing, being fast asleep.

"After that," continued the Hatter, "I cut some more bread-and-butter——"

"But what did the Dormouse say?" one of the jury asked.

"That I ca'n't remember," said the Hatter.

"You *must* remember," remarked the King, "or I'll have you executed."

²⁸shook both his shoes off

The miserable Hatter dropped his teacup and bread-and-butter, and went down on one knee. "I'm a poor man, your Majesty," he began.

"You're a *very* poor *speaker*," said the King.

Here one of the guinea-pigs cheered, and was immediately suppressed by the officers of the court. (As that is rather a hard word, I will just explain to you how it was done. They had a large canvas bag, which tied up at the mouth with strings: into this they slipped the guinea-pig, head first, and then sat upon it.)

"I'm glad I've seen that done," thought Alice. "I've so often read in the newspapers, at the end of trials, 'There was some attempts at applause, which was immediately suppressed by the officers of the court,' and I never understood what it meant till now."

"If that's all you know about it, you may stand down," continued the King.

"I ca'n't go no lower," said the Hatter: "I'm on the floor, as it is."

"Then you may *sit* down," the King replied.

Here the other guinea-pig cheered, and was suppressed.

"Come, that finished the guinea-pigs!" thought Alice. "Now we shall get on better."

"I'd rather finish my tea," said the Hatter, with an anxious look at the Queen, who was reading the list of singers.

"You may go," said the King, and the Hatter hurriedly left the court, without even waiting to put his shoes on.

"—and just take his head off outside," the Queen added to one of the officers; but the Hatter was out of sight before the officer could get to the door.

"Call the next witness!" said the King.

The next witness was the Duchess's cook. She carried the pepper-box in her hand, and Alice guessed who it was, even before she got into the court, by the way the people near the door began sneezing all at once.

"Give your evidence," said the King.

"Sha'n't," said the cook.

The King looked anxiously at the White Rabbit, who said, in a low voice, "Your Majesty must cross-examine *this* witness."

"Well, if I must, I must," the King said with a melancholy air, and, after folding his arms and frowning at the cook till his eyes were nearly out of sight, he said, in a deep voice, "What are tarts made of?"

"Pepper, mostly," said the cook.

“Treacle,” said a sleepy voice behind her.

“Collar that Dormouse!” the Queen shrieked out. “Behead that Dormouse! Turn that Dormouse out of court! Suppress him! Pinch him! Off with his whiskers!”

For some minutes the whole court was in confusion, getting the Dormouse turned out, and, by the time they had settled down again, the cook had disappeared.

“Never mind!” said the King, with an air of great relief. “Call the next witness.” And, he added, in an under-tone to the Queen, “Really, my dear, *you* must cross-examine the next witness. It quite makes my forehead ache!”

Alice watched the White Rabbit as he fumbled over the list, feeling very curious to see what the next witness would be like, “—for they haven’t got much evidence *yet*,” she said to herself. Imagine her surprise, when the White Rabbit read out, at the top of his shrill little voice, the name “Alice!”

Chapter XII. Alice’s Evidence

“Here!” cried Alice, quite forgetting in the flurry of the moment how large she had grown in the last few minutes, and she jumped up in such a hurry that she tipped over the jury-box with the edge of her skirt, upsetting all the jury-men on to the heads of the crowd below, and there they lay sprawling about, reminding her very much of a globe of gold-fish she had accidentally upset the week before.

“Oh, I *beg* your pardon!” she exclaimed in a tone of great dismay, and began picking them up again as quickly as she could, for the accident of the gold-fish kept running in her head, and she had a vague sort of idea that they must be collected at once and put back into the jury-box, or they would die.

“The trial cannot proceed,” said the King, in a very grave voice, “until all the jurymen are back in their proper places—*all*,” he repeated with great emphasis, looking hard at Alice as he said do.

Alice looked at the jury-box, and saw that, in her haste, she had put the Lizard in head downwards, and the poor little thing was waving its tail about in a melancholy way, being quite unable to move. She soon got it out again, and put it right; “not that it signifies much,” she said to herself; “I should think it would be *quite* as much use in the trial one way up as the other.”

As soon as the jury had a little recovered from the shock of being upset, and their slates and pencils had been found and handed back to them, they set to work very diligently to write out a history of the accident, all except the Lizard, who seemed too much overcome to do anything but sit with its mouth open, gazing up into the roof of the court.

“What do you know about this business?” the King said to Alice.

“Nothing,” said Alice.

“Nothing *whatever*?” persisted the King.

“Nothing whatever,” said Alice.

“That’s very important,” the King said, turning to the jury. They were just beginning to write this down on their slates, when the White Rabbit interrupted: “*Unimportant*, your Majesty means, of course,” he said, in a very respectful tone, but frowning and making faces at him as he spoke.

“*Unimportant*, of course, I meant,” the King hastily said, and went on to himself in an undertone, “important—unimportant—unimportant—important—” as if he were trying which word sounded best.

Some of the jury wrote it down “important,” and some “unimportant.” Alice could see this, as she was near enough to look over their slates; “but it doesn’t matter a bit,” she thought to herself.

At this moment the King, who had been for some time busily writing in his note-book, called out “Silence!”, and read out from his book, “Rule Forty-two. *All persons more than a mile high to leave the court.*”

Everybody looked at Alice.

“*I’m* not a mile high,” said Alice.

“You are,” said the King.

“Nearly two miles high,” added the Queen.

“Well, I sha’n’t go, at any rate,” said Alice: “besides, that’s not a regular rule: you invented it just now.”

“It’s the oldest rule in the book,” said the King.

“Then it ought to be Number One,” said Alice.

The King turned pale, and shut his note-book hastily. “Consider your verdict,” he said to the jury, in a low trembling voice.

“There’s more evidence to come yet, please your Majesty,” said the White Rabbit, jumping up in a great hurry: “this paper has just been picked up.”

“What’s in it?” said the Queen.

“I haven’t opened it yet,” said the White Rabbit; “but it seems to be a letter, written by the prisoner to—to somebody.”

“It must have been that,” said the King, “unless it was written to nobody, which isn’t usual, you know.”

“Who is it directed to?” said one of the jurymen.

“It isn’t directed at all,” said the White Rabbit: “in fact, there’s nothing written on the *outside*.” He unfolded the paper as he spoke, and added “It isn’t a letter, after all: it’s a set of verses.”

“Are they in the prisoner’s handwriting?” asked another of the jurymen.

“No, they’re not,” said the White Rabbit, “and that’s the queerest thing about it.” (The jury all looked puzzled.)

“He must have imitated somebody else’s hand,” said the King. (The jury all brightened up again.)

“Please your Majesty,” said the Knave, “I didn’t write it, and they ca’n’t prove that I²⁹ did: there’s no name signed at the end.”

“If you didn’t sign it,” said the King, “that only makes the matter worse. You *must* have meant some mischief, or else you’d have signed your name like an honest man.”

There was a general clapping of hands at this: it was the first really clever thing the King had said that day.

“That *proves* his guilt, of course³⁰,” said the Queen: “so off with——.”³¹

“It *doesn’t* prove anything³² of the sort!” said Alice. “Why, you don’t even know what they’re about!”

“Read them,” said the King.

The White Rabbit put on his spectacles. “Where shall I begin, please your Majesty?” he asked.

²⁹prove I

³⁰(missing in first version)

³¹(missing in first version)

³²proves nothing

“Begin at the beginning,” the King said, ³³“and go on till you come to the end: then stop.”

There was dead silence in the court, whilst the White Rabbit read out these verses:—³⁴

*“They told me you had been to her,
And mentioned me to him:
She gave me a good character,
But said I could not swim.*

*He sent them word I had not gone
(We know it to be true):
If she should push the matter on,
What would become of you?*

*I gave her one, they gave him two,
You gave us three or more;
They all returned from him to you,
Though they were mine before.*

*If I or she should chance to be
Involved in this affair,
He trusts to you to set them free,
Exactly as we were.*

*My notion was that you had been
(Before she had this fit)
An obstacle that came between
Him, and ourselves, and it.*

*Don’t let him know she liked them best,
For this must ever be
A secret, kept from all the rest,
Between yourself and me.”*

“That’s the most important piece of evidence we’ve heard yet,” said the King, rubbing his hands; “so now let the jury——”

“If any one of them can explain it,” said Alice, (she had grown so large in the last few minutes that she wasn’t a bit afraid of interrupting him,) “I’ll give him sixpence. *I* don’t believe there’s an atom of meaning in it.”

The jury all wrote down, on their slates, “*She* doesn’t believe there’s an atom of meaning in it,” but none of them attempted to explain the paper.

“If there’s no meaning in it,” said the King, “that saves a world of trouble, you know, as we needn’t try to find any. And yet I don’t know,” he went on, spreading out the verses on his knee, and looking at them with one eye; “I seem to see some meaning in them, after all. ‘—*said I could not swim*—’ you ca’n’t swim, can you?” he added, turning to the Knave.

The Knave shook his head sadly. “Do I look like it?” he said. (Which he certainly did *not*, being made entirely of cardboard.)

“All right, so far,” said the King; and he went on muttering over the verses to himself: “‘*We know it to be true*’—that’s the jury, of course—‘*If she should*

³³gravely

³⁴These were the verses the White Rabbit read:—

push the matter on’—that must be the Queen—‘What would become of you?’—What, indeed!—³⁵‘I gave her one, they gave him two’—why, that must be what he did with the tarts, you know——”

“But, it goes on ‘they all returned from him to you,’” said Alice.

“Why, there they are?” said the King triumphantly, pointing to the tarts on the table. “Nothing can be clearer than *that*. Then again ‘before she had this fit’—you never had *fits*, my dear, I think?” he said to the Queen.

“Never!” said the Queen, furiously, throwing an inkstand at the Lizard as she spoke. (The unfortunate little Bill had left off writing on his slate with one

³⁵(missing in first version)

finger, as he found it made no mark; but he now hastily began again, using the ink, that was trickling down his face, as long as it lasted.)

“Then the words don’t *fit* you,” said the King, looking round the court with a smile. There was a dead silence.

“It’s a pun!” the King added in an angry tone, and everybody laughed. “Let the jury consider their verdict,” the King said, for about the twentieth time that day.

“No, no!” said the Queen. “Sentence first—verdict afterwards.”

“Stuff and nonsense!” said Alice loudly. “The idea of having the sentence first!”

“Hold your tongue!” said the Queen, turning purple.

“I wo’n’t!” said Alice.

“Off with her head!” the Queen shouted at the top of her voice. Nobody moved.

“Who cares for *you*?” said Alice (she had grown to her full size by this time). “You’re nothing but a pack of cards!”

At this the whole pack rose up into the air, and came flying down upon her; she gave a little scream, half of fright and half of anger, and tried to beat them off, and found herself lying on the bank, with her head in the lap of her sister, who was gently brushing away some dead leaves that had fluttered down from the trees upon her face.

“Wake up, Alice dear!” said her sister. “Why, what a long sleep you’ve had!”

“Oh, I’ve had such a curious dream!” said Alice. And she told her sister, as well as she could remember them, all these strange Adventures of hers that you have just been reading about; and, when she had finished, her sister kissed her, and said “It *was* a curious dream, dear, certainly; but now run in to your tea: it’s getting late.” So Alice got up and ran off, thinking while she ran, as well she might, what a wonderful dream it had been.

But her sister sat still just as she left her, leaning her head on her hand, watching the setting sun, and thinking of little Alice and all her wonderful Adventures, till she too began dreaming after a fashion, and this was her dream:—

First, she dreamed ³⁶about little Alice herself: ³⁷once again the tiny hands were clasped upon her knee, and the bright eager eyes were looking up into hers—she could hear the very tones of her voice, and see that queer little toss of her head to keep back the wandering hair that *would* always get into her eyes—and still as she listened, or seemed to listen, the whole place around her became alive the strange creatures of her little sister’s dream.

The long grass rustled at her feet as the White Rabbit hurried by—the frightened Mouse splashed his way through the neighbouring pool—she could hear the rattle of the teacups as the March Hare and his friends shared their never-ending meal, and the shrill voice of the Queen ordering off her unfortunate guests to execution—once more the pig-baby was sneezing on the Duchess’s knee, while plates and dishes crashed around it—once more the shriek of the Gryphon, the squeaking of the Lizard’s slate-pencil, and the choking of the suppressed guinea-pigs, filled the air, mixed up with the distant sobs of the miserable Mock Turtle.

³⁶of

³⁷and once

So she sat on, with closed eyes, and half believed herself in Wonderland, though she knew she had but to open them again, and all would change to dull reality—the grass would be only rustling in the wind, and the pool rippling to the waving of the reeds—the rattling teacups would change to tinkling sheep-bells, and the Queen’s shrill cries to the voice of the shepherd-boy—and the sneeze of the baby, the shriek of the Gryphon, and all the other queer noises, would change (she knew) to the confused clamour of the busy farm-yard—while the lowing of the cattle in the distance would take the place of the Mock Turtle’s heavy sobs.

Lastly, she pictured to herself how this same little sister of hers would, in the after-time, be herself a grown woman; and how she would keep, through all her riper years, the simple and loving heart of her childhood; and how she would gather about her other little children, and make *their* eyes bright and eager with many a strange tale, perhaps even with the dream of Wonderland of long ago; and how she would feel with all their simple sorrows, and find a pleasure in all their simple joys, remembering her own child-life, and the happy summer days.

2.2 Through the Looking-Glass, and What Alice Found There

Source: Through the Looking-Glass, editions from 1872 (with minor differences as noted) and 1897

Chapter I. Looking-Glass House

One thing was certain, that the *white* kitten had had nothing to do with it—it was the black kitten’s fault entirely. For the white kitten had been having its face washed by the old cat for the last quarter of an hour (and bearing it pretty well, considering): so you see that it *couldn’t* have had any hand in the mischief.

The way Dinah washed her children’s faces was this: first she held the poor thing down by its ear with one paw, and then with the other paw she rubbed its face all over, the wrong way, beginning at the nose: and just now, as I said, she was hard at work on the white kitten, which was lying quite still and trying to purr—no doubt feeling that it was all meant for its good.

But the black kitten had been finished with earlier in the afternoon, and so, while Alice was sitting curled up in a corner of the great arm-chair, half talking to herself and half asleep, the kitten had been having a grand game of romps with the ball of worsted Alice had been trying to wind up, and had been rolling it up and down till it had all come undone again: and there it was, spread over the hearth-rug, all knots and tangles, with the kitten running after its own tail in the middle.

“Oh, you wicked little thing!” cried Alice, catching up the kitten, and giving it a little kiss to make it understand that it was in disgrace. “Really, Dinah ought to have taught you better manners! You *ought*, Dinah, you know you ought!” she added, looking reproachfully at the old cat, and speaking in as cross a voice as she could manage—and then she scrambled back into the arm-chair, taking the kitten and the worsted with her, and began winding up the ball again. But she didn’t get on very fast, as she was talking all the time, sometimes to the kitten, and sometimes to herself. Kitty sat very demurely on her knee, pretending to

watch the progress of the winding, and now and then putting out one paw and gently touching the ball, as if it would be glad to help if it might.

“Do you know what to-morrow is, Kitty?” Alice began. “You’d have guessed if you’d been up in the window with me—only Dinah was making you tidy, so you couldn’t. I was watching the boys getting in sticks for the bonfire—and it wants plenty of sticks, Kitty! Only it got so cold, and it snowed so, they had to leave off. Never mind, Kitty, we’ll go and see the bonfire to-morrow.” Here Alice wound two or three turns of the worsted round the kitten’s neck, just to see how it would look: this led to a scramble, in which the ball rolled down upon the floor, and yards and yards of it got unwound again.

“Do you know, I was so angry, Kitty,” Alice went on, as soon as they were comfortably settled again, “when I saw all the mischief you had been doing, I was very nearly opening the window, and putting you out into the snow! And you’d have deserved it, you little mischievous darling! What have you got to say for yourself? Now don’t interrupt me!” she went on, holding up one finger. “I’m going to tell you all your faults. Number one: you squeaked twice while Dinah was washing your face this morning. Now you ca’n’t deny it, Kitty: I heard you! What’s that you say?” (pretending that the kitten was speaking). “Her paw went into your eye? Well, that’s *your* fault, for keeping your eyes open—if you’d shut them tight up, it wouldn’t have happened. Now don’t make any more excuses, but listen! Number two: you pulled Snowdrop away by the tail just as I had put down the saucer of milk before her! What, you were thirsty, were you? How do you know she wasn’t thirsty too? Now for number three:

you unwound every bit of the worsted while I wasn't looking!

"That's three faults, Kitty, and you've not been punished for any of them yet. You know I'm saving up all your punishments for Wednesday week—Suppose they had saved up all *my* punishments?" she went on, talking more to herself than the kitten. "What *would* they do at the end of a year? I should be sent to prison, I suppose, when the day came. Or—let me see—suppose each punishment was to be going without a dinner: then, when the miserable day came, I should have to go without fifty dinners at once! Well, I shouldn't mind *that* much! I'd far rather go without them than eat them!

"Do you hear the snow against the window-panes, Kitty? How nice and soft it sounds! Just as if some one was kissing the window all over outside. I wonder if the snow *loves* the trees and fields, that it kisses them so gently? And then it covers them up snug, you know, with a white quilt: and perhaps it says 'Go to sleep, darlings, till the summer comes again.' And when they wake up in the summer, Kitty, they dress themselves all in green, and dance about—whenever the wind blows—oh, that's very pretty!" cried Alice, dropping the ball of worsted to clap her hands. "And I do so *wish* it was true! I'm sure the woods look sleepy in the autumn, when the leaves are getting brown.

"Kitty, can you play chess? Now, don't smile, my dear, I'm asking it seriously. Because, when we were playing just now, you watched just as if you understood it: and when I said 'Check!' you purred! Well, it *was* a nice check, Kitty, and really I might have won, if it hadn't been for that nasty Knight, that came wiggling down among my pieces. Kitty, dear, let's pretend——" And here I wish I could tell you half the things Alice used to say, beginning with her favourite phrase "Let's pretend." She had had quite a long argument with her sister only the day before—all because Alice had begun with "Let's pretend we're kings and queens;" and her sister, who liked being very exact, had argued that they couldn't, because there were only two of them, and Alice had been reduced at last to say "Well, *you* can be one of them, then, and *I'll* be all the rest." And once she had really frightened her old nurse by shouting suddenly in her ear, "Nurse! Do let's pretend that I'm a hungry hyæna, and you're a bone."

But this is taking us away from Alice's speech to the kitten. "Let's pretend that you're the Red Queen, Kitty! Do you know, I think if you sat up and folded your arms, you'd look exactly like her. Now do try, there's a dear!" And Alice got the Red Queen off the table, and set it up before the kitten as a model for it to imitate: however, the thing didn't succeed, principally, Alice said, because the kitten wouldn't fold its arms properly. So, to punish it, she held it up to the Looking-glass, that it might see how sulky it was, "—and if you're not good directly," she added, "I'll put you through into Looking-glass House. How would you like *that*?"

"Now, if you'll only attend, Kitty, and not talk so much, I'll tell you all my ideas about Looking-glass House. First, there's the room you can see through the glass—that's just the same as our drawing room, only the things go the other way. I can see all of it when I get upon a chair—all but the bit behind the fireplace. Oh! I do so wish I could see *that* bit! I want so much to know whether they've a fire in the winter: you never *can* tell, you know, unless our fire smokes, and then smoke comes up in that room too—but that may be only pretence, just to make it look as if they had a fire. Well then, the books are something like our books, only the words go the wrong way: I know *that*, because I've held up one of our books to the glass, and then they hold up one in the other room.

“How would you like to live in Looking-glass House, Kitty? I wonder if they’d give you milk in there? Perhaps Looking-glass milk isn’t good to drink—but oh, Kitty! now we come to the passage. You can just see a little *peep* of the passage in Looking-glass House, if you leave the door of our drawing-room wide open: and it’s very like our passage as far as you can see, only you know it may be quite different on beyond. Oh, Kitty, how nice it would be if we could only get through into Looking-glass House! I’m sure it’s got, oh! such beautiful things in it! Let’s pretend there’s a way of getting through into it, somehow, Kitty. Let’s pretend the glass has got all soft like gauze, so that we can get through. Why, it’s turning into a sort of mist now, I declare! It’ll be easy enough to get through——” She was up on the chimney-piece while she said this, though she hardly knew how she had got there. And certainly the glass *was* beginning to melt away, just like a bright silvery mist.

In another moment Alice was through the glass, and had jumped lightly down into the Looking-glass room. The very first thing she did was to look whether there was a fire in the fireplace, and she was quite pleased to find that there was a real one, blazing away as brightly as the one she had left behind. “So I shall be as warm here as I was in the old room,” thought Alice: “warmer, in fact, because there’ll be no one here to scold me away from the fire. Oh, what fun it’ll be, when they see me through the glass in here, and ca’n’t get at me!”

Then she began looking about, and noticed that what could be seen from

the old room was quite common and uninteresting, but that all the rest was as different as possible. For instance, the pictures on the wall next the fire seemed to be all alive, and the very clock on the chimney-piece (you know you can only see the back of it in the Looking-glass) had got the face of a little old man, and grinned at her.

“They don’t keep this room so tidy as the other,” Alice thought to herself, as she noticed several of the chessmen down in the hearth among the cinders; but in another moment, with a little “Oh!” of surprise, she was down on her hands and knees watching them. The chessmen were walking about, two and two!

“Here are the Red King and the Red Queen,” Alice said (in a whisper, for fear of frightening them), “and there are the White King and the White Queen sitting on the edge of the shovel—and here are two castles walking arm in arm—I don’t think they can hear me,” she went on, as she put her head closer down, “and I’m nearly sure they ca’n’t see me. I feel somehow as if I were invisible——”

Here something began squeaking on the table behind Alice, and made her turn her head just in time to see one of the White Pawns roll over and begin kicking: she watched it with great curiosity to see what would happen next.

“It is the voice of my child!” the White Queen cried out, as she rushed past the King, so violently that she knocked him over among the cinders. “My precious Lily! My imperial kitten!” and she began scrambling wildly up the side of the fender.

“Imperial fiddlestick!” said the King, rubbing his nose, which had been hurt by the fall. He had a right to be a *little* annoyed with the Queen, for he was covered with ashes from head to foot.

Alice was very anxious to be of use, and, as the poor little Lily was nearly screaming herself into a fit, she hastily picked up the Queen and set her on the table by the side of her noisy little daughter.

The Queen gasped, and sat down: the rapid journey through the air had quite taken away her breath, and for a minute or two she could do nothing but hug the little Lily in silence. As soon as she had recovered her breath a little, she

called out to the White King, who was sitting sulkily among the ashes, "Mind the volcano!"

"What volcano?" said the King, looking up anxiously into the fire, as if he thought that was the most likely place to find one.

"Blew—me—up," panted the Queen, who was still a little out of breath. "Mind you come up—the regular way—don't get blown up!"

Alice watched the White King as he slowly struggled up from bar to bar, till at last she said "Why, you'll be hours and hours getting to the table, at that rate. I'd far better help you, hadn't I?" But the King took no notice of the question: it was quite clear that he could neither hear her nor see her.

So Alice picked him up very gently, and lifted him across more slowly than she had lifted the Queen, that she mightn't take his breath away; but, before she put him on the table, she thought she might as well dust him a little, he was so covered with ashes.

She said afterwards that she had never seen in all her life such a face as the King made, when he found himself held in the air by an invisible hand, and being dusted: he was far too much astonished to cry out, but his eyes and his mouth went on getting larger and larger, and rounder and rounder, till her hand shook so with laughing that she nearly let him drop upon the floor.

"Oh! *please* don't make such faces, my dear!" she cried out, quite forgetting that the King couldn't hear her. "You make me laugh so that I can hardly hold you! And don't keep your mouth so wide open! All the ashes will get into it—there, now I think you're tidy enough!" she added, as she smoothed his hair, and set him upon the table near the Queen.

The King immediately fell flat on his back, and lay perfectly still; and Alice was a little alarmed at what she had done, and went round the room to see if she could find any water to throw over him. However, she could find nothing but a bottle of ink, and when she got back with it she found he had recovered,

and he and the Queen were talking together in a frightened whisper—so low, that Alice could hardly hear what they said.

The King was saying “I assure you, my dear, I turned cold to the very ends of my whiskers!”

To which the Queen replied “You haven’t got any whiskers.”

“The horror of that moment,” the King went on, “I shall never, *never* forget!”

“You will, though,” the Queen said, “if you don’t make a memorandum of it.”

Alice looked on with great interest as the King took an enormous memorandum-book out of his pocket, and began writing. A sudden thought struck her, and she took hold of the end of the pencil, which came some way over his shoulder, and began writing for him.

The poor King looked puzzled and unhappy, and struggled with the pencil for some time without saying anything; but Alice was too strong for him, and at last he panted out “My dear! I really *must* get a thinner pencil. I ca’n’t manage this one a bit: it writes all manner of things that I don’t intend——”

“What manner of things?” said the Queen, looking over the book (in which Alice had put ‘*The White Knight is sliding down the poker. He balances very badly*’). “That’s not a memorandum of *your* feelings!”

There was a book lying near Alice on the table, and while she sat watching the White King (for she was still a little anxious about him, and had the ink all ready to throw over him, in case he fainted again), she turned over the leaves, to find some part that she could read, “—for it’s all in some language I don’t know,” she said to herself.

It was like this.

JABBERWOCKY.

'Twas brillig, and the slithy toves
Did gyre and gimble in the wabe:
All mimsy were the borogoves,
And the mome raths outgrabe.

She puzzled over this for some time, but at last a bright thought struck her. “Why, it’s a Looking-glass book, of course! And if I hold it up to a glass, the words will all go the right way again.”

This was the poem that Alice read.

JABBERWOCKY.

*'Twas brillig, and the slithy toves
Did gyre and gimble in the wabe:
All mimsy were the borogoves,
And the mome raths outgrabe.*

*“Beware the Jabberwock, my son!
The jaws that bite, the claws that catch!
Beware the Jubjub bird, and shun
The frumious Bandersnatch!”*

*He took his vorpal sword in hand:
Long time the manxome foe he sought—
So rested he by the Tumtum tree,
And stood awhile in thought.*

*And, as in uffish thought he stood,
The Jabberwock, with eyes of flame,
Came whiffling through the tulgey wood,
And burred as it came!*

*One, two! One, two! And through and through
The vorpal blade went snicker-snack!
He left it dead, and with its head
He went galumphing back.*

*“And hast thou slain the Jabberwock?
Come to my arms, my beamish boy!
O frabjous day! Callooh! Callay!”
He chortled in his joy.*

*'Twas brillig, and the slithy toves
Did gyre and gimble in the wabe:
All mimsy were the borogoves,
And the mome raths outgrabe.*

“It seems very pretty,” she said when she had finished it, “but it’s *rather* hard to understand!” (You see she didn’t like to confess, even to herself, that she couldn’t make it out at all.) “Somehow it seems to fill my head with ideas—only I don’t exactly know what they are! However, *somebody* killed *something*: that’s clear, at any rate——”

“But oh!” thought Alice, suddenly jumping up, “if I don’t make haste, I shall have to go back through the Looking-glass, before I’ve seen what the rest of the house is like! Let’s have a look at the garden first!” She was out of the room in a moment, and ran down stairs—or, at least, it wasn’t exactly running, but a new invention of hers for getting down stairs quickly and easily, as Alice said to herself. She just kept the tips of her fingers on the hand-rail, and floated gently down without even touching the stairs with her feet: then she floated on through the hall, and would have gone straight out at the door in the same way, if she hadn’t caught hold of the door-post. She was getting a little giddy with so much floating in the air, and was rather glad to find herself walking again in the natural way.

Chapter II. The Garden of Live Flowers

“I should see the garden far better,” said Alice to herself, “if I could get to the top of that hill: and here’s a path that leads straight to it—at least, no, it doesn’t do *that*——” (after going a few yards along the path, and turning several sharp corners), “but I suppose it will at last. But how curiously it twists! It’s more like a corkscrew than a path! Well, *this* turn goes to the hill, I suppose—no, it doesn’t! This goes straight back to the house! Well then, I’ll try it the other way.”

And so she did: wandering up and down, and trying turn after turn, but always coming back to the house, do what she would. Indeed, once, when she turned a corner rather more quickly than usual, she ran against it before she could stop herself.

“It’s no use talking about it,” Alice said, looking up at the house and pretending it was arguing with her. “I’m *not* going in again yet. I know I should have to get through the Looking-glass again—back into the old room—and there’d be an end of all my adventures!”

So, resolutely turning her back upon the house, she set out once more down the path, determined to keep straight on till she got to the hill. For a few minutes all went on well, and she was just saying “I really *shall* do it this time——” when the path gave a sudden twist and shook itself (as she described it afterwards), and the next moment she found herself actually walking in at the door.

“Oh, it’s too bad!” she cried. “I never saw such a house for getting in the way! Never!”

However, there was the hill full in sight, so there was nothing to be done but start again. This time she came upon a large flower-bed, with a border of daisies, and a willow-tree growing in the middle.

“O Tiger-lily!” said Alice, addressing herself to one that was waving gracefully about in the wind, “I *wish* you could talk!”

“We *can* talk,” said the Tiger-lily, “when there’s anybody worth talking to.”

Alice was so astonished that she couldn’t speak for a minute: it quite seemed to take her breath away. At length, as the Tiger-lily only went on waving about, she spoke again, in a timid voice—almost in a whisper. “And can *all* the flowers talk?”

“As well as *you* can,” said the Tiger-lily. “And a great deal louder.”

“It isn’t manners for us to begin, you know,” said the Rose, “and I really was wondering when you’d speak! Said I to myself, ‘Her face has got *some* sense in

it, though it's not a clever one! Still, you're the right colour, and that goes a long way."

"I don't care about the colour," the Tiger-lily remarked. "If only her petals curled up a little more, she'd be all right."

Alice didn't like being criticized, so she began asking questions. "Aren't you sometimes frightened at being planted out here, with nobody to take care of you?"

"There's the tree in the middle," said the Rose. "What else is it good for?"

"But what could it do, if any danger came?" Alice asked.

"It could bark," said the Rose.

"It says 'Bough-wough!'" cried a Daisy. "That's why its branches are called boughs!"

"Didn't you know *that?*" cried another Daisy. And here they all began shouting together, till the air seemed quite full of little shrill voices. "Silence, every one of you!" cried the Tiger-lily, waving itself passionately from side to side, and trembling with excitement. "They know I ca'n't get at them!" it panted, bending its quivering head towards Alice, "or they wouldn't dare to do it!"

"Never mind!" Alice said in a soothing tone, and, stooping down to the daisies, who were just beginning again, she whispered "If you don't hold your tongues, I'll pick you!"

There was silence in a moment, and several of the pink daisies turned white.

"That's right!" said the Tiger-lily. "The daisies are worst of all. When one speaks, they all begin together, and it's enough to make one wither to hear the way they go on!"

"How is it you can all talk so nicely?" Alice said, hoping to get it into a better temper by a compliment. "I've been in many gardens before, but none of the flowers could talk."

"Put your hand down, and feel the ground," said the Tiger-lily. "Then you'll know why."

Alice did so. "It's very hard," she said; "but I don't see what that has to do with it."

"In most gardens," the Tiger-lily said, "they make the beds too soft—so that the flowers are always asleep."

This sounded a very good reason, and Alice was quite pleased to know it. "I never thought of that before!" she said.

"It's *my* opinion that you never think *at all*," the Rose said, in a rather severe tone.

"I never saw anybody that looked stupider," a Violet said, so suddenly, that Alice quite jumped; for it hadn't spoken before.

"Hold *your* tongue!" cried the Tiger-lily. "As if *you* ever saw anybody! You keep your head under the leaves, and snore away there, till you know no more what's going on in the world, than if you were a bud!"

"Are there any more people in the garden besides me?" Alice said, not choosing to notice the Rose's last remark.

"There's one other flower in the garden that can move about like you," said the Rose. "I wonder how you do it—" ("You're always wondering," said the Tiger-lily), "but she's more bushy than you are."

"Is she like me?" Alice asked eagerly, for the thought crossed her mind, "There's another little girl in the garden, somewhere!"

“Well, she has the same awkward shape as you,” the Rose said: “but she’s redder—and her petals are shorter, I think.”

“They’re¹ done up close, almost like a dahlia,” said the Tiger-lily²: “not tumbled about³, like yours.”

“But that’s not *your* fault,” the Rose added kindly. “You’re beginning to fade, you know—and then one ca’n’t help one’s petals getting a little untidy.”

Alice didn’t like this idea at all: so, to change the subject, she asked “Does she ever come out here?”

“I daresay you’ll see her soon,” said the Rose. “She’s one of the kind that has nine spikes, you know.”⁴

“Where does she wear them⁵?” Alice asked with some curiosity.

“Why, all round her head, of course,” the Rose replied. “I was wondering *you* hadn’t got some too. I thought it was the regular rule.”

“She’s coming!” cried the Larkspur. “I hear her footstep, thump, thump, along the gravel-walk!”

Alice looked round eagerly and found that it was the Red Queen. “She’s grown a good deal!” was her first remark. She had indeed: when Alice first found her in the ashes, she had been only three inches high—and here she was, half a head taller than Alice herself!

“It’s the fresh air that does it,” said the Rose: “wonderfully fine air it is, out here.”

“I think I’ll go and meet her,” said Alice, for, though the flowers were interesting enough, she felt that it would be far grander to have a talk with a real Queen.

“You ca’n’t possibly do that,” said the Rose: “*I* should advise you to walk the other way.”

This sounded nonsense to Alice, so she said nothing, but set off at once towards the Red Queen. To her surprise, she lost sight of her in a moment, and found herself walking in at the front-door again.

A little provoked, she drew back, and after looking everywhere for the Queen (whom she spied out at last, a long way off), she thought she would try the plan, this time, of walking in the opposite direction.

It succeeded beautifully. She had not been walking a minute before she found herself face to face with the Red Queen, and full in sight of the hill she had been so long aiming at.

“Where do you come from?” said the Red Queen. “And where are you going? Look up, speak nicely, and don’t twiddle your fingers all the time.”

Alice attended to all these directions, and explained, as well as she could, that she had lost her way.

“I don’t know what you mean by *your* way,” said the Queen: “all the ways about here belong to *me*—but why did you come out here at all?” she added in a kinder tone. “Curtsey while you’re thinking what to say. It saves time.”

Alice wondered a little at this, but she was too much in awe of the Queen to disbelieve it. “I’ll try it when I go home,” she thought to herself, “the next time I’m a little late for dinner.”

¹Her petals are

²the Tiger-lily interrupted

³about anyhow

⁴“She’s one of the thorny kind.”

⁵the thorns

"It's time for you to answer now," the Queen said, looking at her watch: "open your mouth a *little* wider when you speak, and always say 'your Majesty.'"

"I only wanted to see what the garden was like, your Majesty——"

"That's right," said the Queen, patting her on the head, which Alice didn't like at all: "though, when you say 'garden'—*I've* seen gardens, compared with which this would be a wilderness."

Alice didn't dare to argue the point, but went on: "—and I thought I'd try and find my way to the top of that hill——"

"When you say 'hill,'" the Queen interrupted, "*I* could show you hills, in comparison with which you'd call that a valley."

"No, I shouldn't," said Alice, surprised into contradicting her at last: "a hill *ca'n't* be a valley, you know. That would be nonsense——"

The Red Queen shook her head. "You may call it 'nonsense' if you like," she said, "but *I've* heard nonsense, compared with which that would be as sensible as a dictionary!"

Alice curtsied again, as she was afraid from the Queen's tone that she was a *little* offended: and they walked on in silence till they got to the top of the little hill.

For some minutes Alice stood without speaking, looking out in all directions over the country—and a most curious country it was. There were a number of tiny little brooks running straight across it from side to side, and the ground between was divided up into squares by a number of little green hedges, that reached from brook to brook.

"I declare it's marked out just like a large chess-board!" Alice said at last. "There ought to be some men moving about somewhere—and so there are!" she added in a tone of delight, and her heart began to beat quick with excitement as she went on. "It's a great huge game of chess that's being played—all over the world—if this *is* the world at all, you know. Oh, what fun it is! How I *wish* I was one of them! I wouldn't mind being a Pawn, if only I might join—though of course I should *like* to be a Queen, best."

She glanced rather shyly at the real Queen as she said this, but her companion only smiled pleasantly, and said "That's easily managed. You can be the White Queen's Pawn, if you like, as Lily's too young to play; and you're in the

Second Square to begin with: when you get to the Eighth Square you'll be a Queen——” Just at this moment, somehow or other, they began to run.

Alice never could quite make out, in thinking it over afterwards, how it was that they began: all she remembers is, that they were running hand in hand, and the Queen went so fast that it was all she could do to keep up with her: and still the Queen kept crying “Faster! Faster!”, but Alice felt she *could not* go faster, though she had no breath left to say so.

The most curious part of the thing was, that the trees and the other things round them never changed their places at all: however fast they went, they never seemed to pass anything. “I wonder if all the things move along with us?” thought poor puzzled Alice. And the Queen seemed to guess her thoughts, for she cried “Faster! Don't try to talk!”

Not that Alice had any idea of doing *that*. She felt as if she would never be able to talk again, she was getting so much out of breath: and still the Queen cried “Faster! Faster!”, and dragged her along. “Are we nearly there?” Alice managed to pant out at last.

“Nearly there!” the Queen repeated. “Why, we passed it ten minutes ago! Faster!” And they ran on for a time in silence, with the wind whistling in Alice's ears, and almost blowing her hair off her head, she fancied.

“Now! Now!” cried the Queen. “Faster! Faster!” And they went so fast that at last they seemed to skim through the air, hardly touching the ground with their feet, till suddenly, just as Alice was getting quite exhausted, they stopped, and she found herself sitting on the ground, breathless and giddy.

The Queen propped her up against a tree, and said kindly, “You may rest a little, now.”

Alice looked round her in great surprise. “Why, I do believe we've been under this tree the whole time! Everything's just as it was!”

“Of course it is,” said the Queen. “What would you have it?”

“Well, in *our* country,” said Alice, still panting a little, “you'd generally get to somewhere else—if you ran very fast for a long time, as we've been doing.”

“A slow sort of country!” said the Queen. “Now, *here*, you see, it takes all the running *you* can do, to keep in the same place. If you want to get somewhere else, you must run at least twice as fast as that!”

“I'd rather not try, please!” said Alice. “I'm quite content to stay here—only

I *am* so hot and thirsty!"

"I know what *you'd* like!" the Queen said good-naturedly, taking a little box out of her pocket. "Have a biscuit?"

Alice thought it would not be civil to say "No," though it wasn't at all what she wanted. So she took it, and ate it as well as she could: and it was *very* dry: and she thought she had never been so nearly choked in all her life.

"While you're refreshing yourself," said the Queen, "I'll just take the measurements." And she took a ribbon out of her pocket, marked in inches, and began measuring the ground, and sticking little pegs in here and there.

"At the end of two yards," she said, putting in a peg to mark the distance, "I shall give you your directions—have another biscuit?"

"No, thank you," said Alice: "one's *quite* enough!"

"Thirst quenched, I hope?" said the Queen.

Alice did not know what to say to this, but luckily the Queen did not wait for an answer, but went on. "At the end of *three* yards I shall repeat them—for fear of your forgetting them. At the end of *four*, I shall say good-bye. And at the end of *five*, I shall go!"

She had got all the pegs put in by this time, and Alice looked on with great interest as she returned to the tree, and then began slowly walking down the row.

At the two-yard peg she faced round, and said "A pawn goes two squares in its first move, you know. So you'll go *very* quickly through the Third Square—by railway, I should think—and you'll find yourself in the Fourth Square in no time. Well, *that* square belongs to Tweedledum and Tweedledee—the Fifth is mostly water—the Sixth belongs to Humpty Dumpty—But you make no remark?"

"I—I didn't know I had to make one—just then," Alice faltered out.

"You *should* have said," the Queen went on in a tone of grave reproof. "It's extremely kind of you to tell me all this'—however, we'll suppose it said—the Seventh Square is all forest—however, one of the Knights will show you the way—and in the Eighth Square we shall be Queens together, and it's all feasting and fun!" Alice got up and curtsayed, and sat down again.

At the next peg the Queen turned again, and this time she said "Speak in French when you ca'n't think of the English for a thing—turn out your toes as you walk—and remember who you are!" She did not wait for Alice to curtsy, this time, but walked on quickly to the next peg, where she turned for a moment to say "Good-bye," and then hurried on to the last.

How it happened, Alice never knew, but exactly as she came to the last peg, she was gone. Whether she vanished into the air, or whether she ran quickly into the wood ("and she *can* run very fast!" thought Alice), there was no way of guessing, but she was gone, and Alice began to remember that she was a Pawn, and that it would soon be time for her to move.

Chapter III. Looking-Glass Insects

Of course the first thing to do was to make a grand survey of the country she was going to travel through. "It's something very like learning geography," thought Alice, as she stood on tiptoe in hopes of being able to see a little further. "Principal rivers—there *are* none. Principal mountains—I'm on the only one, but I don't think it's got any name. Principal towns—why, what *are* those creatures, making honey down there? They ca'n't be bees—nobody ever saw

bees a mile off, you know——” and for some time she stood silent, watching one of them that was bustling about among the flowers, poking its proboscis into them, “just as if it was a regular bee,” thought Alice.

However, this was anything but a regular bee: in fact it was an elephant—as Alice soon found out, though the idea quite took her breath away at first. “And what enormous flowers they must be!” was her next idea. “Something like cottages with the roofs taken off, and stalks put to them—and what quantities of honey they must make! I think I’ll go down and—no, I wo’n’t go *just* yet,” she went on, checking herself just as she was beginning to run down the hill, and trying to find some excuse for turning shy so suddenly. “It’ll never do to go down among them without a good long branch to brush them away—and what fun it’ll be when they ask me how I liked my walk. I shall say ‘Oh, I liked it well enough——’ (here came the favourite little toss of the head), ‘only it *was* so dusty and hot, and the elephants *did* tease so!’

“I think I’ll go down the other way,” she said after a pause; “and perhaps I may visit the elephants later on. Besides, I *do* so want to get into the Third Square!”

So, with this excuse, she ran down the hill, and jumped over the first of the six little brooks.

* * * *
 * * *
* * * *

“Tickets, please!” said the Guard, putting his head in at the window. In a moment everybody was holding out a ticket: they were about the same size as the people, and quite seemed to fill the carriage.

“Now then! Show your ticket, child!” the Guard went on, looking angrily at Alice. And a great many voices all said together (“like the chorus of a song,” thought Alice) “Don’t keep him waiting, child! Why, his time is worth a thousand pounds a minute!”

“I’m afraid I haven’t got one,” Alice said in a frightened tone: “there wasn’t a ticket-office where I came from.” And again the chorus of voices went on. “There wasn’t room for one where she came from. The land there is worth a thousand pounds an inch!”

“Don’t make excuses,” said the Guard: “you should have bought one from the engine-driver.” And once more the chorus of voices went on with “The man that drives the engine. Why, the smoke alone is worth a thousand pounds a puff!”

Alice thought to herself “Then there’s no use in speaking.” The voices didn’t join in, *this* time, as she hadn’t spoken, but, to her great surprise, they all *thought* in chorus (I hope you understand what *thinking in chorus* means—for I must confess that *I* don’t), “Better say nothing at all. Language is worth a thousand pounds a word!”

“I shall dream about a thousand pounds to-night, I know I shall!” thought Alice.

All this time the Guard was looking at her, first through a telescope, then through a microscope, and then through an opera-glass. At last he said “You’re travelling the wrong way,” and shut up the window, and went away.

“So young a child,” said the gentleman sitting opposite to her, (he was dressed in white paper,) “ought to know which way she’s going, even if she doesn’t know her own name!”

A Goat, that was sitting next to the gentleman in white, shut his eyes and said in a loud voice, “She ought to know her way to the ticket-office, even if she doesn’t know her alphabet!”

There was a Beetle sitting next to the Goat (it was a very queer carriage-full of passengers altogether), and, as the rule seemed to be that they should all speak in turn, *he* went on with “She’ll have to go back from here as luggage!”

Alice couldn’t see who was sitting beyond the Beetle, but a hoarse voice spoke next. “Change engines——” it said, and there it choked and was obliged to leave off.

“It sounds like a horse,” Alice thought to herself. And an extremely small voice, close to her ear, said “You might make a joke on that—something about ‘horse’ and ‘hoarse,’ you know.”

Then a very gentle voice in the distance said, “She must be labelled ‘Lass, with care,’ you know——”

And after that other voices went on (“What a number of people there are in the carriage!” thought Alice), saying “She must go by post, as she’s got a head on her——” “She must be sent as a message by the telegraph——” “She must draw the train herself the rest of the way——,” and so on.

But the gentleman dressed in white paper leaned forwards and whispered in her ear, “Never mind what they all say, my dear, but take a return-ticket every time the train stops.”

“Indeed I sha’n’t!” Alice said rather impatiently. “I don’t belong to this railway journey at all—I was in a wood just now—and I wish I could get back there!”

“You might make a joke on *that*,” said the little voice close to her ear: “something about ‘you *would* if you could,’ you know.”

“Don’t tease so,” said Alice, looking about in vain to see where the voice

came from. “If you’re so anxious to have a joke made, why don’t you make one yourself?”

The little voice sighed deeply. It was *very* unhappy, evidently, and Alice would have said something pitying to comfort it, “if it would only sigh like other people!” she thought. But this was such a wonderfully small sigh, that she wouldn’t have heard it at all, if it hadn’t come *quite* close to her ear. The consequence of this was that it tickled her ear very much, and quite took off her thoughts from the unhappiness of the poor little creature.

“I know you are a friend,” the little voice went on: “a dear friend, and an old friend. And you wo’n’t hurt me, though I *am* an insect.”

“What kind of insect?” Alice inquired, a little anxiously. What she really wanted to know was, whether it could sting or not, but she thought this wouldn’t be quite a civil question to ask.

“What, then you don’t——” the little voice began, when it was drowned by a shrill scream from the engine, and everybody jumped up in alarm, Alice among the rest.

The Horse, who had put his head out of the window, quietly drew it in and said “It’s only a brook we have to jump over.” Everybody seemed satisfied with this, though Alice felt a little nervous at the idea of trains jumping at all. “However, it’ll take us into the Fourth Square, that’s some comfort!” she said to herself. In another moment she felt the carriage rise straight up into the air, and in her fright she caught at the thing nearest to her hand, which happened to be the Goat’s beard.

* * * *
 * * *
* * * *

But the beard seemed to melt away as she touched it, and she found herself sitting quietly under a tree—while the Gnat (for that was the insect she had been talking to) was balancing itself on a twig just over her head, and fanning her with its wings.

It certainly was a *very* large Gnat: “about the size of a chicken,” Alice thought. Still, she couldn’t feel nervous with it, after they had been talking together so long.

“—then you don’t like *all* insects?” the Gnat went on, as quietly as if nothing had happened.

“I like them when they can talk,” Alice said. “None of them ever talk, where *I* come from.”

“What sort of insects do you rejoice in, where *you* come from?” the Gnat inquired.

“I don’t *rejoice* in insects at all,” Alice explained, “because I’m rather afraid of them—at least the large kinds. But I can tell you the names of some of them.”

“Of course they answer to their names?” the Gnat remarked carelessly.

“I never knew them do it.”

“What’s the use of their having names,” the Gnat said, “if they wo’n’t answer to them?”

“No use to *them*,” said Alice; “but it’s useful to the people that name them, I suppose. If not, why do things have names at all?”

"I ca'n't say," the Gnat replied. "Further on, in the wood down there, they've got no names—however, go on with your list of insects: you're wasting time."

"Well, there's the Horse-fly," Alice began, counting off the names on her fingers.

"All right," said the Gnat. "Half way up that bush, you'll see a Rocking-horse-fly, if you look. It's made entirely of wood, and gets about by swinging itself from branch to branch."

"What does it live on?" Alice asked, with great curiosity. "Sap and sawdust," said the Gnat. "Go on with the list."

Alice looked up at the Rocking-horse-fly with great interest, and made up her mind that it must have been just repainted, it looked so bright and sticky; and then she went on.

"And there's the Dragon-fly."

"Look on the branch above your head," said the Gnat, "and there you'll find a Snap-dragon-fly. Its body is made of plum-pudding, its wings of holly-leaves, and its head is a raisin burning in brandy."

"And what does it live on?" Alice asked, as before.

“Frumenty and mince-pie,” the Gnat replied; “and it makes its nest in a Christmas-box.”

“And then there’s the Butterfly,” Alice went on, after she had taken a good look at the insect with its head on fire, and had thought to herself, “I wonder if that’s the reason insects are so fond of flying into candles—because they want to turn into Snap-dragon-flies!”

“Crawling at your feet,” said the Gnat (Alice drew her feet back in some alarm), “you may observe a Bread-and-butter-fly. Its wings are thin slices of bread-and-butter, its body is a crust, and its head is a lump of sugar.”

“And what does *it* live on?”

“Weak tea with cream in it.”

A new difficulty came into Alice’s head. “Supposing it couldn’t find any?” she suggested.

“Then it would die, of course.”

“But that must happen very often,” Alice remarked thoughtfully.

“It always happens,” said the Gnat.

After this, Alice was silent for a minute or two, pondering. The Gnat amused itself meanwhile by humming round and round her head: at last it settled again and remarked “I suppose you don’t want to lose your name?”

“No, indeed,” Alice said, a little anxiously.

“And yet I don’t know,” the Gnat went on in a careless tone: “only think how convenient it would be if you could manage to go home without it! For instance, if the governess wanted to call you to your lessons, she would call out ‘Come here——,’ and there she would have to leave off, because there wouldn’t be any name for her to call, and of course you wouldn’t have to go, you know.”

“That would never do, I’m sure,” said Alice: “the governess would never think of excusing me lessons for that. If she couldn’t remember my name, she’d call me ‘Miss,’ as the servants do.”

“Well, if she said ‘Miss,’ and didn’t say anything more,” the Gnat remarked, “of course you’d miss your lessons. That’s a joke. I wish *you* had made it.”

“Why do you wish *I* had made it?” Alice asked. “It’s a very bad one.”

But the Gnat only sighed deeply, while two large tears came rolling down its cheeks.

“You shouldn’t make jokes,” Alice said, “if it makes you so unhappy.”

Then came another of those melancholy little sighs, and this time the poor Gnat really seemed to have sighed itself away, for, when Alice looked up, there was nothing whatever to be seen on the twig, and, as she was getting quite chilly with sitting still so long, she got up and walked on.

She very soon came to an open field, with a wood on the other side of it: it looked much darker than the last wood, and Alice felt a *little* timid about going into it. However, on second thoughts, she made up her mind to go on: “for I certainly wo’n’t go *back*,” she thought to herself, and this was the only way to the Eighth Square.

“This must be the wood,” she said thoughtfully to herself, “where things have no names. I wonder what’ll become of *my* name when I go in? I shouldn’t like to lose it at all—because they’d have to give me another, and it would be almost certain to be an ugly one. But then the fun would be trying to find the creature that had got my old name! That’s just like the advertisements, you know, when people lose dogs—‘*answers to the name of "Dash": had on a brass collar*’—just fancy calling everything you met ‘Alice,’ till one of them answered! Only they wouldn’t answer at all, if they were wise.”

She was rambling on in this way when she reached the wood: it looked very cool and shady. “Well, at any rate it’s a great comfort,” she said as she stepped under the trees, “after being so hot, to get into the—into the—into *what?*” she went on, rather surprised at not being able to think of the word. “I mean to get under the—under the—under *this*, you know!” putting her hand on the trunk of the tree. “What *does* it call itself, I wonder? I do believe it’s got no name—why, to be sure it hasn’t!”

She stood silent for a minute, thinking: then she suddenly began again. “Then it really *has* happened, after all! And now, who am I? I *will* remember, if I can! I’m determined to do it!” But being determined didn’t help her much, and all she could say, after a great deal of puzzling, was, “L, I *know* it begins with L!”

Just then a Fawn came wandering by: it looked at Alice with its large gentle eyes, but didn’t seem at all frightened. “Here then! Here then!” Alice said, as she held out her hand and tried to stroke it; but it only started back a little, and then stood looking at her again.

“What do you call yourself?” the Fawn said at last. Such a soft sweet voice it had!

“I wish I knew!” thought poor Alice. She answered, rather sadly, “Nothing, just now.”

“Think again,” it said: “that wo’n’t do.”

Alice thought, but nothing came of it. “Please, would you tell me what *you* call yourself?” she said timidly. “I think that might help a little.”

“I’ll tell you, if you’ll move a little further on,” the Fawn said. “I ca’n’t remember *here*.”

So they walked on together though the wood, Alice with her arms clasped lovingly round the soft neck of the Fawn, till they came out into another open field, and here the Fawn gave a sudden bound into the air, and shook itself free from Alice’s arms. “I’m a Fawn!” it cried out in a voice of delight. “And, dear me! you’re a human child!” A sudden look of alarm came into its beautiful brown eyes, and in another moment it had darted away at full speed.

Alice stood looking after it, almost ready to cry with vexation at having lost her dear little fellow-traveller so suddenly. "However, I know my name now," she said: "that's *some* comfort. Alice—Alice—I wo'n't forget it again. And now, which of these finger-posts ought I to follow, I wonder?"

It was not a very difficult question to answer, as there was only one road through the wood, and the two finger-posts both pointed along it. "I'll settle it," Alice said to herself, "when the road divides and they point different ways."

But this did not seem likely to happen. She went on and on, a long way, but, wherever the road divided, there were sure to be two finger-posts pointing the same way, one marked 'TO TWEEDLEDUM'S HOUSE,' and the other 'TO THE HOUSE OF TWEEDLEDEE.'

"I do believe," said Alice at last, "that they live in the *same* house! I wonder I never thought of that before—But I ca'n't stay there long. I'll just call and say 'How d'ye do?' and ask them the way out of the wood. If I could only get to the Eighth Square before it gets dark!" So she wandered on, talking to herself as she went, till, on turning a sharp corner, she came upon two fat little men, so suddenly that she could not help starting back, but in another moment she recovered herself, feeling sure that they must be.

Chapter IV. Tweedledum and Tweedledee

They were standing under a tree, each with an arm round the other's neck, and Alice knew which was which in a moment, because one of them had 'DUM' embroidered on his collar, and the other 'DEE.' "I suppose they've each got 'TWEEDLE' round at the back of the collar," she said to herself.

They stood so still that she quite forgot they were alive, and she was just looking round to see if the word 'TWEEDLE' was written at the back of each collar, when she was startled by a voice coming from the one marked 'DUM.'

"If you think we're wax-works," he said, "you ought to pay, you know. Wax-works weren't made to be looked at for nothing. Nohow!"

“Contrariwise,” added the one marked ‘DEE,’ “if you think we’re alive, you ought to speak.”

“I’m sure I’m very sorry,” was all Alice could say; for the words of the old song kept ringing through her head like the ticking of a clock, and she could hardly help saying them out loud:—

*“Tweedledum and Tweedledee
Agreed to have a battle;
For Tweedledum said Tweedledee
Had spoiled his nice new rattle.*

*Just then flew down a monstrous crow,
As black as a tar-barrel;
Which frightened both the heroes so,
They quite forgot their quarrel.”*

Quoted from nursery
rhyme

“I know what you’re thinking about,” said Tweedledum; “but it isn’t so, nohow.”

“Contrariwise,” continued Tweedledee, “if it was so, it might be; and if it were so, it would be; but as it isn’t, it ain’t. That’s logic.”

“I was thinking,” Alice said very politely, “which is the best way out of this wood: it’s getting so dark. Would you tell me, please?”

But the little men only looked at each other and grinned.

They looked so exactly like a couple of great schoolboys, that Alice couldn’t help pointing her finger at Tweedledum, and saying “First Boy!”

“Nohow!” Tweedledum cried out briskly, and shut his mouth up again with a snap.

“Next Boy!” said Alice, passing on to Tweedledee, though she felt quite certain he would only shout out “Contrariwise!” and so he did.

“You’ve been wrong!” cried Tweedledum. “The first thing in a visit is to say ‘How d’ye do?’ and shake hands!” And here the two brothers gave each other a hug, and then they held out the two hands that were free, to shake hands with her.

Alice did not like shaking hands with either of them first, for fear of hurting the other one’s feelings; so, as the best way out of the difficulty, she took hold of both hands at once: the next moment they were dancing round in a ring. This seemed quite natural (she remembered afterwards), and she was not even surprised to hear music playing: it seemed to come from the tree under which they were dancing, and it was done (as well as she could make it out) by the branches rubbing one across the other, like fiddles and fiddle-sticks.

“But it certainly *was* funny,” (Alice said afterwards, when she was telling her sister the history of all this,) “to find myself singing ‘*Here we go round the mulberry bush.*’ I don’t know when I began it, but somehow I felt as if I’d been singing it a long long time!”

The other two dancers were fat, and very soon out of breath. “Four times round is enough for one dance,” Tweedledum panted out, and they left off dancing as suddenly as they had begun: the music stopped at the same moment.

Then they let go of Alice’s hands, and stood looking at her for a minute: there was a rather awkward pause, as Alice didn’t know how to begin a conversation with people she had just been dancing with. “It would never do to say

'How d'ye do?' *now*," she said to herself: "we seem to have got beyond that, somehow!"

"I hope you're not much tired?" she said at last.

"Nohow. And thank you *very* much for asking," said Tweedledum.

"So *much* obliged!" added Tweedledee. "You like poetry?"

"Ye-es, pretty well—*some* poetry," Alice said doubtfully. "Would you tell me which road leads out of the wood?"

"What shall I repeat to her?" said Tweedledee, looking round at Tweedledum with great solemn eyes, and not noticing Alice's question.

"'The Walrus and the Carpenter' is the longest," Tweedledum replied, giving his brother an affectionate hug.

Tweedledee began instantly:

The sun was shining——"

Here Alice ventured to interrupt him. "If it's *very* long," she said, as politely as she could, "would you please tell me first which road——"

Tweedledee smiled gently, and began again:

*"The sun was shining on the sea,
Shining with all his might:
He did his very best to make
The billows smooth and bright—
And this was odd, because it was
The middle of the night.*

*The moon was shining sulkily,
Because she thought the sun
Had got no business to be there
After the day was done—
'It's very rude of him,' she said,
'To come and spoil the fun!'*

*The sea was wet as wet could be,
The sands were dry as dry.
You could not see a cloud, because
No cloud was in the sky:
No birds were flying overhead—
There were no birds to fly.*

*The Walrus and the Carpenter
Were walking close at hand;
They wept like anything to see
Such quantities of sand:
'If this were only cleared away,'
They said, 'it would be grand!'*

*'If seven maids with seven mops
Swept it for half a year,
Do you suppose,' the Walrus said,
'That they could get it clear?'
'I doubt it,' said the Carpenter,
And shed a bitter tear.*

'O Oysters, come and walk with us!'

The Walrus did beseech.

'A pleasant walk, a pleasant talk,

Along the briny beach:

We cannot do with more than four,

To give a hand to each.'

The eldest Oyster looked at him.

But never a word he said:

The eldest Oyster winked his eye,

And shook his heavy head—

Meaning to say he did not choose

To leave the oyster-bed.

But four young oysters hurried up,

All eager for the treat:

Their coats were brushed, their faces washed,

Their shoes were clean and neat—

And this was odd, because, you know,

They hadn't any feet.

Four other Oysters followed them,

And yet another four;

And thick and fast they came at last,

And more, and more, and more—

All hopping through the frothy waves,

And scrambling to the shore.

The Walrus and the Carpenter

Walked on a mile or so,

And then they rested on a rock

Conveniently low:

And all the little Oysters stood

And waited in a row.

'The time has come,' the Walrus said,

'To talk of many things:

Of shoes—and ships—and sealing-wax—

*Of cabbages—and kings—
And why the sea is boiling hot—
And whether pigs have wings.'*

*'But wait a bit,' the Oysters cried,
'Before we have our chat;
For some of us are out of breath,
And all of us are fat!'
'No hurry!' said the Carpenter.
They thanked him much for that.
'A loaf of bread,' the Walrus said,
'Is what we chiefly need:
Pepper and vinegar besides
Are very good indeed—
Now if you're ready Oysters dear,
We can begin to feed.'
'But not on us!' the Oysters cried,
Turning a little blue.
'After such kindness, that would be
A dismal thing to do!'
'The night is fine,' the Walrus said.
'Do you admire the view?'
'It was so kind of you to come!
And you are very nice!'
The Carpenter said nothing but
'Cut us another slice.
I wish you were not quite so deaf—
I've had to ask you twice!'
'It seems a shame,' the Walrus said,
'To play them such a trick.
After we've brought them out so far,
And made them trot so quick!'
The Carpenter said nothing but
'The butter's spread too thick!'*

*'I weep for you,' the Walrus said:
'I deeply sympathize.'
With sobs and tears he sorted out
Those of the largest size,
Holding his pocket-handkerchief
Before his streaming eyes.
'O Oysters,' said the Carpenter,
'You've had a pleasant run!
Shall we be trotting home again?'
But answer came there none—
And that was scarcely odd, because
They'd eaten every one.'*

"I like the Walrus best," said Alice: "because you see he was a *little* sorry for the poor oysters."

"He ate more than the Carpenter, though," said Tweedledee. "You see he held his handkerchief in front, so that the Carpenter couldn't count how many he took: contrariwise."

"That was mean!" Alice said indignantly. "Then I like the Carpenter best—if he didn't eat so many as the Walrus."

"But he ate as many as he could get," said Tweedledum.

This was a puzzler. After a pause, Alice began, "Well! They were *both* very unpleasant characters——" Here she checked herself in some alarm, at hearing something that sounded to her like the puffing of a large steam-engine in the wood near them, though she feared it was more likely to be a wild beast. "Are there any lions or tigers about here?" she asked timidly.

"It's only the Red King snoring," said Tweedledee.

"Come and look at him!" the brothers cried, and they each took one of Alice's hands, and led her up to where the King was sleeping.

"Isn't he a *lovely* sight?" said Tweedledum.

Alice couldn't say honestly that he was. He had a tall red night-cap on, with a tassel, and he was lying crumpled up into a sort of untidy heap, and snoring loud—"fit to snore his head off!" as Tweedledum remarked.

"I'm afraid he'll catch cold with lying on the damp grass," said Alice, who was a very thoughtful little girl.

"He's dreaming now," said Tweedledee: "and what do you think he's dreaming about?"

Alice said "Nobody can guess that."

"Why, about *you!*" Tweedledee exclaimed, clapping his hands triumphantly. "And if he left off dreaming about you, where do you suppose you'd be?"

"Where I am now, of course," said Alice.

"Not you!" Tweedledee retorted contemptuously. "You'd be nowhere. Why, you're only a sort of thing in his dream!"

"If that there King was to wake," added Tweedledum, "you'd go out—bang!—just like a candle!"

"I shouldn't!" Alice exclaimed indignantly. "Besides, if *I'm* only a sort of thing in his dream, what are *you*, I should like to know?"

"Ditto," said Tweedledum.

"Ditto, ditto!" cried Tweedledee.

He shouted this so loud that Alice couldn't help saying "Hush! You'll be waking him, I'm afraid, if you make so much noise."

"Well, it no use *your* talking about waking him," said Tweedledum, "when you're only one of the things in his dream. You know very well you're not real."

"I *am* real!" said Alice, and began to cry.

"You wo'n't make yourself a bit realler by crying," Tweedledee remarked: "there's nothing to cry about."

"If I wasn't real," Alice said—half-laughing through her tears, it all seemed so ridiculous—"I shouldn't be able to cry."

"I hope you don't suppose those are *real* tears?" Tweedledum interrupted in a tone of great contempt.

"I know they're talking nonsense," Alice thought to herself: "and it's foolish to cry about it." So she brushed away her tears, and went on as cheerfully as she could, "At any rate I'd better be getting out of the wood, for really it's coming on very dark. Do you think it's going to rain?"

Tweedledum spread a large umbrella over himself and his brother, and looked up into it. "No, I don't think it is," he said: "at least—not under *here*. Nohow."

“But it may rain *outside*?”

“It may—if it chooses,” said Tweedledee: “we’ve no objection. Contrariwise.”

“Selfish things!” thought Alice, and she was just going to say “Good-night” and leave them, when Tweedledum sprang out from under the umbrella, and seized her by the wrist.

“Do you see *that*?” he said, in a voice choking with passion, and his eyes grew large and yellow all in a moment, as he pointed with a trembling finger at a small white thing lying under the tree.

“It’s only a rattle,” Alice said, after a careful examination of the little white thing. “Not a rattle-*snake*, you know,” she added hastily, thinking that he was frightened: “only an old rattle—quite old and broken.”

“I knew it was!” cried Tweedledum, beginning to stamp about wildly and tear his hair. “It’s spoilt, of course!” Here he looked at Tweedledee, who immediately sat down on the ground, and tried to hide himself under the umbrella.

Alice laid her hand upon his arm, and said in a soothing tone, “You needn’t be so angry about an old rattle.”

“But it *isn’t* old!” Tweedledum cried, in a greater fury than ever. “It’s *new*, I tell you—I bought it yesterday—my nice NEW RATTLE!” and his voice rose to a perfect scream.

All this time Tweedledee was trying his best to fold up the umbrella, with himself in it: which was such an extraordinary thing to do, that it quite took off Alice’s attention from the angry brother. But he couldn’t quite succeed, and it ended in his rolling over, bundled up in the umbrella, with only his head out: and there he lay, opening and shutting his mouth and his large eyes—“looking more like a fish than anything else,” Alice thought.

“Of course you agree to have a battle?” Tweedledum said in a calmer tone.

“I suppose so,” the other sulkily replied, as he crawled out of the umbrella: “only *she* must help us to dress up, you know.”

So the two brothers went off hand-in-hand into the wood, and returned in a minute with their arms full of things—such as bolsters, blankets, hearth-rugs, table-cloths, dish-covers and coal-scuttles. “I hope you’re a good hand at pinning and tying strings?” Tweedledum remarked. “Every one of these things has got

to go on, somehow or other.”

Alice said afterwards she had never seen such a fuss made about anything in all her life—the way those two bustled about—and the quantity of things they put on—and the trouble they gave her in tying strings and fastening buttons—“Really they’ll be more like bundles of old clothes than anything else, by the time they’re ready!” she said to herself, as she arranged a bolster round the neck of Tweedledee, “to keep his head from being cut off,” as he said.

“You know,” he added very gravely, “it’s one of the most serious things that can possibly happen to one in a battle—to get one’s head cut off.”

Alice laughed loud: but she managed to turn it into a cough, for fear of hurting his feelings.

“Do I look very pale?” said Tweedledum, coming up to have his helmet tied on. (He *called* it a helmet, though it certainly looked much more like a saucepan.)

“Well—yes—a *little*,” Alice replied gently.

“I’m very brave, generally,” he went on in a low voice: “only to-day I happen to have a headache.”

“And *I’ve* got a toothache!” said Tweedledee, who had overheard the remark. “I’m far worse than you!”

“Then you’d better not fight to-day,” said Alice, thinking it a good opportunity to make peace.

“We *must* have a bit of a fight, but I don’t care about going on long,” said Tweedledum. “What’s the time now?”

Tweedledee looked at his watch, and said “Half-past four.”

“Let’s fight till six, and then have dinner,” said Tweedledum.

“Very well,” the other said, rather sadly: “and *she* can watch us—only you’d better not come *very* close,” he added: “I generally hit everything I can see—when I get really excited.”

“And *I* hit every thing within reach,” cried Tweedledum, “whether I can see it or not!”

Alice laughed. “You must hit the *trees* pretty often, I should think,” she said.

Tweedledum looked round him with a satisfied smile. "I don't suppose," he said, "there'll be a tree left standing, for ever so far round, by the time we've finished!"

"And all about a rattle!" said Alice, still hoping to make them a *little* ashamed of fighting for such a trifle.

"I shouldn't have minded it so much," said Tweedledum, "if it hadn't been a new one."

"I wish the monstrous crow would come!" thought Alice.

"There's only one sword, you know," Tweedledum said to his brother: "but *you* can have the umbrella—it's quite as sharp. Only we must begin quick. It's getting as dark as it can."

"And darker," said Tweedledee.

It was getting dark so suddenly that Alice thought there must be a thunderstorm coming on. "What a thick black cloud that is!" she said. "And how fast it comes! Why, I do believe it's got wings!"

"It's the crow!" Tweedledum cried out in a shrill voice of alarm; and the two brothers took to their heels and were out of sight in a moment.

Alice ran a little way into the wood, and stopped under a large tree. "It can never get at me *here*," she thought: "it's far too large to squeeze itself in among the trees. But I wish it wouldn't flap its wings so—it makes quite a hurricane in the wood—here's somebody's shawl being blown away!"

Chapter V. Wool and Water

She caught the shawl as she spoke, and looked about for the owner: in another moment the White Queen came running wildly through the wood, with both arms stretched out wide, as if she were flying, and Alice very civilly went to meet her with the shawl.

"I'm very glad I happened to be in the way," Alice said, as she helped her to put on her shawl again.

The White Queen only looked at her in a helpless frightened sort of way, and kept repeating something in a whisper to herself that sounded like "Bread-and-butter, bread-and-butter," and Alice felt that if there was to be any conversation at all, she must manage it herself. So she began rather timidly: "Am I addressing the White Queen?"

"Well, yes, if you call that a-dressing," the Queen said. "It isn't *my* notion of the thing, at all."

Alice thought it would never do to have an argument at the very beginning of their conversation, so she smiled and said "If your Majesty will only tell me the right way to begin, I'll do it as well as I can."

"But I don't want it done at all!" groaned the poor Queen. "I've been a-dressing myself for the last two hours."

It would have been all the better, as it seemed to Alice, if she had got some one else to dress her, she was so dreadfully untidy. "Every single thing's crooked," Alice thought to herself, "and she's all over pins!—May I put your shawl straight for you?" she added aloud.

"I don't know what's the matter with it!" the Queen said, in a melancholy voice. "It's out of temper, I think. I've pinned it here, and I've pinned it there, but there's no pleasing it!"

"It *ca'n't* go straight, you know, if you pin it all on one side," Alice said, as she gently put it right for her; "and, dear me, what a state your hair is in!"

"The brush has got entangled in it!" the Queen said with a sigh. "And I lost the comb yesterday."

Alice carefully released the brush, and did her best to get the hair into order. "Come, you look rather better now!" she said, after altering most of the pins. "But really you should have a lady's-maid!"

"I'm sure I'll take *you* with pleasure!" the Queen said. "Twopence a week, and jam every other day."

Alice couldn't help laughing, as she said "I don't want you to hire *me*—and I don't care for jam."

"It's very good jam," said the Queen.

"Well, I don't want any *to-day*, at any rate."

"You couldn't have it if you *did* want it," the Queen said. "The rule is, jam to-morrow and jam yesterday—but never jam *to-day*."

"It *must* come sometimes to 'jam to-day,'" Alice objected.

"No, it *ca'n't*," said the Queen. "It's jam every *other* day: to-day isn't any *other* day, you know."

"I don't understand you," said Alice. "It's dreadfully confusing!"

"That's the effect of living backwards," the Queen said kindly: "it always makes one a little giddy at first——"

"Living backwards!" Alice repeated in great astonishment. "I never heard of such a thing!"

"—but there's one great advantage in it, that one's memory works both ways."

"I'm sure *mine* only works one way," Alice remarked. "I *ca'n't* remember things before they happen."

"It's a poor sort of memory that only works backwards," the Queen remarked.

"What sort of things do *you* remember best?" Alice ventured to ask.

"Oh, things that happened the week after next," the Queen replied in a careless tone. "For instance, now," she went on, sticking a large piece of plaster on her finger as she spoke, "there's the King's Messenger. He's in prison now, being punished: and the trial doesn't even begin till next Wednesday: and of course the crime comes last of all."

"Suppose he never commits the crime?" said Alice.

"That would be all the better, wouldn't it?" the Queen said, as she bound the plaster round her finger with a bit of ribbon.

Alice felt there was no denying *that*. "Of course it would be all the better," she said: "but it wouldn't be all the better his being punished."

"You're wrong *there*, at any rate," said the Queen. "Were *you* ever punished?"

"Only for faults," said Alice.

"And you were all the better for it, I know!" the Queen said triumphantly.

"Yes, but then I *had* done the things I was punished for," said Alice: "that makes all the difference."

"But if you *hadn't* done them," the Queen said, "that would have been better still; better, and better, and better!" Her voice went higher with each "better," till it got quite to a squeak at last.

Alice was just beginning to say "There's a mistake somewhere——," when the Queen began screaming, so loud that she had to leave the sentence unfinished.

“Oh, oh, oh!” shouted the Queen, shaking her hand about as if she wanted to shake it off. “My finger’s bleeding! Oh, oh, oh, oh!”

Her screams were so exactly like the whistle of a steam-engine, that Alice had to hold both her hands over her ears.

“What *is* the matter?” she said, as soon as there was a chance of making herself heard. “Have you pricked your finger?”

“I haven’t pricked it *yet*,” the Queen said, “but I soon shall—oh, oh, oh!”

“When do you expect to do it?” Alice asked, feeling very much inclined to laugh.

“When I fasten my shawl again,” the poor Queen groaned out: “the brooch will come undone directly. Oh, oh!” As she said the words the brooch flew open, and the Queen clutched wildly at it, and tried to clasp it again.

“Take care!” cried Alice. “You’re holding it all crooked!” And she caught at the brooch; but it was too late: the pin had slipped, and the Queen had pricked her finger.

“That accounts for the bleeding, you see,” she said to Alice with a smile. “Now you understand the way things happen here.”

“But why don’t you scream *now*?” Alice asked, holding her hands ready to put over her ears again.

“Why, I’ve done all the screaming already,” said the Queen. “What would be the good of having it all over again?”

By this time it was getting light. “The crow must have flown away, I think,” said Alice: “I’m so glad it’s gone. I thought it was the night coming on.”

“I wish *I* could manage to be glad!” the Queen said. “Only I never can remember the rule. You must be very happy, living in this wood, and being glad whenever you like!”

“Only it is so *very* lonely here!” Alice said in a melancholy voice; and, at the thought of her loneliness, two large tears came rolling down her cheeks.

“Oh, don’t go on like that!” cried the poor Queen, wringing her hands in despair. “Consider what a great girl you are. Consider what a long way you’ve come to-day. Consider what o’clock it is. Consider anything, only don’t cry!”

Alice could not help laughing at this, even in the midst of her tears. “Can *you* keep from crying by considering things?” she asked.

“That’s the way it’s done,” the Queen said with great decision: “nobody can do two things at once, you know. Let’s consider your age to begin with—how old are you?”

“I’m seven and a half, exactly.”

“You needn’t say ‘exactly,’” the Queen remarked. “I can believe it without that. Now I’ll give *you* something to believe. I’m just one hundred and one, five months and a day.”

“I ca’n’t believe *that!*” said Alice.

“Ca’n’t you?” the Queen said in a pitying tone. “Try again: draw a long breath, and shut your eyes.”

Alice laughed. “There’s no use trying,” she said: “one *ca’n’t* believe impossible things.”

“I daresay you haven’t had much practice,” said the Queen. “When I was your age, I always did it for half-an-hour a day. Why, sometimes I’ve believed as many as six impossible things before breakfast. There goes the shawl again!”

The brooch had come undone as she spoke, and a sudden gust of wind blew the Queen’s shawl across a little brook. The Queen spread out her arms again,

and went flying after it, and this time she succeeded in catching it for herself. "I've got it!" she cried in a triumphant tone. "Now you shall see me pin it on again, all by myself!"

"Then I hope your finger is better now?" Alice said very politely, as she crossed the little brook after the Queen.

* * * * *
* * * * *
* * * * *

"Oh, much better!" cried the Queen, her voice rising to a squeak as she went on. "Much be-etter! Be-etter! Be-e-e-etter! Be-e-ehh!" The last word ended in a long bleat, so like a sheep that Alice quite started.

She looked at the Queen, who seemed to have suddenly wrapped herself up in wool. Alice rubbed her eyes, and looked again. She couldn't make out what had happened at all. Was she in a shop? And was that really—was it really a *sheep* that was sitting on the other side of the counter? Rub as she could, she could make nothing more of it: she was in a little dark shop, leaning with her elbows on the counter, and opposite to her was an old Sheep, sitting in an arm-chair, knitting, and every now and then leaving off to look at her through a great pair of spectacles.

“What is it you want to buy?” the Sheep said at last, looking up for a moment from her knitting.

“I don’t *quite* know yet,” Alice said very gently. “I should like to look all round me first, if I might.”

“You may look in front of you, and on both sides, if you like,” said the Sheep; “but you can’t look *all* round you—unless you’ve got eyes at the back of your head.”

But these, as it happened, Alice had *not* got: so she contented herself with turning round, looking at the shelves as she came to them.

The shop seemed to be full of all manner of curious things—but the oddest part of it all was, that whenever she looked hard at any shelf, to make out exactly what it had on it, that particular shelf was always quite empty, though the others round it were crowded as full as they could hold.

“Things flow about so here!” she said at last in a plaintive tone, after she had spent a minute or so in vainly pursuing a large bright thing, that looked sometimes like a doll and sometimes like a work-box, and was always in the shelf next above the one she was looking at. “And this one is the most provoking of all—but I’ll tell you what——” she added, as a sudden thought struck her, “I’ll follow it up to the very top shelf of all. It’ll puzzle it to go through the ceiling, I expect!”

But even this plan failed: the ‘thing’ went through the ceiling as quietly as possible, as if it were quite used to it.

“Are you a child or a teetotum?” the Sheep said, as she took up another pair of needles. “You’ll make me giddy soon, if you go on turning round like that.” She was now working with fourteen pairs at once, and Alice couldn’t help looking at her in great astonishment.

“How *can* she knit with so many?” the puzzled child thought to herself. “She gets more and more like a porcupine every minute!”

“Can you row?” the Sheep asked, handing her a pair of knitting-needles as she spoke.

“Yes, a little—but not on land—and not with needles——” Alice was beginning to say, when suddenly the needles turned into oars in her hands, and she found they were in a little boat, gliding along between banks: so there was nothing for it but to do her best.

“Feather!” cried the Sheep, as she took up another pair of needles.

This didn’t sound like a remark that needed any answer: so Alice said nothing, but pulled away. There was something very queer about the water, she thought, as every now and then the oars got fast in it, and would hardly come out again.

“Feather! Feather!” the Sheep cried again, taking more needles. “You’ll be catching a crab directly.”

“A dear little crab!” thought Alice. “I should like that.”

“Didn’t you hear me say ‘Feather’?” the Sheep cried angrily, taking up quite a bunch of needles.

“Indeed I did,” said Alice: “you’ve said it very often—and very loud. Please where *are* the crabs?”

“In the water, of course!” said the Sheep, sticking some of the needles into her hair, as her hands were full. “Feather, I say!”

“*Why* do you say ‘Feather’ so often?” Alice asked at last, rather vexed. “I’m not a bird!”

"You are," said the Sheep: "you're a little goose."

This offended Alice a little, so there was no more conversation for a minute or two, while the boat glided gently on, sometimes among beds of weeds (which made the oars stick fast in the water, worse than ever), and sometimes under trees, but always with the same tall river-banks frowning over their heads.

"Oh, please! There are some scented rushes!" Alice cried in a sudden transport of delight. "There really are—and *such* beauties!"

"You needn't say 'please' to *me* about 'em," the Sheep said, without looking up from her knitting: "I didn't put 'em there, and I'm not going to take 'em away."

"No, but I meant—please, may we wait and pick some?" Alice pleaded. "If you don't mind stopping the boat for a minute."

"How am *I* to stop it?" said the Sheep. "If you leave off rowing, it'll stop of itself."

So the boat was left to drift down the stream as it would, till it glided gently in among the waving rushes. And then the little sleeves were carefully rolled up, and the little arms were plunged in elbow-deep to get hold of the rushes a good long way down before breaking them off—and for a while Alice forgot all about the Sheep and the knitting, as she bent over the side of the boat, with just the ends of her tangled hair dipping into the water—while with bright eager eyes she caught at one bunch after another of the darling scented rushes.

"I only hope the boat wo'n't tipple over!" she said to herself. "Oh, *what* a lovely one! Only I couldn't quite reach it." And it certainly *did* seem a little provoking ("almost as if it happened on purpose," she thought) that, though she managed to pick plenty of beautiful rushes as the boat glided by, there was always a more lovely one that she couldn't reach.

"The prettiest are always further!" she said at last, with a sigh at the obstinacy of the rushes in growing so far off, as, with flushed cheeks and dripping hair and hands, she scrambled back into her place, and began to arrange her new-found treasures.

What mattered it to her just then that the rushes had begun to fade, and to lose all their scent and beauty, from the very moment that she picked them? Even real scented rushes, you know, last only a very little while—and these, being dream-rushes, melted away almost like snow, as they lay in heaps at her feet—but Alice hardly noticed this, there were so many other curious things to think about.

They hadn't gone much farther before the blade of one of the oars got fast in the water and *wouldn't* come out again (so Alice explained it afterwards), and the consequence was that the handle of it caught her under the chin, and, in spite of a series of little shrieks of 'Oh, oh, oh!' from poor Alice, it swept her straight off the seat, and down among the heap of rushes.

However, she wasn't a bit hurt, and was soon up again: the Sheep went on with her knitting all the while, just as if nothing had happened. "That was a nice crab you caught!" she remarked, as Alice got back into her place, very much relieved to find herself still in the boat.

"Was it? I didn't see it," said Alice, peeping cautiously over the side of the boat into the dark water. "I wish it hadn't let go—I should so like to see a little crab to take home with me!" But the Sheep only laughed scornfully, and went on with her knitting.

"Are there many crabs here?" said Alice.

“Crabs, and all sorts of things,” said the Sheep: “plenty of choice, only make up your mind. Now, what *do* you want to buy?”

“To buy!” Alice echoed in a tone that was half astonished and half frightened—for the oars, and the boat, and the river, had vanished all in a moment, and she was back again in the little dark shop.

“I should like to buy an egg, please,” she said timidly. “How do you sell them?”

“Fivepence farthing for one—twopence for two,” the Sheep replied.

“Then two are cheaper than one?” Alice said in a surprised tone, taking out her purse.

“Only you *must* eat them both, if you buy two,” said the Sheep.

“Then I’ll have *one*, please,” said Alice, as she put the money down on the counter. For she thought to herself, “They mightn’t be at all nice, you know.”

The Sheep took the money, and put it away in a box: then she said “I never put things into people’s hands—that would never do—you must get it for yourself.” And so saying, she went off to the other end of the shop, and set the egg upright on a shelf.

“I wonder *why* it wouldn’t do?” thought Alice, as she groped her way among the tables and chairs, for the shop was very dark towards the end. “The egg seems to get further away the more I walk towards it. Let me see, is this a chair? Why, it’s got branches, I declare! How very odd to find trees growing

here! And actually here's a little brook! Well, this is the very queerest shop I ever saw!"

* * * *
* * * *
* * * *

So she went on, wondering more and more at every step, as everything turned into a tree the moment she came up to it, and she quite expected the egg to do the same.

Chapter VI. Humpty Dumpty

However, the egg only got larger and larger, and more and more human: when she had come within a few yards of it, she saw that it had eyes and a nose and mouth; and, when she had come close to it, she saw clearly that it was HUMPTY DUMPTY himself. "It ca'n't be anybody else!" she said to herself. "I'm as certain of it, as if his name were written all over his face!"

It might have been written a hundred times, easily, on that enormous face. Humpty Dumpty was sitting, with his legs crossed like a Turk, on the top of a high wall—such a narrow one that Alice quite wondered how he could keep his balance—and, as his eyes were steadily fixed in the opposite direction, and he didn't take the least notice of her, she thought he must be a stuffed figure, after all.

"And how exactly like an egg he is!" she said aloud, standing with her hands ready to catch him, for she was every moment expecting him to fall.

"It's *very* provoking," Humpty Dumpty said after a long silence, looking away from Alice as he spoke, "to be called an egg—*very!*"

"I said you *looked* like an egg, Sir," Alice gently explained. "And some eggs are very pretty, you know," she added, hoping to turn her remark into a sort of a compliment.

"Some people," said Humpty Dumpty, looking away from her as usual, "have no more sense than a baby!"

Alice didn't know what to say to this: it wasn't at all like conversation, she thought, as he never said anything to *her*; in fact, his last remark was evidently addressed to a tree—so she stood and softly repeated to herself:—

*"Humpty Dumpty sat on a wall:
Humpty Dumpty had a great fall.
All the King's horses and all the King's men
Couldn't put Humpty Dumpty in his place again."*

Quoted from nursery rhyme

"That last line is much too long for the poetry," she added, almost out loud, forgetting that Humpty Dumpty would hear her.

"Don't stand chattering to yourself like that," Humpty Dumpty said, looking at her for the first time, "but tell me your name and your business."

"My *name* is Alice, but——"

"It's a stupid name enough!" Humpty Dumpty interrupted impatiently. "What does it mean?"

"*Must* a name mean something?" Alice asked doubtfully.

“Of course it must,” Humpty Dumpty said with a short laugh: “*my* name means the shape I am—and a good handsome shape it is, too. With a name like yours, you might be any shape, almost.”

“Why do you sit out here all alone?” said Alice, not wishing to begin an argument.

“Why, because there’s nobody with me!” cried Humpty Dumpty. “Did you think I didn’t know the answer to *that*? Ask another.”

“Don’t you think you’d be safer down on the ground?” Alice went on, not with any idea of making another riddle, but simply in her good-natured anxiety for the queer creature. “That wall is so *very* narrow!”

“What tremendously easy riddles you ask!” Humpty Dumpty growled out. “Of course I don’t think so! Why, if ever I *did* fall off—which there’s no chance of—but *if* I did——” Here he pursed his lips, and looked so solemn and grand that Alice could hardly help laughing.

“*If I did* fall,” he went on, “*the King has promised me*—ah, you may turn pale, if you like! You didn’t think I was going to say that, did you? *The King has promised me—with his very own mouth—to—to——*”

“To send all his horses and all his men,” Alice interrupted, rather unwisely.

“Now I declare that’s too bad!” Humpty Dumpty cried, breaking into a sudden passion. “You’ve been listening at doors—and behind trees—and down chimneys—or you couldn’t have known it!”

“I haven’t, indeed!” Alice said very gently. “It’s in a book.”

“Ah, well! They may write such things in a *book*,” Humpty Dumpty said in a calmer tone. “That’s what you call a History of England, that is. Now, take a good look at me! I’m one that has spoken to a King, *I* am: mayhap you’ll never see such another: and, to show you I’m not proud, you may shake hands with me!” And he grinned almost from ear to ear, as he leant forwards (and as nearly as possible fell off the wall in doing so) and offered Alice his hand. She watched him a little anxiously as she took it. “If he smiled much more, the ends of his mouth might meet behind,” she thought: “and then I don’t know *what* would happen to his head! I’m afraid it would come off!”

“Yes, all his horses and all his men,” Humpty Dumpty went on. “They’d pick me up again in a minute, *they* would! However, this conversation is going on a little too fast: let’s go back to the last remark but one.”

“I’m afraid I ca’n’t quite remember it,” Alice said, very politely.

“In that case we start *afresh*⁶,” said Humpty Dumpty, “and it’s my turn to choose a subject——” (“He talks about it just as if it was a game!” thought Alice.) “So here’s a question for you. How old did you say you were?”

Alice made a short calculation, and said “Seven years and six months.”

“Wrong!” Humpty Dumpty exclaimed triumphantly. “You never said a word like it!”

“I though you meant ‘How old *are* you?’” Alice explained.

“If I’d meant that, I’d have said it,” said Humpty Dumpty.

Alice didn’t want to begin another argument, so she said nothing.

“Seven years and six months!” Humpty Dumpty repeated thoughtfully. “An uncomfortable sort of age. Now if you’d asked *my* advice, I’d have said ‘Leave off at seven’——but it’s too late now.”

“I never ask advice about growing,” Alice said indignantly.

“Too proud?” the other inquired.

Alice felt even more indignant at this suggestion. “I mean,” she said, “that one ca’n’t help growing older.”

“*One* ca’n’t, perhaps,” said Humpty Dumpty; “but *two* can. With proper assistance, you might have left off at seven.”

“What a beautiful belt you’ve got on!” Alice suddenly remarked. (They had had quite enough of the subject of age, she thought: and, if they really were to take turns in choosing subjects, it was *her* turn now.) “At least,” she corrected herself on second thoughts, “a beautiful cravat, I should have said—no, a belt, I mean—I beg your pardon!” she added in dismay, for Humpty Dumpty looked thoroughly offended, and she began to wish she hadn’t chosen that subject. “If I only knew,” she thought to herself, “which was neck and which was waist!”

Evidently Humpty Dumpty was very angry, though he said nothing for a minute or two. When he *did* speak again, it was in a deep growl.

“It is a—*most—provoking—*thing,” he said at last, “when a person doesn’t know a cravat from a belt!”

“I know it’s very ignorant of me,” Alice said, in so humble a tone that Humpty Dumpty relented.

“It’s a cravat, child, and a beautiful one, as you say. It’s a present from the White King and Queen. There now!”

“Is it really?” said Alice, quite pleased to find that she *had* chosen a good subject, after all.

⁶fresh

“They gave it me,” Humpty Dumpty continued thoughtfully, as he crossed one knee over the other and clasped his hands round it, “they gave it me—for an un-birthday present.”

“I beg your pardon?” Alice said with a puzzled air.

“I’m not offended,” said Humpty Dumpty.

“I mean, what *is* an un-birthday present?”

“A present given when it isn’t your birthday, of course.”

Alice considered a little. “I like birthday presents best,” she said at last.

“You don’t know what you’re talking about!” cried Humpty Dumpty. “How many days are there in a year?”

“Three hundred and sixty-five,” said Alice.

“And how many birthdays have you?”

“One.”

“And if you take one from three hundred and sixty-five, what remains?”

“Three hundred and sixty-four, of course.”

Humpty Dumpty looked doubtful. “I’d rather see that done on paper,” he said.

Alice couldn’t help smiling as she took out her memorandum-book, and worked the sum for him:

$$\begin{array}{r} 365 \\ \underline{1} \\ 364 \end{array}$$

Humpty Dumpty took the book, and looked at it carefully. “That seems to be done right——” he began.

“You’re holding it upside down!” Alice interrupted.

“To be sure I was!” Humpty Dumpty said gaily, as she turned it round for him. “I thought it looked a little queer. As I was saying, that *seems* to be done right—though I haven’t time to look it over thoroughly just now—and that shows that there are three hundred and sixty-four days when you might get un-birthday presents——”

“Certainly,” said Alice.

“And only *one* for birthday presents, you know. There’s glory for you!”

“I don’t know what you mean by ‘glory,’” Alice said.

Humpty Dumpty smiled contemptuously. “Of course you don’t—till I tell you. I meant ‘there’s a nice knock-down argument for you!’”

“But ‘glory’ doesn’t mean ‘a nice knock-down argument,’” Alice objected.

“When *I* use a word,” Humpty Dumpty said in rather a scornful tone, “it means just what I choose it to mean—neither more nor less.”

“The question is,” said Alice, “whether you *can* make words mean so many different things.”

“The question is,” said Humpty Dumpty, “which is to be master——that’s all.”

Alice was too much puzzled to say anything; so after a minute Humpty Dumpty began again. “They’ve a temper, some of them—particularly verbs: they’re the proudest—adjectives you can do anything with, but not verbs—however, *I* can manage the whole lot of them! Impenetrability! That’s what *I* say!”

“Would you tell me, please,” said Alice, “what that means?”

“Now you talk like a reasonable child,” said Humpty Dumpty, looking very much pleased. “I meant by ‘impenetrability’ that we’ve had enough of that subject, and it would be just as well if you’d mention what you mean to do next, as I suppose you don’t mean to stop here all the rest of your life.”

“That’s a great deal to make one word mean,” Alice said in a thoughtful tone.

“When I make a word do a lot of work like that,” said Humpty Dumpty, “I always pay it extra.”

“Oh!” said Alice. She was too much puzzled to make any other remark.

“Ah, you should see ’em come round me of a Saturday night,” Humpty Dumpty went on, wagging his head gravely from side to side, “for to get their wages, you know.”

(Alice didn’t venture to ask what he paid them with; and so you see I ca’n’t tell *you*.)

“You seem very clever at explaining words, Sir,” said Alice. “Would you kindly tell me the meaning of the poem called ‘Jabberwocky’?”

“Let’s hear it,” said Humpty Dumpty. “I can explain all the poems that were ever invented—and a good many that haven’t been invented just yet.”

This sounded very hopeful, so Alice repeated the first verse:—

*“’Twas brillig, and the slithy toves
Did gyre and gimble in the wabe;
All mimsy were the borogoves,
And the mome raths outgrabe.”*

“That’s enough to begin with,” Humpty Dumpty interrupted: “there are plenty of hard words there. ‘*Brillig*’ means four o’clock in the afternoon—the time when you begin *broiling* things for dinner.”

“That’ll do very well,” said Alice: “and ‘*slithy*’?”

“Well, ‘*slithy*’ means ‘lithe and slimy.’ ‘Lithe’ is the same as ‘active.’ You see it’s like a portmanteau—there are two meanings packed up into one word.”

“I see it now,” Alice remarked thoughtfully: “and what are ‘*toves*’?”

“Well, ‘*toves*’ are something like badgers—they’re something like lizards—and they’re something like corkscrews.”

“They must be very curious-looking creatures.”

“They are that,” said Humpty Dumpty: “also they make their nests under sun-dials—also they live on cheese.”

“And what’s to ‘*gyre*’ and to ‘*gimble*’?”

“To ‘*gyre*’ is to go round and round like a gyroscope. To ‘*gimble*’ is to make holes like a gimblet.”

“And ‘*the wabe*’ is the grass-plot round a sun-dial, I suppose?” said Alice, surprised at her own ingenuity.

“Of course it is. It’s called ‘*wabe*,’ you know, because it goes a long way before it, and a long way behind it——”

“And a long way beyond it on each side,” Alice added.

“Exactly so. Well then, ‘*mimsy*’ is ‘flimsy and miserable’ (there’s another portmanteau for you). And a ‘*borogove*’ is a thin shabby-looking bird with its feathers sticking out all round—something like a live mop.”

“And then ‘*mome raths*’?” said Alice. “I’m afraid I’m giving you a great deal of trouble.”

“Well, a ‘*rath*’ is a sort of green pig: but ‘*mome*’ I’m not certain about. I think it’s short for ‘from home’—meaning that they’d lost their way, you know.”

“And what does ‘*outgrabe*’ mean?”

“Well, ‘*outgrabing*’ is something between bellowing and whistling, with a kind of sneeze in the middle: however, you’ll hear it done, maybe—down in the wood yonder—and when you’ve once heard it you’ll be *quite* content. Who’s been repeating all that hard stuff to you?”

“I read it in a book,” said Alice. “But I *had* some poetry repeated to me much easier than that, by—Tweedledee, I think it was.”

“As to poetry, you know,” said Humpty Dumpty, stretching out one of his great hands, “I can repeat poetry as well as other folk, if it comes to that——”

“Oh, it needn’t come to that!” Alice hastily said, hoping to keep him from beginning.

“The piece I’m going to repeat,” he went on without noticing her remark, “was written entirely for your amusement.”

Alice felt that in that case she really *ought* to listen to it; so she sat down, and said “Thank you” rather sadly.

*“In winter, when the fields are white,
I sing this song for your delight——”*

only I don’t sing it,” he added, as an explanation.

“I see you don’t,” said Alice.

“If you can *see* whether I’m singing or not, you’ve sharper eyes than most.” Humpty Dumpty remarked severely. Alice was silent.

*“In spring, when woods are getting green,
I’ll try and tell you what I mean:”*

“Thank you very much,” said Alice.

*“In summer, when the days are long,
Perhaps you’ll understand the song:
In autumn, when the leaves are brown,
Take pen and ink, and write it down.”*

“I will, if I can remember it so long,” said Alice.

“You needn’t go on making remarks like that,” Humpty Dumpty said: “they’re not sensible, and they put me out.”

*“I sent a message to the fish:
I told them ‘This is what I wish.’
The little fishes of the sea,
They sent an answer back to me.
The little fishes’ answer was
‘We cannot do it, Sir, because——’”*

“I’m afraid I don’t quite understand,” said Alice.

“It gets easier further on,” Humpty Dumpty replied.

*"I sent to them again to say
 'It will be better to obey.'
 The fishes answered with a grin,
 'Why, what a temper you are in!'
 I told them once, I told them twice:
 They would not listen to advice.
 I took a kettle large and new,
 Fit for the deed I had to do.
 My heart went hop, my heart went thump:
 I filled the kettle at the pump.
 Then some one came to me and said,
 'The little fishes are in bed.'
 I said to him, I said it plain,
 'Then you must wake them up again.'
 I said it very loud and clear:
 I went and shouted in his ear."*

Humpty Dumpty raised his voice almost to a scream as he repeated this verse, and Alice thought with a shudder, "I wouldn't have been the messenger for *anything!*"

*"But he was very stiff and proud:
 He said 'You needn't shout so loud!
 And he was very proud and stiff:
 He said 'I'd go and wake them, if——'
 I took a corkscrew from the shelf:
 I went to wake them up myself.
 And when I found the door was locked,
 I pulled and pushed and kicked and knocked.
 And when I found the door was shut,
 I tried to turn the handle, but——"*

There was a long pause.

"Is that all?" Alice timidly asked.

"That's all," said Humpty Dumpty. "Good-bye."

This was rather sudden, Alice thought: but, after such a *very* strong hint that she ought to be going, she felt that it would hardly be civil to stay. So she got up, and held out her hand. "Good-bye, till we meet again!" she said as cheerfully as she could.

"I shouldn't know you again if we *did* meet," Humpty Dumpty replied in a discontented tone, giving her one of his fingers to shake: "you're so exactly like other people."

"The face is what one goes by, generally," Alice remarked in a thoughtful tone.

"That's just what I complain of," said Humpty Dumpty. "Your face is the same as everybody has—the two eyes, so——" (marking their places in the air with this thumb) "nose in the middle, mouth under. It's always the same. Now

if you had the two eyes on the same side of the nose, for instance—or the mouth at the top—that would be *some* help.”

“It wouldn’t look nice,” Alice objected. But Humpty Dumpty only shut his eyes, and said “Wait till you’ve tried.”

Alice waited a minute to see if he would speak again, but, as he never opened his eyes or took any further notice of her, she said “Good-bye!” once more, and, getting no answer to this, she quietly walked away: but she couldn’t help saying to herself, as she went, “Of all the unsatisfactory——” (she repeated this aloud, as it was a great comfort to have such a long word to say) “of all the unsatisfactory people I *ever* met——” She never finished the sentence, for at this moment a heavy crash shook the forest from end to end.

Chapter VII. The Lion and the Unicorn

The next moment soldiers came running through the wood, at first in twos and threes, then ten or twenty together, and at last in such crowds that they seemed to fill the whole forest. Alice got behind a tree, for fear of being run over, and watched them go by.

She thought that in all her life she had never seen soldiers so uncertain on their feet: they were always tripping over something or other, and whenever one went down, several more always fell over him, so that the ground was soon covered with little heaps of men.

Then came the horses. Having four feet, these managed rather better than the foot-soldiers; but even *they* stumbled now and then; and it seemed to be a regular rule that, whenever a horse stumbled, the rider fell off instantly. The confusion got worse every moment, and Alice was very glad to get out of the wood into an open place, where she found the White King seated on the ground, busily writing in his memorandum-book.

"I've sent them all!" the King cried in a tone of delight, on seeing Alice. "Did you happen to meet any soldiers, my dear, as you came through the wood?"

"Yes, I did," said Alice: "several thousand, I should think."

"Four thousand two hundred and seven, that's the exact number," the King said, referring to his book. "I couldn't send all the horses, you know, because two of them are wanted in the game. And I haven't sent the two Messengers, either. They're both gone to the town. Just look along the road, and tell me if you can see either of them."

"I see nobody on the road," said Alice.

"I only wish *I* had such eyes," the King remarked in a fretful tone. "To be able to see Nobody! And at that distance, too! Why, it's as much as *I* can do to see real people, by this light!"

All this was lost on Alice, who was still looking intently along the road, shading her eyes with one hand. "I see somebody now!" she exclaimed at last. "But he's coming very slowly—and what curious attitudes he goes into!" (For the Messenger kept skipping up and down, and wriggling like an eel, as he came along, with his great hands spread out like fans on each side.)

"Not at all," said the King. "He's an Anglo-Saxon Messenger—and those are Anglo-Saxon attitudes. He only does them when he's happy. His name is Haigha." (He pronounced it so as to rhyme with 'mayor'.)

"I love my love with an H," Alice couldn't help beginning, "because he is Happy. I hate him with an H, because he is Hideous. I fed him with—with—with Ham-sandwiches and Hay. His name is Haigha, and he lives—"

"He lives on the Hill," the King remarked simply, without the least idea that he was joining in the game, while Alice was still hesitating for the name of a town beginning with H. "The other Messenger's called Hatta. I must have *two*, you know—to come and go. One to come, and one to go."

"I beg your pardon?" said Alice.

"It isn't respectable to beg," said the King.

"I only meant that I didn't understand," said Alice. "Why one to come and one to go?"

"Don't I tell you?" the King repeated impatiently. "I must have *two*—to fetch and carry. One to fetch, and one to carry."

At this moment the Messenger arrived: he was far too much out of breath to say a word, and could only wave his hands about, and make the most fearful faces at the poor King.

"This young lady loves you with an H," the King said, introducing Alice in the hope of turning off the Messenger's attention from himself—but it _{was} of no⁷ use—the Anglo-Saxon attitudes only got more extraordinary every moment, while the great eyes rolled wildly from side to side.

"You alarm me!" said the King. "I feel faint—Give me a ham sandwich!"

⁷was no

On which the Messenger, to Alice's great amusement, opened a bag that hung round his neck, and handed a sandwich to the King, who devoured it greedily.

"Another sandwich!" said the King.

"There's nothing but hay left now," the Messenger said, peeping into the bag.

"Hay, then," the King murmured in a faint whisper.

Alice was glad to see that it revived him a good deal. "There's nothing like eating hay when you're faint," he remarked to her, as he munched away.

"I should think throwing cold water over you would be better," Alice suggested: "—or some sal-volatile."

"I didn't say there was nothing *better*," the King replied. "I said there was nothing *like* it." Which Alice did not venture to deny.

"Who did you pass on the road?" the King went on, holding out his hand to the Messenger for some more hay.

"Nobody," said the Messenger.

"Quite right," said the King: "this young lady saw him too. So of course Nobody walks slower than you."

"I do my best," the Messenger said in a sullen tone. "I'm sure nobody walks much faster than I do!"

"He ca'n't do that," said the King, "or else he'd have been here first. However, now you've got your breath, you may tell us what's happened in the town."

"I'll whisper it," said the Messenger, putting his hands to his mouth in the shape of a trumpet and stooping so as to get close to the King's ear. Alice was sorry for this, as she wanted to hear the news too. However, instead of whispering, he simply shouted at the top of his voice, "They're at it again!"

"Do you call *that* a whisper?" cried the poor King, jumping up and shaking himself. "If you do such a thing again, I'll have you buttered! It went through and through my head like an earthquake!"

"It would have to be a very tiny earthquake!" thought Alice. "Who are at it again?" she ventured to ask.

"Why, the Lion and the Unicorn, of course," said the King.

"Fighting for the crown?"

"Yes, to be sure," said the King: "and the best of the joke is, that it's *my* crown all the while! Let's run and see them." And they trotted off, Alice repeating to herself, as she ran, the words of the old song:—

*"The Lion and the Unicorn were fighting for the crown:
The Lion beat the Unicorn all round the town.
Some gave them white bread, some gave them brown;
Some gave them plum-cake and drummed them out of town."*

Quoted from nursery
rhyme

"Does—the one—that wins—get the crown?" she asked, as well as she could, for the run was putting her quite out of breath.

"Dear me, no!" said the King. "What an idea!"

"Would you—be good enough——" Alice panted out, after running a little further, "to stop a minute—just to get—one's breath again?"

"I'm *good* enough," the King said, "only I'm not *strong* enough. You see, a minute goes by so fearfully quick. You might as well try to stop a Bandersnatch!"

Alice had no more breath for talking; so they trotted on in silence, till they came in sight of a great crowd, in the middle of which the Lion and Unicorn were fighting. They were in such a cloud of dust, that at first Alice could not make out which was which; but she soon managed to distinguish the Unicorn by his horn.

They placed themselves close to where Hatta, the other messenger, was standing watching the fight, with a cup of tea in one hand and a piece of bread-and-butter in the other.

"He's only just out of prison, and he hadn't finished his tea when he was sent in," Haigha whispered to Alice: "and they only give them oyster-shells in there—so you see he's very hungry and thirsty. How are you, dear child?" he went on, putting his arm affectionately round Hatta's neck.

Hatta looked round and nodded, and went on with his bread-and-butter.

"Were you happy in prison, dear child?" said Haigha.

Hatta looked round once more, and this time a tear or two trickled down his cheek; but not a word would he say.

"Speak, ca'n't you!" Haigha cried impatiently. But Hatta only munched away, and drank some more tea.

"Speak, wo'n't you!" cried the King. "How are they getting on with the fight?"

Hatta made a desperate effort, and swallowed a large piece of bread-and-butter. "They're getting on very well," he said in a choking voice: "each of them has been down about eighty-seven times."

"Then I suppose they'll soon bring the white bread and the brown?" Alice ventured to remark.

"It's waiting for 'em now," said Hatta; "this is a bit of it as I'm eating."

There was a pause in the fight just then, and the Lion and the Unicorn sat down, panting, while the King called out "Ten minutes allowed for refreshments!" Haigha and Hatta set to work at once, carrying rough trays of white and brown bread. Alice took a piece to taste, but it was *very* dry.

"I don't think they'll fight any more to-day," the King said to Hatta: "go and order the drums to begin." And Hatta went bounding away like a grasshopper.

For a minute or two Alice stood silent, watching him. Suddenly she brightened up. "Look, look!" she cried, pointing eagerly. "There's the White Queen running across the country! She came flying out of the wood over yonder— How fast those Queens *can* run!"

"There's some enemy after her, no doubt," the King said, without even looking round. "That wood's full of them."

"But aren't you going to run and help her?" Alice asked, very much surprised at his taking it so quietly.

"No use, no use!" said the King. "She runs so fearfully quick. You might as well try to catch a Bandersnatch! But I'll make a memorandum about her, if you like—She's a dear good creature," he repeated softly to himself, as he opened his memorandum-book. "Do you spell 'creature' with a double 'e'?"

At this moment the Unicorn sauntered by them, with his hands in his pockets. "I had the best of it this time?" he said to the King, just glancing at him as he passed.

"A little—a little," the King replied, rather nervously. "You shouldn't have run him through with your horn, you know."

"It didn't hurt him," the Unicorn said carelessly, and he was going on, when his eye happened to fall upon Alice: he turned round rather instantly, and stood for some time looking at her with an air of the deepest disgust.

"What—is—this?" he said at last.

"This is a child!" Haigha replied eagerly, coming in front of Alice to introduce her, and spreading out both his hands towards her in an Anglo-Saxon attitude. "We only found it to-day. It's as large as life, and twice as natural!"

"I always thought they were fabulous monsters!" said the Unicorn. "Is it alive?"

"It can talk," said Haigha solemnly.

The Unicorn looked dreamily at Alice, and said "Talk, child."

Alice could not help her lips curling up into a smile as she began: "Do you

know, I always thought Unicorns were fabulous monsters, too? I never saw one alive before!”

“Well, now that we *have* seen each other,” said the Unicorn, “if you’ll believe in me, I’ll believe in you. Is that a bargain?”

“Yes, if you like,” said Alice.

“Come, fetch out the plum-cake, old man!” the Unicorn went on, turning from her to the King. “None of your brown bread for me!”

“Certainly—certainly!” the King muttered, and beckoned to Haigha. “Open the bag!” he whispered. “Quick! Not that one—that’s full of hay!”

Haigha took a large cake out of the bag, and gave it to Alice to hold, while he got out a dish and carving-knife. How they all came out of it Alice couldn’t guess. It was just like a conjuring-trick, she thought.

The Lion had joined them while this was going on: he looked very tired and sleepy, and his eyes were half shut. “What’s this!” he said, blinking lazily at Alice, and speaking in a deep hollow tone that sounded like the tolling of a great bell.

“Ah, what *is* it, now?” the Unicorn cried eagerly. “You’ll never guess! *I* couldn’t.”

The Lion looked at Alice wearily. “Are you animal—or vegetable—or mineral?” he said, yawning at every other word.

“It’s a fabulous monster!” the Unicorn cried out, before Alice could reply.

“Then hand round the plum-cake, Monster,” the Lion said, lying down and putting his chin on his paws. “And sit down, both of you,” (to the King and the Unicorn): “fair play with the cake, you know!”

The King was evidently very uncomfortable at having to sit down between the two great creatures; but there was no other place for him.

“What a fight we might have for the crown, *now!*” the Unicorn said, looking slyly up at the crown, which the poor King was nearly shaking off his head, he trembled so much.

“I should win easy,” said the Lion.

“I’m not so sure of that,” said the Unicorn.

“Why, I beat you all round the town, you chicken!” the Lion replied angrily, half getting up as he spoke.

Here the King interrupted, to prevent the quarrel going on: he was very nervous, and his voice quite quivered. “All round the town?” he said. “That’s a good long way. Did you go by the old bridge, or the market-place? You get the best view by the old bridge.”

“I’m sure I don’t know,” the Lion growled out as he lay down again. “There was too much dust to see anything. What a time the Monster is, cutting up that cake!”

Alice had seated herself on the bank of a little brook, with the great dish on her knees, and was sawing away diligently with the knife. “It’s very provoking!” she said, in reply to the Lion (she was getting quite used to being called ‘the Monster’). “I’ve cut several slices already, but they always join on again!”

“You don’t know how to manage Looking-glass cakes,” the Unicorn remarked. “Hand it round first, and cut it afterwards.”

This sounded nonsense, but Alice very obediently got up, and carried the dish round, and the cake divided itself into three pieces as she did so. “*Now* cut it up,” said the Lion, as she returned to her place with the empty dish.

“I say, this isn’t fair!” cried the Unicorn, as Alice sat with the knife in her hand, very much puzzled how to begin. “The Monster has given the Lion twice as much as me!”

“She’s kept none for herself, anyhow,” said the Lion. “Do you like plum-cake, Monster?”

But before Alice could answer him, the drums began.

Where the noise came from, she couldn’t make out: the air seemed full of it, and it rang through and through her head till she felt quite deafened. She started to her feet and sprang across the little brook in her terror,

* * * *
 * * *
* * * *

and had just time to see the Lion and the Unicorn rise to their feet, with angry looks at being interrupted in their feast, before she dropped to her knees, and put her hands over her ears, vainly trying to shut out the dreadful uproar.

“If *that* doesn’t ‘drum them out of town,’” she thought to herself, “nothing ever will!”

Chapter VIII. “It’s my own Invention”

After a while the noise seemed gradually to die away, till all was dead silence, and Alice lifted up her head in some alarm. There was no one to be seen, and her first thought was that she must have been dreaming about the Lion and the Unicorn and those queer Anglo-Saxon Messengers. However, there was the great dish still lying at her feet, on which she had tried to cut the plum-cake, “So I wasn’t dreaming, after all,” she said to herself, “unless—unless we’re all part of the same dream. Only I do hope it’s *my* dream, and not the Red King’s! I don’t like belonging to another person’s dream,” she went on in a rather complaining tone: “I’ve a great mind to go and wake him, and see what happens!”

At this moment her thoughts were interrupted by a loud shouting of “Ahoy! Ahoy! Check!” and a Knight, dressed in crimson armour, came galloping down

upon her, brandishing a great club. Just as he reached her, the horse stopped suddenly: "You're my prisoner!" the Knight cried, as he tumbled off his horse.

Startled as she was, Alice was more frightened for him than for herself at the moment, and watched him with some anxiety as he mounted again. As soon as he was comfortably in the saddle, he began once more "You're my——" but here another voice broke in "Ahoy! Ahoy! Check!" and Alice looked round in some surprise for the new enemy.

This time it was a White Knight. He drew up at Alice's side, and tumbled off his horse just as the Red Knight had done: then he got on again, and the two Knights sat and looked at each other for some time without speaking. Alice looked from one to the other in some bewilderment.

"She's *my* prisoner, you know!" the Red Knight said at last.

"Yes, but then *I* came and rescued her!" the White Knight replied.

"Well, we must fight for her, then," said the Red Knight, as he took up his helmet (which hung from the saddle, and was something the shape of a horse's head) and put it on.

"You will observe the Rules of Battle, of course?" the White Knight remarked, putting on his helmet too.

"I always do," said the Red Knight, and they began banging away at each other with such fury that Alice got behind a tree to be out of the way of the blows.

"I wonder, now, what the Rules of Battle are," she said to herself, as she watched the fight, timidly peeping out from her hiding-place. "One Rule seems to be, that if one Knight hits the other, he knocks him off his horse; and, if he misses, he tumbles off himself—and another Rule seems to be that they hold their clubs with their arms, as if they were Punch and Judy—What a noise

they make when they tumble! Just like a whole set of fire-irons falling into the fender! And how quiet the horses are! They let them get on and off them just as if they were tables!"

Another Rule of Battle, that Alice had not noticed, seemed to be that they always fell on their heads; and the battle ended with their both falling off in this way, side by side. When they got up again, they shook hands, and then the Red Knight mounted and galloped off.

"It was a glorious victory, wasn't it?" said the White Knight, as he came up panting.

"I don't know," Alice said doubtfully. "I don't want to be anybody's prisoner. I want to be a Queen."

"So you will, when you've crossed the next brook," said the White Knight. "I'll see you safe to the end of the wood—and then I must go back, you know. That's the end of my move."

"Thank you very much," said Alice. "May I help you off with your helmet?" It was evidently more than he could manage by himself: however she managed to shake him out of it at last.

"Now one can breathe more easily," said the Knight, putting back his shaggy hair with both hands, and turning his gentle face and large mild eyes to Alice. She thought she had never seen such a strange-looking soldier in all her life.

He was dressed in tin armour, which seemed to fit him very badly, and he had a queer-shaped little deal box fastened across his shoulder, upside-down, and with the lid hanging open. Alice looked at it with great curiosity.

"I see you're admiring my little box," the Knight said in a friendly tone. "It's my own invention—to keep clothes and sandwiches in. You see I carry it upside-down, so that the rain ca'n't get in."

"But the things can get *out*," Alice gently remarked. "Do you know the lid's open?"

"I didn't know it," the Knight said, a shade of vexation passing over his face. "Then all the things must have fallen out! And the box is no use without them." He unfastened it as he spoke, and was just going to throw it into the bushes, when a sudden thought seemed to strike him, and he hung it carefully on a tree. "Can you guess why I did that?" he said to Alice.

Alice shook her head.

"In hopes some bees may make a nest in it—then I should get the honey."

"But you've got a bee-hive—or something like one—fastened to the saddle," said Alice.

"Yes, it's a very good bee-hive," the Knight said in a discontented tone, "one of the best kind. But not a single bee has come near it yet. And the other thing is a mouse-trap. I suppose the mice keep the bees out—or the bees keep the mice out, I don't know which."

"I was wondering what the mouse-trap was for," said Alice. "It isn't very likely there would be any mice on the horse's back."

"Not very likely, perhaps," said the Knight: "but, if they *do* come, I don't choose to have them running all about."

"You see," he went on after a pause, "it's as well to be provided for *everything*. That's the reason the horse has all those anklets round his feet."

"But what are they for?" Alice asked in a tone of great curiosity.

"To guard against the bites of sharks," the Knight replied. "It's an invention

of my own. And now help me on. I'll go with you to the end of the wood—
What's that dish for?"

"It's meant for plum-cake," said Alice.

"We'd better take it with us," the Knight said. "It'll come in handy if we find any plum-cake. Help me to get it into this bag."

This took a very long time to manage, though Alice held the bag open very carefully, because the Knight was so *very* awkward in putting in the dish: the first two or three times that he tried he fell in himself instead. "It's rather a tight fit, you see," he said, as they got it in at last; "there are so many candlesticks in the bag." And he hung it to the saddle, which was already loaded with bunches of carrots, and fire-irons, and many other things.

"I hope you've got your hair well fastened on?" he continued, as they set off.

"Only in the usual way," Alice said, smiling.

"That's hardly enough," he said, anxiously. "You see the wind is so *very* strong here. It's as strong as soup."

"Have you invented a plan for keeping the hair from being blown *off*⁸?" Alice enquired.

"Not yet," said the Knight. "But I've got a plan for keeping it from *falling* off."

"I should like to hear it, very much."

"First you take an upright stick," said the Knight. "Then you make your hair creep up it, like a fruit-tree. Now the reason hair falls off is because it hangs *down*—things never fall *upwards*, you know. It's a plan of my own invention. You may try it if you like."

It didn't sound a comfortable plan, Alice thought, and for a few minutes she walked on in silence, puzzling over the idea, and every now and then stopping to help the poor Knight, who certainly was *not* a good rider.

Whenever the horse stopped (which it did very often), he fell off in front; and, whenever it went on again (which it generally did rather suddenly), he fell off behind. Otherwise he kept on pretty well, except that he had a habit of now and then falling off sideways; and, as he generally did this on the side on which Alice was walking, she soon found that it was the best plan not to walk *quite* close to the horse.

"I'm afraid you've not had much practice in riding," she ventured to say, as she was helping him up from his fifth tumble.

The Knight looked very much surprised, and a little offended at the remark. "What makes you say that?" he asked, as he scrambled back into the saddle, keeping hold of Alice's hair with one hand, to save himself from falling over on the other side.

"Because people don't fall off quite so often, when they've had much practice."

"I've had plenty of practice," the Knight said very gravely: "plenty of practice!"

Alice could think of nothing better to say than "Indeed?" but she said it as heartily as she could. They went on a little way in silence after this, the Knight with his eyes shut, muttering to himself, and Alice watching anxiously for the next tumble.

⁸Mistakenly "of" in later editions

“The great art of riding,” the Knight suddenly began in a loud voice, waving his right arm as he spoke, “is to keep——” Here the sentence ended as suddenly as it had begun, as the Knight fell heavily on the top of his head exactly in the path where Alice was walking. She was quite frightened this time, and said in an anxious tone, as she picked him up, “I hope no bones are broken?”

“None to speak of,” the Knight said, as if he didn’t mind breaking two or three of them. “The great art of riding, as I was saying, is—to keep your balance properly. Like this, you know——”

He let go the bridle, and stretched out both his arms to show Alice what he meant, and this time he fell flat on his back, right under the horse’s feet.

“Plenty of practice!” he went on repeating, all the time that Alice was getting him on his feet again. “Plenty of practice!”

“It’s too ridiculous!” cried Alice, losing all her patience this time. “You ought to have a wooden horse on wheels, that you ought!”

“Does that kind go smoothly?” the Knight asked in a tone of great interest, clasping his arms round the horse’s neck as he spoke, just in time to save himself from tumbling off again.

“Much more smoothly than a live horse,” Alice said, with a little scream of laughter, in spite of all she could do to prevent it.

“I’ll get one,” the Knight said thoughtfully to himself. “One or two—several.”

There was a short silence after this, and then the Knight went on again. “I’m a great hand at inventing things. Now, I daresay you noticed, that last time you picked me up, that I was looking rather thoughtful?”

“You *were* a little grave,” said Alice.

(Frontispiece)

“Well, just then I was inventing a new way of getting over a gate—would you like to hear it?”

“Very much indeed,” Alice said politely.

“I’ll tell you how I came to think of it,” said the Knight. “You see, I said to myself ‘The only difficulty is with the feet: the *head* is high enough already.’ Now, first I put my head on the top of the gate—then the head’s high enough—then I stand on my head—then the feet are high enough, you see—then I’m over, you see.”

“Yes, I suppose you’d be over when that was done,” Alice said thoughtfully: “but don’t you think it would be rather hard?”

“I haven’t tried it yet,” the Knight said, gravely; “so I ca’n’t tell for certain—but I’m afraid it *would* be a little hard.”

He looked so vexed at the idea, that Alice changed the subject hastily. “What a curious helmet you’ve got!” she said cheerfully. “Is that your invention too?”

The Knight looked down proudly at his helmet, which hung from the saddle. “Yes,” he said; “but I’ve invented a better one than that—like a sugar-loaf. When I used to wear it, if I fell off the horse, it always touched the ground directly. So I had a *very* little way to fall, you see—But there *was* the danger of falling *into* it, to be sure. That happened to me once—and the worst of it was, before I could get out again, the other White Knight came and put it on. He thought it was his own helmet.”

The Knight looked so solemn about it that Alice did not dare to laugh. “I’m afraid you must have hurt him,” she said in a trembling voice, “being on the top of his head.”

“I had to kick him, of course,” the Knight said, very seriously. “And then he took the helmet off again—but it took hours and hours to get me out. I was as fast as—as lightning, you know.”

“But that’s a different kind of fastness,” Alice objected.

The Knight shook his head. “It was all kinds of fastness with me, I can assure you!” he said. He raised his hands in some excitement as he said this, and instantly rolled out of the saddle, and fell headlong into a deep ditch.

Alice ran to the side of the ditch to look for him. She was rather startled by the fall, as for some time he had kept on very well, and she was afraid that he really *was* hurt this time. However, though she could see nothing but the soles of his feet, she was much relieved to hear that he was talking on in his usual tone. “All kinds of fastness,” he repeated: “but it was careless of him to put another man’s helmet on—with the man in it, too.”

“How *can* you go on talking so quietly, head downwards?” Alice asked, as she dragged him out by the feet, and laid him in a heap on the bank.

The Knight looked surprised at the question. “What does it matter where my body happens to be?” he said. “My mind goes on working all the same. In fact, the more head-downwards I am, the more I keep inventing new things.”

“Now the cleverest thing of the sort that I ever did,” he went on after a pause, “was inventing a new pudding during the meat-course.”

“In time to have it cooked for the next course?” said Alice. “Well, that *was* quick work, certainly!”

“Well, not the *next* course,” the Knight said in a slow thoughtful tone: “no, certainly not the next *course*.”

“Then it would have to be the next day. I suppose you wouldn’t have two pudding-courses in one dinner?”

“Well, not the *next* day,” the Knight repeated as before: “not the next *day*. In fact,” he went on, holding his head down, and his voice getting lower and lower, “I don’t believe that pudding ever *was* cooked! In fact, I don’t believe that pudding ever *will* be cooked! And yet it was a very clever pudding to invent.”

“What did you mean it to be made of?” Alice asked, hoping to cheer him up, for the poor Knight seemed quite low-spirited about it.

“It began with blotting-paper,” the Knight answered with a groan.

“That wouldn’t be very nice, I’m afraid——”

“Not very nice *alone*,” he interrupted, quite eagerly: “but you’ve no idea what a difference it makes, mixing it with other things—such as gunpowder and sealing-wax. And here I must leave you.” They had just come to the end of the wood.

Alice could only look puzzled: she was thinking of the pudding.

“You are sad,” the Knight said in an anxious tone: “let me sing you a song to comfort you.”

“Is it very long?” Alice asked, for she had heard a good deal of poetry that day.

“It’s long,” said the Knight, “but it’s very, *very* beautiful. Everybody that hears me sing it—either it brings the *tears* into their eyes, or else——”

“Or else what?” said Alice, for the Knight had made a sudden pause.

“Or else it doesn’t, you know. The name of the song is called ‘*Haddock’s Eyes*.’”

“Oh, that’s the name of the song, is it?” Alice said, trying to feel interested.

“No, you don’t understand,” the Knight said, looking a little vexed. “That’s what the name is *called*. The name really *is* ‘*The Aged Aged Man*.’”

“Then I ought to have said ‘That’s what the *song* is called’?” Alice corrected herself.

“No, you oughtn’t: that’s quite another thing! The *song* is called ‘*Ways And Means*’: but that’s only what it’s *called*, you know!”

“Well, what *is* the song, then?” said Alice, who was by this time completely bewildered.

"I was coming to that," the Knight said. "The song really *is* 'A-sitting on A Gate': and the tune's my own invention."

So saying, he stopped his horse and let the reins fall on its neck: then, slowly beating time with one hand, and with a faint smile lighting up his gentle foolish face, as if he enjoyed the music of his song, he began.

Of all the strange things that Alice saw in her journey Through The Looking-Glass, this was the one that she always remembered most clearly. Years afterwards she could bring the whole scene back again, as if it had been only yesterday—the mild blue eyes and kindly smile of the Knight—the setting sun gleaming through his hair, and shining on his armour in a blaze of light that quite dazzled her—the horse quietly moving about, with the reins hanging loose on his neck, cropping the grass at her feet—and the black shadows of the forest behind—all this she took in like a picture, as, with one hand shading her eyes, she leant against a tree, watching the strange pair, and listening, in a half-dream, to the melancholy music of the song.

"But the tune *isn't* his own invention," she said to herself: "it's 'I give thee all, I can no more.'" She stood and listened very attentively, but no tears came into her eyes.

Quoted from *My Heart and Lute* by Thomas Moore

*"I'll tell thee everything I can:
There's little to relate.
I saw an aged aged man,
A-sitting on a gate.
'Who are you, aged man?' I said.
'And how is it you live?'
And his answer trickled through my head,
Like water through a sieve.
He said 'I look for butterflies
That sleep among the wheat:
I make them into mutton-pies,
And sell them in the street.
I sell them unto men,' he said,
'Who sail on stormy seas;
And that's the way I get my bread—
A trifle, if you please.'
But I was thinking of a plan
To dye one's whiskers green,
And always use so large a fan
That they could not be seen.
So, having no reply to give
To what the old man said,
I cried 'Come, tell me how you live!'
And thumped him on the head.
His accents mild took up the tale:
He said 'I go my ways,
And when I find a mountain-rill,
I set it in a blaze;
And thence they make a stuff they call
Rolands' Macassar-Oil—*

Parody on *Resolution and Independence* by William Wordsworth

*Yet twopence-halfpenny is all
 They give me for my toil.'*
*But I was thinking of a way
 To feed oneself on batter,
 And so go on from day to day
 Getting a little fatter.
 I shook him well from side to side,
 Until his face was blue:
 'Come, tell me how you live,' I cried,
 'And what it is you do!'*

*He said 'I hunt for haddocks' eyes
 Among the heather bright,
 And work them into waistcoat-buttons
 In the silent night.
 And these I do not sell for gold
 Or coin of silvery shine,
 But for a copper halfpenny,
 And that will purchase nine.
 'I sometimes dig for buttered rolls,
 Or set limed twigs for crabs:
 I sometimes search the grassy knolls
 For wheels of Hansom-cabs.
 And that's the way' (he gave a wink)
 'By which I get my wealth—
 And very gladly will I drink
 Your Honour's noble health.'*
*I heard him then, for I had just
 Completed my design
 To keep the Menai bridge from rust*

*By boiling it in wine.
 I thanked him much for telling me
 The way he got his wealth,
 But chiefly for his wish that he
 Might drink my noble health.
 And now, if e'er by chance I put
 My fingers into glue,
 Or madly squeeze a right-hand foot
 Into a left-hand shoe,
 Or if I drop upon my toe
 A very heavy weight,
 I weep, for it reminds me so,
 Of that old man I used to know—
 Whose look was mild, whose speech was slow,
 Whose hair was whiter than the snow,
 Whose face was very like a crow,
 With eyes, like cinders, all aglow,
 Who seemed distracted with his woe,
 Who rocked his body to and fro,
 And muttered mumblingly and low,
 As if his mouth were full of dough,
 Who snorted like a buffalo—
 That summer evening, long ago,
 A-sitting on a gate.”*

As the Knight sang the last words of the ballad, he gathered up the reins, and turned his horse's head along the road by which they had come. "You've only a few yards to go," he said, "down the hill and over that little brook, and then you'll be a Queen—but you'll stay and see me off first?" he added as Alice turned with an eager look in the direction to which he pointed. "I sha'n't be long. You'll wait and wave your handkerchief when I get to that turn in the road! I think it'll encourage me, you see."

"Of course I'll wait," said Alice: "and thank you very much for coming so far—and for the song—I liked it very much."

"I hope so," the Knight said doubtfully: "but you didn't cry so much as I thought you would."

So they shook hands, and then the Knight rode slowly away into the forest. "It wo'n't take long to see him *off*, I expect," Alice said to herself, as she stood watching him. "There he goes! Right on his head as usual! However, he gets on again pretty easily—that comes of having so many things hung round the horse——" So she went on talking to herself, as she watched the horse walking leisurely along the road, and the Knight tumbling off, first on one side and then on the other. After the fourth or fifth tumble he reached the turn, and then she waved her handkerchief to him, and waited till he was out of sight.

"I hope it encouraged him," she said, as she turned to run down the hill: "and now for the last brook, and to be a Queen! How grand it sounds!" A very few steps brought her to the edge of the brook. "The Eighth Square at last!" she cried as she bounded across,

* * * * *
* * * * *
* * * * *

and threw herself down to rest on a lawn as soft as moss, with little flower-beds dotted about it here and there. “Oh, how glad I am to get here! And what *is* this on my head?” she exclaimed in a tone of dismay, as she put her hands up to something very heavy, that fitted tight all round her head.

“But how *can* it have got there without my knowing it?” she said to herself, as she lifted it off, and set it on her lap to make out what it could possibly be.

It was a golden crown.

Chapter IX. Queen Alice

“Well, this *is* grand!” said Alice. “I never expected I should be a Queen so soon—and I’ll tell you what it is, your Majesty,” she went on, in a severe tone

(she was always rather fond of scolding herself), "it'll never do for you to be lolling about on the grass like that! Queens have to be dignified, you know!"

So she got up and walked about—rather stiffly just at first, as she was afraid that the crown might come off: but she comforted herself with the thought that there was nobody to see her, "and if I really am a Queen," she said as she sat down again, "I shall be able to manage it quite well in time."

Everything was happening so oddly that she didn't feel a bit surprised at finding the Red Queen and the White Queen sitting close to her, one on each side: she would have liked very much to ask them how they came there, but she feared it would not be quite civil. However, there would be no harm, she thought, in asking if the game was over. "Please, would you tell me——" she began, looking timidly at the Red Queen.

"Speak when you're spoken to!" the Queen sharply interrupted her.

"But if everybody obeyed that rule," said Alice, who was always ready for a little argument, "and if you only spoke when you were spoken to, and the other person always waited for *you* to begin, you see nobody would ever say anything, so that——"

"Ridiculous!" cried the Queen. "Why, don't you see, child——" here she broke off with a frown, and, after thinking for a minute, suddenly changed the subject of the conversation. "What do you mean by 'If you really are a Queen'? What right have you to call yourself so? You ca'n't be a Queen, you know, till you've passed the proper examination. And the sooner we begin it, the better."

"I only said 'if'!" poor Alice pleaded in a piteous tone.

The two Queens looked at each other, and the Red Queen remarked, with a little shudder, "She *says* she only said 'if'——"

"But she said a great deal more than that!" the White Queen moaned, wringing her hands. "Oh, ever so much more than that!"

"So you did, you know," the Red Queen said to Alice. "Always speak the truth—think before you speak—and write it down afterwards."

"I'm sure I didn't mean——" Alice was beginning, but the Red Queen interrupted her impatiently.

"That's just what I complain of! You *should* have meant! What do you suppose is the use of child without any meaning? Even a joke should have some meaning—and a child's more important than a joke, I hope. You couldn't deny that, even if you tried with both hands."

"I don't deny things with my *hands*," Alice objected.

"Nobody said you did," said the Red Queen. "I said you couldn't if you tried."

"She's in that state of mind," said the White Queen, "that she wants to deny *something*—only she doesn't know what to deny!"

"A nasty, vicious temper," the Red Queen remarked; and then there was an uncomfortable silence for a minute or two.

The Red Queen broke the silence by saying, to the White Queen, "I invite you to Alice's dinner-party this afternoon."

The White Queen smiled feebly, and said "And I invite *you*."

"I didn't know I was to have a party at all," said Alice; "but, if there *is* to be one, I think *I* ought to invite the guests."

"We gave you the opportunity of doing it," the Red Queen remarked: "but I daresay you've not had many lessons in manners yet?"

"Manners are not taught in lessons," said Alice. "Lessons teach you to do sums, and things of that sort."

"Can you do Addition?" the White Queen asked. "What's one and one and one and one and one and one and one and one and one and one?"

"I don't know," said Alice. "I lost count."

"She ca'n't do Addition," the Red Queen interrupted. "Can you do Subtraction? Take nine from eight."

"Nine from eight I ca'n't, you know," Alice replied very readily: "but——"

"She ca'n't do Subtraction," said the White Queen. "Can you do Division? Divide a loaf by a knife—what's the answer to *that*?"

"I suppose——" Alice was beginning, but the Red Queen answered for her. "Bread-and-butter, of course. Try another Subtraction sum. Take a bone from a dog: what remains?"

Alice considered. "The bone wouldn't remain, of course, if I took it—and the dog wouldn't remain: it would come to bite me—and I'm sure *I* shouldn't remain!"

"Then you think nothing would remain?" said the Red Queen.

"I think that's the answer."

"Wrong, as usual," said the Red Queen: "the dog's temper would remain."

"But I don't see how——"

"Why, look here!" the Red Queen cried. "The dog would lose its temper, wouldn't it?"

"Perhaps it would," Alice replied cautiously.

"Then if the dog went away, its temper would remain!" the Queen exclaimed triumphantly.

Alice said, as gravely as she could, "They might go different ways." But she couldn't help thinking to herself "What dreadful nonsense we *are* talking!"

"She ca'n't do sums a *bit*!" the Queens said together, with great emphasis.

"Can *you* do sums?" Alice said, turning suddenly on the White Queen, for she didn't like being found fault with so much.

The Queen gasped and shut her eyes. "I can do Addition," she said, "if you give me time—but I ca'n't do Subtraction, under *any* circumstances!"

"Of course you know your ABC?" said the Red Queen.

"To be sure I do," said Alice.

"So do I," the White Queen whispered: "we'll often say it over together, dear. And I'll tell you a secret—I can read words of one letter! Isn't *that* grand! However, don't be discouraged. You'll come to it in time."

Here the Red Queen began again. "Can you answer useful questions?" she said. "How is bread made?"

"I know *that!*" Alice cried eagerly. "You take some flour——"

"Where do you pick the flower?" the White Queen asked. "In a garden or in the hedges?"

"Well, it isn't *picked* at all," Alice explained: "it's *ground*——"

"How many acres of ground?" said the White Queen. "You mustn't leave out so many things."

"Fan her head!" the Red Queen anxiously interrupted. "She'll be feverish after so much thinking." So they set to work and fanned her with bunches of leaves, till she had to beg them to leave off, it blew her hair about so.

"She's all right again now," said the Red Queen. "Do you know Languages? What's the French for fiddle-de-dee?"

"Fiddle-de-dee's not English," Alice replied gravely.

"Who ever said it was?" said the Red Queen.

Alice thought she saw a way out of the difficulty, this time. "If you'll tell me what language 'fiddle-de-dee' is, I'll tell you the French for it!" she exclaimed triumphantly.

But the Red Queen drew herself up rather stiffly, and said "Queens never make bargains."

"I wish Queens never asked questions," Alice thought to herself.

"Don't let us quarrel," the White Queen said in an anxious tone. "What is the cause of lightning?"

"The cause of lightning," Alice said very decidedly, for she felt quite certain about this, "is the thunder—no, no!" she hastily corrected herself. "I meant the other way."

"It's too late to correct it," said the Red Queen: "when you've once said a thing, that fixes it, and you must take the consequences."

"Which reminds me——" the White Queen said, looking down and nervously clasping and unclasping her hands, "we had *such* a thunderstorm last Tuesday—I mean one of the last set of Tuesdays, you know."

Alice was puzzled. "In *our* country," she remarked, "there's only one day at a time."

The Red Queen said "That's a poor thin way of doing things. Now *here*, we mostly have days and nights two or three at a time, and sometimes in the winter we take as many as five nights together—for warmth, you know."

"Are five nights warmer than one night, then?" Alice ventured to ask.

"Five times as warm, of course."

"But they should be five times as *cold*, by the same rule——"

"Just so!" cried the Red Queen. "Five times as warm, *and* five times as cold—just as I'm five times as rich as you are, *and* five times as clever!"

Alice sighed and gave it up. "It's exactly like a riddle with no answer!" she thought.

"Humpty Dumpty saw it too," the White Queen went on in a low voice, more as if she were talking to herself. "He came to the door with a corkscrew in his hand——"

“What did he want?” said the Red Queen.

“He said he *would* come in,” the White Queen went on, “because he was looking for a hippopotamus. Now, as it happened, there wasn’t such a thing in the house, that morning.”

“Is there generally?” Alice asked in an astonished tone.

“Well, only on Thursdays,” said the Queen.

“I know what he came for,” said Alice: “he wanted to punish the fish, because——”

Here the White Queen began again. “It was *such* a thunderstorm, you ca’n’t think!” (“She *never* could, you know,” said the Red Queen.) “And part of the roof came off, and ever so much thunder got in—and it went rolling round the room in great lumps—and knocking over the tables and things—till I was so frightened, I couldn’t remember my own name!”

Alice thought to herself “I never should *try* to remember my name in the middle of an accident! Where would be the use of it?” but she did not say this aloud, for fear of hurting the poor Queen’s feeling.

“Your Majesty must excuse her,” the Red Queen said to Alice, taking one of the White Queen’s hands in her own, and gently stroking it: “she means well, but she ca’n’t help saying foolish things, as a general rule.”

The White Queen looked timidly at Alice, who felt she *ought* to say something kind, but really couldn’t think of anything at the moment.

“She never was really well brought up,” the Red Queen went on: “but it’s amazing how good-tempered she is! Pat her on the head, and see how pleased she’ll be!” But this was more than Alice had courage to do.

“A little kindness—and putting her hair in papers—would do wonders with her——”

The White Queen gave a deep sigh, and laid her head on Alice’s shoulder. “I *am* so sleepy!” she moaned.

“She’s tired, poor thing!” said the Red Queen. “Smooth her hair—lend her your nightcap—and sing her a soothing lullaby.”

“I haven’t got a nightcap with me,” said Alice, as she tried to obey the first direction: “and I don’t know any soothing lullabies.”

“I must do it myself, then,” said the Red Queen, and she began:—

*“Hush-a-by lady, in Alice’s lap!
Till the feast’s ready, we’ve time for a nap:
When the feast’s over, we’ll go to the ball—
Red Queen, and White Queen, and Alice, and all!”*

Parody on nursery
rhyme *Rock-a-bye
Baby*

“And now you know the words,” she added, as she put her head down on Alice’s other shoulder, “just sing it through to *me*. I’m getting sleepy, too.” In another moment both Queens were fast asleep, and snoring loud.

“What *am* I to do?” exclaimed Alice, looking about in great perplexity, as first one round head, and then the other, rolled down from her shoulder, and lay like a heavy lump in her lap. “I don’t think it *ever* happened before, that any one had to take care of two Queens asleep at once! No, not in all the History of England—it couldn’t, you know, because there never was more than one Queen at a time. Do wake up, you heavy things!” she went on in an impatient tone; but there was no answer but a gentle snoring.

The snoring got more distinct every minute, and sounded more like a tune: at last she could even make out words, and she listened so eagerly that, when the two great heads suddenly vanished from her lap, she hardly missed them.

She was standing before an arched doorway, over which were the words "QUEEN ALICE" in large letters, and on each side of the arch there was a bell-handle; one was marked "Visitors' Bell," and the other "Servants' Bell."

"I'll wait till the song's over," thought Alice, "and then I'll ring—the—*which* bell must I ring?" she went on, very much puzzled by the names. "I'm not a visitor, and I'm not a servant. There *ought* to be one marked 'Queen,' you know——"

Just then the door opened a little way, and a creature with a long beak put its head out for a moment and said "No admittance till the week after next!" and shut the door again with a bang.

Alice knocked and rang in vain for a long time; but at last a very old Frog, who was sitting under a tree, got up and hobbled slowly towards her: he was dressed in bright yellow, and had enormous boots on.

"What is it, now?" the Frog said in a deep hoarse whisper.

Alice turned round, ready to find fault with anybody. "Where's the servant whose business it is to answer the door?" she began angrily.

"Which door?" said the Frog.

Alice almost stamped with irritation at the slow drawl in which he spoke. "*This* door, of course!"

The Frog looked at the door with his large dull eyes for a minute: then he went nearer and rubbed it with his thumb, as if he were trying whether the paint would come off: then he looked at Alice.

"To answer the door?" he said. "What's it been asking of?" He was so hoarse that Alice could scarcely hear him.

"I don't know what you mean," she said.

"I speaks English, doesn't I?" the Frog went on. "Or are you deaf? What did it ask you?"

"Nothing!" Alice said impatiently. "I've been knocking at it!"

"Shouldn't do that—shouldn't do that——" the Frog muttered. "Vexes it, you know." Then he went up and gave the door a kick with one of his great feet.

“You let *it* alone,” he panted out, as he hobbled back to his tree, “and it’ll let *you* alone, you know.”

At this moment the door was flung open, and a shrill voice was heard singing:—

*“To the Looking-Glass world it was Alice that said
I’ve a sceptre in hand, I’ve a crown on my head.
Let the Looking-Glass creatures, whatever they be
Come and dine with the Red Queen, the White Queen, and me.”*

Parody on *Bonny Dundee* (*The Doom of Devorgoil*) by Walter Scott

And hundreds of voices joined in the chorus:—

*“Then fill up the glasses as quick as you can,
And sprinkle the table with buttons and bran:
Put cats in the coffee, and mice in the tea—
And welcome Queen Alice with thirty-times-three!”*

Then followed a confused noise of cheering, and Alice thought to herself “Thirty times three makes ninety. I wonder if any one’s counting?” In a minute there was silence again, and the same shrill voice sang another verse:—

*“‘O Looking-Glass creatures,’ quoth Alice, ‘draw near!
'Tis an honour to see me, a favour to hear:
'Tis a privilege high to have dinner and tea
Along with the Red Queen, the White Queen, and me!’”*

Then came the chorus again:—

*“Then fill up the glasses with treacle and ink,
Or anything else that is pleasant to drink:
Mix sand with the cider, and wool with the wine—
And welcome Queen Alice with ninety-times-nine!”*

“Ninety times nine!” Alice repeated in despair, “Oh, that’ll never be done! I’d better go in at once——” and in she went, and there was a dead silence the moment she appeared.

Alice glanced nervously along the table, as she walked up the large hall, and noticed that there were about fifty guests, of all kinds: some were animals, some birds, and there were even a few flowers among them. “I’m glad they’ve come without waiting to be asked,” she thought: “I should never have known who were the right people to invite!”

There were three chairs at the head of the table: the Red and White Queens had already taken two of them, but the middle one was empty. Alice sat down in it, rather uncomfortable at the silence, and longing for some one to speak.

At last the Red Queen began. “You’ve missed the soup and fish,” she said. “Put on the joint!” And the waiters set a leg of mutton before Alice, who looked at it rather anxiously, as she had never had to carve a joint before.

“You look a little shy: let me introduce you to that leg of mutton,” said the Red Queen. “Alice——Mutton: Mutton——Alice.” The leg of mutton got up in the dish and made a little bow to Alice; and Alice returned the bow, not knowing whether to be frightened or amused.

“May I give you a slice?” she said, taking up the knife and fork, and looking from one Queen to the other.

“Certainly not,” the Red Queen said, very decidedly: “it isn’t etiquette to cut any one you’ve been introduced to. Remove the joint!” And the waiters carried it off, and brought a large plum-pudding in its place.

“I wo’n’t be introduced to the pudding, please,” Alice said rather hastily, “or we shall get no dinner at all. May I give you some?”

But the Red Queen looked sulky, and growled “Pudding——Alice: Alice——Pudding. Remove the pudding!”, and the waiters took it away so quickly that Alice couldn’t return its bow.

However, she didn’t see why the Red Queen should be the only one to give orders; so, as an experiment, she called out “Waiter! Bring back the pudding!”, and there it was again in a moment, like a conjuring-trick. It was so large that she couldn’t help feeling a *little* shy with it, as she had been with the mutton: however, she conquered her shyness by a great effort, and cut a slice and handed it to the Red Queen.

“What impertinence!” said the Pudding. “I wonder how you’d like it, if I were to cut a slice out of *you*, you creature!”

It spoke in a thick, suety sort of voice, and Alice hadn’t a word to say in reply: she could only sit and look at it and gasp.

“Make a remark,” said the Red Queen: “it’s ridiculous to leave all the conversation to the pudding!”

“Do you know, I’ve had such a quantity of poetry repeated to me to-day,” Alice began, a little frightened at finding that, the moment she opened her lips, there was dead silence, and all eyes were fixed upon her; “and it’s a very curious thing, I think—every poem was about fishes in some way. Do you know why they’re so fond of fishes, all about here?”

She spoke to the Red Queen, whose answer was a little wide of the mark. “As to fishes,” she said, very slowly and solemnly, putting her mouth close to Alice’s ear, “her White Majesty knows a lovely riddle—all in poetry—all about fishes. Shall she repeat it?”

“Her Red Majesty’s very kind to mention it,” the White Queen murmured into Alice’s other ear, in a voice like the cooing of a pigeon. “It would be *such* a treat! May I?”

“Please do,” Alice said very politely.

The White Queen laughed with delight, and stroked Alice’s cheek. Then she began:

*“‘First, the fish must be caught.’
That is easy: a baby, I think, could have caught it.
‘Next, the fish must be bought.’
That is easy: a penny, I think, would have bought it.
‘Now cook me the fish!’
That is easy, and will not take more than a minute.
‘Let it lie in a dish!’
That is easy, because it already is in it.
‘Bring it here! Let me sup!’
It is easy to set such a dish on the table.
‘Take the dish-cover up!’*

*Ah, that is so hard that I fear I'm unable!
For it holds it like glue—
Holds the lid to the dish, while it lies in the middle:
Which is easiest to do,
Un-dish-cover the fish, or dishcover the riddle?"*

"Take a minute to think about it, and then guess," said the Red Queen. "Meanwhile, we'll drink your health—Queen Alice's health!" she screamed at the top of her voice, and all the guests began drinking it directly, and very queerly they managed it: some of them put their glasses upon their heads like extinguishers, and drank all that trickled down their faces—others upset the decanters, and drank the wine as it ran off the edges of the table—and three of them (who looked like kangaroos) scrambled into the dish of roast mutton, and began eagerly lapping up the gravy, "just like pigs in a trough!" thought Alice.

"You ought to return thanks in a neat speech," the Red Queen said, frowning at Alice as she spoke.

"We must support you, you know," the White Queen whispered, as Alice got up to do it, very obediently, but a little frightened.

"Thank you very much," she whispered in reply, "but I can do quite well without."

"That wouldn't be at all the thing," the Red Queen said very decidedly: so Alice tried to submit to it with a good grace.

("And they *did* push so!" she said afterwards, when she was telling her sister the history of the feast. "You would have thought they wanted to squeeze me flat!")

In fact it was rather difficult for her to keep in her place while she made her speech: the two Queens pushed her so, one on each side, that they nearly lifted her up into the air. "I rise to return thanks——" Alice began: and she really *did* rise as she spoke, several inches; but she got hold of the edge of the table, and managed to pull herself down again.

"Take care of yourself!" screamed the White Queen, seizing Alice's hair with both her hands. "Something's going to happen!"

And then (as Alice afterwards described it) all sorts of things happened in a moment. The candles all grew up to the ceiling, looking something like a bed of rushes with fireworks at the top. As to the bottles, they each took a pair of plates, which they hastily fitted on as wings, and so, with forks for legs, went fluttering about in all directions: "and very like birds they look," Alice thought to herself, as well as she could in the dreadful confusion that was beginning.

At this moment she heard a hoarse laugh at her side, and turned to see what was the matter with the White Queen; but, instead of the Queen, there was the leg of mutton sitting in the chair. "Here I am!" cried a voice from the soup-tureen, and Alice turned again, just in time to see the Queen's broad good-natured face grinning at her for a moment over the edge of the tureen, before she disappeared into the soup.

There was not a moment to be lost. Already several of the guests were lying down in the dishes, and the soup-ladle was walking up the table towards Alice's chair, and beckoning to her impatiently to get out of its way.

"I ca'n't stand this any longer!" she cried, as she jumped up and seized the table-cloth with both hands: one good pull, and plates, dishes, guests, and candles came crashing down together in a heap on the floor.

“And as for *you*,” she went on, turning fiercely upon the Red Queen, whom she considered as the cause of all the mischief—but the Queen was no longer at her side—she had suddenly dwindled down to the size of a little doll, and was now on the table, merrily running round and round after her own shawl, which was trailing behind her.

At any other time, Alice would have felt surprised at this, but she was far too much excited to be surprised at anything *now*. “As for *you*,” she repeated, catching hold of the little creature in the very act of jumping over a bottle which had just lighted upon the table, “I’ll shake you into a kitten, that I will!”

Chapter X. Shaking

She took her off the table as she spoke, and shook her backwards and forwards with all her might.

The Red Queen made no resistance whatever: only her face grew very small, and her eyes got large and green: and still, as Alice went on shaking her, she kept on growing shorter—and fatter—and softer—and rounder—and——

Chapter XI. Waking

——and it really *was* a kitten, after all.

Chapter XII. Which Dreamed It?

“Your Red Majesty shouldn’t purr so loud,” Alice said, rubbing her eyes, and addressing the kitten, respectfully, yet with some severity. “You woke me out of oh! such a nice dream! And you’ve been along with me, Kitty—all through the Looking-Glass world. Did you know it, dear?”

It is a very inconvenient habit of kittens (Alice had once made the remark) that, whatever you say to them, they *always* purr. “If they would only purr for ‘yes’ and mew for ‘no,’ or any rule of that sort,” she had said, “so that one could

keep up a conversation! But how *can* you talk with a person if they *always* say the same thing?"

On this occasion the kitten only purred: and it was impossible to guess whether it meant 'yes' or 'no.'

So Alice hunted among the chessmen on the table till she had found the Red Queen: then she went down on her knees on the hearth-rug, and put the kitten and the Queen to look at each other. "Now, Kitty!" she cried, clapping her hands triumphantly. "Confess that was what you turned into!"

("But it wouldn't look at it," she said, when she was explaining the thing afterwards to her sister: "it turned away its head, and pretended not to see it: but it looked a *little* ashamed of itself, so I think it *must* have been the Red Queen.")

"Sit up a little more stiffly, dear!" Alice cried with a merry laugh. "And curtsy while you're thinking what to—what to purr. It saves time, remember!" And she caught it up and gave it one little kiss, "just in honour of having been a Red Queen."

"Snowdrop, my pet!" she went on, looking over her shoulder at the White Kitten, which was still patiently undergoing its toilet, "when *will* Dinah have finished with your White Majesty, I wonder? That must be the reason you were so untidy in my dream.—Dinah! do you know that you're scrubbing a White Queen? Really, it's most disrespectful of you!

"And what did *Dinah* turn to, I wonder?" she prattled on, as she settled comfortably down, with one elbow in the rug, and her chin in her hand, to watch the kittens. "Tell me, Dinah, did you turn to Humpty Dumpty? I *think*

you did—however, you'd better not mention it to your friends just yet, for I'm not sure.

“By the way, Kitty, if only you'd been really with me in my dream, there was one thing you *would* have enjoyed—I had such a quantity of poetry said to me, all about fishes! To-morrow morning you shall have a real treat. All the time you're eating your breakfast, I'll repeat 'The Walrus and the Carpenter' to you; and then you can make believe it's oysters, dear!

“Now, Kitty, let's consider who it was that dreamed it all. This is a serious question, my dear, and you should *not* go on licking your paw like that—as if Dinah hadn't washed you this morning! You see, Kitty, it *must* have been either me or the Red King. He was part of my dream, of course—but then I was part of his dream, too! *Was* it the Red King, Kitty? You were his wife, my dear, so you ought to know—Oh, Kitty, *do* help to settle it! I'm sure your paw can wait!” But the provoking kitten only began on the other paw, and pretended it hadn't heard the question.

Which do *you* think it was?

Chapter I

Alice was beginning to get very tired of sitting by her sister on the bank, and of having nothing to do: once or twice she had peeped into the book her sister was reading, but it had no pictures or conversations in it, and where is the use of a book, thought Alice, without pictures or conversations? So she was considering in her own mind, (as well as she could, for the hot day made her feel very sleepy and stupid,) whether the pleasure of making a daisy-chain was worth the trouble of getting up and picking the daisies, when a white rabbit with pink eyes ran close by her.

There was nothing very remarkable in that, nor did Alice think it so *very* much out of the way to hear the rabbit say to itself “dear, dear! I shall be too late!” (when she thought it over afterwards, it occurred to her that she ought to have wondered at this, but at the time it all seemed quite natural); but when the rabbit actually *took a watch out of its waistcoat-pocket*, looked at it, and then hurried on, Alice started to her feet, for it flashed across her mind that she had never before seen a rabbit with either a waistcoat-pocket or a watch to take out of it, and, full of curiosity, she hurried across the field after it, and was just in time to see it pop down a large rabbit-hole under the hedge. In a moment down went Alice after it, never once considering how in the world she was to get out again.

The rabbit-hole went straight on like a tunnel for some way, and then dipped suddenly down, so suddenly, that Alice had not a moment to think about stopping herself, before she found herself falling down what seemed a deep well.

Either the well was very deep, or she fell very slowly, for she had plenty of time as she went down to look about her, and to wonder what would happen next. First, she tried to look down and make out what she was coming to, but it was too dark to see anything: then, she looked at the sides of the well, and noticed that they were filled with cupboards and book-shelves: here and there were maps and pictures hung on pegs. She took a jar down off one of the shelves as she passed: it was labelled "Orange Marmalade," but to her great disappointment it was empty: she did not like to drop the jar, for fear of killing somebody underneath, so managed to put it into one of the cupboards as she fell past it.

"Well!" thought Alice to herself, "after such a fall as this, I shall think nothing of tumbling down stairs! How brave they'll all think me at home! Why, I wouldn't say anything about it, even if I fell off the top of the house!" (which was most likely true.)

Down, down, down. Would the fall *never* come to an end? "I wonder how many miles I've fallen by this time?" she said aloud, "I must be getting somewhere near the centre of the earth. Let me see: that would be four thousand miles down, I think—" (for you see Alice had learnt several things of this sort in her lessons in the schoolroom, and though this was not a *very* good opportunity of showing off her knowledge, as there was no one to hear her, still it was good practice to say it over,) "yes that's the right distance, but then what Longitude or Latitude-line shall I be in?" (Alice had no idea what Longitude was, or Latitude either, but she thought they were nice grand words to say.)

Presently she began again: "I wonder if I shall fall right *through* the earth! How funny it'll be to come out among the people that walk with their heads downwards! But I shall have to ask them what the name of the country is, you know. Please, Ma'am, is this New Zealand or Australia?"—and she tried to curtsy as she spoke (fancy *curtseying* as you're falling through the air! do you think you could manage it?) "and what an ignorant little girl she'll think me for asking! No, it'll never do to ask: perhaps I shall see it written up somewhere."

Down, down, down: there was nothing else to do, so Alice soon began talking again. "Dinah will miss me very much tonight, I should think!" (Dinah was the cat.) "I hope they'll remember her saucer of milk at tea-time! Oh, dear Dinah, I wish I had you here! There are no mice in the air, I'm afraid, but you might catch a bat, and that's very like a mouse, you know, my dear. But do cats eat bats, I wonder?" And here Alice began to get rather sleepy, and kept on saying to herself, in a dreamy sort of way "do cats eat bats? do cats eat bats?" and sometimes, "do bats eat cats?" for, as she couldn't answer either question, it didn't much matter which way she put it. She felt that she was dozing off, and had just begun to dream that she was walking hand in hand with Dinah, and was saying to her very earnestly, "Now, Dinah, my dear, tell me the truth. Did you ever eat a bat?" when suddenly, bump! bump! down she came upon a heap of sticks and shavings, and the fall was over.

Alice was not a bit hurt, and jumped on to her feet directly: she looked up, but it was all dark overhead; before her was another long passage, and the white rabbit was still in sight, hurrying down it. There was not a moment to be lost: away went Alice like the wind, and just heard it say, as it turned a corner, "my ears and whiskers, how late it's getting!" She turned the corner after it, and instantly found herself in a long, low hall, lit up by a row of lamps which hung from the roof.

There were doors all round the hall, but they were all locked, and when

Alice had been all round it, and tried them all, she walked sadly down the middle, wondering how she was ever to get out again: suddenly she came upon a little three-legged table, all made of solid glass; there was nothing lying upon it, but a tiny golden key, and Alice's first idea was that it might belong to one of the doors of the hall, but alas! either the locks were too large, or the key too small, but at any rate it would open none of them. However, on the second time round, she came to a low curtain, behind which was a door about eighteen inches high: she tried the little key in the keyhole, and it fitted! Alice opened the door, and looked down a small passage, not larger than a rat-hole, into the loveliest garden you ever saw. How she longed to get out of that dark hall, and wander about among those beds of bright flowers and those cool fountains, but she could not even get her head through the doorway, "and even if my head would go through," thought poor Alice, "it would be very little use without my shoulders. Oh, how I wish I could shut up like a telescope! I think I could, if I only knew how to begin." For, you see, so many out-of-the-way things had happened lately, that Alice began to think very few things indeed were really impossible.

There was nothing else to do, so she went back to the table, half hoping she might find another key on it, or at any rate a book of rules for shutting up people like telescopes: this time there was a little bottle on it—"which certainly was not there before" said Alice—and tied round the neck of the bottle was a paper label with the words **DRINK ME** beautifully printed on it in large letters.

It was all very well to say "drink me," "but I'll look first," said the wise

little Alice, “and see whether the bottle’s marked “poison” or not,” for Alice had read several nice little stories about children that got burnt, and eaten up by wild beasts, and other unpleasant things, because they *would* not remember the simple rules their friends had given them, such as, that, if you get into the fire, it will burn you, and that, if you cut your finger very deeply with a knife, it generally bleeds, and she had never forgotten that, if you drink a bottle marked “poison,” it is almost certain to disagree with you, sooner or later.

However, this bottle was *not* marked poison, so Alice tasted it, and finding it very nice, (it had, in fact, a sort of mixed flavour of cherry-tart, custard, pine-apple, roast turkey, toffy, and hot buttered toast,) she very soon finished it off.

* * * * *

“What a curious feeling!” said Alice, “I must be shutting up like a telescope.”

It was so indeed: she was now only ten inches high, and her face brightened up as it occurred to her that she was now the right size for going through the little door into that lovely garden. First, however, she waited for a few minutes to see whether she was going to shrink any further: she felt a little nervous about this, “for it might end, you know,” said Alice to herself, “in my going out altogether, like a candle, and what should I be like then, I wonder?” and she tried to fancy what the flame of a candle is like after the candle is blown out, for she could not remember having ever seen one. However, nothing more happened so she decided on going into the garden at once, but, alas for poor Alice! when she got to the door, she found she had forgotten the little golden key, and when she went back to the table for the key, she found she could not possibly reach it: she could see it plainly enough through the glass, and she tried her best to climb up one of the legs of the table, but it was too slippery, and when she had tired herself out with trying, the poor little thing sat down and cried.

“Come! there’s no use in crying!” said Alice to herself rather sharply, “I advise you to leave off this minute!” (she generally gave herself very good advice, and sometimes scolded herself so severely as to bring tears into her eyes, and once she remembered boxing her own ears for having been unkind to herself in a

game of croquet she was playing with herself, for this curious child was very fond of pretending to be two people,) “but it’s no use now,” thought poor Alice, “to pretend to be two people! Why, there’s hardly enough of me left to make one respectable person!”

Soon her eyes fell on a little ebony box lying under the table: she opened it, and found in it a very small cake, on which was lying a card with the words **EAT ME** beautifully printed on it in large letters. “I’ll eat,” said Alice, “and if it makes me larger, I can reach the key, and if it makes me smaller, I can creep under the door, so either way I’ll get into the garden, and I don’t care which happens!”

She ate a little bit, and said anxiously to herself “which way? which way?” and laid her hand on the top of her head to feel which way it was growing, and was quite surprised to find that she remained the same size: to be sure this is what generally happens when one eats cake, but Alice had got into the way of expecting nothing but out-of-the-way things to happen, and it seemed quite dull and stupid for things to go on in the common way.

So she set to work, and very soon finished off the cake.

* * * * *

“Curiouser and curiouser!” cried Alice, (she was so surprised that she quite forgot how to speak good English,) “now I’m opening out like the largest telescope that ever was! Goodbye, feet!” (for when she looked down at her feet, they seemed almost out of sight, they were getting so far off,) “oh, my poor little feet, I wonder who will put on your shoes and stockings for you now, dears? I’m sure I can’t! I shall be a great deal too far off to bother myself about you: you must manage the best way you can—but I must be kind to them,” thought Alice, “or perhaps they won’t walk the way I want to go! Let me see: I’ll give them a new pair of boots every Christmas.”

And she went on planning to herself how she would manage it “they must go by the carrier,” she thought, “and how funny it’ll seem, sending presents to one’s own feet! And how odd the directions will look!

ALICE’S RIGHT FOOT, ESQ.

THE CARPET,

with ALICE’S LOVE.

oh dear! what nonsense I am talking!”

Just at this moment, her head struck against the roof of the hall: in fact, she was now rather more than nine feet high, and she at once took up the little golden key, and hurried off to the garden door.

Poor Alice! it was as much as she could do, lying down on one side, to look through into the garden with one eye, but to get through was more hopeless than ever: she sat down and cried again.

“You ought to be ashamed of yourself,” said Alice, “a great girl like you,” (she might well say this,) “to cry in this way! Stop this instant, I tell you!” But she cried on all the same, shedding gallons of tears, until there was a large pool, about four inches deep, all round her, and reaching half way across the hall. After a time, she heard a little pattering of feet in the distance, and dried her eyes to see what was coming. It was the white rabbit coming back again, splendidly dressed, with a pair of white kid gloves in one hand, and a nosegay in the other. Alice was ready to ask help of any one, she felt so desperate, and as

the rabbit passed her, she said, in a low, timid voice, “If you please, Sir—” the rabbit started violently, looked up once into the roof of the hall, from which the voice seemed to come, and then dropped the nosegay and the white kid gloves, and skurried away into the darkness, as hard as it could go.

Alice took up the nosegay and gloves, and found the nosegay so delicious that she kept smelling at it all the time she went on talking to herself—“dear, dear! how queer everything is today! and yesterday everything happened just as usual: I wonder if I was changed in the night? Let me think: was I the same when I got up this morning? I think I remember feeling rather different. But if I’m not the same, who in the world am I? Ah, that’s the great puzzle!” And she began thinking over all the children she knew of the same age as herself, to see if she could have been changed for any of them.

“I’m sure I’m not Gertrude,” she said, “for her hair goes in such long ringlets, and mine doesn’t go in ringlets at all—and I’m sure I ca’n’t be Florence, for I know all sorts of things, and she, oh! she knows such a very little! Besides, *she’s* she, and *I’m* I, and—oh dear! how puzzling it all is! I’ll try if I know all the things I used to know. Let me see: four times five is twelve, and four times six is thirteen, and four times seven is fourteen—oh dear! I shall never get to twenty at this rate! But the Multiplication Table don’t signify—let’s try Geography. London is the capital of France, and Rome is the capital of Yorkshire, and Paris—oh dear! dear! *that’s* all wrong, I’m certain! I must have been changed for Florence! I’ll try and say “How doth the little,” and she crossed her hands on her lap, and began, but her voice sounded hoarse and strange, and the words did not sound the same as they used to do:

“How doth the little crocodile
Improve its shining tail,
And pour the waters of the Nile

Parody on *How Doth
the Little Busy Bee*
by Isaac Watts

On every golden scale!
“How cheerfully it seems to grin!
How neatly spreads its claws!
And welcomes little fishes in
With gently-smiling jaws!”

“I’m sure those are not the right words,” said poor Alice, and her eyes filled with tears as she thought “I must be Florence after all, and I shall have to go and live in that poky little house, and have next to no toys to play with, and oh! ever so many lessons to learn! No! I’ve made up my mind about it: if I’m Florence, I’ll stay down here! It’ll be no use their putting their heads down and saying ‘come up, dear!’ I shall only look up and say ‘who am I then? answer me that first, and then, if I like being that person, I’ll come up: if not, I’ll stay down here till I’m somebody else—but, oh dear!” cried Alice with a sudden burst of tears, “I do wish they *would* put their heads down! I am so tired of being all alone here!”

As she said this, she looked down at her hands, and was surprised to find she had put on one of the rabbit’s little gloves while she was talking. “How *can* I have done that?” thought she, “I must be growing small again.” She got up and went to the table to measure herself by it, and found that, as nearly as she could guess, she was now about two feet high, and was going on shrinking rapidly: soon she found out that the reason of it was the nosegay she held in her hand: she dropped it hastily, just in time to save herself from shrinking away altogether, and found that she was now only three inches high.

“Now for the garden!” cried Alice, as she hurried back to the little door, but the little door was locked again, and the little gold key was lying on the glass table as before, and “things are worse than ever!” thought the poor little girl, “for I never was as small as this before, never! And I declare it’s too bad, it is!”

At this moment her foot slipped, and splash! she was up to her chin in salt water. Her first idea was that she had fallen into the sea: then she remembered that she was under ground, and she soon made out that it was the pool of tears

she had wept when she was nine feet high. "I wish I hadn't cried so much!" said Alice, as she swam about, trying to find her way out, "I shall be punished for it now, I suppose, by being drowned in my own tears! Well! that'll be a queer thing, to be sure! However, every thing is queer today." Very soon she saw something splashing about in the pool near her: at first she thought it must be a walrus or a hippopotamus, but then she remembered how small she was herself, and soon made out that it was only a mouse, that had slipped in like herself.

"Would it be any use, now," thought Alice, "to speak to this mouse? The rabbit is something quite out-of-the-way, no doubt, and so have I been, ever since I came down here, but that is no reason why the mouse should not be able to talk. I think I may as well try."

So she began: "oh Mouse, do you know how to get out of this pool? I am very tired of swimming about here, oh Mouse!" The mouse looked at her rather inquisitively, and seemed to her to wink with one of its little eyes, but it said nothing.

"Perhaps it doesn't understand English," thought Alice; "I daresay it's a French mouse, come over with William the Conqueror!" (for, with all her knowledge of history, Alice had no very clear notion how long ago anything had happened,) so she began again: "où est ma chatte?" which was the first sentence out of her French lesson-book. The mouse gave a sudden jump in the pool, and seemed to quiver with fright: "oh, I beg your pardon!" cried Alice hastily, afraid that she had hurt the poor animal's feelings, "I quite forgot you didn't like cats!"

"Not like cats!" cried the mouse, in a shrill, passionate voice, "would *you* like cats if you were me?"

"Well, perhaps not," said Alice in a soothing tone, "don't be angry about it. And yet I wish I could show you our cat Dinah: I think you'd take a fancy to cats if you could only see her. She is such a dear quiet thing," said Alice, half to herself, as she swam lazily about in the pool, "she sits purring so nicely by the fire, licking her paws and washing her face: and she is such a nice soft thing to nurse, and she's such a capital one for catching mice—oh! I beg your pardon!" cried poor Alice again, for this time the mouse was bristling all over, and she felt certain that it was really offended, "have I offended you?"

"Offended indeed!" cried the mouse, who seemed to be positively trembling with rage, "our family always *hated* cats! Nasty, low, vulgar things! Don't talk to me about them any more!"

Quoted from *La Bagatelle: Intended to introduce children of three or four years old to some knowledge of the French language*

“I won’t indeed!” said Alice, in a great hurry to change the conversation, “are you—are you—fond of—dogs?” The mouse did not answer, so Alice went on eagerly: “there is such a nice little dog near our house I should like to show you! A little bright-eyed terrier, you know, with oh! such long curly brown hair! And it’ll fetch things when you throw them, and it’ll sit up and beg for its dinner, and all sorts of things—I ca’n’t remember half of them—and it belongs to a farmer, and he says it kills all the rats and—oh dear!” said Alice sadly, “I’m afraid I’ve offended it again!” for the mouse was swimming away from her as hard as it could go, and making quite a commotion in the pool as it went.

So she called softly after it: “mouse dear! Do come back again, and we won’t talk about cats and dogs any more, if you don’t like them!” When the mouse heard this, it turned and swam slowly back to her: its face was quite pale, (with passion, Alice thought,) and it said in a trembling low voice “let’s get to the shore, and then I’ll tell you my history, and you’ll understand why it is I hate cats and dogs.”

It was high time to go, for the pool was getting quite full of birds and animals that had fallen into it. There was a Duck and a Dodo, a Lory and an Eaglet, and several other curious creatures. Alice led the way, and the whole party swam to the shore.

Chapter II

They were indeed a curious looking party that assembled on the bank—the birds with draggled feathers, the animals with their fur clinging close to them—all dripping wet, cross, and uncomfortable. The first question of course was, how to get dry: they had a consultation about this, and Alice hardly felt at all surprised at finding herself talking familiarly with the birds, as if she had known them all her life. Indeed, she had quite a long argument with the Lory, who at last turned sulky, and would only say “I am older than you, and must know best,” and this Alice would not admit without knowing how old the Lory was, and as the Lory positively refused to tell its age, there was nothing more to be said.

At last the mouse, who seemed to have some authority among them, called out “sit down, all of you, and attend to me! I’ll soon make you dry enough!” They all sat down at once, shivering, in a large ring, Alice in the middle, with her eyes anxiously fixed on the mouse, for she felt sure she would catch a bad cold if she did not get dry very soon.

“Ahem!” said the mouse, with a self-important air, “are you all ready? This is the driest thing I know. Silence all round, if you please!

“William the Conqueror, whose cause was favoured by the pope, was soon submitted to by the English, who wanted leaders, and had been of late much accustomed to usurpation and conquest. Edwin and Morcar, the earls of Mercia and Northumbria—”

“Ugh!” said the Lory with a shiver.

“I beg your pardon?” said the mouse, frowning, but very politely, “did you speak?”

“Not I!” said the Lory hastily.

“I thought you did,” said the mouse, “I proceed. Edwin and Morcar, the earls of Mercia and Northumbria, declared for him; and even Stigand, the patriotic archbishop of Canterbury, found it advisable to go with Edgar Atheling to meet William and offer him the crown. William’s conduct was at first moderate—how are you getting on now, dear?” said the mouse, turning to Alice as it spoke.

“As wet as ever,” said poor Alice, “it doesn’t seem to dry me at all.”

“In that case,” said the Dodo solemnly, rising to his feet, “I move that the meeting adjourn, for the immediate adoption of more energetic remedies—”

“Speak English!” said the Duck, “I don’t know the meaning of half those long words, and what’s more, I don’t believe you do either!” And the Duck quacked a comfortable laugh to itself. Some of the other birds tittered audibly.

“I only meant to say,” said the Dodo in a rather offended tone, “that I know of a house near here, where we could get the young lady and the rest of the party dried, and then we could listen comfortably to the story which I think you were good enough to promise to tell us,” bowing gravely to the mouse.

The mouse made no objection to this, and the whole party moved along the river bank, (for the pool had by this time begun to flow out of the hall, and the edge of it was fringed with rushes and forget-me-nots,) in a slow procession, the Dodo leading the way. After a time the Dodo became impatient, and, leaving the Duck to bring up the rest of the party, moved on at a quicker pace with Alice, the Lory, and the Eaglet, and soon brought them to a little cottage, and

Quoted from *Short Course of History* by Havilland Chepmell

there they sat snugly by the fire, wrapped up in blankets, until the rest of the party had arrived, and they were all dry again.

Then they all sat down again in a large ring on the bank, and begged the mouse to begin his story.

“Mine is a long and a sad tale!” said the mouse, turning to Alice, and sighing.

“It *is* a long tail, certainly,” said Alice, looking down with wonder at the mouse’s tail, which was coiled nearly all round the party, “but why do you call it sad?” and she went on puzzling about this as the mouse went on speaking, so that her idea of the tale was something like this:

We lived beneath the mat
Warm and snug and fat
But one woe, & that
Was the cat!

To our joys
a clog, In
our eyes a
fog, On our
hearts a log
Was the dog!

When the
cat’s away,
Then
the mice
will
play,
But, alas!
one day, (So they say)

Came the dog and
 cat, Hunting
 for a
 rat,
 Crushed
 the mice
 all flat;
 Each
 one
 as
 he
 sat
 Underneath the mat,
 Warm,
 & snug, & fat—
 Think of that!

“You are not attending!” said the mouse to Alice severely, “what are you thinking of?”

“I beg your pardon,” said Alice very humbly, “you had got to the fifth bend, I think?”

“I had *not!*” cried the mouse, sharply and very angrily.

“A knot!” said Alice, always ready to make herself useful, and looking anxiously about her, “oh, do let me help to undo it!”

“I shall do nothing of the sort!” said the mouse, getting up and walking away from the party, “you insult me by talking such nonsense!”

“I didn’t mean it!” pleaded poor Alice, “but you’re so easily offended, you know.”

The mouse only growled in reply.

“Please come back and finish your story!” Alice called after it, and the others all joined in chorus “yes, please do!” but the mouse only shook its ears, and walked quickly away, and was soon out of sight.

“What a pity it wouldn’t stay!” sighed the Lory, and an old Crab took the opportunity of saying to its daughter “Ah, my dear! let this be a lesson to you never to lose *your* temper!” “Hold your tongue, Ma!” said the young Crab, a little snappishly, “you’re enough to try the patience of an oyster!”

“I wish I had our Dinah here, I know I do!” said Alice aloud, addressing no one in particular, “*she’d* soon fetch it back!”

“And who is Dinah, if I might venture to ask the question?” said the Lory.

Alice replied eagerly, for she was always ready to talk about her pet, “Dinah’s

our cat. And she's such a capital one for catching mice, you can't think! And oh! I wish you could see her after the birds! Why, she'll eat a little bird as soon as look at it!"

This answer caused a remarkable sensation among the party: some of the birds hurried off at once; one old magpie began wrapping itself up very carefully, remarking "I really must be getting home: the night air does not suit my throat," and a canary called out in a trembling voice to its children "come away from her, my dears, she's no fit company for you!" On various pretexts, they all moved off, and Alice was soon left alone.

She sat for some while sorrowful and silent, but she was not long before she recovered her spirits, and began talking to herself again as usual: "I do wish some of them had stayed a little longer! and I was getting to be such friends with them—really the Lory and I were almost like sisters! and so was that dear little Eaglet! And then the Duck and the Dodo! How nicely the Duck sang to us as we came along through the water: and if the Dodo hadn't known the way to that nice little cottage, I don't know when we should have got dry again—" and there is no knowing how long she might have prattled on in this way, if she had not suddenly caught the sound of pattering feet.

It was the white rabbit, trotting slowly back again, and looking anxiously about it as it went, as if it had lost something, and she heard it muttering to itself "the Marchioness! the Marchioness! oh my dear paws! oh my fur and whiskers! She'll have me executed, as sure as ferrets are ferrets! Where *can* I have dropped them, I wonder?" Alice guessed in a moment that it was looking for the nosegay and the pair of white kid gloves, and she began hunting for them, but they were now nowhere to be seen—everything seemed to have changed since her swim in the pool, and her walk along the river-bank with its fringe of rushes and forget-me-nots, and the glass table and the little door had vanished.

Soon the rabbit noticed Alice, as she stood looking curiously about her, and at once said in a quick angry tone, "why, Mary Ann! what *are* you doing out here? Go home this moment, and look on my dressing-table for my gloves and nosegay, and fetch them here, as quick as you can run, do you hear?" and Alice was so much frightened that she ran off at once, without saying a word, in the direction which the rabbit had pointed out.

She soon found herself in front of a neat little house, on the door of which was a bright brass plate with the name **W. RABBIT, ESQ.** She went in, and

hurried upstairs, for fear she should meet the real Mary Ann and be turned out of the house before she had found the gloves: she knew that one pair had been lost in the hall, “but of course,” thought Alice, “it has plenty more of them in its house. How queer it seems to be going messages for a rabbit! I suppose Dinah’ll be sending me messages next!” And she began fancying the sort of things that would happen: “Miss Alice! come here directly and get ready for your walk!” “Coming in a minute, nurse! but I’ve got to watch this mousehole till Dinah comes back, and see that the mouse doesn’t get out—” “only I don’t think,” Alice went on, “that they’d let Dinah stop in the house, if it began ordering people about like that!”

By this time she had found her way into a tidy little room, with a table in the window on which was a looking-glass and, (as Alice had hoped,) two or three pairs of tiny white kid gloves: she took up a pair of gloves, and was just going to leave the room, when her eye fell upon a little bottle that stood near the looking-glass: there was no label on it this time with the words “drink me,” but nonetheless she uncorked it and put it to her lips: “I know something interesting is sure to happen,” she said to herself, “whenever I eat or drink anything, so I’ll see what this bottle does. I do hope it’ll make me grow larger, for I’m quite tired of being such a tiny little thing!”

It did so indeed, and much sooner than she expected: before she had drunk half the bottle, she found her head pressing against the ceiling, and she stooped to save her neck from being broken, and hastily put down the bottle, saying to herself “that’s quite enough—I hope I sha’n’t grow any more—I wish I hadn’t drunk so much!”

Alas! it was too late: she went on growing and growing, and very soon had to kneel down: in another minute there was not room even for this, and she tried the effect of lying down, with one elbow against the door, and the other arm curled round her head. Still she went on growing, and as a last resource

she put one arm out of the window, and one foot up the chimney, and said to herself “now I can do no more—what *will* become of me?”

Luckily for Alice, the little magic bottle had now had its full effect, and she grew no larger; still it was very uncomfortable, and as there seemed to be no sort of chance of ever getting out of the room again, no wonder she felt unhappy. “It was much pleasanter at home,” thought poor Alice, “when one wasn’t always growing larger and smaller, and being ordered about by mice and rabbits—I almost wish I hadn’t gone down that rabbit-hole, and yet, and yet—it’s rather curious, you know, this sort of life. I do wonder what *can* have happened to me! When I used to read fairy-tales, I fancied that sort of thing never happened, and now here I am in the middle of one! There out to be a book written about me, that there ought! and when I grow up I’ll write one—but I’m grown up now” said she in a sorrowful tone, “at least there’s no room to grow up any more *here*.”

“But then,” thought Alice, “shall I *never* get any older than I am now? That’ll be a comfort, one way—never to be an old woman—but then—always to have lessons to learn! Oh, I shouldn’t like *that*!”

“Oh, you foolish Alice!” she said again, “how can you learn lessons in here? Why, there’s hardly room for you, and no room at all for any lesson-books!”

And so she went on, taking first one side, and then the other, and making quite a conversation of it altogether, but after a few minutes she heard a voice outside, which made her stop to listen.

“Mary Ann! Mary Ann!” said the voice, “fetch me my gloves this moment!” Then came a little pattering of feet on the stairs: Alice knew it was the rabbit coming to look for her, and she trembled till she shook the house, quite forgetting that she was now about a thousand times as large as the rabbit, and had no reason to be afraid of it. Presently the rabbit came to the door, and tried to open it, but as it opened inwards, and Alice’s elbow was against it, the attempt proved a failure. Alice heard it say to itself “then I’ll go round and get in at the window.”

“*That* you wo’n’t!” thought Alice, and, after waiting till she fancied she heard the rabbit, just under the window, she suddenly spread out her hand, and made a snatch in the air. She did not get hold of anything, but she heard a little shriek and a fall and a crash of breaking glass, from which she concluded that it was just possible it had fallen into a cucumber-frame, or something of the sort.

Next came an angry voice—the rabbit’s—“Pat, Pat! where are you?” And

then a voice she had never heard before, “shure then I’m here! digging for apples, anyway, yer honour!”

“Digging for apples indeed!” said the rabbit angrily, “here, come and help me out of *this*!”—Sound of more breaking glass.

“Now, tell me, Pat, what is that coming out of the window?”

“Shure it’s an arm, yer honour!” (He pronounced it “arrum”.)

“An arm, you goose! Who ever saw an arm that size? Why, it fills the whole window, don’t you see?”

“Shure, it does, yer honour, but it’s an arm for all that.”

“Well, it’s no business there: go and take it away!”

There was a long silence after this, and Alice could only hear whispers now and then, such as “shure I don’t like it, yer honour, at all at all!” “do as I tell you, you coward!” and at last she spread out her hand again and made another snatch in the air. This time there were *two* little shrieks, and more breaking glass—“what a number of cucumber-frames there must be!” thought Alice, “I wonder what they’ll do next! As for pulling me out of the window, I only wish they *could*! I’m sure *I* don’t want to stop in here any longer!”

She waited for some time without hearing anything more: at last came a rumbling of little cart-wheels, and the sound of a good many voices all talking together: she made out the words “where’s the other ladder?—why, I hadn’t to bring but one, Bill’s got the other—here, put ’em up at this corner—no, tie ’em together first—they don’t reach high enough yet—oh, they’ll do well enough, don’t be particular—here, Bill! catch hold of this rope—will the roof bear?—mind that loose slate—oh, it’s coming down! heads below!” (a loud crash) “now, who did that?—it was Bill, I fancy—who’s to go down the chimney?—nay, *I* sha’n’t! *you* do it!—*that* I won’t then—Bill’s got to go down—here, Bill! the

master says you've to go down the chimney!"

"Oh, so Bill's got to come down the chimney, has he?" said Alice to herself, "why, they seem to put everything upon Bill! I wouldn't be in Bill's place for a good deal: the fireplace is a pretty tight one, but I *think* I can kick a little!"

She drew her foot as far down the chimney as she could, and waited till she heard a little animal (she couldn't guess what sort it was) scratching and scrambling in the chimney close above her: then, saying to herself "this is Bill," she gave one sharp kick, and waited again to see what would happen next.

The first thing was a general chorus of "there goes Bill!" then the rabbit's voice alone "catch him, you by the hedge!" then silence, and then another confusion of voices, "how was it, old fellow? what happened to you? tell us all about it."

Last came a little feeble squeaking voice, ("that's Bill" thought Alice,) which said "well, I hardly know—I'm all of a fluster myself—something comes at me like a Jack-in-the-box, and the next minute up I goes like a rocket!" "And so you did, old fellow!" said the other voices.

"We must burn the house down!" said the voice of the rabbit, and Alice called out as loud as she could "if you do, I'll set Dinah at you!" This caused silence again, and while Alice was thinking "but how can I get Dinah here?" she found to her great delight that she was getting smaller: very soon she was able to get up out of the uncomfortable position in which she had been lying, and in two or three minutes more she was once more three inches high.

She ran out of the house as quick as she could, and found quite a crowd of little animals waiting outside—guinea-pigs, white mice, squirrels, and "Bill" a little green lizard, that was being supported in the arms of one of the guinea-

pigs, while another was giving it something out of a bottle. They all made a rush at her the moment she appeared, but Alice ran her hardest, and soon found herself in a thick wood.

Chapter III

“The first thing I’ve got to do,” said Alice to herself, as she wandered about in the wood, “is to grow to my right size, and the second thing is to find my way into that lovely garden. I think that will be the best plan.”

It sounded an excellent plan, no doubt, and very neatly and simply arranged: the only difficulty was, that she had not the smallest idea how to set about it,

and while she was peering anxiously among the trees round her, a little sharp bark just over her head made her look up in a great hurry.

An enormous puppy was looking down at her with large round eyes, and feebly stretching out one paw, trying to reach her: "poor thing!" said Alice in a coaxing tone, and she tried hard to whistle to it, but she was terribly alarmed all the while at the thought that it might be hungry, in which case it would probably devour her in spite of all her coaxing. Hardly knowing what she did, she picked up a little bit of stick, and held it out to the puppy: whereupon the puppy jumped into the air off all its feet at once, and with a yelp of delight rushed at the stick, and made believe to worry it then Alice dodged behind a great thistle to keep herself from being run over, and, the moment she appeared at the other side, the puppy made another dart at the stick, and tumbled head over heels in its hurry to get hold: then Alice, thinking it was very like having a game of play with a cart-horse, and expecting every moment to be trampled under its feet, ran round the thistle again: then the puppy began a series of short charges at the stick, running a very little way forwards each time and a long way back, and barking hoarsely all the while, till at last it sat down a good way off, panting, with its tongue hanging out of its mouth, and its great eyes half shut.

This seemed to Alice a good opportunity for making her escape. She set off at once, and ran till the puppy's bark sounded quite faint in the distance, and till she was quite tired and out of breath.

"And yet what a dear little puppy it was!" said Alice, as she leant against a buttercup to rest herself, and fanned herself with her hat. "I should have liked teaching it tricks, if—if I'd only been the right size to do it! Oh! I'd nearly forgotten that I've got to grow up again! Let me see; how *is* it to be managed? I suppose I ought to eat or drink something or other, but the great question is what?"

The great question certainly was, what? Alice looked all round her at the flowers and the blades of grass but could not see anything that looked like the right thing to eat under the circumstances. There was a large mushroom near her, about the same height as herself, and when she had looked under it, and on both sides of it, and behind it, it occurred to her to look and see what was on the top of it.

She stretched herself up on tiptoe, and peeped over the edge of the mushroom, and her eyes immediately met those of a large blue caterpillar, which was sitting with its arms folded, quietly smoking a long hookah, and taking not the least notice of her or of anything else.

For some time they looked at each other in silence: at last the caterpillar took the hookah out of its mouth, and languidly addressed her.

"Who are you?" said the caterpillar.

This was not an encouraging opening for a conversation: Alice replied rather shyly, "I—I hardly know, sir, just at present—at least I know who I *was* when I got up this morning, but I think I must have been changed several times since that."

"What do you mean by that?" said the caterpillar, "explain yourself!"

"I ca'n't explain *myself*, I'm afraid, sir," said Alice, "because I'm not myself, you see."

"I don't see," said the caterpillar.

"I'm afraid I ca'n't put it more clearly," Alice replied very politely, "for I ca'n't understand it myself, and really to be so many different sizes in one day is very confusing."

"It isn't," said the caterpillar.

"Well, perhaps you haven't found it so yet," said Alice, "but when you have to turn into a chrysalis, you know, and then after that into a butterfly, I should think it'll feel a little queer, don't you think so?"

"Not a bit," said the caterpillar.

"All I know is," said Alice, "it would feel queer to *me*."

"*You!*" said the caterpillar contemptuously, "who are you?"

Which brought them back again to the beginning of the conversation: Alice felt a little irritated at the caterpillar making such *very* short remarks, and she drew herself up and said very gravely "I think you ought to tell me who *you* are, first."

"Why?" said the caterpillar.

Here was another puzzling question: and as Alice had no reason ready, and the caterpillar seemed to be in a very bad temper, she turned round and walked away.

"Come back!" the caterpillar called after her, "I've something important to say!"

This sounded promising: Alice turned and came back again.

"Keep your temper," said the caterpillar.

"Is that all?" said Alice, swallowing down her anger as well as she could.

“No,” said the caterpillar.

Alice thought she might as well wait, as she had nothing else to do, and perhaps after all the caterpillar might tell her something worth hearing. For some minutes it puffed away at its hookah without speaking, but at last it unfolded its arms, took the hookah out of its mouth again, and said “so you think you’re changed, do you?”

“Yes, sir,” said Alice, “I ca’n’t remember the things I used to know—I’ve tried to say “How doth the little busy bee” and it came all different!”

“Try and repeat “You are old, father William,”” said the caterpillar.

Alice folded her hands, and began:

1.

“You are old, father William,” the young man said,

“And your hair is exceedingly white:

And yet you incessantly stand on your head—

Do you think, at your age, it is right?”

2.

“In my youth,” father William replied to his son,

“I feared it *might* injure the brain

But now that I’m perfectly sure I have none,

Why, I do it again and again.”

Parody on *The Old Man's Comforts and How He Gained Them*
by Robert Southey

3.

“You are old,” said the youth, “as I mentioned before,
And have grown most uncommonly fat:
Yet you turned a back-somersault in at the door—
Pray what is the reason of that?”

4.

“In my youth,” said the sage, as he shook his gray locks,
“I kept all my limbs very supple,
By the use of this ointment, five shillings the box—
Allow me to sell you a couple.”

5.

“You are old,” said the youth, “and your jaws are too weak
For anything tougher than suet:
Yet you eat all the goose, with the bones and the beak—
Pray, how did you manage to do it?”

6.

“In my youth,” said the old man, “I took to the law,
And argued each case with my wife,
And *the muscular strength, which it gave to my jaw,*
Has lasted the rest of my life.”

7.

“You are old,” said the youth; “one would hardly suppose
That your eye was as steady as ever:
Yet you balanced an eel on the end of your nose—
What made you so *awfully* clever?”

8.

“I have answered three questions, and that is enough,”
Said his father, “don’t give yourself airs!
Do you think I can listen all day to such stuff?
Be off, or I’ll kick you down stairs!”

“That is not said right,” said the caterpillar.

“Not *quite* right, I’m afraid,” said Alice timidly, “some of the words have got altered.”

“It is wrong from beginning to end,” said the caterpillar decidedly, and there was silence for some minutes: the caterpillar was the first to speak.

“What size do you want to be?” it asked.

“Oh, I’m not particular as to size,” Alice hastily replied, “only one doesn’t like changing so often, you know.”

“Are you content now?” said the caterpillar.

“Well, I should like to be a *little* larger, sir, if you wouldn’t mind,” said Alice, “three inches is such a wretched height to be.”

“It is a very good height indeed!” said the caterpillar loudly and angrily, rearing itself straight up as it spoke (it was exactly three inches high).

“But I’m not used to it!” pleaded poor Alice in a piteous tone, and she thought to herself “I wish the creatures wouldn’t be so easily offended!”

“You’ll get used to it in time,” said the caterpillar, and it put the hookah into its mouth, and began smoking again.

This time Alice waited quietly until it chose to speak again: in a few minutes the caterpillar took the hookah out of its mouth, and got down off the mushroom, and crawled away into the grass, merely remarking as it went; “the top will make you grow taller, and the stalk will make you grow shorter.”

“The top of *what?* the stalk of *what?*” thought Alice.

“Of the mushroom,” said the caterpillar, just as if she had asked it aloud, and in another moment was out of sight.

Alice remained looking thoughtfully at the mushroom for a minute, and then picked it and carefully broke it in two, taking the stalk in one hand, and the top in the other. “*Which* does the stalk do?” she said, and nibbled a little bit of it to try; the next moment she felt a violent blow on her chin: it had struck her foot!

She was a good deal frightened by this very sudden change, but as she did not shrink any further, and had not dropped the top of the mushroom, she did not give up hope yet. There was hardly room to open her mouth, with her chin pressing against her foot, but she did it at last, and managed to bite off a little bit of the top of the mushroom.

* * * * *

“Come! my head’s free at last!” said Alice in a tone of delight, which changed into alarm in another moment, when she found that her shoulders were nowhere

to be seen: she looked down upon an immense length of neck, which seemed to rise like a stalk out of a sea of green leaves that lay far below her.

“What *can* all that green stuff be?” said Alice, “and where *have* my shoulders got to? And oh! my poor hands! how is it I ca’n’t see you?” She was moving them about as she spoke, but no result seemed to follow, except a little rustling among the leaves. Then she tried to bring her head down to her hands, and was delighted to find that her neck would bend about easily in every direction, like a serpent. She had just succeeded in bending it down in a beautiful zig-zag, and was going to dive in among the leaves, which she found to be the tops of the trees of the wood she had been wandering in, when a sharp hiss made her draw back: a large pigeon had flown into her face, and was violently beating her with its wings.

“Serpent!” screamed the pigeon.

“I’m *not* a serpent!” said Alice indignantly, “let me alone!”

“I’ve tried every way!” the pigeon said desperately, with a kind of sob: “nothing seems to suit ‘em!”

“I haven’t the least idea what you mean,” said Alice.

“I’ve tried the roots of trees, and I’ve tried banks, and I’ve tried hedges,” the pigeon went on without attending to her, “but them serpents! There’s no pleasing ‘em!”

Alice was more and more puzzled, but she thought there was no use in saying anything till the pigeon had finished.

“As if it wasn’t trouble enough hatching the eggs!” said the pigeon, “without being on the look out for serpents, day and night! Why, I haven’t had a wink of sleep these three weeks!”

“I’m very sorry you’ve been annoyed,” said Alice, beginning to see its meaning.

“And just as I’d taken the highest tree in the wood,” said the pigeon raising its voice to a shriek, “and was just thinking I was free of ’em at last, they must needs come down from the sky! Ugh! Serpent!”

“But I’m *not* a serpent,” said Alice, “I’m a—I’m a—”

“Well! *What* are you?” said the pigeon, “I see you’re trying to invent something.”

“I—I’m a little girl,” said Alice, rather doubtfully, as she remembered the number of changes she had gone through.

“A likely story indeed!” said the pigeon, “I’ve seen a good many of them in my time, but never *one* with such a neck as yours! No, you’re a serpent, I know *that* well enough! I suppose you’ll tell me next that you never tasted an egg!”

“I *have* tasted eggs, certainly,” said Alice, who was a very truthful child, “but indeed I do’n’t want any of yours. I do’n’t like them raw.”

“Well, be off, then!” said the pigeon, and settled down into its nest again. Alice crouched down among the trees, as well as she could, as her neck kept getting entangled among the branches, and several times she had to stop and untwist it. Soon she remembered the pieces of mushroom which she still held in her hands, and set to work very carefully, nibbling first at one and then at the other, and growing sometimes taller and sometimes shorter, until she had succeeded in bringing herself down to her usual size.

It was so long since she had been of the right size that it felt quite strange at first, but she got quite used to it in a minute or two, and began talking to herself as usual: “well! there’s half my plan done now! How puzzling all these changes are! I’m never sure what I’m going to be, from one minute to another! However, I’ve got to my right size again: the next thing is, to get into that beautiful garden—how *is* that to be done, I wonder?”

Just as she said this, she noticed that one of the trees had a doorway leading

right into it. "That's very curious!" she thought, "but everything's curious today: I may as well go in." And in she went.

Once more she found herself in the long hall, and close to the little glass table: "now, I'll manage better this time" she said to herself, and began by taking the little golden key, and unlocking the door that led into the garden. Then she set to work eating the pieces of mushroom till she was about fifteen inches high: then she walked down the little passage: and *then*—she found herself at last in the beautiful garden, among the bright flowerbeds and the cool fountains.

Chapter IV

A large rose tree stood near the entrance of the garden: the roses on it were white, but there were three gardeners at it, busily painting them red. This Alice thought a very curious thing, and she went near to watch them, and just as she came up she heard one of them say “look out, Five! Don’t go splashing paint over me like that!”

“I couldn’t help it,” said Five in a sulky tone, “Seven jogged my elbow.”

On which Seven lifted up his head and said “that’s right, Five! Always lay the blame on others!”

“*You’d* better not talk!” said Five, “I heard the Queen say only yesterday she thought of having you beheaded!”

“What for?” said the one who had spoken first.

“That’s not your business, Two!” said Seven.

“Yes, it *is* his business!” said Five, “and I’ll tell him: it was for bringing in tulip-roots to the cook instead of potatoes.”

Seven flung down his brush, and had just begun “well! Of all the unjust things—” when his eye fell upon Alice, and he stopped suddenly; the others looked round, and all of them took off their hats and bowed low.

“Would you tell me, please,” said Alice timidly, “why you are painting those roses?”

Five and Seven looked at Two, but said nothing: Two began, in a low voice, “why, Miss, the fact is, this ought to have been a red rose tree, and we put a white one in by mistake, and if the Queen was to find it out, we should all have our heads cut off. So, you see, we’re doing our best, before she comes, to—” At this moment Five, who had been looking anxiously across the garden called out

“the Queen! the Queen!” and the three gardeners instantly threw themselves flat upon their faces. There was a sound of many footsteps, and Alice looked round, eager to see the Queen.

First came ten soldiers carrying clubs; these were all shaped like the three gardeners, flat and oblong, with their hands and feet at the corners: next the ten courtiers; these were all ornamented with diamonds, and walked two and two, as the soldiers did. After these came the Royal children: there were ten of them, and the little dears came jumping merrily along, hand in hand, in couples: they were all ornamented with hearts. Next came the guests, mostly kings and queens, among whom Alice recognised the white rabbit: it was talking in a hurried nervous manner, smiling at everything that was said, and went by without noticing her. Then followed the Knave of Hearts, carrying the King’s crown on a cushion, and, last of all this grand procession, came **THE KING AND QUEEN OF HEARTS**.

When the procession came opposite to Alice, they all stopped and looked at her, and the Queen said severely “who is this?” She said it to the Knave of Hearts, who only bowed and smiled in reply.

“Idiot!” said the Queen, turning up her nose, and asked Alice “what’s your name?”

“My name is Alice, so please your Majesty,” said Alice boldly, for she thought to herself “why, they’re only a pack of cards! I needn’t be afraid of them!”

“Who are these?” said the Queen, pointing to the three gardeners lying round the rose tree, for, as they were lying on their faces, and the pattern on their backs was the same as the rest of the pack, she could not tell whether they were gardeners, or soldiers, or courtiers, or three of her own children.

“How should *I* know?” said Alice, surprised at her own courage, “it’s no business of *mine*.”

The Queen turned crimson with fury, and, after glaring at her for a minute, began in a voice of thunder “off with her—”

“Nonsense!” said Alice, very loudly and decidedly, and the Queen was silent.

The King laid his hand upon her arm, and said timidly “remember, my dear! She is only a child!”

The Queen turned angrily away from him, and said to the Knave “turn them over!”

The Knave did so, very carefully, with one foot.

"Get up!" said the Queen, in a shrill loud voice, and the three gardeners instantly jumped up, and began bowing to the King, the Queen, the Royal children, and everybody else.

"Leave off that!" screamed the Queen, "you make me giddy." And then, turning to the rose tree, she went on "what *have* you been doing here?"

"May it please your Majesty," said Two very humbly, going down on one knee as he spoke, "we were trying—"

"*I see!*" said the Queen, who had meantime been examining the roses, "off with their heads!" and the procession moved on, three of the soldiers remaining behind to execute the three unfortunate gardeners, who ran to Alice for protection.

"You sha'n't be beheaded!" said Alice, and she put them into her pocket: the three soldiers marched once round her, looking for them, and then quietly marched off after the others.

"Are their heads off?" shouted the Queen.

"Their heads are gone," the soldiers shouted in reply, "if it please your Majesty!"

"That's right!" shouted the Queen, "can you play croquet?"

The soldiers were silent, and looked at Alice, as the question was evidently meant for her.

"Yes!" shouted Alice at the top of her voice.

"Come on then!" roared the Queen, and Alice joined the procession, wondering very much what would happen next.

"It's—it's a very fine day!" said a timid little voice: she was walking by the white rabbit, who was peeping anxiously into her face.

"Very," said Alice, "where's the Marchioness?"

"Hush, hush!" said the rabbit in a low voice, "she'll hear you. The Queen's the Marchioness: didn't you know that?"

"No, I didn't," said Alice, "what of?"

"Queen of Hearts," said the rabbit in a whisper, putting its mouth close to her ear, "and Marchioness of Mock Turtles."

"What are *they?*" said Alice, but there was no time for the answer, for they had reached the croquet-ground, and the game began instantly.

Alice thought she had never seen such a curious croquet-ground in all her life: it was all in ridges and furrows: the croquet-balls were live hedgehogs, the mallets live ostriches, and the soldiers had to double themselves up, and stand on their feet and hands, to make the arches.

The chief difficulty which Alice found at first was to manage her ostrich: she got its body tucked away, comfortably enough, under her arm, with its legs hanging down, but generally, just as she had got its neck straightened out nicely, and was going to give a blow with its head, it *would* twist itself round, and look up into her face, with such a puzzled expression that she could not help bursting out laughing: and when she had got its head down, and was going to begin again, it was very confusing to find that the hedgehog had unrolled itself, and was in the act of crawling away: besides all this, there was generally a ridge or a furrow in her way, wherever she wanted to send the hedgehog to, and as the doubled-up soldiers were always getting up and walking off to other parts of the ground, Alice soon came to the conclusion that it was a very difficult game indeed.

The players all played at once without waiting for turns, and quarrelled all the while at the tops of their voices, and in a very few minutes the Queen was in a furious passion, and went stamping about and shouting “off with his head!” of “off with her head!” about once in a minute. All those whom she sentenced were taken into custody by the soldiers, who of course had to leave off being arches to do this, so that, by the end of half an hour or so, there were no arches left, and all the players, except the King, the Queen, and Alice, were in custody, and under sentence of execution.

Then the Queen left off, quite out of breath, and said to Alice “have you seen the Mock Turtle?”

“No,” said Alice, “I don’t even know what a Mock Turtle is.”

“Come on then,” said the Queen, “and it shall tell you its history.”

As they walked off together, Alice heard the King say in a low voice, to the company generally, “you are all pardoned.”

“Come, that’s a good thing!” thought Alice, who had felt quite grieved at the number of executions which the Queen had ordered.

They very soon came upon a Gryphon, which lay fast asleep in the sun: (if you don’t know what a Gryphon is, look at the picture): “Up, lazy thing!” said the Queen, “and take this young lady to see the Mock Turtle, and to hear its history. I must go back and see after some executions I ordered,” and she walked off, leaving Alice with the Gryphon. Alice did not quite like the look of the creature, but on the whole she thought it quite as safe to stay as to go after that savage Queen: so she waited.

The Gryphon sat up and rubbed its eyes: then it watched the Queen till she was out of sight: then it chuckled. “What fun!” said the Gryphon, half to itself, half to Alice.

“What *is* the fun?” said Alice.

“Why, *she*,” said the Gryphon; “it’s all her fancy, that: they never executes nobody, you know: come on!”

“Everybody says ‘come on!’ here,” thought Alice as she walked slowly after the Gryphon; “I never was ordered about so before in all my life—never!”

They had not gone far before they saw the Mock Turtle in the distance, sitting sad and lonely on a little ledge of rock, and, as they came nearer, Alice could here it sighing as if its heart would break. She pitied it deeply: “what is its sorrow?” she asked the Gryphon, and the Gryphon answered, very nearly in

the same words as before, "it's all its fancy, that: it hasn't got no sorrow, you know: come on!"

So they went up to the Mock Turtle, who looked at them with large eyes full of tears, but said nothing.

"This here young lady" said the Gryphon, "wants for to know your history, she do."

"I'll tell it," said the Mock Turtle, in a deep hollow tone, "sit down, and don't speak till I've finished."

So they sat down, and no one spoke for some minutes: Alice thought to herself "I don't see how it can *ever* finish, if it doesn't begin," but she waited patiently.

"Once," said the Mock Turtle at last, with a deep sigh, "I was a real Turtle."

These words were followed by a very long silence, broken only by an occasional exclamation of "hjkrrh!" from the Gryphon, and the constant heavy sobbing of the Mock Turtle. Alice was very nearly getting up and saying, "thank you, sir, for your interesting story," but she could not help thinking there *must* be more to come, so she sat still and said nothing.

"When we were little," the Mock Turtle went on, more calmly, though still sobbing a little now and then, "we went to school in the sea. The master was an old Turtle—we used to call him Tortoise—"

"Why did you call him Tortoise, if he wasn't one?" asked Alice.

"We called him Tortoise because he taught us," said the Mock Turtle angrily, "really you are very dull!"

"You ought to be ashamed of yourself for asking such a simple question," added the Gryphon, and then they both sat silent and looked at poor Alice, who felt ready to sink into the earth: at last the Gryphon said to the Mock Turtle, "get on, old fellow! Don't be all day!" and the Mock Turtle went on in these words:

"You may not have lived much under the sea—" ("I haven't," said Alice,) "and perhaps you were never even introduced to a lobster—" (Alice began to say "I once tasted—" but hastily checked herself, and said "no, never," instead,) "so you can have no idea what a delightful thing a Lobster Quadrille is!"

"No, indeed," said Alice, "what sort of a thing is it?"

"Why," said the Gryphon, "you form into a line along the sea shore—"

"Two lines!" cried the Mock Turtle, "seals, turtles, salmon, and so on—advance twice—"

"Each with a lobster as partner!" cried the Gryphon.

"Of course," the Mock Turtle said, "advance twice, set to partners—"

"Change lobsters, and retire in same order—" interrupted the Gryphon.

"Then, you know," continued the Mock Turtle, "you throw the—"

"The lobsters!" shouted the Gryphon, with a bound into the air.

"As far out to sea as you can—"

"Swim after them!" screamed the Gryphon.

"Turn a somersault in the sea!" cried the Mock Turtle, capering wildly about.

"Change lobsters again!" yelled the Gryphon at the top of its voice, "and then—"

"That's all," said the Mock Turtle, suddenly dropping its voice, and the two creatures, who had been jumping about like mad things all this time, sat down again very sadly and quietly, and looked at Alice.

"It must be a very pretty dance," said Alice timidly.

“Would you like to see a little of it?” said the Mock Turtle.

“Very much indeed,” said Alice.

“Come, let’s try the first figure!” said the Mock Turtle to the Gryphon, “we can do it without lobsters, you know. Which shall sing?”

“Oh! *you* sing!” said the Gryphon, “I’ve forgotten the words.”

So they began solemnly dancing round and round Alice, every now and then treading on her toes when they came too close, and waving their fore-paws to mark the time, while the Mock Turtle sang, slowly and sadly, these words:

“Beneath the waters *of* the sea
Are lobsters thick as thick can be—
They love to dance with you and me,
My own, my gentle Salmon!”

Parody on Negro
minstrel song *Sally
Come Up*

The Gryphon joined in singing the chorus, which was:

“Salmon come up! Salmon go down!
Salmon come twist your tail around!
Of all the fishes *of* the sea
There’s none so good as Salmon!”

“Thank you,” said Alice, feeling very glad that the figure was over.

“Shall we try the second figure?” said the Gryphon, “or would you prefer a song?”

“Oh, a song, please!” Alice replied, so eagerly, that the Gryphon said, in a rather offended tone, “hm! no accounting for tastes! Sing her ‘Mock Turtle Soup’, will you, old fellow!”

The Mock Turtle sighed deeply, and began, in a voice sometimes choked with sobs, to sing this:

“Beautiful Soup, so rich and green,
 Waiting in a hot tureen!
 Who for such dainties would not stoop?
 Soup of the evening, beautiful Soup!
 Soup of the evening, beautiful Soup!
 Beau—ootiful Soo—oop!
 Beau—ootiful Soo—oop!
 Soo—oop of the e—e—evening,
 Beautiful beautiful Soup!”

Parody on *Star of the Evening* by James M. Sayles

“Chorus again!” cried the Gryphon, and the Mock Turtle had just begun to repeat it, when a cry of “the trial’s beginning!” was heard in the distance.

“Come on!” cried the Gryphon, and, taking Alice by the hand, he hurried off, without waiting for the end of the song.

“What trial is it?” panted Alice as she ran, but the Gryphon only answered “come on!” and ran the faster, and more and more faintly came, borne on the breeze that followed them, the melancholy words:

 “Soo—oop of the e—e—evening,
 Beautiful beautiful Soup!”

The King and Queen were seated on their throne when they arrived, with a great crowd assembled around them: the Knave was in custody: and before the King stood the white rabbit, with a trumpet in one hand, and a scroll of parchment in the other.

“Herald! read the accusation!” said the King.

On this the white rabbit blew three blasts on the trumpet, and then unrolled the parchment scroll, and read as follows:

 “The Queen of Hearts she made some tarts
 All on a summer day:
 The Knave of Hearts he stole those tarts,
 And took them quite away!”

Quoted from nursery rhyme

“Now for the evidence,” said the King, “and then the sentence.”

“No!” said the Queen, “first the sentence, and then the evidence!”

“Nonsense!” cried Alice, so loudly that everybody jumped, “the idea of having the sentence first!”

“Hold your tongue!” said the Queen.

“I won’t!” said Alice, “you’re nothing but a pack of cards! Who cares for you?”

At this the whole pack rose up into the air, and came flying down upon her: she gave a little scream of fright, and tried to beat them off, and found herself lying on the bank, with her head in the lap of her sister, who was gently brushing away some leaves that had fluttered down from the trees on to her face.

“Wake up! Alice dear!” said her sister, “what a nice long sleep you’ve had!”

“Oh, I’ve had such a curious dream!” said Alice, and she told her sister all her *Adventures Under Ground*, as you have read them, and when she had finished, her sister kissed her and said “it *was* a curious dream, dear, certainly! But now run in to your tea: it’s getting late.”

So Alice ran off, thinking while she ran (as well she might) what a wonderful dream it had been.

But her sister sat there some while longer, watching the setting sun, and thinking of little Alice and her Adventures, till she too began dreaming after a fashion, and this was her dream:

She saw an ancient city, and a quiet river winding near it along the plain, and up the stream went slowly gliding a boat with a merry party of children on board—she could hear their voices and laughter like music over the water—and among them was another little Alice, who sat listening with bright eager eyes to a tale that was being told, and she listened for the words of the tale, and lo! it was the dream of her own little sister. So the boat wound slowly along, beneath the bright summer-day, with its merry crew and its music of voices and laughter, till it passed round one of the many turnings of the stream, and she saw it no more.

Then she thought, (in a dream within the dream, as it were,) how this same little Alice would, in the after-time, be herself a grown woman: and how she would keep, through her riper years, the simple and loving heart of her childhood: and how she would gather around her other little children, and make *their* eyes bright and eager with many a wonderful tale, perhaps even with these very adventures of the little Alice of long-ago: and how she would feel with all their simple sorrows, and find a pleasure in all their simple joys, remembering her own child-life, and the happy summer days.

The final image is not included in the book, in the manuscript it is pasted on a drawing:

I. The White Rabbit

Once upon a time, there was a little girl called Alice: and she had a very curious dream.

Would you like to hear what it was that she dreamed about?

Well, this was the *first* thing that happened. A White Rabbit came running by, in a great hurry; and, just as it passed Alice, it stopped, and took its watch out of its pocket.

Wasn't *that* a funny thing? Did *you* ever see a Rabbit that had a watch, and a pocket to put it in? Of course, when a Rabbit has a watch, it *must* have

a pocket to put it in: it would never do to carry it about in its mouth—and it wants its hands sometimes, to run about with.

Hasn't it got pretty pink eyes (I think *all* White Rabbits have pink eyes); and pink ears; and a nice brown coat; and you can just see its red pocket-handkerchief peeping out of its coat-pocket: and, what with its blue neck-tie and its yellow waistcoat, it really is *very* nicely dressed.

“Oh dear, oh dear!” said the Rabbit. “I shall be too late!” *What* would it be too late *for*, I wonder? Well, you see, it had to go and visit the Duchess (you'll see a picture of the Duchess, soon, sitting in her kitchen): and the Duchess was a very cross old lady: and the Rabbit *knew* she'd be very angry indeed if he kept her waiting. So the poor thing was as frightened as frightened could be (Don't you see how he's trembling? Just shake the book a little, from side to side, and you'll soon see him tremble), because he thought the Duchess would have his head cut off, for a punishment. That was what the Queen of Hearts used to do, when *she* was angry with people (you'll see a picture of *her*, soon): at least she used to *order* their heads to be cut off, and she always *thought* it was done, though they never *really* did it.

And so, when the White Rabbit ran away, Alice wanted to see what would happen to it: so she ran after it: and she ran, and she ran, till she tumbled right down the rabbit-hole.

And then she had a very long fall indeed. Down, and down, and down, till she began to wonder if she was going right *through* the World, so as to come out on the other side!

It was just like a very deep well: only there was no water in it. If anybody *really* had such a fall as that, it would kill them, most likely: but you know it doesn't hurt a bit to fall in a *dream*, because, all the time you *think* you're falling, you really *are* lying somewhere, safe and sound, and fast asleep!

However, this terrible fall came to an end at last, and down came Alice on a heap of sticks and dry leaves. But she wasn't a bit hurt, and up she jumped, and ran after the Rabbit again.

And so that was the beginning of Alice's curious dream. And, next time you see a White Rabbit, try and fancy *you're* going to have a curious dream, just like dear little Alice.

II. How Alice Grew Tall

And so, after Alice had tumbled down the rabbit-hole, and had run a long long way underground, all of a sudden she found herself in a great hall, with doors all round it.

But all the Doors were locked: so, you see, poor Alice couldn't get out of the hall: and that made her very sad.

However, after a little while, she came to a little table, all made of glass, with three legs (There are *two* of the legs in the picture, and just the *beginning* of the other leg, do you see?), and on the table was a little key: and she went round the hall, and tried if she could unlock any of the doors with it.

Poor Alice! The key wouldn't unlock *any* of the doors. But at last she came upon a tiny little door: and oh, how glad she was, when she found the key would fit it!

So she unlocked the tiny little door, and she stooped down and looked through it, and what do you think she saw? Oh, such a beautiful garden!

And she did so *long* to go into it! But the door was *far* too small. She couldn't squeeze herself through, any more than *you* could squeeze yourself into a mouse-hole!

So poor little Alice locked up the door, and took the key back to the table again: and *this* time she found quite a new thing on it (now look at the picture again), and what do you think it was? It was a little bottle, with a label tied to it, with the words "DRINK ME" on the label.

So she tasted it: and it was *very* nice: so she set to work, and drank it up. And then *such* a curious thing happened to her! You'll never guess what it was: so I shall have to tell you. She got smaller, and smaller, till at last she was just the size of a little doll!

Then she said to herself "*Now* I'm the right size to get through the little door!" And away she ran. But, when she got there, the door was locked, and the key was on the top of the table, and she couldn't reach it! *Wasn't* it a pity she had locked up the door again?

Well, the next thing she found was a little cake: and it had the words "EAT ME" marked on it. So of course she set to work and ate it up. And *then* what do you think happened to her? No, you'll never guess! I shall have to tell you again.

She grew, and she grew, and she grew. Taller than she was before! Taller than *any* child! Taller than any grown-up person! Taller, and taller, and taller! Just look at the picture, and you'll *see* how tall she got!

Which would *you* have liked the best, do you think, to be a little tiny Alice, no larger than a kitten, or a great tall Alice, with your head always knocking against the ceiling?

III. The Pool of Tears

Perhaps you think Alice must have been very much pleased, when she had eaten the little cake, to find herself growing so tremendously tall? Because of course it would be easy enough, *now*, to reach the little key off the glass table, and to open the little tiny door.

Well, of course she could do *that*: but what good was it to get the door open, when she couldn't get *through*? She was worse off than ever, poor thing! She could just manage, by putting her head down, close to the ground, to *look* through with one eye! But that was *all* she could do. No wonder the poor tall child sat down and cried as if her heart would break.

So she cried, and she cried. And her tears ran down the middle of the hall, like a deep river. And very soon there was quite a large Pool of Tears, reaching half-way down the hall.

And there she might have staid, till this very day, if the White Rabbit hadn't happened to come through the hall, on his way to visit the Duchess. He was dressed up as grand as grand could be, and he had a pair of white kid gloves in one hand, and a little fan in the other hand: and he kept on muttering to himself "Oh, the Duchess, the Duchess! Oh, *won't* she be savage if I've kept her waiting!"

But he didn't see Alice, you know. So when she began to say "If you please, Sir——" her voice seemed to come from the top of the hall, because her head was so high up. And the Rabbit was dreadfully frightened: and he dropped the gloves and the fan, and ran away as hard as he could go.

Then a *very* curious thing indeed happened. Alice took up the fan, and began to fan herself with it: and, lo and behold, she got quite small again, and, all in a minute, she was just about the size of a mouse!

Now look at the picture, and you'll soon guess what happened next. It looks just like the sea, doesn't it? But it *really* is the Pool of Tears—all made of *Alice's* tears, you know!

And Alice has tumbled into the Pool: and the Mouse has tumbled in: and there they are, swimming about together.

Doesn't Alice look pretty, as she swims across the picture? You can just see

her blue stockings, far away under the water.

But why is the Mouse swimming away from Alice in such a hurry? Well, the reason is, that Alice began talking about cats and dogs: and a Mouse always *hates* talking about cats and dogs!

Suppose you were swimming about, in a Pool of your own Tears: and suppose somebody began talking to *you* about lesson-books and bottles of medicine, wouldn't *you* swim away as hard as you could go?

IV. The Caucus-Race

When Alice and the Mouse had got out of the Pool of Tears, of course they were very wet: and so were a lot of other curious creatures, that had tumbled in as well. There was a Dodo (that's the great bird, in front, leaning on a walking-stick); and a Duck; and a Lory (that's just behind the Duck, looking over its head); and an Eaglet (that's on the left-hand side of the Lory); and several others.

Well, and so they didn't know how in the world they were to get dry again. But the Dodo—who was a very wise bird—told them the right way was to have a Caucus-Race. And what do you think *that* was?

You don't know? Well, you *are* an ignorant child! Now, be very attentive, and I'll soon cure you of your ignorance!

First, you must have a *racecourse*. It ought to be a *sort* of circle, but it doesn't much matter *what* shape it is, so long as it goes a good way round, and joins on to itself again.

Then, you must put all the *racers* on the course, here and there: it doesn't matter *where*, so long as you don't crowd them too much together.

Then, you needn't say "One, two, three, and away!" but let them all set off running just when they like, and leave off just when they like.

So all these creatures, Alice and all, went on running round and round, till they were all quite dry again. And then the Dodo said *everybody* had won, and *everybody* must have prizes!

Of course *Alice* had to give them their prizes. And she had nothing to give them but a few comfits she happened to have in her pocket. And there was just one a-piece, all round. And there was no prize for Alice!

So what do you think they did? Alice had nothing left but her thimble. Now look at the picture, and you'll see what happened.

"Hand it over here!" said the Dodo.

Then the Dodo took the thimble and handed it back to Alice, and said "We beg your acceptance of this elegant thimble!" And then all the other creatures cheered.

Wasn't *that* a curious sort of present to give her? Suppose they wanted to give *you* a birthday-present, would you rather they should go to you toy-cupboard, and pick out your nicest doll, and say "Here, my love, here's a lovely birthday-present for you!" or would you like them to give you something *new*, something that *didn't* belong to you before?

V. Bill, the Lizard

Now I'm going to tell you about Alice's Adventures in the White Rabbit's house.

Do you remember how the Rabbit dropped his gloves and his fan, when he was so frightened at hearing Alice's voice, that seemed to come down from the sky? Well, of course he couldn't go to visit the Duchess *without* his gloves and his fan: so, after a bit, he came back again to look for them.

By this time the Dodo and all the other curious creatures had gone away, and Alice was wandering about all alone.

So what do you think he did? Actually he thought she was his housemaid, and began ordering her about! "Mary Ann!" he said. "Go home this very minute, and fetch me a pair of gloves and a fan! Quick, now!"

Perhaps he couldn't see very clearly with his pink eyes: for I'm sure Alice doesn't look very *like* a housemaid, *does* she? However she was a very good-natured little girl: so she wasn't a bit offended, but ran off to the Rabbit's house as quick as she could.

It was lucky she found the door open: for, if she had had to ring, I suppose the *real* Mary Ann would have come to open the door: and she would *never* have let Alice come in. And I'm sure it was *very* lucky she didn't meet the real Mary Ann, as she trotted upstairs: for I'm afraid she would have taken Alice for a robber!

So at last she found her way into the Rabbit's room: and there was a pair of gloves lying on the table, and she was just going to take them up and go away, when she happened to see a little bottle on the table. And of course it had the words "DRINK ME!" on the label. And of course Alice drank some!

Well, I think that was *rather* lucky, too: don't *you*? For, if she *hadn't* drunk any, all this wonderful adventure, that I'm about to tell you about, wouldn't have happened at all. And wouldn't *that* have been a pity?

You're getting so used to Alice's Adventures, that I daresay you can guess

what happened next? If you ca'n't, I'll tell you.

She grew, and she grew, and she grew. And in a very short time the room was full of *Alice*: just in the same way as a jar is full of jam! There was *Alice* all the way up to the ceiling: and *Alice* in every corner of the room!

The door opened inwards: so of course there wasn't any room to open it: so when the Rabbit got tired of waiting, and came to fetch his gloves for himself, of course he couldn't get in.

So what do you think he did? (Now we come to the picture). He sent Bill, the Lizard, up to the roof of the house, and told him to get down the chimney. But Alice happened to have one of her feet in the fire-place: so, when she heard Bill coming down the chimney, she just gave a little tiny kick, and away went Bill, flying up into the sky!

Poor little Bill! Don't you pity him very much? How frightened he must have been!

VI. The Dear Little Puppy

Well, it doesn't look such a very *little* Puppy, does it? But then, you see, Alice had grown very small-indeed: and *that's* what makes the Puppy look so large. When Alice had eaten one of those little magic cakes, that she found in the White Rabbit's house, it made her get quite small, directly, so that she could get through the door: or else she could *never* have got out of the house again. Wouldn't *that* have been a pity? Because then she wouldn't have dreamed all the other curious things that we're going to read about.

So it really *was* a *little* Puppy, you see. And isn't it a little *pet*? And look at the way it's barking at the little stick that Alice is holding out for it! You can see she was a *little* afraid of it, all the time, because she's got behind that great thistle, for fear it should run over her. That would have been just about as bad, for *her*, as it would be for *you* to be run over by a waggon and four horses!

Have you got a little pet puppy at *your* home? If you have, I hope you're always kind to it, and give it nice things to eat.

Once upon a time, I knew some little children, about as big as you; and they had a little pet dog of their own; and it was called *Dash*. And this is what they told me about its birthday-treat.

"Do you know, one day we remembered it was Dash's birthday that day. So we said 'Let's give Dash a nice birthday-treat, like what we have on *our* birthdays!' So we thought and we thought 'Now, what is it *we* like best of all, on *our* birthdays?' And we thought and we thought. And at last we all called out together 'Why, it's *oatmeal-porridge*, of course!' So of course we thought Dash would be *quite* sure to like it very much, too.

"So we went to the cook, and we got her to make a saucerful of nice oatmeal-porridge. And then we called Dash into the house, and we said 'Now, Dash, you're going to have your birthday-treat!' We expect Dash would jump for joy: but it didn't, one bit!

“So we put the saucer down before it, and we said ‘Now, Dash, don’t be greedy! Eat it nicely, like a good dog!’

“So Dash just tasted it with the tip of its tongue: and then it made, oh, such a horrid face! And then, do you know, it did *hate* it so, it wouldn’t eat a bit more of it! So we had to put it all down its throat with a spoon!”

I wonder if Alice will give *this* little Puppy some porridge? I don’t think she *can*, because she hasn’t got any with her. I can’t see any saucer in the picture.

VII. The Blue Caterpillar

Would you like to know what happened to Alice, after she had got away from the Puppy? It was far too large an animal, you know, for *her* to play with. (I don’t suppose *you* would much enjoy playing with a young Hippopotamus, would you? You would always be expecting to be crushed as flat as a pancake under its great heavy feet!) So Alice was very glad to run away, while it wasn’t looking.

Well, she wandered up and down, and didn’t know what in the world to do, to make herself grow up to her right size again. Of course she knew that she had to eat or drink *something*: that was the regular rule, you know: but she couldn’t guess *what* thing.

However, she soon came to a great mushroom, that was so tall that she couldn't see over the top of it without standing on tip-toe. And what do you think she saw? Something that I'm sure *you* never talked to, in all your life!

It was a large Blue Caterpillar.

I'll tell you, soon, what Alice and the Caterpillar talked about: but first let us have a good look at the picture.

That curious thing, standing in front of the Caterpillar, is called a "hookah": and it's used for smoking. The smoke comes through that long tube, that winds round and round like a serpent.

And do you see its long nose and chin? At least, they *look* exactly like a nose and chin, don't they? But they really *are* two of its legs. You know a Caterpillar has got *quantities* of legs: you can see some more of them, further down.

What a bother it must be to a Caterpillar, counting over such a lot of legs, every night, to make sure it hasn't lost any of them!

And *another* great bother must be, having to settle *which* leg it had better move first. I think, if *you* had forty or fifty legs, and if you wanted to go a walk, you'd be such a time in settling which leg to begin with, that you'd never go a walk at all!

And what did Alice and the Caterpillar *talk* about, I wonder?

Well, Alice told it how *very* confusing it was, being first one size and then another.

And the Caterpillar asked her if she liked the size she was, just then.

And Alice said she would like to be just a *little* bit larger—three inches was such a *wretched* height to be! (Just mark off three inches on the wall, about the length of your middle finger, and you'll see what size she was.)

And the Caterpillar told her one side of the mushroom would make her grow *taller*, and the other side would make her grow *shorter*.

So Alice took two little bits of it with her to nibble, and managed to make herself quite a nice comfortable height, before she went on to visit the Duchess.

VIII. The Pig-Baby

Would you like to hear about Alice's visit to the Duchess? It was a very interesting visit indeed, I can assure you.

Of course she knocked at the door to begin with: but nobody came: so she had to open it for herself.

Now, if you look at the picture, you'll see exactly what Alice saw when she got inside.

The door led right into the kitchen, you see. The Duchess sat in the middle of the room, nursing the Baby. The Baby was howling. The soup was boiling. The Cook was stirring the soup. The Cat—it was a *Cheshire* Cat—was grinning, as Cheshire Cats always do. All these things were happening just as Alice went in.

The Duchess has a beautiful cap and gown, hasn't she? But I'm afraid she *hasn't* got a very beautiful *face*.

The Baby—well, I daresay you've seen *several* nicer babies than *that*: and more good-tempered ones, too. However, take a good look at it, and we'll see if you know it again, next time you meet it!

The Cook—well, you *may* have seen nicer cooks, once or twice.

But I'm nearly sure you've *never* seen a nicer *Cat*! Now *have* you? And *wouldn't* you like to have a Cat of your own, just like that one, with lovely green eyes, and smiling so sweetly?

The Duchess was very rude to Alice. And no wonder. Why, she even called her own *Baby* "Pig!" And it *wasn't* a Pig, *was* it? And she ordered the Cook to chop off Alice's head: though of course the Cook didn't do it: and at last she threw the Baby at her! So Alice caught the Baby, and took it away with her: and I think that was about the best thing she could do.

So she wandered away, through the wood, carrying the ugly little thing with her. And a great job it was to keep hold of it, it wriggled about so. But at last she found out that the *proper* way was, to keep tight hold of its left foot and its right ear.

But don't *you* try to hold on to a Baby like that, my Child! There are not many babies that *like* being nursed in *that* way!

Well, and so the Baby kept grunting, and grunting, so that Alice had to say to it, quite seriously, "If you're going to turn into a *Pig*, my dear, I'll have nothing more to do with you. Mind now!"

And at last she looked down into its face, and what *do* you think had happened to it? Look at the picture, and see if you can guess.

"Why, *that's* not the Baby that Alice was nursing, is it?"

Ah, I *knew* you wouldn't know it again, though I told you to take a good look at it! Yes, it *is* the Baby. And it's turned into a little *Pig*!

So Alice put it down, and let it trot away into the wood. And she said to herself "It was a *very* ugly *Baby*: but it makes rather a handsome *Pig*, I think."

Don't you think she was right?

IX. The Cheshire-Cat

All alone, all alone! Poor Alice! No Baby, not even a *Pig* to keep her company!

So you may be sure she was very glad indeed, when she saw the Cheshire-Cat, perched up in a tree, over her head.

The Cat has a very nice smile, no doubt: but just look what a lot of teeth it's got! Isn't Alice just a *little* shy of it?

Well, yes, a *little*. But then, it couldn't help having teeth, you know: and it *could* have helped smiling, supposing it had been cross. So, on the whole, she was *glad*.

Doesn't Alice look very prim, holding her head so straight up, and with her hands behind her, just as if she were going to say her lessons to the Cat!

And that reminds me. There's a little lesson I want to teach *you*, while we're looking at this picture of Alice and the Cat. Now don't be in a bad temper about it, my dear Child! It's a very *little* lesson indeed!

Do you see that Fox-Glove growing close to the tree? And do you know why it's called a *Fox-Glove*? Perhaps you think it's got something to do with a Fox? No indeed! *Foxes* never wear Gloves!

The right word is "*Folk's-Gloves*." Did you ever hear that Fairies used to be called "the good *Folk*"?

Now we've finished the lesson, and we'll wait a minute, till you've got your

temper again.

Well? Do you feel quite good-natured again? No temper-ache? No crossness about the corners of the mouth? Then we'll go on.

"Cheshire Puss!" said Alice. (*Wasn't* that a pretty name for a Cat?) "Would you tell me which way I ought to go from here?"

And so the Cheshire-Cat told her which way she ought to go, if she wanted to visit the Hatter, and which way to go, to visit the March Hare. "They're both mad!" said the Cat.

And then the Cat vanished away, just like the flame of a candle when it goes out!

So Alice set off, to visit the March Hare. And as she went along, there was the Cat again! And she told it she didn't *like* it coming and going so quickly.

So this time the Cat vanished quite slowly, beginning with the tail, and ending with the grin. Wasn't *that* a curious thing, a Grin without any Cat? Would you like to see one?

If you turn up the corner of this leaf, you'll have Alice looking at the Grin: and she doesn't look a bit more frightened than when she was looking at the Cat, *does* she?

X. The Mad Tea-Party

This is the Mad Tea-Party. You see Alice had left the Cheshire-Cat, and had gone off to see the March Hare and the Hatter, as the Cheshire-Cat had advised her: and she found them having tea under a great tree, with a Dormouse sitting between them.

There were only those three at the table, but there were quantities of tea-cups set all along it. You ca'n't see all the table, you know, and even in the bit you *can* see there are nine cups, counting the one the Mach Hare has got in his hand.

That's the March Hare, with the long ears, and straws mixed up with his hair. The straws showed he was mad—I don't know why. Never twist up straws among *your* hair, for fear people should think you're mad!

There was a nice green arm-chair at the end of the table, that looked as if it was just meant for Alice: so she went and sat down in it.

Then she had quite a long talk with the March Hare and the Hatter. The Dormouse didn't say much. You see it was fast asleep generally, and it only just woke up for a moment, now and then.

As long as it was asleep, it was very useful to the March Hare and the Hatter, because it had a nice round soft head, just like a pillow: so they could put their elbows on it, and lean across it, and talk to each other quite comfortably. You wouldn't like people to use *your* head for a pillow, *would* you? But if you were fast asleep, like the Dormouse, you wouldn't feel it: so I suppose you wouldn't care about it.

I'm afraid they gave Alice *very* little to eat and drink. However, after a bit, she helped herself to some tea and bread-and-butter: only I don't quite see where she *got* the bread-and-butter: and she had no plate for it. Nobody seems to have a plate except the Hatter. I believe the March Hare must have had one as well: because, when they all moved one place on (that was the rule at this curious tea-party), and Alice had to go into the place of the March Hare, she found he had just upset the milk-jug into his plate. So I suppose his plate and the milk-jug are hidden behind that large tea-pot.

The Hatter used to carry about hats to sell: and even the one that he's got on his head is meant to be sold. You see it's got its price marked on it—a "10" and a "6"—that means "ten shillings and sixpence." Wasn't that a funny way of selling hats? And hasn't he got a beautiful neck-tie on? Such a lovely yellow tie, with large red spots.

He has just got up to say to Alice "Your hair wants cutting!" That was a rude thing to say, *wasn't* it? And do you think her hair *does* want cutting? I think it's a very pretty length—just the right length.

XI. The Queen's Garden

This is a little bit of the beautiful garden I told you about. You see Alice had managed at last to get quite small, so that she could go through the little door. I suppose she was about as tall as a mouse, if it stood on its hind-legs: so of course this was a *very* tiny rose-tree: and these are *very* tiny gardeners.

What funny little men they are! But *are* they men, do you think? I think they must be live cards, with just a head, and arms, and legs, so as to *look* like little men. And what *are* they doing with that red paint, I wonder? Well, you see, this is what they told Alice. The Queen of Hearts wanted to have a *red* rose-tree just in that corner: and these poor little gardeners had made a great mistake, and had put in a *white* one instead: and they were so frightened about it, because the Queen was *sure* to be angry, and then she would order all their heads to be cut off!

She was a dreadfully savage Queen, and that was the way she always did, when she was angry with people. "Off with their head!" They didn't *really* cut their heads off, you know: because nobody ever obeyed her: but that was what she always *said*.

Now ca'n't you guess what the poor little gardeners are trying to do? They're trying to paint the roses *red*, and they're in a great hurry to get it done before the Queen comes. And then *perhaps* the Queen won't find out it was a *white* rose-tree to begin with: and then *perhaps* the little men won't get their heads cut off!

You see there were *five* large white roses on the tree—such a job to get them all painted red! But they've got three and a half done, now, and if only they wouldn't stop to talk—work away, little men, *do* work away! Or the Queen will be coming before it's done! And if she finds any *white* roses on the tree, do you know what will happen? It will be "Off with their heads!" Oh, work away, my little men! Hurry, hurry!

The Queen has come! And *isn't* she angry? Oh, my poor little Alice!

XII. The Lobster-Quadrille

Did you ever play at Croquet? There are large wooden balls, painted with different colours, that you have to roll about; and arches of wire, that you have to send them through; and great wooden mallets, with long handles, to knock the balls about with.

Now look at the picture, and you'll see that *Alice* has just been playing a Game of Croquet.

"But she *couldn't* play, with that great red what's-its-name in her arms! Why, how could she hold the mallet?"

Why, my dear Child, that great red what's-its-name (its *real* name is "*a Flamingo*") *is* the mallet! In this Croquet-Game, the balls were live *Hedge-hogs*—you know a hedge-hog can roll itself up into a ball?—and the mallets were live *Flamingos*!

So Alice is just resting from the Game, for a minute, to have a chat with that dear old thing, the Duchess: and of course she keeps her mallet under her arm, so as not to lose it.

"But I don't think she *was* a dear old thing, one bit! To call her Baby a *Pig*, and to want to chop off Alice's head!"

Oh, that was only a joke, about chopping off Alice's head: and as to the Baby—why, it *was* a Pig, you know! And just look at her *smile*! Why, it's wider than all Alice's head: and yet you can only see half of it!

Well, they'd only had a *very* little chat, when the Queen came and took Alice away, to see the Gryphon and the Mock Turtle.

You don't know what a Gryphon is? Well! Do you know anything? That's the question. However, look at the picture. That creature with a red head, and red claws, and green scales, is the Gryphon. Now you know.

And the other's the Mock Turtle. It's got a calf's-head, because calf's-head is used to make Mock Turtle Soup. Now you know.

"But what are they doing, going round and round Alice like that?"

Why, I thought of course you'd know that! They're dancing a Lobster-Quadrille.

And next time *you* meet a Gryphon and a Mock Turtle, I daresay they'll dance it for *you*, if you ask them prettily. Only don't let them come *quite* close, or they'll be treading on your toes, as they did on poor Alice's.

XIII. Who Stole the Tarts?

Did you ever hear how the Queen of Hearts made some tarts? And can you tell me what became of them?

"Why, of *course* I can! Doesn't the song tell all about it?"

*The Queen of Hearts, she made some tarts:
All on a summer day:
The Knave of Hearts, he stole those tarts,
And took them quite away!"*

Quoted from nursery rhyme

Well, yes, the *Song* says so. But it would never do to punish the poor Knave, just because there was a *Song* about him. They had to take him prisoner, and put chains on his wrists, and bring him before the King of Hearts, so that there might be a regular trial.

(Frontispiece)

Now, if you look at the big picture, at the beginning of this book, you'll see what a grand thing a trial is, when the Judge is a King!

The King is very grand, *isn't* he? But he doesn't look very *happy*. I think that big crown, on the top of his wig, must be *very* heavy and uncomfortable. But he had to wear them *both*, you see, so that people might know he was a Judge *and* a King.

And *doesn't* the Queen look cross? She can see the dish of tarts on the table, that she had taken such trouble to make. And she can see the bad Knave (do you see the chains hanging from his wrists?) that stole them away from her: so I don't think it's any wonder if she *does* feel a *little* cross.

The White Rabbit is standing near the King, reading out the *Song*, to tell

everybody what a bad Knave he is: and the Jury (you can just see two of them, up in the Jury-box, the Frog and the Duck) have to settle whether he's "guilty" or "not guilty."

Now I'll tell you about the accident that happened to Alice.

You see, she was sitting close by the Jury-box: and she was called as a witness. You know what a "witness" is? A "witness" is a person who has seen the prisoner do whatever he's accused of, or at any rate knows *something* that's important in the trial.

But *Alice* hadn't seen the Queen *make* the tarts: and she hadn't seen the Knave *take* the tarts: and, in fact, she didn't know anything about it: so why in the world they wanted *her* to be a witness, I'm sure *I* ca'n't tell you!

Anyhow, they *did* want her. And the White Rabbit blew his big trumpet, and shouted out "Alice!" And so Alice jumped up in a great hurry. And then—

And then what *do* you think happened? Why, her skirt caught against the Jury-box, and tipped it over, and all the poor little Jurors came tumbling out of it!

Let's try if we can make out all the twelve. You know there ought to be twelve to make up a Jury. I can see the Frog, and the Dormouse, and the Rat and the Ferret, and the Hedgehog, and the Lizard, and the Bantam-Cock, and the Mole, and the Duck, and the Squirrel, and a screaming bird, with a long beak, just behind the Mole.

But that only makes eleven: we must find one more creature.

Oh, do you see a little white head, coming out behind the Mole, and just under the Duck's beak? That makes up the twelve.

Mr. Tenniel says the screaming bird is a *Storkling* (of course you know what *that is?*) and the little white head is a *Mouseling*. Isn't it a little *darling?*

Alice picked them all up again, very carefully, and I hope they weren't *much* hurt!

XIV. The Shower of Cards

Oh dear, oh dear! What *is* it all about? And what's happening to Alice?

Well, I'll tell you all about it, as well I can. The way the trial ended was this. The King wanted the Jury to settle whether the Knave of Hearts was *guilty* or *not guilty*—that means that they were to settle whether *he* had stolen the Tarts, or if somebody else had taken them. But the wicked Queen wanted to have his *punishment* settled, first of all. That wasn't at all fair, *was* it? Because, you know, supposing he never *took* the Tarts, then of course he oughtn't to be punished. Would *you* like to be punished for something you hadn't done?

So Alice said “Stuff and nonsense!”

So the Queen said “Off with her head!” (Just what she always said, when she was angry.)

So Alice said “Who cares for *you*? You’re nothing but a pack of cards!”

So they were *all* very angry, and flew up into the air, and came tumbling down again, all over Alice, just like a shower of rain.

And I think you’ll *never* guess what happened next. The next thing was, Alice woke up out of her curious dream. And she found that the cards were only some leaves off the tree, that the wind had blown down upon her face.

Wouldn’t it be a nice thing to have a curious dream, just like Alice?

The best plan is this. First lie down under a tree, and wait till a White Rabbit runs by, with a watch in his hand: then shut your eyes, and pretend to be dear little Alice.

Good-bye, Alice dear, good-bye!

2.5 Sylvie and Bruno

Source: Sylvie and Bruno

Chapter I. Less Bread! More Taxes!

—and then all the people cheered again, and one man, who was more excited than the rest, flung his hat high into the air, and shouted (as well as I could make out) “Who roar for the Sub-Warden?” *Everybody* roared, but whether it was for the Sub-Warden, or not, did not clearly appear: some were shouting “Bread!” and some “Taxes!”, but no one seemed to know what it was they really wanted.

All this I saw from the open window of the Warden’s breakfast-saloon, looking across the shoulder of the Lord Chancellor, who had sprung to his feet the moment the shouting began, almost as if he had been expecting it, and had rushed to the window which commanded the best view of the market-place.

“What *can* it all mean?” he kept repeating to himself, as, with his hands clasped behind him, and his gown floating in the air, he paced rapidly up and down the room. “I never heard such shouting before—and at this time of the morning, too! And with such unanimity! Doesn’t it strike *you* as very remarkable?”

I represented, modestly, that to *my* ears it appeared that they were shouting for different things, but the Chancellor would not listen to my suggestion for a moment. “They all shout the same words, I assure you!” he said: then, leaning well out of the window, he whispered to a man who was standing close underneath, “Keep ’em together, ca’n’t you? The Warden will be here directly. Give ’em the signal for the march up!” All this was evidently not meant for *my* ears, but I could scarcely help hearing it, considering that my chin was almost on the Chancellor’s shoulder.

The ‘march up’ was a very curious sight: a straggling procession of men, marching two and two, began from the other side of the market-place, and advanced in an irregular zig-zag fashion towards the Palace, wildly tacking from side to side, like a sailing vessel making way against an unfavourable wind—so that the head of the procession was often further from us at the end of one tack than it had been at the end of the previous one.

Yet it was evident that all was being done under orders, for I noticed that all eyes were fixed on the man who stood just under the window, and to whom the Chancellor was continually whispering. This man held his hat in one hand and a little green flag in the other: whenever he waved the flag the procession advanced a little nearer, when he dipped it they sidled a little farther off, and whenever he waved his hat they all raised a hoarse cheer. “Hoo-roah!” they cried, carefully keeping time with the hat as it bobbed up and down. “Hoo-roah! Noo! Consti! Tooshun! Less! Bread! More! Taxes!”

“That’ll do, that’ll do!” the Chancellor whispered. “Let ’em rest a bit till I give you the word. He’s not here yet!” But at this moment the great folding-doors of the saloon were flung open, and he turned with a guilty start to receive His High Excellency. However it was only Bruno, and the Chancellor gave a little gasp of relieved anxiety.

The march-up

"Morning!" said the little fellow, addressing the remark, in a general sort of way, to the Chancellor and the waiters. "Doos oo know where Sylvie is? I's looking for Sylvie!"

"She's with the Warden, I believe, y'reince!" the Chancellor replied with a low bow. There was, no doubt, a certain amount of absurdity in applying this title (which, as of course you see without my telling you, was nothing but 'your Royal Highness' condensed into one syllable) to a small creature whose father was merely the Warden of Outland: still, large excuse must be made for a man who had passed several years at the Court of Fairyland, and had there acquired the almost impossible art of pronouncing five syllables as one.

But the bow was lost upon Bruno, who had run out of the room, even while the great feat of The Unpronounceable Monosyllable was being triumphantly performed.

Just then, a single voice in the distance was understood to shout "A speech from the Chancellor!" "Certainly, my friends!" the Chancellor replied with extraordinary promptitude. "You shall have a speech!" Here one of the waiters, who had been for some minutes busy making a queer-looking mixture of egg and sherry, respectfully presented it on a large silver salver. The Chancellor took it haughtily, drank it off thoughtfully, smiled benevolently on the happy waiter as he set down the empty glass, and began. To the best of my recollection this is what he said.

"Ahem! Ahem! Ahem! Fellow-sufferers, or rather suffering fellows——" ("Don't call 'em names!" muttered the man under the window. "I didn't say *felons*!" the Chancellor explained.) "You may be sure that I always sympa——" ("Ear, 'ear!" shouted the crowd, so loudly as quite to drown the orator's thin squeaky voice) "—that I always sympa——" he repeated. ("Don't simper quite so much!" said the man under the window. "It makes yer look a idiot!") And, all this time, "Ear, 'ear!" went rumbling round the market-place, like a peal of thunder.) "That I always *sympathise*!" yelled the Chancellor, the first moment there was silence. "But your *true* friend is the *Sub-Warden*! Day and night he is brooding on your wrongs—I should say your *rights*—that is to say your *wrongs*—no, I mean your *rights*——" ("Don't talk no more!" growled the man under the window. "You're making a mess of it!") At this moment the Sub-Warden entered the saloon. He was a thin man, with a mean and crafty face, and a greenish-yellow complexion; and he crossed the room very slowly, looking suspiciously about him as if he thought there might be a savage dog hidden somewhere. "Bravo!" he cried, patting the Chancellor on the back. "You did that speech very well indeed. Why, you're a born orator, man!"

"Oh, that's nothing!" the Chancellor replied, modestly, with downcast eyes. "Most orators are *born*, you know."

The Sub-Warden thoughtfully rubbed his chin. "Why, so they are!" he admitted. "I never considered it in that light. Still, you did it very well. A word in your ear!"

The rest of their conversation was all in whispers: so, as I could hear no more, I thought I would go and find Bruno.

I found the little fellow standing in the passage, and being addressed by one of the men in livery, who stood before him, nearly bent double from extreme respectfulness, with his hands hanging in front of him like the fins of a fish. "His High Excellency," this respectful man was saying, "is in his Study, y'reince!" (He didn't pronounce this quite so well as the Chancellor.) Thither Bruno trotted,

and I thought it well to follow him.

The Warden, a tall dignified man with a grave but very pleasant face, was seated before a writing-table, which was covered with papers, and holding on his knee one of the sweetest and loveliest little maidens it has ever been my lot to see. She looked four or five years older than Bruno, but she had the same rosy cheeks and sparkling eyes, and the same wealth of curly brown hair. Her eager smiling face was turned upwards towards her father's, and it was a pretty sight to see the mutual love with which the two faces—one in the Spring of Life, the other in its late Autumn—were gazing on each other.

"No, you've never seen him," the old man was saying: "you couldn't, you know, he's been away so long—traveling from land to land, and seeking for health, more years than you've been alive, little Sylvie!"

Here Bruno climbed upon his other knee, and a good deal of kissing, on a rather complicated system, was the result.

"He only came back last night," said the Warden, when the kissing was over: "he's been traveling post-haste, for the last thousand miles or so, in order to be here on Sylvie's birthday. But he's a very early riser, and I dare say he's in the Library already. Come with me and see him. He's always kind to children. You'll be sure to like him."

"Has the Other Professor come too?" Bruno asked in an awe-struck voice.

"Yes, they arrived together. The Other Professor is—well, you won't like him quite so much, perhaps. He's a little more *dreamy*, you know."

"I wiss *Sylvie* was a little more dreamy," said Bruno.

"What *do* you mean, Bruno?" said Sylvie.

Bruno went on addressing his father. "She says she *ca'n't*, oo know. But I thinks it isn't *ca'n't*, it's *wo'n't*."

"Says she *ca'n't* dream!" the puzzled Warden repeated.

"She *do* say it," Bruno persisted. "When I says to her 'Let's stop lessons!', she says 'Oh, I *ca'n't* *dream* of letting oo stop yet!'"

"He always wants to stop lessons," Sylvie explained, "five minutes after we begin!"

"Five minutes' lessons a day!" said the Warden. "You won't learn much at *that* rate, little man!"

"That's just what Sylvie says," Bruno rejoined. "She says I *wo'n't* learn my lessons. And I tells her, over and over, I *ca'n't* learn 'em. And what doos oo think she says? She says 'It isn't *ca'n't*, it's *wo'n't*!'"

"Let's go and see the Professor," the Warden said, wisely avoiding further discussion. The children got down off his knees, each secured a hand, and the happy trio set off for the Library—followed by me. I had come to the conclusion by this time that none of the party (except, for a few moments, the Lord Chancellor) was in the least able to see me.

"What's the matter with him?" Sylvie asked, walking with a little extra sedateness, by way of example to Bruno at the other side, who never ceased jumping up and down.

"What *was* the matter—but I hope he's all right now—was lumbago, and rheumatism, and that kind of thing. He's been curing *himself*, you know: he's a very learned doctor. Why, he's actually *invented* three new diseases, besides a new way of breaking your collar-bone!"

"Is it a nice way?" said Bruno.

Visiting the professor

“Well, hum, not *very*,” the Warden said, as we entered the Library. “And here *is* the Professor. Good morning, Professor! Hope you’re quite rested after your journey!”

A jolly-looking, fat little man, in a flowery dressing-gown, with a large book under each arm, came trotting in at the other end of the room, and was going straight across without taking any notice of the children. “I’m looking for Vol. Three,” he said. “Do you happen to have seen it?”

“You don’t see my *children*, Professor!” the Warden exclaimed, taking him by the shoulders and turning him round to face them.

The Professor laughed violently: then he gazed at them through his great spectacles, for a minute or two, without speaking.

At last he addressed Bruno. “I hope you have had a good night, my child?”

Bruno looked puzzled. “I’s had the same night *oo’ve* had,” he replied. “There’s only been *one* night since yesterday!”

It was the Professor’s turn to look puzzled now. He took off his spectacles, and rubbed them with his handkerchief. Then he gazed at them again. Then he turned to the Warden. “Are they bound?” he enquired.

“No, we aren’t,” said Bruno, who thought himself quite able to answer *this* question.

The Professor shook his head sadly. “Not even half-bound?”

“Why *would* we be half-bound?” said Bruno. “We’re not prisoners!”

But the Professor had forgotten all about them by this time, and was speaking to the Warden again. “You’ll be glad to hear,” he was saying, “that the Barometer’s beginning to move——”

“Well, which way?” said the Warden—adding to the children, “Not that *I* care, you know. Only *he* thinks it affects the weather. He’s a wonderfully clever man, you know. Sometimes he says things that only the Other Professor can understand. Sometimes he says things that *nobody* can understand! Which way is it, Professor? Up or down?”

“Neither!” said the Professor, gently clapping his hands. “It’s going sideways—if I may so express myself.”

“And what kind of weather does *that* produce?” said the Warden. “Listen, children! Now you’ll hear something worth knowing!”

“Horizontal weather,” said the Professor, and made straight for the door, very nearly trampling on Bruno, who had only just time to get out of his way.

“*Isn’t* he learned?” the Warden said, looking after him with admiring eyes. “Positively he runs over with learning!”

“But he needn’t run over *me*!” said Bruno.

The Professor was back in a moment: he had changed his dressing-gown for a frock-coat, and had put on a pair of very strange-looking boots, the tops of which were open umbrellas. “I thought you’d like to see them,” he said. “*These* are the boots for horizontal weather!”

“But what’s the use of wearing umbrellas round one’s knees?”

“In *ordinary* rain,” the Professor admitted, “they would *not* be of much use. But if ever it rained *horizontally*, you know, they would be invaluable—simply invaluable!”

“Take the Professor to the breakfast-saloon, children,” said the Warden. “And tell them not to wait for me. I had breakfast early, as I’ve some business to attend to.” The children seized the Professor’s hands, as familiarly as if they had known him for years, and hurried him away. I followed respectfully behind.

Chapter II. L’Amie Inconnue

As we entered the breakfast-saloon, the Professor was saying “—and he had breakfast by himself, early: so he begged you wouldn’t wait for him, my Lady. This way, my Lady,” he added, “this way!” And then, with (as it seemed to me) most superfluous politeness, he flung open the door of my compartment, and ushered in “—a young and lovely lady!” I muttered to myself with some bitterness. “And this is, of course, the opening scene of Vol. I. *She* is the Heroine. And *I* am one of those subordinate characters that only turn up when needed for the development of her destiny, and whose final appearance is outside the church, waiting to greet the Happy Pair!”

“Yes, my Lady, change at Fayfield,” were the next words I heard (oh that too obsequious Guard!), “next station but one.” And the door closed, and the lady settled down into her corner, and the monotonous throb of the engine (making one feel as if the train were some gigantic monster, whose very circulation we could feel) proclaimed that we were once more speeding on our way. “The lady had a perfectly formed nose,” I caught myself saying to myself, “hazel eyes, and lips——” and here it occurred to me that to see, for myself, what “the lady” was really like, would be more satisfactory than much speculation.

I looked round cautiously, and—was entirely disappointed of my hope. The veil, which shrouded her whole face, was too thick for me to see more than the glitter of bright eyes and the hazy outline of what *might* be a lovely oval

Boots for horizontal weather

face, but might also, unfortunately, be an equally *unlovely* one. I closed my eyes again, saying to myself “—couldn’t have a better chance for an experiment in Telepathy! I’ll *think out* her face, and afterwards test the portrait with the original.”

At first, no result at all crowned my efforts, though I ‘divided my swift mind,’ now hither, now thither, in a way that I felt sure would have made Æneas green with envy: but the dimly-seen oval remained as provokingly blank as ever—a mere Ellipse, as if in some mathematical diagram, without even the Foci that might be made to do duty as a nose and a mouth. Gradually, however, the conviction came upon me that I could, by a certain concentration of thought, *think the veil away*, and so get a glimpse of the mysterious face—as to which the two questions, “is she pretty?” and “is she plain?”, still hung suspended, in my mind, in beautiful equipoise.

Success was partial—and fitful—still there *was* a result: ever and anon, the veil seemed to vanish, in a sudden flash of light: but, before I could fully realise the face, all was dark again. In each such glimpse, the face seemed to grow more childish and more innocent: and, when I had at last *thought* the veil entirely away, it was, unmistakably, the sweet face of little Sylvie!

“So, either I’ve been dreaming about Sylvie,” I said to myself, “and this is the reality. Or else I’ve really been with Sylvie, and this is a dream! Is Life itself a dream, I wonder?”

To occupy the time, I got out the letter, which had caused me to take this sudden railway-journey from my London home down to a strange fishing-town on the North coast, and read it over again:—

“*Dear old Friend,*

“I’m sure it will be as great a pleasure to me, as it can possibly be to you, to meet once more after so many years: and of course I shall be ready to give you all the benefit of such medical skill as I have: only, you know, one mustn’t violate professional etiquette! And you are already in the hands of a first-rate London doctor, with whom it would be utter affectation for me to pretend to compete. (I make no doubt he is right in saying the heart is affected: all your symptoms point that way.) One thing, at any rate, I have already done in my doctorial capacity—secured you a bedroom on the ground-floor, so that you will not need to ascend the stairs at all.

“I shall expect you by last train on Friday, in accordance with your letter: and, till then, I shall say, in the words of the old song, ‘Oh for Friday night! Friday’s lang a-coming!’

“Yours always, Arthur Forester.

“P.S. Do you believe in Fate?”

This Postscript puzzled me sorely. “He is far too sensible a man,” I thought, “to have become a Fatalist. And yet what else can he mean by it?” And, as I folded up the letter and put it away, I inadvertently repeated the words aloud. “Do you believe in Fate?”

The fair ‘Incognita’ turned her head quickly at the sudden question. “No, I don’t!” she said with a smile. “Do you?”

“I—I didn’t mean to ask the question!” I stammered, a little taken aback at having begun a conversation in so unconventional a fashion.

The lady’s smile became a laugh—not a mocking laugh, but the laugh of a happy child who is perfectly at her ease. “Didn’t you?” she said. “Then it was a case of what you Doctors call ‘unconscious cerebration’?”

Quoted from *Idylls of the King* by Alfred Lord Tennyson

Quoted from *Oh for Friday Night!* by John Clark Milne

"I am no Doctor," I replied. "Do I look so like one? Or what makes you think it?"

She pointed to the book I had been reading, which was so lying that its title, "Diseases of the Heart," was plainly visible.

"One needn't be a *Doctor*," I said, "to take an interest in medical books. There's another class of readers, who are yet more deeply interested——"

"You mean the *Patients*?" she interrupted, while a look of tender pity gave new sweetness to her face. "But," with an evident wish to avoid a possibly painful topic, "one needn't be *either*, to take an interest in books of *Science*. Which contain the greatest amount of Science, do you think, the books, or the minds?"

"Rather a profound question for a lady!" I said to myself, holding, with the conceit so natural to Man, that Woman's intellect is essentially shallow. And I considered a minute before replying. "If you mean *living* minds, I don't think it's possible to decide. There is so much *written* Science that no living person has ever *read*: and there is so much *thought-out* Science that hasn't yet been *written*. But, if you mean the whole human race, then I think the *minds* have it: everything, recorded in *books*, must have once been in some *mind*, you know."

"Isn't that rather like one of the Rules in Algebra?" my Lady enquired. ("*Algebra* too!" I thought with increasing wonder.) "I mean, if we consider thoughts as *factors*, may we not say that the Least Common Multiple of all the *minds* contains that of all the *books*; but not the other way?"

"Certainly we may!" I replied, delighted with the illustration. "And what a grand thing it would be," I went on dreamily, thinking aloud rather than talking, "if we could only *apply* that Rule to books! You know, in finding the Least Common Multiple, we strike out a quantity wherever it occurs, except in the term where it is raised to its highest power. So we should have to erase every recorded thought, except in the sentence where it is expressed with the greatest intensity."

My Lady laughed merrily. "*Some* books would be reduced to blank paper, I'm afraid!" she said.

"They would. Most libraries would be terribly diminished in *bulk*. But just think what they would gain in *quality*!"

"When will it be done?" she eagerly asked. "If there's any chance of it in *my* time, I think I'll leave off reading, and wait for it!"

"Well, perhaps in another thousand years or so——"

"Then there's no use waiting!" said my Lady. "Let's sit down. Uggug, my pet, come and sit by me!"

"Anywhere but by *me*!" growled the Sub-Warden. "The little wretch always manages to upset his coffee!"

I guessed at once (as perhaps the reader will also have guessed, if, like myself, he is *very* clever at drawing conclusions) that my Lady was the Sub-Warden's wife, and that Uggug (a hideous fat boy, about the same age as Sylvie, with the expression of a prize-pig) was their son. Sylvie and Bruno, with the Lord Chancellor, made up a party of seven.

"And you actually got a plunge-bath every morning?" said the Sub-Warden, seemingly in continuation of a conversation with the Professor. "Even at the little roadside-inns?"

"Oh, certainly, certainly!" the Professor replied with a smile on his jolly face. "Allow me to explain. It is, in fact, a very simple problem in Hydrodynamics.

A portable plunge-bath

(That means a combination of Water and Strength.) If we take a plunge-bath, and a man of great strength (such as myself) about to plunge into it, we have a perfect example of this science. I am bound to admit," the Professor continued, in a lower tone and with downcast eyes, "that we need a man of *remarkable* strength. He must be able to spring from the floor to about twice his own height, gradually turning over as he rises, so as to come down again head first."

"Why, you need a *flea*, not a *man*!" exclaimed the Sub-Warden.

"Pardon me," said the Professor. "This particular kind of bath is *not* adapted for a flea. Let us suppose," he continued, folding his table-napkin into a graceful festoon, "that this represents what is perhaps *the* necessity of this Age—the Active Tourist's Portable Bath. You may describe it briefly, if you like," looking at the Chancellor, "by the letters A. T. P. B."

The Chancellor, much disconcerted at finding everybody looking at him, could only murmur, in a shy whisper, "Precisely so!"

"One great advantage of this plunge-bath," continued the Professor, "is that it requires only half-a-gallon of water——"

"I don't call it a *plunge*-bath," His Sub-Excellency remarked, "unless your Active Tourist goes *right under*!"

"But he *does* go right under," the old man gently replied. "The A. T. hangs up the P. B. on a nail—*thus*. He then empties the water-jug into it—places the empty jug below the bag—leaps into the air—descends head-first into the bag—the water rises round him to the top of the bag—and there you are!" he triumphantly concluded. "The A. T. is as much under water as if he'd gone a mile or two down into the Atlantic!"

"And he's drowned, let us say, in about four minutes——"

"By no means!" the Professor answered with a proud smile. "After about a minute, he quietly turns a tap at the lower end of the P. B.—all the water runs back into the jug—and there you are again!"

"But how in the world is he to get *out* of the bag again?"

"*That*, I take it," said the Professor, "is the most beautiful part of the whole invention. All the way up the P. B., inside, are loops for the thumbs; so it's something like going up-stairs, only perhaps less comfortable; and, by the time the A. T. has risen out of the bag, all but his head, he's sure to topple over, one

way or the other—the Law of Gravity secures *that*. And there he is on the floor again!”

“A little bruised, perhaps?”

“Well, yes, a little bruised; but *having had his plunge-bath*: that’s the great thing.”

“Wonderful! It’s almost beyond belief!” murmured the Sub-Warden. The Professor took it as a compliment, and bowed with a gratified smile.

“*Quite* beyond belief!” my Lady added—meaning, no doubt, to be more complimentary still. The Professor bowed, but he didn’t smile *this* time.

“I can assure you,” he said earnestly, “that, *provided the bath was made*, I used it every morning. I certainly *ordered* it—that I am clear about—my only doubt is, whether the man ever finished making it. It’s difficult to remember, after so many years——”

At this moment the door, very slowly and creakingly, began to open, and Sylvie and Bruno jumped up, and ran to meet the well-known footstep.

Chapter III. Birthday-Presents

“It’s my brother!” the Sub-Warden exclaimed, in a warning whisper. “Speak out, and be quick about it!”

The appeal was evidently addressed to the Lord Chancellor, who instantly replied, in a shrill monotone, like a little boy repeating the alphabet, “As I was remarking, your Sub-Excellency, this portentous movement——”

“You began too soon!” the other interrupted, scarcely able to restrain himself to a whisper, so great was his excitement. “He couldn’t have heard you. Begin again!”

“As I was remarking,” chanted the obedient Lord Chancellor, “this portentous movement has already assumed the dimensions of a Revolution!”

“And what *are* the dimensions of a Revolution?” The voice was genial and mellow, and the face of the tall dignified old man, who had just entered the room, leading Sylvie by the hand, and with Bruno riding triumphantly on his shoulder, was too noble and gentle to have scared a less guilty man: but the Lord Chancellor turned pale instantly, and could hardly articulate the words “The dimensions—your—your High Excellency? I—I—scarcely comprehend!”

“Well, the length, breadth, and thickness, if you like it better!” And the old man smiled, half-contemptuously.

The Lord Chancellor recovered himself with a great effort, and pointed to the open window. “If your High Excellency will listen for a moment to the shouts of the exasperated populace——” (“of the exasperated populace!” the Sub-Warden repeated in a louder tone, as the Lord Chancellor, being in a state of abject terror, had dropped almost into a whisper)“—you will understand what it is they want.”

And at that moment there surged into the room a hoarse confused cry, in which the only clearly audible words were “Less—bread—More—taxes!” The old man laughed heartily. “What in the world——” he was beginning; but the Chancellor heard him not. “Some mistake!” he muttered, hurrying to the window, from which he shortly returned with an air of relief. “*Now* listen!” he exclaimed, holding up his hand impressively. And now the words came quite distinctly, and with the regularity of the ticking of a clock, “More—bread—Less—taxes!”

"More bread!" the Warden repeated in astonishment. "Why, the new Government Bakery was opened only last week, and I gave orders to sell the bread at cost-price during the present scarcity! What *can* they expect more?"

"The Bakery's closed, y'reince!" the Chancellor said, more loudly and clearly than he had spoken yet. He was emboldened by the consciousness that *here*, at least, he had evidence to produce: and he placed in the Warden's hands a few printed notices, that were lying ready, with some open ledgers, on a side-table.

"Yes, yes, *I* see!" the Warden muttered, glancing carelessly through them. "Order countermanded by my brother, and supposed to be *my* doing! Rather sharp practice! It's all right!" he added in a louder tone. "My name is signed to it: so I take it on myself. But what do they mean by 'Less Taxes'? How *can* they be less? I abolished the last of them a month ago!"

"It's been put on again, y'reince, and by y'reince's own orders!", and other printed notices were submitted for inspection.

The Warden, whilst looking them over, glanced once or twice at the Sub-Warden, who had seated himself before one of the open ledgers, and was quite absorbed in adding it up; but he merely repeated "It's all right. I accept it as my doing."

"And they do say," the Chancellor went on sheepishly—looking much more like a convicted thief than an Officer of State, "that a change of Government, by the abolition of the Sub-Warden—I mean," he hastily added, on seeing the Warden's look of astonishment, "the abolition of the *office* of Sub-Warden, and giving the present holder the right to act as *Vice*-Warden whenever the Warden is absent—would appease all this seedling discontent. I mean," he added, glancing at a paper he held in his hand, "all this *seething* discontent!"

"For fifteen years," put in a deep but very harsh voice, "my husband has been acting as Sub-Warden. It is too long! It is much too long!" My Lady was a vast creature at all times: but, when she frowned and folded her arms, as now, she looked more gigantic than ever, and made one try to fancy what a haystack would look like, if out of temper.

"He would distinguish himself as a Vice!" my Lady proceeded, being far too stupid to see the double meaning of her words. "There has been no such Vice in Outland for many a long year, as he would be!"

"What course would *you* suggest, Sister?" the Warden mildly enquired.

My Lady stamped, which was undignified: and snorted, which was ungraceful. "This is no *jesting* matter!" she bellowed.

"I will consult my brother," said the Warden. "Brother!"

"—and seven makes a hundred and ninety-four, which is sixteen and twopence," the Sub-Warden replied. "Put down two and carry sixteen."

The Chancellor raised his hands and eyebrows, lost in admiration. "*Such* a man of business!" he murmured.

"Brother, could I have a word with you in my Study?" the Warden said in a louder tone. The Sub-Warden rose with alacrity, and the two left the room together.

My Lady turned to the Professor, who had uncovered the urn, and was taking its temperature with his pocket-thermometer. "Professor!" she began, so loudly and suddenly that even Uggug, who had gone to sleep in his chair, left off snoring and opened one eye. The Professor pocketed his thermometer in a moment, clasped his hands, and put his head on one side with a meek smile.

"You were teaching my son before breakfast, I believe?" my Lady loftily remarked. "I hope he strikes you as having talent?"

"Oh, very much so indeed, my Lady!" the Professor hastily replied, unconsciously rubbing his ear, while some painful recollection seemed to cross his mind. "I was very forcibly struck by His Magnificence, I assure you!"

"He is a charming boy!" my Lady exclaimed. "Even his snores are more musical than those of other boys!"

If that *were* so, the Professor seemed to think, the snores of *other* boys must be something too awful to be endured: but he was a cautious man, and he said nothing.

"And he's so clever!" my Lady continued. "No one will enjoy your Lecture more—by the way, have you fixed the time for it yet? You've never given one, you know: and it was promised years ago, before you——"

"Yes, yes, my Lady, *I* know! Perhaps next Tuesday—or Tuesday week——"

"That will do very well," said my Lady, graciously. "Of course you will let the Other Professor lecture as well?"

"I think *not*, my Lady," the Professor said with some hesitation. "You see, he always stands with his back to the audience. It does very well for *reciting*; but for *lecturing*——"

"You are quite right," said my Lady. "And, now I come to think of it, there would hardly be time for more than *one* Lecture. And it will go off all the better, if we begin with a Banquet, and a Fancy-dress Ball——"

"It will indeed!" the Professor cried, with enthusiasm.

"I shall come as a Grass-hopper," my Lady calmly proceeded. "What shall *you* come as, Professor?"

The Professor smiled feebly. "I shall come as—as early as I can, my Lady!"

"You mustn't come in before the doors are opened," said my Lady.

"I ca'n't," said the Professor. "Excuse me a moment. As this is Lady Sylvie's birthday, I would like to——" and he rushed away.

Bruno began feeling in his pockets, looking more and more melancholy as he did so: then he put his thumb in his mouth, and considered for a minute: then he quietly left the room.

He had hardly done so before the Professor was back again, quite out of breath. "Wishing you many happy returns of the day, my dear child!" he went on, addressing the smiling little girl, who had run to meet him. "Allow me to give you a birthday-present. It's a second-hand pincushion, my dear. And it only cost fourpence-halfpenny!"

"Thank you, it's *very* pretty!" And Sylvie rewarded the old man with a hearty kiss.

"And the *pins* they gave me for nothing!" the Professor added in high glee. "Fifteen of em, and only *one* bent!"

"I'll make the bent one into a *hook*!" said Sylvie. "To catch Bruno with, when he runs away from his lessons!"

"You ca'n't guess what *my* present is!" said Uggug, who had taken the butter-dish from the table, and was standing behind her, with a wicked leer on his face.

"No, I ca'n't guess," Sylvie said without looking up. She was still examining the Professor's pincushion.

"It's *this*!" cried the bad boy, exultingly, as he emptied the dish over her, and then, with a grin of delight at his own cleverness, looked round for applause.

Sylvie coloured crimson, as she shook off the butter from her frock: but she kept her lips tight shut, and walked away to the window, where she stood looking out and trying to recover her temper.

Uggug's triumph was a very short one: the Sub-Warden had returned, just in time to be a witness of his dear child's playfulness, and in another moment a skilfully-applied box on the ear had changed the grin of delight into a howl of pain.

"My darling!" cried his mother, enfolding him in her fat arms. "Did they box his ears for nothing? A precious pet!"

"It's not for *nothing*!" growled the angry father. "Are you aware, Madam, that *I* pay the house-bills, out of a fixed annual sum? The loss of all that wasted butter falls on *me*! Do you hear, Madam!"

"Hold your tongue, Sir!" My Lady spoke very quietly—almost in a whisper. But there was something in her *look* which silenced him. "Don't you see it was only a *joke*? And a very clever one, too! He only meant that he loved nobody *but* her! And, instead of being pleased with the compliment, the spiteful little thing has gone away in a huff!"

The Sub-Warden was a very good hand at changing a subject. He walked across to the window. "My dear," he said, "is that a *pig* that I see down below, rooting about among your flower-beds?"

"A *pig*!" shrieked my Lady, rushing madly to the window, and almost pushing her husband out, in her anxiety to see for herself. "Whose pig is it? How did it get in? Where's that crazy Gardener gone?"

At this moment Bruno re-entered the room, and passing Uggug (who was blubbering his loudest, in the hope of attracting notice) as if he was quite used to that sort of thing, he ran up to Sylvie and threw his arms round her. "I went to my toy-cupboard," he said with a very sorrowful face, "to see if there were *somefin* fit for a present for oo! And there isn't *nuffin*! They's *all* broken, every one! And I haven't got *no* money left, to buy oo a birthday-present! And I ca'n't give oo nuffin but *this*!" ("*This*" was a very earnest hug and a kiss.)

"Oh, thank you, darling!" cried Sylvie. "I like *your* present best of all!" (But if so, why did she give it back so quickly?)

His Sub-Excellency turned and patted the two children on the head with his long lean hands. "Go away, dears!" he said. "There's business to talk over."

Sylvie and Bruno went away hand in hand: but, on reaching the door, Sylvie came back again and went up to Uggug timidly. "I don't mind about the butter," she said, "and I—I'm sorry he hurt you!" And she tried to shake hands with the little ruffian: but Uggug only blubbered louder, and wouldn't make friends. Sylvie left the room with a sigh.

The Sub-Warden glared angrily at his weeping son. "Leave the room, Sirrah!" he said, as loud as he dared. His wife was still leaning out of the window, and kept repeating "I *ca'n't* see that pig! Where *is* it?"

"It's moved to the right—now it's gone a little to the left," said the Sub-Warden: but he had his back to the window, and was making signals to the Lord Chancellor, pointing to Uggug and the door, with many a cunning nod and wink.

The Chancellor caught his meaning at last, and, crossing the room, took that interesting child by the ear—the next moment he and Uggug were out of the room, and the door shut behind them: but not before one piercing yell had rung through the room, and reached the ears of the fond mother.

Removal of Uggug

“What *is* that hideous noise?” she fiercely asked, turning upon her startled husband.

“It’s some hyæna—or other,” replied the Sub-Warden, looking vaguely up to the ceiling, as if that was where they usually were to be found. “Let us to business, my dear. Here comes the Warden.” And he picked up from the floor a wandering scrap of manuscript, on which I just caught the words ‘after which Election duly holden the said Sibimet and Tabikat his wife may at their pleasure assume Imperial—’ before, with a guilty look, he crumpled it up in his hand.

Chapter IV. A Cunning Conspiracy

The Warden entered at this moment: and close behind him came the Lord Chancellor, a little flushed and out of breath, and adjusting his wig, which appeared to have been dragged partly off his head.

“But where is my precious child?” my Lady enquired, as the four took their seats at the small side-table devoted to ledgers and bundles and bills.

“He left the room a few minutes ago—with the Lord Chancellor,” the Sub-Warden briefly explained.

“Ah!” said my Lady, graciously smiling on that high official. “Your Lordship has a very *taking* way with children! I doubt if any one could *gain the ear* of my darling Uggug so quickly as *you* can!” For an entirely stupid woman, my Lady’s remarks were curiously full of meaning, of which she herself was wholly unconscious.

The Chancellor bowed, but with a very uneasy air. “I think the Warden was about to speak,” he remarked, evidently anxious to change the subject.

But my Lady would not be checked. “He is a clever boy,” she continued with enthusiasm, “but he needs a man like your Lordship to *draw him out!*”

The Chancellor bit his lip, and was silent. He evidently feared that, stupid as she looked, she understood what she said *this* time, and was having a joke at his expense. He might have spared himself all anxiety: whatever accidental meaning her *words* might have, she *herself* never meant anything at all.

"It is all settled!" the Warden announced, wasting no time over preliminaries. "The Sub-Wardenship is abolished, and my brother is appointed to act as Vice-Warden whenever I am absent. So, as I am going abroad for a while, he will enter on his new duties at once."

"And there will really be a Vice after all?" my Lady enquired.

"I hope so!" the Warden smilingly replied.

My Lady looked much pleased, and tried to clap her hands: but you might as well have knocked two feather-beds together, for any noise it made. "When my husband is Vice," she said, "it will be the same as if we had a *hundred* Vices!"

"Hear, hear!" cried the Sub-Warden.

"You seem to think it very remarkable," my Lady remarked with some severity, "that your wife should speak the truth!"

"No, not *remarkable* at all!" her husband anxiously explained. "*Nothing* is remarkable that *you* say, sweet one!"

My Lady smiled approval of the sentiment, and went on. "And am I Vice-Wardenship?"

"If you choose to use that title," said the Warden: "but 'Your Excellency' will be the proper style of address. And I trust that both '*His* Excellency' and '*Her* Excellency' will observe the Agreement I have drawn up. The provision I am *most* anxious about is this." He unrolled a large parchment scroll, and read aloud the words "'*item*, that we will be kind to the poor.' The Chancellor worded it for me," he added, glancing at that great Functionary. "I suppose, now, that word '*item*' has some deep legal meaning?"

"Undoubtedly!" replied the Chancellor, as articulately as he could with a pen between his lips. He was nervously rolling and unrolling several other scrolls, and making room among them for the one the Warden had just handed to him. "These are merely the rough copies," he explained: "and, as soon as I have put in the final corrections—" making a great commotion among the different parchments, "—a semi-colon or two that I have accidentally omitted—" here he darted about, pen in hand, from one part of the scroll to another, spreading sheets of blotting-paper over his corrections, "all will be ready for signing."

"Should it not be read out, first?" my Lady enquired.

"No need, no need!" the Sub-Warden and the Chancellor exclaimed at the same moment, with feverish eagerness.

"No need at all," the Warden gently assented. "Your husband and I have gone through it together. It provides that he shall exercise the full authority of Warden, and shall have the disposal of the annual revenue attached to the office, until my return, or, failing that, until Bruno comes of age: and that he shall then hand over, to myself or to Bruno as the case may be, the Wardenship, the unspent revenue, and the contents of the Treasury, which are to be preserved, intact, under his guardianship."

All this time the Sub-Warden was busy, with the Chancellor's help, shifting the papers from side to side, and pointing out to the Warden the place where he was to sign. He then signed it himself, and my Lady and the Chancellor added their names as witnesses.

"Short partings are best," said the Warden. "All is ready for my journey. My children are waiting below to see me off." He gravely kissed my Lady, shook hands with his brother and the Chancellor, and left the room.

The three waited in silence till the sound of wheels announced that the Warden was out of hearing: then, to my surprise, they broke into peals of

'What a game!'

uncontrollable laughter.

"What a game, oh, what a game!" cried the Chancellor. And he and the Vice-Warden joined hands, and skipped wildly about the room. My Lady was too dignified to skip, but she laughed like the neighing of a horse, and waved her handkerchief above her head: it was clear to her very limited understanding that *something* very clever had been done, but what it *was* she had yet to learn.

"You said I should hear all about it when the Warden had gone," she remarked, as soon as she could make herself heard.

"And so you shall, Tabby!" her husband graciously replied, as he removed the blotting-paper, and showed the two parchments lying side by side. "This is the one he read but didn't sign: and this is the one he signed but didn't read! You see it was all covered up, except the place for signing the names——"

"Yes, yes!" my Lady interrupted eagerly, and began comparing the two Agreements. "'Item, that he shall exercise the authority of Warden, in the Warden's absence.' Why, that's been changed into 'shall be absolute governor for life, with the title of Emperor, if elected to that office by the people.' What! Are you *Emperor*, darling?"

"Not yet, dear," the Vice-Warden replied. "It won't do to let this paper be seen, just at present. All in good time."

My Lady nodded, and read on. "'Item, that we will be kind to the poor.' Why, that's omitted altogether!"

"Course it is!" said her husband. "*We're* not going to bother about the wretches!"

"*Good*," said my Lady, with emphasis, and read on again. "'Item, that the contents of the Treasury be preserved intact.' Why, that's altered into 'shall be at the absolute disposal of the Vice-Warden'! Well, Sibby, that *was* a clever trick! *All* the Jewels, only think! May I go and put them on directly?"

"Well, not *just* yet, Lovey," her husband uneasily replied. "You see the public mind isn't quite *ripe* for it yet. We must feel our way. Of course we'll have the coach-and-four out, at once. And I'll take the title of Emperor, as soon as we can safely hold an Election. But they'll hardly stand our using the *Jewels*, as long as they know the Warden's alive. We must spread a report of his death. A little Conspiracy——"

"A Conspiracy!" cried the delighted lady, clapping her hands. "Of all things, I *do* like a Conspiracy! It's so interesting!"

The Vice-Warden and the Chancellor interchanged a wink or two. "Let her conspire to her heart's content!" the cunning Chancellor whispered. "It'll do no harm!"

"And when will the Conspiracy——"

"Hist!" her husband hastily interrupted her, as the door opened, and Sylvie and Bruno came in, with their arms twined lovingly round each other—Bruno sobbing convulsively, with his face hidden on his sister's shoulder, and Sylvie more grave and quiet, but with tears streaming down her cheeks.

"Mustn't cry like that!" the Vice-Warden said sharply, but without any effect on the weeping children. "Cheer 'em up a bit!" he hinted to my Lady.

"*Cake!*" my Lady muttered to herself with great decision, crossing the room and opening a cupboard, from which she presently returned with two slices of plum-cake. "Eat, and don't cry!" were her short and simple orders: and the poor children sat down side by side, but seemed in no mood for eating.

For the second time the door opened—or rather was *burst* open, this time, as Uggug rushed violently into the room, shouting "that old Beggar's come again!"

"He's not to have any food——" the Vice-Warden was beginning, but the Chancellor interrupted him. "It's all right," he said, in a low voice: "the servants have their orders."

"He's just under here," said Uggug, who had gone to the window, and was looking down into the court-yard.

"Where, my darling?" said his fond mother, flinging her arms round the neck of the little monster. All of us (except Sylvie and Bruno, who took no notice of what was going on) followed her to the window. The old Beggar looked up at us with hungry eyes. "Only a crust of bread, your Highness!" he pleaded. He was a fine old man, but looked sadly ill and worn. "A crust of bread is what I crave!" he repeated. "A single crust, and a little water!"

"Here's some water, drink this!" Uggug bellowed, emptying a jug of water over his head.

"Well done, my boy!" cried the Vice-Warden. "That's the way to settle such folk!"

"Clever boy!" the Wardeness chimed in. "*Hasn't* he good spirits?"

"Take a stick to him!" shouted the Vice-Warden, as the old Beggar shook the water from his ragged cloak, and again gazed meekly upwards.

"Take a red-hot poker to him!" my Lady again chimed in.

Possibly there was no red-hot poker handy: but some *sticks* were forthcoming in a moment, and threatening faces surrounded the poor old wanderer, who waved them back with quiet dignity. "No need to break my old bones," he said. "I am going. Not even a crust!"

"Poor, *poor* old man!" exclaimed a little voice at my side, half choked with sobs. Bruno was at the window, trying to throw out his slice of plum-cake, but Sylvie held him back.

"He *shall* have my cake!" Bruno cried, passionately struggling out of Sylvie's arms.

"Yes, yes, darling!" Sylvie gently pleaded. "But don't *throw* it out! He's gone away, don't you see? Let's go after him." And she led him out of the room, unnoticed by the rest of the party, who were wholly absorbed in watching the old Beggar.

'Drink this!'

The Conspirators returned to their seats, and continued their conversation in an undertone, so as not to be heard by Uggug, who was still standing at the window.

“By the way, there was something about Bruno succeeding to the Wardenship,” said my Lady. “How does *that* stand in the new Agreement?”

The Chancellor chuckled. “Just the same, word for word,” he said, “with *one* exception, my Lady. Instead of ‘Bruno,’ I’ve taken the liberty to put in——” he dropped his voice to a whisper, “—to put in ‘Uggug,’ you know!”

“Uggug, indeed!” I exclaimed, in a burst of indignation I could no longer control. To bring out even that one word seemed a gigantic effort: but, the cry once uttered, all effort ceased at once: a sudden gust swept away the whole scene, and I found myself sitting up, staring at the young lady in the opposite corner of the carriage, who had now thrown back her veil, and was looking at me with an expression of amused surprise.

Chapter V. A Beggar’s Palace

That I had said *something*, in the act of waking, I felt sure: the hoarse stifled cry was still ringing in my ears, even if the startled look of my fellow-traveler had not been evidence enough: but what could I possibly say by way of apology?

“I hope I didn’t frighten you?” I stammered out at last. “I have no idea what I said. I was dreaming.”

“You said ‘*Uggug indeed!*’” the young lady replied, with quivering lips that *would* curve themselves into a smile, in spite of all her efforts to look grave. “At least—you didn’t *say* it—you *shouted* it!”

“I’m very sorry,” was all I could say, feeling very penitent and helpless. “She *has* Sylvie’s eyes!” I thought to myself, half-doubting whether, even now, I were fairly awake. “And that sweet look of innocent wonder is all Sylvie’s, too. But Sylvie *hasn’t* got that calm resolute mouth—nor that far-away look of dreamy sadness, like one that has had some deep sorrow, very long ago——” And the thick-coming fancies almost prevented my hearing the lady’s next words.

“If you had had a ‘Shilling Dreadful’ in your hand,” she proceeded, “something about Ghosts—or Dynamite—or Midnight Murder—one could understand it: those things aren’t worth the shilling, unless they give one a Nightmare. But really—with only a *medical treatise*, you know——” and she glanced, with a pretty shrug of contempt, at the book over which I had fallen asleep.

Her friendliness, and utter unreserve, took me aback for a moment; yet there was no touch of forwardness, or boldness, about the child—for child, almost, she seemed to be: I guessed her at scarcely over twenty—all was the innocent frankness of some angelic visitant, new to the ways of earth and the conventionalisms—or, if you will, the barbarisms—of Society. “Even so,” I mused, “will *Sylvie* look and speak, in another ten years.”

“You don’t care for Ghosts, then,” I ventured to suggest, “unless they are really terrifying?”

“Quite so,” the lady assented. “The regular Railway-Ghosts—I mean the Ghosts of ordinary Railway-literature—are very poor affairs. I feel inclined to say, with Alexander Selkirk, ‘Their tameness is shocking to me’! And they never do any Midnight Murders. They couldn’t ‘welter in gore,’ to save their lives!”

“‘Weltering in gore’ is a very expressive phrase, certainly. Can it be done in *any* fluid, I wonder?”

Quoted from *The Solitude of Alexander Selkirk* by William Cowper

“I think *not*,” the lady readily replied—quite as if she had thought it out, long ago. “It has to be something *thick*. For instance, you might welter in bread-sauce. That, being *white*, would be more suitable for a Ghost, supposing it wished to welter!”

“You have a real good *terrifying* Ghost in that book?” I hinted.

“How *could* you guess?” she exclaimed with the most engaging frankness, and placed the volume in my hands. I opened it eagerly, with a not unpleasant thrill (like what a good ghost-story gives one) at the ‘uncanny’ coincidence of my having so unexpectedly divined the subject of her studies.

It was a book of Domestic Cookery, open at the article ‘Bread Sauce.’

I returned the book, looking, I suppose, a little blank, as the lady laughed merrily at my discomfiture. “It’s far more exciting than some of the modern ghosts, I assure you! Now there was a Ghost last month—I don’t mean a *real* Ghost in—in Supernature—but in a Magazine. It was a perfectly *flavourless* Ghost. It wouldn’t have frightened a mouse! It wasn’t a Ghost that one would even offer a chair to!”

“Three score years and ten, baldness, and spectacles, have their advantages after all!” I said to myself. “Instead of a bashful youth and maiden, gasping out monosyllables at awful intervals, here we have an old man and a child, quite at their ease, talking as if they had known each other for years! Then you think,” I continued aloud, “that we ought *sometimes* to ask a Ghost to sit down? But have we any authority for it? In Shakespeare, for instance—there are plenty of ghosts *there*—does Shakespeare ever give the stage-direction ‘*hands chair to Ghost*’?”

The lady looked puzzled and thoughtful for a moment: then she *almost* clapped her hands. “Yes, yes, he *does*!” she cried. “He makes Hamlet say ‘*Rest, rest, perturbed Spirit!*’”

“And that, I suppose, means an easy-chair?”

“An American rocking-chair, I *think*——”

“Fayfield Junction, my Lady, change for Elveston!” the guard announced, flinging open the door of the carriage: and we soon found ourselves, with all our portable property around us, on the platform.

The accommodation, provided for passengers waiting at this Junction, was distinctly inadequate—a single wooden bench, apparently intended for three sitters only: and even this was already partially occupied by a very old man, in a smock frock, who sat, with rounded shoulders and drooping head, and with hands clasped on the top of his stick so as to make a sort of pillow for that wrinkled face with its look of patient weariness.

“Come, you be off!” the Station-master roughly accosted the poor old man. “You be off, and make way for your betters! This way, my Lady!” he added in a perfectly different tone. “If your Ladyship will take a seat, the train will be up in a few minutes.” The cringing servility of his manner was due, no doubt, to the address legible on the pile of luggage, which announced their owner to be “Lady Muriel Orme, passenger to Elveston, *via* Fayfield Junction.”

As I watched the old man slowly rise to his feet, and hobble a few paces down the platform, the lines came to my lips:—

“From sackcloth couch the Monk arose,
With toil his stiffen’d limbs he rear’d;
A hundred years had flung their snows

Quoted from *Hamlet*
by William
Shakespeare

Quoted from *The Lay
of the Last Minstrel*
by Sir Walter Scott

On his thin locks and floating beard.”

‘Come, you be off!’

But the lady scarcely noticed the little incident. After one glance at the ‘banished man,’ who stood tremulously leaning on his stick, she turned to me. “This is *not* an American rocking-chair, by any means! Yet may I say,” slightly changing her place, so as to make room for me beside her, “may I say, in Hamlet’s words, ‘Rest, rest——’” she broke off with a silvery laugh.

“—perturbed Spirit!” I finished the sentence for her. “Yes, that describes a railway-traveler *exactly!* And here is an instance of it,” I added, as the tiny local train drew up alongside the platform, and the porters bustled about, opening carriage-doors—one of them helping the poor old man to hoist himself into a third-class carriage, while another of them obsequiously conducted the lady and myself into a first-class.

She paused, before following him, to watch the progress of the other passenger. “Poor old man!” she said. “How weak and ill he looks! It was a shame to let him be turned away like that. I’m very sorry——” At this moment it

dawned on me that these words were not addressed to *me*, but that she was unconsciously thinking aloud. I moved away a few steps, and waited to follow her into the carriage, where I resumed the conversation.

"Shakespeare *must* have traveled by rail, if only in a dream: 'perturbed Spirit' is such a happy phrase."

"'Perturbed' referring, no doubt," she rejoined, "to the sensational booklets peculiar to the Rail. If Steam has done nothing else, it has at least added a whole new Species to English Literature!"

"No doubt of it," I echoed. "The true origin of all our medical books—and all our cookery-books——"

"No, no!" she broke in merrily. "I didn't mean *our* Literature! *We* are quite abnormal. But the booklets—the little thrilling romances, where the Murder comes at page fifteen, and the Wedding at page forty—surely *they* are due to Steam?"

"And when we travel by Electricity—if I may venture to develop your theory—we shall have leaflets instead of booklets, and the Murder and the Wedding will come on the same page."

"A development worthy of Darwin!" the lady exclaimed enthusiastically. "Only *you* reverse his theory. Instead of developing a mouse into an elephant, you would develop an elephant into a mouse!" But here we plunged into a tunnel, and I leaned back and closed my eyes for a moment, trying to recall a few of the incidents of my recent dream.

"I thought I saw——" I murmured sleepily: and then the phrase insisted on conjugating itself, and ran into "you thought you saw—he thought he saw——" and then it suddenly went off into a song:—

"He thought he saw an Elephant,
That practised on a fife:
He looked again, and found it was
A letter from his wife.
'At length I realise,' he said,
'The bitterness of Life!'"

And what a wild being it was who sang these wild words! A Gardener he seemed to be—yet surely a mad one, by the way he brandished his rake—madder, by the way he broke, ever and anon, into a frantic jig—maddest of all, by the shriek in which he brought out the last words of the stanza!

It was so far a description of himself that he had the *feet* of an Elephant: but the rest of him was skin and bone: and the wisps of loose straw, that bristled all about him, suggested that he had been originally stuffed with it, and that nearly all the stuffing had come out.

Sylvie and Bruno waited patiently till the end of the first verse. Then Sylvie advanced alone (Bruno having suddenly turned shy) and timidly introduced herself with the words "Please, I'm Sylvie!"

"And who's that other thing?" said the Gardener.

"What thing?" said Sylvie, looking round. "Oh, that's Bruno. He's my brother."

"Was he your brother yesterday?" the Gardener anxiously enquired.

"Course I were!" cried Bruno, who had gradually crept nearer, and didn't at all like being talked about without having his share in the conversation.

The gardener

“Ah, well!” the Gardener said with a kind of groan. “Things change so, here. Whenever I look again, it’s sure to be something different! Yet I does my duty! I gets up wriggle-early at five——”

“If I was *oo*,” said Bruno, “I wouldn’t wriggle so early. It’s as bad as being a worm!” he added, in an undertone to Sylvie.

“But you shouldn’t be lazy in the morning, Bruno,” said Sylvie. “Remember, it’s the *early* bird that picks up the worm!”

“It may, if it likes!” Bruno said with a slight yawn. “I don’t like eating worms, one bit. I always stop in bed till the early bird has picked them up!”

“I wonder you’ve the face to tell me such fibs!” cried the Gardener.

To which Bruno wisely replied “Oo don’t want a *face* to tell fibs wiz—only a *mouf*.”

Sylvie discreetly changed the subject. “And did you plant all these flowers?” she said. “What a lovely garden you’ve made! Do you know, I’d like to live here *always*!”

“In the winter-nights——” the Gardener was beginning.

“But I’d nearly forgotten what we came about!” Sylvie interrupted. “Would you please let us through into the road? There’s a poor old beggar just gone out—and he’s very hungry—and Bruno wants to give him his cake, you know!”

“It’s as much as my place is worth!” the Gardener muttered, taking a key from his pocket, and beginning to unlock a door in the garden-wall.

“How much *are* it wurf?” Bruno innocently enquired.

But the Gardener only grinned. “That’s a secret!” he said. “Mind you come back quick!” he called after the children, as they passed out into the road. I had just time to follow them, before he shut the door again.

We hurried down the road, and very soon caught sight of the old Beggar, about a quarter of a mile ahead of us, and the children at once set off running to overtake him. Lightly and swiftly they skimmed over the ground, and I could not in the least understand how it was I kept up with them so easily. But the unsolved problem did not worry me so much as at another time it might have done, there were so many other things to attend to.

The old Beggar must have been very deaf, as he paid no attention whatever to Bruno’s eager shouting, but trudged wearily on, never pausing until the child got in front of him and held up the slice of cake. The poor little fellow was quite out of breath, and could only utter the one word “Cake!”—not with the gloomy decision with which Her Excellency had so lately pronounced it, but with a sweet childish timidity, looking up into the old man’s face with eyes that loved ‘all things both great and small.’

The old man snatched it from him, and devoured it greedily, as some hungry wild beast might have done, but never a word of thanks did he give his little benefactor—only growled “More, more!” and glared at the half-frightened children.

“There *is* no more!” Sylvie said with tears in her eyes. “I’d eaten mine. It was a shame to let you be turned away like that. I’m very sorry——”

I lost the rest of the sentence, for my mind had recurred, with a great shock of surprise, to Lady Muriel Orme, who had so lately uttered these very words of Sylvie’s—yes, and in Sylvie’s own voice, and with Sylvie’s gentle pleading eyes!

“Follow me!” were the next words I heard, as the old man waved his hand, with a dignified grace that ill suited his ragged dress, over a bush, that stood by the road side, which began instantly to sink into the earth. At another

Quoted from *The Rime of the Ancient Mariner* by Samuel Taylor Coleridge

time I might have doubted the evidence of my eyes, or at least have felt some astonishment: but, in *this* strange scene, my whole being seemed absorbed in strong curiosity as to what would happen next.

When the bush had sunk quite out of our sight, marble steps were seen, leading downwards into darkness. The old man led the way, and we eagerly followed.

The staircase was so dark, at first, that I could only just see the forms of the children, as, hand-in-hand, they groped their way down after their guide: but it got lighter every moment, with a strange silvery brightness, that seemed to exist in the air, as there were no lamps visible; and, when at last we reached a level floor, the room, in which we found ourselves, was almost as light as day.

It was eight-sided, having in each angle a slender pillar, round which silken draperies were twined. The wall between the pillars was entirely covered, to the height of six or seven feet, with creepers, from which hung quantities of ripe fruit and of brilliant flowers, that almost hid the leaves. In another place, perchance, I might have wondered to see fruit and flowers growing together: here, my chief wonder was that neither fruit nor flowers were such as I had ever seen before. Higher up, each wall contained a circular window of coloured glass; and over all was an arched roof, that seemed to be spangled all over with jewels.

With hardly less wonder, I turned this way and that, trying to make out how in the world we had come in: for there was no door: and all the walls were thickly covered with the lovely creepers.

“We are safe here, my darlings!” said the old man, laying a hand on Sylvie’s shoulder, and bending down to kiss her. Sylvie drew back hastily, with an offended air: but in another moment, with a glad cry of “Why, it’s *Father!*”, she had run into his arms.

“Father! Father!” Bruno repeated: and, while the happy children were being hugged and kissed, I could but rub my eyes and say “Where, then, are the rags gone to?”; for the old man was now dressed in royal robes that glittered with jewels and gold embroidery, and wore a circlet of gold around his head.

Chapter VI. The Magic Locket

“Where are we, father?” Sylvie whispered, with her arms twined closely around the old man’s neck, and with her rosy cheek lovingly pressed to his.

“In Elfland, darling. It’s one of the provinces of Fairyland.”

“But I thought Elfland was *ever* so far from Outland: and we’ve come such a *tiny* little way!”

“You came by the Royal Road, sweet one. Only those of royal blood can travel along it: but *you’ve* been royal ever since I was made King of Elfland—that’s nearly a month ago. They sent *two* ambassadors, to make sure that their invitation to me, to be their new King, should reach me. One was a Prince; so *he* was able to come by the Royal Road, and to come invisibly to all but me: the other was a Baron; so *he* had to come by the common road, and I dare say he hasn’t even *arrived* yet.”

“Then how far have we come?” Sylvie enquired.

“Just a thousand miles, sweet one, since the Gardener unlocked that door for you.”

“A thousand miles!” Bruno repeated. “And may I eat one?”

“Eat a *mile*, little rogue?”

A beggar's palace (Frontispiece)

"No," said Bruno. "I mean may I eat one of that fruits?"

"Yes, child," said his father: "and then you'll find out what *Pleasure* is like—the *Pleasure* we all seek so madly, and enjoy so mournfully!"

Bruno ran eagerly to the wall, and picked a fruit that was *shaped* something like a banana, but had the *colour* of a strawberry.

He ate it with beaming looks, that became gradually more gloomy, and were very blank indeed by the time he had finished.

"It hasn't got no taste at all!" he complained. "I couldn't feel nuffin in my mouf! It's a—what's that hard word, Sylvie?"

"It was a *Phlizz*," Sylvie gravely replied. "Are they *all* like that, father?"

"They're all like that to *you*, darling, because you don't belong to Elfland—yet. But to *me* they are real."

Bruno looked puzzled. "I'll try anuvver kind of fruits!" he said, and jumped down off the King's knee. "There's some lovely striped ones, just like a rainbow!" And off he ran.

Meanwhile the Fairy-King and Sylvie were talking together, but in such low tones that I could not catch the words: so I followed Bruno, who was picking and eating other kinds of fruit, in the vain hope of finding *some* that had a taste. I tried to pick some myself—but it was like grasping air, and I soon gave up the attempt and returned to Sylvie.

"Look well at it, my darling," the old man was saying, "and tell me how you like it."

"It's just *lovely*," cried Sylvie, delightedly. "Bruno, come and look!" And she held up, so that he might see the light through it, a heart-shaped Locket, apparently cut out of a single jewel, of a rich blue colour, with a slender gold chain attached to it.

"It are welly pretty," Bruno more soberly remarked: and he began spelling out some words inscribed on it. "All—will—love—Sylvie," he made them out at last. "And so they doos!" he cried, clasping his arms round her neck. "*Everybody* loves Sylvie!"

"But *we* love her best, don't we, Bruno?" said the old King, as he took possession of the Locket. "Now, Sylvie, look at *this*." And he showed her, lying on the palm of his hand, a Locket of a deep crimson colour, the same shape as the blue one and, like it, attached to a slender golden chain.

"Lovelier and lovelier!" exclaimed Sylvie, clasping her hands in ecstasy. "Look, Bruno!"

"And there's words on this one, too," said Bruno. "Sylvie—will—love—all."

"Now you see the difference," said the old man: "different colours and different words. Choose one of them, darling. I'll give you whichever you like best."

Sylvie whispered the words, several times over, with a thoughtful smile, and then made her decision. "It's *very* nice to be loved," she said: "but it's nicer to love other people! May I have the red one, Father?"

The old man said nothing: but I could see his eyes fill with tears, as he bent his head and pressed his lips to her forehead in a long loving kiss. Then he undid the chain, and showed her how to fasten it round her neck, and to hide it away under the edge of her frock. "It's for you to *keep*, you know," he said in a low voice, "not for other people to *see*. You'll remember how to use it?"

"Yes, I'll remember," said Sylvie.

The crimson locket

“And now, darlings, it’s time for you to go back, or they’ll be missing you, and then that poor Gardener will get into trouble!”

Once more a feeling of wonder rose in my mind as to how in the world we were to *get* back again—since I took it for granted that, wherever the children went, *I* was to go—but no shadow of doubt seemed to cross *their* minds, as they hugged and kissed him, murmuring, over and over again, “Good-bye, darling Father!” And then, suddenly and swiftly, the darkness of midnight seemed to close in upon us, and through the darkness harshly rang a strange wild song:—

“He thought he saw a Buffalo
Upon the chimney-piece:
He looked again, and found it was
His Sisters Husband’s Niece.
‘Unless you leave this house,’ he said,
‘I’ll send for the Police!’”

“That was *me!*” he added, looking out at us, through the half-opened door, as we stood waiting in the road. “And that’s what I’d have done—as sure as potatoes aren’t radishes—if she hadn’t have taken herself off! But I always loves my *pay-rints* like anything.”

“Who are oor *pay-rints*?” said Bruno.

“Them as pay *rint* for me, a course!” the Gardener replied. “You can come in now, if you like.”

He flung the door open as he spoke, and we got out, a little dazzled and stupefied (at least *I* felt so) at the sudden transition from the half-darkness of the railway-carriage to the brilliantly-lighted platform of Elveston Station.

A footman, in a handsome livery, came forwards and respectfully touched his hat. “The carriage is here, my Lady,” he said, taking from her the wraps

'He thought he saw a Buffalo'

and small articles she was carrying; and Lady Muriel, after shaking hands and bidding me "Good-night!" with a pleasant smile, followed him.

It was with a somewhat blank and lonely feeling that I betook myself to the van from which the luggage was being taken out: and, after giving directions to have my boxes sent after me, I made my way on foot to Arthur's lodgings, and soon lost my lonely feeling in the hearty welcome my old friend gave me, and the cozy warmth and cheerful light of the little sitting-room into which he led me.

"Little, as you see, but quite enough for us two. Now, take the easy-chair, old fellow, and let's have another look at you! Well, you *do* look a bit pulled down!" and he put on a solemn professional air. "I prescribe Ozone, *quant. suff.* Social dissipation, *fiant pilulæ quam plurimæ*: to be taken, feasting, three times a day!"

"But, Doctor!" I remonstrated. "Society doesn't 'receive' three times a day!"

"That's all *you* know about it!" the young Doctor gaily replied. "At home, lawn-tennis, 3 P.M. At home, kettledrum, 5 P.M. At home, music (Elveston doesn't give dinners), 8 P.M. Carriages at 10. There you are!"

It sounded very pleasant, I was obliged to admit. "And I know some of the *lady*-society already," I added. "One of them came in the same carriage with me."

"What was she like? Then perhaps I can identify her."

"The *name* was Lady Muriel Orme. As to what she was *like*—well, *I* thought her very beautiful. Do you know her?"

"Yes—I do know her." And the grave Doctor coloured slightly as he added

“Yes, I agree with you. She *is* beautiful.”

“*I* quite lost my heart to her!” I went on mischievously. “We talked——”

“Have some supper!” Arthur interrupted with an air of relief, as the maid entered with the tray. And he steadily resisted all my attempts to return to the subject of Lady Muriel until the evening had almost worn itself away. Then, as we sat gazing into the fire, and conversation was lapsing into silence, he made a hurried confession.

“I hadn’t meant to tell you anything about her,” he said (naming no names, as if there were only one ‘she’ in the world!) “till you had seen more of her, and formed your own judgment of her: but somehow you surprised it out of me. And I’ve not breathed a word of it to any one else. But I can trust *you* with a secret, old friend! Yes! It’s true of *me*, what I suppose *you* said in jest.”

“In the merest jest, believe me!” I said earnestly. “Why, man, I’m three times her age! But if she’s *your* choice, then I’m sure she’s all that is good and——”

“—and sweet,” Arthur went on, “and pure, and self-denying, and true-hearted, and——” he broke off hastily, as if he could not trust himself to say more on a subject so sacred and so precious. Silence followed: and I leaned back drowsily in my easy-chair, filled with bright and beautiful imaginings of Arthur and his lady-love, and of all the peace and happiness in store for them.

I pictured them to myself walking together, lingeringly and lovingly, under arching trees, in a sweet garden of their own, and welcomed back by their faithful gardener, on their return from some brief excursion.

It seemed natural enough that the gardener should be filled with exuberant delight at the return of so gracious a master and mistress—and how strangely childlike they looked! I could have taken them for Sylvie and Bruno—less natural that he should show it by such wild dances, such crazy songs!

“He thought he saw a Rattlesnake
That questioned him in Greek:
He looked again, and found it was
The Middle of Next Week.
‘The one thing I regret,’ he said,
‘Is that it cannot speak!’”

—least natural of all that the Vice-Warden and ‘my Lady’ should be standing close beside me, discussing an open letter, which had just been handed to him by the Professor, who stood, meekly waiting, a few yards off.

“If it were not for those two brats,” I heard him mutter, glancing savagely at Sylvie and Bruno, who were courteously listening to the Gardener’s song, “there would be no difficulty whatever.”

“Let’s hear that bit of the letter again,” said my Lady. And the Vice-Warden read aloud:—

“——and we therefore entreat you graciously to accept the Kingship, to which you have been unanimously elected by the Council of Elfland: and that you will allow your son Bruno—of whose goodness, cleverness, and beauty, reports have reached us—to be regarded as Heir-Apparent.”

“But what’s the difficulty?” said my Lady.

“Why, don’t you see? The Ambassador, that brought this, is waiting in the house: and he’s sure to see Sylvie and Bruno: and then, when he sees Uggug, and remembers all that about ‘goodness, cleverness, and beauty,’ why, he’s sure to——”

“And *where* will you find a better boy than *Uggug*?” my Lady indignantly interrupted. “Or a wittier, or a lovelier?”

To all of which the Vice-Warden simply replied “Don’t you be a great blethering goose! Our only chance is to keep those two brats out of sight. If *you* can manage *that*, you may leave the rest to *me*. *I’ll* make him believe Uggug to be a model of cleverness and all that.”

“We must change his name to Bruno, of course?” said my Lady.

The Vice-Warden rubbed his chin. “Humph! No!” he said musingly. “Wouldn’t do. The boy’s such an utter idiot, he’d never learn to answer to it.”

“*Idiot*, indeed!” cried my Lady. “He’s no more an idiot than *I* am!”

“You’re right, my dear,” the Vice-Warden soothingly replied. “He isn’t, indeed!”

My Lady was appeased. “Let’s go in and receive the Ambassador,” she said, and beckoned to the Professor. “Which room is he waiting in?” she inquired.

“In the Library, Madam.”

“And *what* did you say his name was?” said the Vice-Warden.

The Professor referred to a card he held in his hand. “His Adiposity the Baron Doppelgeist.”

“Why does he come with such a funny name?” said my Lady.

“He couldn’t well change it on the journey,” the Professor meekly replied, “because of the luggage.”

“*You* go and receive him,” my Lady said to the Vice-Warden, “and *I’ll* attend to the children.”

Chapter VII. The Baron’s Embassy

I was following the Vice-Warden, but, on second thoughts, went after my Lady, being curious to see how she would manage to keep the children out of sight.

I found her holding Sylvie’s hand, and with her other hand stroking Bruno’s hair in a most tender and motherly fashion: both children were looking bewildered and half-frightened.

“My own darlings,” she was saying, “I’ve been planning a little treat for you! The Professor shall take you a long walk into the woods this beautiful evening: and you shall take a basket of food with you, and have a little picnic down by the river!”

Bruno jumped, and clapped his hands. “That *are* nice!” he cried. “Aren’t it, Sylvie?”

Sylvie, who hadn’t quite lost her surprised look, put up her mouth for a kiss. “Thank you *very* much,” she said earnestly.

My Lady turned her head away to conceal the broad grin of triumph that spread over her vast face, like a ripple on a lake. “Little simpletons!” she muttered to herself, as she marched up to the house. I followed her in.

“Quite so, your Excellency,” the Baron was saying as we entered the Library. “All the infantry were under *my* command.” He turned, and was duly presented to my Lady.

“A *military* hero?” said my Lady. The fat little man simpered. “Well, yes,” he replied, modestly casting down his eyes. “My ancestors were all famous for military genius.”

My Lady smiled graciously. “It often runs in families,” she remarked: “just as a love for pastry does.”

The Baron looked slightly offended, and the Vice-Warden discreetly changed the subject. "Dinner will soon be ready," he said. "May I have the honour of conducting your Adiposity to the guest-chamber?"

"Certainly, certainly!" the Baron eagerly assented. "It would never do to keep *dinner* waiting!" And he almost trotted out of the room after the Vice-Warden.

He was back again so speedily that the Vice-Warden had barely time to explain to my Lady that her remark about "a love for pastry" was "unfortunate. You might have seen, with half an eye," he added, "that that's *his* line. Military genius, indeed! Pooh!"

"Dinner ready yet?" the Baron enquired, as he hurried into the room.

"Will be in a few minutes," the Vice-Warden replied. "Meanwhile, let's take a turn in the garden. You were telling me," he continued, as the trio left the house, "something about a great battle in which you had the command of the infantry——"

"True," said the Baron. "The enemy, as I was saying, far outnumbered us: but I marched my men right into the middle of—what's that?" the Military Hero exclaimed in agitated tones, drawing back behind the Vice-Warden, as a strange creature rushed wildly upon them, brandishing a spade.

"It's only the Gardener!" the Vice-Warden replied in an encouraging tone. "Quite harmless, I assure you. Hark, he's singing! It's his favorite amusement."

And once more those shrill discordant tones rang out:—

"He thought he saw a Banker's Clerk
Descending from the bus:
He looked again, and found it was
A Hippopotamus:
'If this should stay to dine,' he said,
'There won't be much for us!'"

Throwing away the spade, he broke into a frantic jig, snapping his fingers, and repeating, again and again

"There won't be much for us!
There won't be much for us!"

Once more the Baron looked slightly offended, but the Vice-Warden hastily explained that the song had no allusion to *him*, and in fact had no meaning at all. "You didn't mean anything by it, now *did* you?" He appealed to the Gardener, who had finished his song, and stood, balancing himself on one leg, and looking at them, with his mouth open.

"I never means nothing," said the Gardener: and Uggug luckily came up at the moment, and gave the conversation a new turn.

"Allow me to present my son," said the Vice-Warden; adding, in a whisper, "one of the best and cleverest boys that ever lived! I'll contrive for you to see some of his cleverness. He knows everything that other boys *don't* know; and in archery, in fishing, in painting, and in music, his skill is—but you shall judge for yourself. You see that target over there? He shall shoot an arrow at it. Dear boy," he went on aloud, "his Adiposity would like to see you shoot. Bring his Highness' bow and arrows!"

Uggug looked very sulky as he received the bow and arrow, and prepared to shoot. Just as the arrow left the bow, the Vice-Warden trod heavily on the toe of the Baron, who yelled with the pain.

'It was a Hippopotamus'

"Ten thousand pardons!" he exclaimed. "I stepped back in my excitement. See! It is a bull's-eye!"

The Baron gazed in astonishment. "He held the bow so awkwardly, it seemed impossible!" he muttered. But there was no room for doubt: there was the arrow, right in the centre of the bull's-eye!

"The lake is close by," continued the Vice-Warden. "Bring his Highness' fishing-rod!" And Uggug most unwillingly held the rod, and dangled the fly over the water.

"A beetle on your arm!" cried my Lady, pinching the poor Baron's arm worse than if ten lobsters had seized it at once. "*That* kind is poisonous," she explained. "But *what* a pity! You missed seeing the fish pulled out!"

An enormous dead cod-fish was lying on the bank, with the hook in its mouth.

"I had always fancied," the Baron faltered, "that cod were *salt-water* fish?"

"Not in *this* country," said the Vice-Warden. "Shall we go in? Ask my son some question on the way—*any* subject you like!" And the sulky boy was violently shoved forwards, to walk at the Baron's side.

"Could your Highness tell me," the Baron cautiously began, "how much seven times nine would come to?"

"Turn to the left!" cried the Vice-Warden, hastily stepping forwards to show the way—so hastily, that he ran against his unfortunate guest, who fell heavily on his face.

"*So* sorry!" my Lady exclaimed, as she and her husband helped him to his feet again. "My son was in the act of saying 'sixty-three' as you fell!"

The Baron said nothing: he was covered with dust, and seemed much hurt, both in body and mind. However, when they had got him into the house, and given him a good brushing, matters looked a little better.

Dinner was served in due course, and every fresh dish seemed to increase the good-humour of the Baron: but all efforts, to get him to express his opinion as to Uggug's cleverness, were in vain, until that interesting youth had left the room, and was seen from the open window, prowling about the lawn with a little basket, which he was filling with frogs.

"So fond of Natural History as he is, dear boy!" said the doting mother. "Now *do* tell us, Baron, what you think of him!"

"To be perfectly candid," said the cautious Baron, "I would like a *little* more evidence. I think you mentioned his skill in——"

"Music?" said the Vice-Warden. "Why, he's simply a prodigy! You shall hear him play the piano." And he walked to the window. "Ug—I mean my boy! Come in for a minute, *and bring the music-master with you!* To turn over the music for him," he added as an explanation.

Uggug, having filled his basket with frogs, had no objection to obey, and soon appeared in the room, followed by a fierce-looking little man, who asked the Vice-Warden "Vot music vill you haf?"

"The Sonata that His Highness plays so charmingly," said the Vice-Warden.

"His Highness haf not——" the music-master began, but was sharply stopped by the Vice-Warden.

"Silence, Sir! Go and turn over the music for his Highness. My dear," (to the Wardeness) "will you show him what to do? And meanwhile, Baron, I'll just show you a most interesting map we have—of Outland, and Fairyland, and that sort of thing."

The map of Fairyland

By the time my Lady had returned, from explaining things to the music-master, the map had been hung up, and the Baron was already much bewildered by the Vice-Warden's habit of pointing to one place while he shouted out the name of another.

My Lady joining in, pointing out other places, and shouting other names, only made matters worse; and at last the Baron, in despair, took to pointing out places for himself, and feebly asked "Is that great yellow splotch *Fairyland*?"

"Yes, that's Fairyland," said the Vice-Warden: "and you might as well give him a hint," he muttered to my Lady, "about going back to-morrow. He eats like a shark! It would hardly do for *me* to mention it."

His wife caught the idea, and at once began giving hints of the most subtle and delicate kind. "Just see what a short way it is back to Fairyland! Why, if you started to-morrow morning, you'd get there in very little more than a week!"

The Baron looked incredulous. "It took me a full month to *come*," he said. "But it's ever so much shorter, going *back*, you know!"

The Baron looked appealingly to the Vice-Warden, who chimed in readily. "You can go back *five* times, in the time it took you to come here *once*—if you start to-morrow morning!"

All this time the Sonata was pealing through the room. The Baron could not help admitting to himself that it was being magnificently played: but he tried in vain to get a glimpse of the youthful performer. Every time he had nearly succeeded in catching sight of him, either the Vice-Warden or his wife was sure to get in the way, pointing out some new place on the map, and deafening him with some new name.

He gave in at last, wished a hasty good-night, and left the room, while his host and hostess interchanged looks of triumph.

"Deftly done!" cried the Vice-Warden. "Craftily contrived! But what means all that tramping on the stairs?" He half-opened the door, looked out, and added in a tone of dismay, "The Baron's boxes are being carried down!"

"And what means all that rumbling of wheels?" cried my Lady. She peeped through the window curtains. "The Baron's carriage has come round!" she groaned.

At this moment the door opened: a fat, furious face looked in: a voice, hoarse with passion, thundered out the words "My room is full of frogs—I leave you!": and the door closed again.

And still the noble Sonata went pealing through the room: but it was *Arthur's* masterly touch that roused the echoes, and thrilled my very soul with the tender music of the immortal 'Sonata Pathetique': and it was not till the last note had died away that the tired but happy traveler could bring himself to utter the words "good-night!" and to seek his much-needed pillow.

Chapter VIII. A Ride On A Lion

The next day glided away, pleasantly enough, partly in settling myself in my new quarters, and partly in strolling round the neighbourhood, under Arthur's guidance, and trying to form a general idea of Elveston and its inhabitants. When five o'clock arrived, Arthur proposed—without any embarrassment this time—to take me with him up to 'the Hall,' in order that I might make acquaintance with the Earl of Ainslie, who had taken it for the season, and renew acquaintance with his daughter Lady Muriel.

My first impressions of the gentle, dignified, and yet genial old man were entirely favourable: and the *real* satisfaction that showed itself on his daughter's face, as she met me with the words "this is indeed an unlooked-for pleasure!", was very soothing for whatever remains of personal vanity the failures and disappointments of many long years, and much buffeting with a rough world, had left in me.

Yet I noted, and was glad to note, evidence of a far deeper feeling than mere friendly regard, in her meeting with Arthur—though this was, as I gathered, an almost daily occurrence—and the conversation between them, in which the Earl and I were only occasional sharers, had an ease and a spontaneity rarely met with except between *very* old friends: and, as I knew that they had not known each other for a longer period than the summer which was now rounding into autumn, I felt certain that 'Love,' and Love alone, could explain the phenomenon.

"How convenient it would be," Lady Muriel laughingly remarked, *à propos* of my having insisted on saving her the trouble of carrying a cup of tea across the room to the Earl, "if cups of tea had no weight at all! Then perhaps ladies would *sometimes* be permitted to carry them for short distances!"

"One can easily imagine a situation," said Arthur, "where things would *necessarily* have no weight, relatively to each other, though each would have its usual weight, looked at by itself."

"Some desperate paradox!" said the Earl. "Tell us how it could be. We shall never guess it."

"Well, suppose this house, just as it is, placed a few billion miles above a planet, and with nothing else near enough to disturb it: of course it falls *to* the planet?"

The Earl nodded. "Of course—though it might take some centuries to do it."

"And is five-o'clock-tea to be going on all the while?" said Lady Muriel.

"That, and other things," said Arthur. "The inhabitants would live their lives, grow up and die, and still the house would be falling, falling, falling! But now as to the relative weight of things. Nothing can be *heavy*, you know, except by *trying* to fall, and being prevented from doing so. You all grant that?"

We all granted that.

“Well, now, if I take this book, and hold it out at arms length, of course I feel its *weight*. It is trying to fall, and I prevent it. And, if I let go, it falls to the floor. But, if we were all falling together, it couldn't be *trying* to fall any quicker, you know: for, if I let go, what more could it do than fall? And, as my hand would be falling too—at the same rate—it would never leave it, for that would be to get ahead of it in the race. And it could never overtake the falling floor!”

“I see it clearly,” said Lady Muriel. “But it makes one dizzy to think of such things! How *can* you make us do it?”

“There is a more curious idea yet,” I ventured to say. “Suppose a cord fastened to the house, from below, and pulled down by some one on the planet. Then of course the *house* goes faster than its natural rate of falling: but the furniture—with our noble selves—would go on falling at their old pace, and would therefore be left behind.”

“Practically, we should rise to the ceiling,” said the Earl. “The inevitable result of which would be concussion of brain.”

“To avoid that,” said Arthur, “let us have the furniture fixed to the floor, and ourselves tied down to the furniture. Then the five-o'clock-tea could go on in peace.”

“With one little drawback!” Lady Muriel gaily interrupted. “We should take the *cups* down with us: but what about the *tea*?”

“I had forgotten the *tea*,” Arthur confessed. “*That*, no doubt, would rise to the ceiling—unless you chose to drink it on the way!”

“Which, I think, is *quite* nonsense enough for one while!” said the Earl. “What news does this gentleman bring us from the great world of London?”

This drew *me* into the conversation, which now took a more conventional tone. After a while, Arthur gave the signal for our departure, and in the cool of the evening we strolled down to the beach, enjoying the silence, broken only by the murmur of the sea and the far-away music of some fishermen's song, almost as much as our late pleasant talk.

We sat down among the rocks, by a little pool, so rich in animal, vegetable, and zoöphytic—or whatever is the right word—life, that I became entranced in the study of it, and, when Arthur proposed returning to our lodgings, I begged to be left there for a while, to watch and muse alone.

The fishermen's song grew ever nearer and clearer, as their boat stood in for the beach; and I would have gone down to see them land their cargo of fish, had not the microcosm at my feet stirred my curiosity yet more keenly.

One ancient crab, that was for ever shuffling frantically from side to side of the pool, had particularly fascinated me: there was a vacancy in its stare, and an aimless violence in its behaviour, that irresistibly recalled the Gardener who had befriended Sylvie and Bruno: and, as I gazed, I caught the concluding notes of the tune of his crazy song.

The silence that followed was broken by the sweet voice of Sylvie. “Would you please let us out into the road?”

“What! After that old beggar again?” the Gardener yelled, and began singing:—

“He thought he saw a Kangaroo
That worked a coffee-mill:

He looked again, and found it was
A Vegetable-Pill.
'Were I to swallow this,' he said,
'I should be very ill!'"

"We don't want him to swallow *anything*," Sylvie explained. "He's not hungry. But we want to see him. So will you please——"

'He thought he saw a Kangaroo'

"Certainly!" the Gardener promptly replied. "I *always* please. Never displeases nobody. There you are!" And he flung the door open, and let us out upon the dusty high-road.

We soon found our way to the bush, which had so mysteriously sunk into the ground: and here Sylvie drew the Magic Locket from its hiding-place, turned it over with a thoughtful air, and at last appealed to Bruno in a rather helpless way. "What *was* it we had to do with it, Bruno? It's all gone out of my head!"

"Kiss it!" was Bruno's invariable recipe in cases of doubt and difficulty. Sylvie kissed it, but no result followed.

"Rub it the wrong way," was Bruno's next suggestion.

"Which *is* the wrong way?" Sylvie most reasonably enquired. The obvious plan was to try *both* ways.

Rubbing from left to right had no visible effect whatever.

From right to left—"Oh, stop, Sylvie!" Bruno cried in sudden alarm. "Whatever *is* going to happen?"

For a number of trees, on the neighbouring hillside, were moving slowly upwards, in solemn procession: while a mild little brook, that had been rippling

at our feet a moment before, began to swell, and foam, and hiss, and bubble, in a truly alarming fashion.

The mouse-lion

“Rub it some other way!” cried Bruno. “Try up-and-down! Quick!”

It was a happy thought. Up-and-down did it: and the landscape, which had been showing signs of mental aberration in various directions, returned to its normal condition of sobriety—with the exception of a small yellowish-brown mouse, which continued to run wildly up and down the road, lashing its tail like a little lion.

“Let’s follow it,” said Sylvie: and this also turned out a happy thought. The mouse at once settled down into a business-like jog-trot, with which we could easily keep pace. The only phenomenon, that gave me any uneasiness, was the rapid increase in the *size* of the little creature we were following, which became every moment more and more like a real lion.

Soon the transformation was complete: and a noble lion stood patiently waiting for us to come up with it. No thought of fear seemed to occur to the children, who patted and stroked it as if it had been a Shetland-pony.

“Help me up!” cried Bruno. And in another moment Sylvie had lifted him upon the broad back of the gentle beast, and seated herself behind him, pillion-fashion. Bruno took a good handful of mane in each hand, and made believe to guide this new kind of steed. “Gee-up!” seemed quite sufficient by way of *verbal* direction: the lion at once broke into an easy canter, and we soon found ourselves in the depths of the forest. I say ‘*we*,’ for I am certain that *I* accompanied them—though *how* I managed to keep up with a cantering lion I am wholly unable to explain. But I was certainly one of the party when we came upon an old beggar-man cutting sticks, at whose feet the lion made a profound obeisance, Sylvie and Bruno at the same moment dismounting, and leaping into the arms of their father.

“From bad to worse!” the old man said to himself, dreamily, when the children had finished their rather confused account of the Ambassador’s visit, gathered no doubt from general report, as they had not seen him themselves. “From bad to worse! That is their destiny. I see it, but I cannot alter it. The selfishness of a mean and crafty man—the selfishness of an ambitious and silly woman—the selfishness of a spiteful and loveless child—all tend one way, from bad to worse!

And you, my darlings, must suffer it awhile, I fear. Yet, when things are at their worst, you can come to me. I can do but little as yet——”

Gathering up a handful of dust and scattering it in the air, he slowly and solemnly pronounced some words that sounded like a charm, the children looking on in awe-struck silence:—

“Let craft, ambition, spite,
Be quenched in Reason’s night,
Till weakness turn to might,
Till what is dark be light,
Till what is wrong be right!”

The cloud of dust spread itself out through the air, as if it were alive, forming curious shapes that were for ever changing into others.

“It makes letters! It makes words!” Bruno whispered, as he clung, half-frightened, to Sylvie. “Only I *ca’n’t* make them out! Read them, Sylvie!”

“I’ll try,” Sylvie gravely replied. “Wait a minute—if only I could see that word——”

“I should be very ill!” a discordant voice yelled in our ears.

“‘Were I to swallow this,’ he said,
‘I should be very ill!’”

Chapter IX. A Jester And A Bear

Yes, we were in the garden once more: and, to escape that horrid discordant voice, we hurried indoors, and found ourselves in the library—Uggug blubbing, the Professor standing by with a bewildered air, and my Lady, with her arms clasped round her son’s neck, repeating, over and over again, “and *did* they give him nasty lessons to learn? My own pretty pet!”

“What’s all this noise about?” the Vice-Warden angrily enquired, as he strode into the room. “And who put the hat-stand here?” And he hung his hat up on Bruno, who was standing in the middle of the room, too much astonished by the sudden change of scene to make any attempt at removing it, though it came down to his shoulders, making him look something like a small candle with a large extinguisher over it.

The Professor mildly explained that His Highness had been graciously pleased to say he wouldn’t do his lessons.

“Do your lessons this instant, you young cub!” thundered the Vice-Warden. “And take *this!*” and a resounding box on the ear made the unfortunate Professor reel across the room.

“Save me!” faltered the poor old man, as he sank, half-fainting, at my Lady’s feet.

“Shave you? Of course I will!” my Lady replied, as she lifted him into a chair, and pinned an anti-macassar round his neck. “Where’s the razor?”

The Vice-Warden meanwhile had got hold of Uggug, and was belabouring him with his umbrella. “Who left this loose nail in the floor?” he shouted. “Hammer it in, I say! Hammer it in!” Blow after blow fell on the writhing Uggug, till he dropped howling to the floor.

'Hammer it in!'

Then his father turned to the 'shaving' scene which was being enacted, and roared with laughter. "Excuse me, dear, I ca'n't help it!" he said as soon as he could speak. "You *are* such an utter donkey! Kiss me, Tabby!"

And he flung his arms round the neck of the terrified Professor, who raised a wild shriek, but whether he received the threatened kiss or not I was unable to see, as Bruno, who had by this time released himself from his extinguisher, rushed headlong out of the room, followed by Sylvie; and I was so fearful of being left alone among all these crazy creatures that I hurried after them.

"We must go to Father!" Sylvie panted, as they ran down the garden. "I'm *sure* things are at their worst! I'll ask the Gardener to let us out again."

"But we ca'n't *walk* all the way!" Bruno whimpered. "How I *wiss* we had a coach-and-four, like Uncle!"

And, shrill and wild, rang through the air the familiar voice:—

"He thought he saw a Coach-and-Four
That stood beside his bed:
He looked again, and found it was
A Bear without a Head.
'Poor thing,' he said, 'poor silly thing!
It's waiting to be fed!"

A Bear without a Head

“No, I ca’n’t let you out again!” he said, before the children could speak. “The Vice-Warden gave it me, he did, for letting you out last time! So be off with you!” And, turning away from them, he began digging frantically in the middle of a gravel-walk, singing, over and over again,

“‘Poor thing,’ he said, ‘poor silly thing!
It’s waiting to be fed!’”

but in a more musical tone than the shrill screech in which he had begun.

The music grew fuller and richer at every moment: other manly voices joined in the refrain: and soon I heard the heavy thud that told me the boat had touched the beach, and the harsh grating of the shingle as the men dragged it up. I roused myself, and, after lending them a hand in hauling up their boat, I lingered yet awhile to watch them disembark a goodly assortment of the hard-won ‘treasures of the deep.’

When at last I reached our lodgings I was tired and sleepy, and glad enough to settle down again into the easy-chair, while Arthur hospitably went to his cupboard, to get me out some cake and wine, without which, he declared, he could not, as a doctor, permit my going to bed.

And how that cupboard-door *did* creak! It surely could not be *Arthur*, who was opening and shutting it so often, moving so restlessly about, and muttering like the soliloquy of a tragedy-queen!

No, it was a *female* voice. Also the figure—half-hidden by the cupboard-door—was a *female* figure, massive, and in flowing robes. Could it be the landlady? The door opened, and a strange man entered the room.

“What *is* that donkey doing?” he said to himself, pausing, aghast, on the threshold.

The lady, thus rudely referred to, was his wife. She had got one of the cupboards open, and stood with her back to him, smoothing down a sheet of brown paper on one of the shelves, and whispering to herself “So, so! Deftly done! Craftily contrived!”

Her loving husband stole behind her on tiptoe, and tapped her on the head. “Boh!” he playfully shouted at her ear. “Never tell me again I ca’n’t say ‘boh’ to a goose!”

My Lady wrung her hands. “Discovered!” she groaned. “Yet no—he is one of us! Reveal it not, oh Man! Let it bide its time!”

“Reveal *what* not?” her husband testily replied, dragging out the sheet of brown paper. “What are you hiding here, my Lady? I insist upon knowing!”

My Lady cast down her eyes, and spoke in the littlest of little voices. “Don’t make fun of it, Benjamin!” she pleaded. “It’s—it’s—don’t you understand? It’s a DAGGER!”

“And what’s *that* for?” sneered His Excellency. “We’ve only got to make people *think* he’s dead! We haven’t got to *kill* him! And made of tin, too!” he snarled, contemptuously bending the blade round his thumb. “Now, Madam, you’ll be good enough to explain. First, what do you call me *Benjamin* for?”

“It’s part of the Conspiracy, Love! One *must* have an alias, you know——”

“Oh, an *alias*, is it? Well! And next, what did you get this dagger for? Come, no evasions! You ca’n’t deceive *me*!”

“I got it for—for—for——” the detected Conspirator stammered, trying her best to put on the assassin-expression that she had been practising at the looking-glass. “For——”

“For *what*, Madam!”

“Well, for eighteenpence, if you *must* know, dearest! That’s what I got it for, on my——”

“Now *don’t* say your Word and Honour!” groaned the other Conspirator. “Why, they aren’t worth half the money, put together!”

“On my *birthday*,” my Lady concluded in a meek whisper. “One *must* have a dagger, you know. It’s part of the——”

“Oh, don’t talk of Conspiracies!” her husband savagely interrupted, as he tossed the dagger into the cupboard. “You know about as much how to manage a Conspiracy as if you were a chicken. Why, the first thing is to get a disguise. Now, just look at this!”

And with pardonable pride he fitted on the cap and bells, and the rest of the Fool’s dress, and winked at her, and put his tongue in his cheek. “Is *that* the sort of thing, now?” he demanded.

My Lady’s eyes flashed with all a Conspirator’s enthusiasm. “The very thing!” she exclaimed, clapping her hands. “You do look, oh, such a *perfect* Fool!”

The Fool smiled a doubtful smile. He was not quite clear whether it was a compliment or not, to express it so plainly. “You mean a Jester? Yes, that’s what I intended. And what do you think *your* disguise is to be?” And he proceeded to unfold the parcel, the lady watching him in rapture.

“Oh, how lovely!” she cried, when at last the dress was unfolded. “What a *splendid* disguise! An Esquimaux peasant-woman!”

“An Esquimaux peasant, indeed!” growled the other. “Here, put it on, and look at yourself in the glass. Why, it’s a *Bear*, ca’n’t you use your eyes?” He checked himself suddenly, as a harsh voice yelled through the room

“He looked again, and found it was
A Bear without a Head!”

But it was only the Gardener, singing under the open window. The Vice-Warden stole on tip-toe to the window, and closed it noiselessly, before he ventured to go on. “Yes, Lovey, a *Bear*: but not without a *head*, I hope! You’re the Bear, and me the Keeper. And if any one knows us, they’ll have sharp eyes, that’s all!”

“I shall have to practise the steps a bit,” my Lady said, looking out through the Bear’s mouth: “one ca’n’t help being rather human just at first, you know. And of course you’ll say ‘Come up, Bruin!’, won’t you?”

“Yes, of course,” replied the Keeper, laying hold of the chain, that hung from the Bear’s collar, with one hand, while with the other he cracked a little whip. “Now go round the room in a sort of a dancing attitude. Very good, my dear, very good. Come up, Bruin! Come up, I say!”

He roared out the last words for the benefit of Uggug, who had just come into the room, and was now standing, with his hands spread out, and eyes and mouth wide open, the very picture of stupid amazement. “Oh, my!” was all he could gasp out.

The Keeper pretended to be adjusting the bear’s collar, which gave him an opportunity of whispering, unheard by Uggug, “*my* fault, I’m afraid! Quite forgot to fasten the door. Plot’s ruined if *he* finds it out! Keep it up a minute or two longer. Be savage!” Then, while seeming to pull it back with all his strength,

‘Come up, Bruin!’

he let it advance upon the scared boy: my Lady, with admirable presence of mind, kept up what she no doubt intended for a savage growl, though it was more like the purring of a cat: and Uggug backed out of the room with such haste that he tripped over the mat, and was heard to fall heavily outside—an accident to which even his doting mother paid no heed, in the excitement of the moment.

The Vice-Warden shut and bolted the door. “Off with the disguises!” he panted. “There’s not a moment to lose. He’s sure to fetch the Professor, and we couldn’t take *him* in, you know!” And in another minute the disguises were stowed away in the cupboard, the door unbolted, and the two Conspirators seated lovingly side-by-side on the sofa, earnestly discussing a book the Vice-Warden had hastily snatched off the table, which proved to be the City-Directory of the capital of Outland.

The door opened, very slowly and cautiously, and the Professor peeped in, Uggug’s stupid face being just visible behind him.

“It is a beautiful arrangement!” the Vice-Warden was saying with enthusiasm. “You see, my precious one, that there are fifteen houses in Green Street, *before* you turn into West Street.”

“*Fifteen* houses! Is it *possible*?” my Lady replied. “I thought it was fourteen!” And, so intent were they on this interesting question, that neither of them even looked up till the Professor, leading Uggug by the hand, stood close before them.

My Lady was the first to notice their approach. “Why, here’s the Professor!” she exclaimed in her blandest tones. “And my precious child too! Are lessons over?”

“A strange thing has happened!” the Professor began in a trembling tone. “His Exalted Fatness” (this was one of Uggug’s many titles) “tells me he has just

seen, in this very room, a Dancing-Bear and a Court-Jester!"

The Vice-Warden and his wife shook with well-acted merriment.

"Not in *this* room, darling!" said the fond mother. "We've been sitting here this hour or more, reading——," here she referred to the book lying on her lap, "—reading the—the City-Directory."

"Let me feel your pulse, my boy!" said the anxious father. "Now put out your tongue. Ah, I thought so! He's a little feverish, Professor, and has had a bad dream. Put him to bed at once, and give him a cooling draught."

"I ain't been dreaming!" his Exalted Fatness remonstrated, as the Professor led him away.

"Bad grammar, Sir!" his father remarked with some sternness. "Kindly attend to *that* little matter, Professor, as soon as you have corrected the feverishness. And, by the way, Professor!" (The Professor left his distinguished pupil standing at the door, and meekly returned.) "There is a rumour afloat, that the people wish to elect an—in point of fact, an—you understand that I mean an——"

"Not *another Professor!*" the poor old man exclaimed in horror.

"No! Certainly not!" the Vice-Warden eagerly explained. "Merely an *Emperor*, you understand."

"An *Emperor!*" cried the astonished Professor, holding his head between his hands, as if he expected it to come to pieces with the shock. "What will the Warden——"

"Why, the *Warden* will most likely *be* the new Emperor!" my Lady explained. "Where could we find a better? Unless, perhaps——" she glanced at her husband.

"Where indeed!" the Professor fervently responded, quite failing to take the hint.

The Vice-Warden resumed the thread of his discourse. "The reason I mentioned it, Professor, was to ask *you* to be so kind as to preside at the Election. You see it would make the thing *respectable*—no suspicion of anything underhand——"

"I fear I ca'n't, your Excellency!" the old man faltered. "What will the Warden——"

"True, true!" the Vice-Warden interrupted. "Your position, as Court-Professor, makes it awkward, I admit. Well, well! Then the Election shall be held without you."

"Better so, than if it were held *within* me!" the Professor murmured with a bewildered air, as if he hardly knew what he was saying. "Bed, I think your Highness said, and a cooling-draught?" And he wandered dreamily back to where Uggug sulkily awaited him.

I followed them out of the room, and down the passage, the Professor murmuring to himself, all the time, as a kind of aid to his feeble memory, "C, C, C; Couch, Cooling-Draught, Correct-Grammar," till, in turning a corner, he met Sylvie and Bruno, so suddenly that the startled Professor let go of his fat pupil, who instantly took to his heels.

Chapter X. The Other Professor

"We were looking for you!" cried Sylvie, in a tone of great relief. "We *do* want you so much, you ca'n't think!"

“What is it, dear children?” the Professor asked, beaming on them with a very different look from what Uggug ever got from him.

“We want you to speak to the Gardener for us,” Sylvie said, as she and Bruno took the old man’s hands and led him into the hall.

“He’s ever so unkind!” Bruno mournfully added. “They’s *all* unkind to us, now that Father’s gone. The Lion were *much* nicer!”

“But you must explain to me, please,” the Professor said with an anxious look, “*which* is the Lion, and *which* is the Gardener. It’s *most* important not to get two such animals confused together. And one’s very liable to do it in their case—both having mouths, you know——”

“Doos oo *always* confuses two animals together?” Bruno asked.

“Pretty often, I’m afraid,” the Professor candidly confessed. “Now, for instance, there’s the rabbit-hutch and the hall-clock.” The Professor pointed them out. “One gets a little confused with *them*—both having doors, you know. Now, only yesterday—would you believe it?—I put some lettuces into the clock, and tried to wind up the rabbit!”

“Did the rabbit *go*, after oo wounded it up?” said Bruno.

The Professor clasped his hands on the top of his head, and groaned. “Go? I should think it *did* go! Why, it’s *gone*! And where ever it’s gone to—that’s what I *ca’n’t* find out! I’ve done my best—I’ve read all the article ‘Rabbit’ in the great dictionary——Come in!”

“Only the tailor, Sir, with your little bill,” said a meek voice outside the door.

“Ah, well, I can soon settle *his* business,” the Professor said to the children, “if you’ll just wait a minute. How much is it, this year, my man?” The tailor had come in while he was speaking.

“Well, it’s been a doubling so many years, you see,” the tailor replied, a little gruffly, “and I think I’d like the money now. It’s two thousand pound, it is!”

“Oh, that’s nothing!” the Professor carelessly remarked, feeling in his pocket, as if he always carried at least *that* amount about with him. “But wouldn’t you like to wait just another year, and make it *four* thousand? Just think how rich you’d be! Why, you might be a *King*, if you liked!”

“I don’t know as I’d care about being a *King*,” the man said thoughtfully. “But it *dew* sound a powerful sight o’ money! Well, I think I’ll wait——”

“Of course you will!” said the Professor. “There’s good sense in *you*, I see. Good-day to you, my man!”

“Will you ever have to pay him that four thousand pounds?” Sylvie asked as the door closed on the departing creditor.

“*Never*, my child!” the Professor replied emphatically. “He’ll go on doubling it, till he dies. You see it’s *always* worth while waiting another year, to get twice as much money! And now what would you like to do, my little friends? Shall I take you to see the Other Professor? This would be an excellent opportunity for a visit,” he said to himself, glancing at his watch: “he generally takes a short rest—of fourteen minutes and a half—about this time.”

Bruno hastily went round to Sylvie, who was standing at the other side of the Professor, and put his hand into hers. “I *thinks* we’d like to go,” he said doubtfully: “only please let’s go all together. It’s best to be on the safe side, oo know!”

“Why, you talk as if you were *Sylvie*!” exclaimed the Professor.

"I know I did," Bruno replied very humbly. "I quite forgot I wasn't Sylvie. Only I fought he might be rarer fierce!"

The Professor laughed a jolly laugh. "Oh, he's quite tame!" he said. "He never bites. He's only a little—a little *dreamy*, you know." He took hold of Bruno's other hand, and led the children down a long passage I had never noticed before—not that there was anything remarkable in *that*: I was constantly coming on new rooms and passages in that mysterious Palace, and very seldom succeeded in finding the old ones again.

Near the end of the passage the Professor stopped. "This is his room," he said, pointing to the solid wall.

"We can't get in through *there*!" Bruno exclaimed.

Sylvie said nothing, till she had carefully examined whether the wall opened anywhere. Then she laughed merrily: "You're playing us a trick, you dear old thing!" she said. "There's no *door* here!"

"There isn't any door to the room," said the Professor. "We shall have to climb in at the window."

The Other Professor

So we went into the garden, and soon found the window of the Other Professor's room. It was a ground-floor window, and stood invitingly open: the Professor first lifted the two children in, and then he and I climbed in after them.

The Other Professor was seated at a table, with a large book open before him, on which his forehead was resting: he had clasped his arms round the book, and was snoring heavily. "He usually reads like that," the Professor remarked, "when the book's very interesting: and then sometimes it's very difficult to get him to attend!"

This seemed to be one of the difficult times: the Professor lifted him up, once or twice, and shook him violently: but he always returned to his book the moment he was let go of, and showed by his heavy breathing that the book was as interesting as ever.

"How dreamy he is!" the Professor exclaimed. "He must have got to a *very* interesting part of the book!" And he rained quite a shower of thumps on the Other Professor's back, shouting "Hoy! Hoy!" all the time. "Isn't it *wonderful* that he should be so dreamy?" he said to Bruno.

"If he's always as *sleepy* as that," Bruno remarked, "a *course* he's dreamy!"
"But what are we to *do*?" said the Professor. "You see he's quite wrapped up in the book!"

"Suppose oo *shuts* the book?" Bruno suggested.

"That's it!" cried the delighted Professor. "Of course that'll do it!" And he shut up the book so quickly that he caught the Other Professor's nose between the leaves, and gave it a severe pinch.

The Other Professor instantly rose to his feet, and carried the book away to the end of the room, where he put it back in its place in the book-case. "I've been reading for eighteen hours and three-quarters," he said, "and now I shall rest for fourteen minutes and a half. Is the Lecture all ready?"

"Very nearly," the Professor humbly replied. "I shall ask you to give me a hint or two—there will be a few little difficulties——"

"And a Banquet, I think you said?"

"Oh, yes! The Banquet comes *first*, of course. People never enjoy Abstract Science, you know, when they're ravenous with hunger. And then there's the Fancy-Dress-Ball. Oh, there'll be lots of entertainment!"

"Where will the Ball come in?" said the Other Professor.

"I *think* it had better come at the beginning of the Banquet—it brings people together so nicely, you know."

"Yes, that's the right order. First the Meeting: then the Eating: then the Treating—for I'm sure any Lecture *you* give us will be a treat!" said the Other Professor, who had been standing with his back to us all this time, occupying himself in taking the books out, one by one, and turning them upside-down. An easel, with a black board on it, stood near him: and, every time that he turned a book upside-down, he made a mark on the board with a piece of chalk.

"And as to the 'Pig-Tale'—which *you* have so kindly promised to give us—" the Professor went on, thoughtfully rubbing his chin. "I think that had better come at the *end* of the Banquet: then people can listen to it quietly."

"Shall I *sing* it?" the Other Professor asked, with a smile of delight.

"If you *can*," the Professor replied, cautiously.

"Let me try," said the Other Professor, seating himself at the pianoforte. "For the sake of argument, let us assume that it begins on A flat." And he struck the note in question. "La, la, la! I think that's within an octave of it." He struck the note again, and appealed to Bruno, who was standing at his side. "Did I sing it like *that*, my child?"

"No, oo didn't," Bruno replied with great decision. "It were more like a duck."

"Single notes are apt to have that effect," the Other Professor said with a sigh. "Let me try a whole verse.

There was a Pig, that sat alone,
Beside a ruined Pump.
By day and night he made his moan:
It would have stirred a heart of stone
To see him wring his hoofs and groan,
Because he could not jump.

Would you call that a tune, Professor?" he asked, when he had finished.

The Professor considered a little. “Well,” he said at last, “some of the notes are the same as others—and some are different—but I should hardly call it a *tune*.”

“Let me try it a bit by myself,” said the Other Professor. And he began touching the notes here and there, and humming to himself like an angry blue-bottle.

“How do you like his singing?” the Professor asked the children in a low voice.

“It isn’t very *beautiful*,” Sylvie said, hesitatingly.

“It’s very extremely *ugly*!” Bruno said, without any hesitation at all.

“All extremes are bad,” the Professor said, very gravely. “For instance, Sobriety is a very good thing, when practised *in moderation*: but even Sobriety, when carried to an *extreme*, has its disadvantages.”

“What are its disadvantages?” was the question that rose in my mind—and, as usual, Bruno asked it for me. “What *are* its lizard bandages?”

“Well, this is *one* of them,” said the Professor. “When a man’s tipsy (that’s one extreme, you know), he sees one thing as two. But, when he’s *extremely* sober (that’s the other extreme), he sees two things as one. It’s equally inconvenient, whichever happens.”

“What does ‘inconvenient’ mean?” Bruno whispered to Sylvie.

“The difference between ‘convenient’ and ‘inconvenient’ is best explained by an example,” said the Other Professor, who had overheard the question. “If you’ll just think over any Poem that contains the two words—such as——”

The Professor put his hands over his ears, with a look of dismay. “If you once let him begin a *Poem*,” he said to Sylvie, “he’ll never leave off again! He never does!”

“Did he ever begin a Poem and not leave off again?” Sylvie enquired.

“Three times,” said the Professor.

Bruno raised himself on tiptoe, till his lips were on a level with Sylvie’s ear. “What became of them three Poems?” he whispered. “Is he saying them all, now?”

“Hush!” said Sylvie. “The Other Professor is speaking!”

“I’ll say it very quick,” murmured the Other Professor, with downcast eyes, and melancholy voice, which contrasted oddly with his face, as he had forgotten to leave off smiling. (“At least it wasn’t exactly a *smile*,” as Sylvie said afterwards: “it looked as if his mouth was made that shape.”)

“Go on then,” said the Professor. “*What must be must be.*”

“Remember that!” Sylvie whispered to Bruno, “It’s a very good rule for whenever you hurt yourself.”

“And it’s a very good rule for whenever I make a noise,” said the saucy little fellow. “So *you* remember it too, Miss!”

“Whatever *do* you mean?” said Sylvie, trying to frown, a thing she never managed particularly well.

“Oftens and oftens,” said Bruno, “haven’t oo told me ‘There mustn’t be so much noise, Bruno!’ when I’ve tolded oo ‘There *must*!’ Why, there isn’t no rules at all about ‘There mustn’t’! But oo never believes *me*!”

“As if any one *could* believe *you*, you wicked wicked boy!” said Sylvie. The *words* were severe enough, but I am of opinion that, when you are really *anxious* to impress a criminal with a sense of his guilt, you ought not to pronounce the sentence with your lips *quite* close to his cheek—since a kiss at the end of it, however accidental, weakens the effect terribly.

Chapter XI. Peter and Paul

“As I was saying,” the Other Professor resumed, “if you’ll just think over any Poem, that contains the words—such as

‘Peter is poor,’ said noble Paul,
‘And I have always been his friend:
And, though my means to give are small,
At least I can afford to *lend*.
How few, in this cold age of greed,
Do good, except on selfish grounds!
But I can feel for Peter’s need,
And *I will lend him fifty pounds!*’

How great was Peter’s joy to find
His friend in such a genial vein!
How cheerfully the bond he signed,
To pay the money back again!
‘We ca’n’t,’ said Paul, ‘be too precise:
’Tis best to fix the very day:
So, by a learned friend’s advice,
I’ve made it Noon, the Fourth of May.’

‘How cheerfully the bond he signed!’

‘But this is April!’ Peter said.

'The First of April, as I think.
 Five little weeks will soon be fled:
 One scarcely will have time to wink!
 Give me a year to speculate—
 To buy and sell—to drive a trade—'
 Said Paul 'I cannot change the date.
 On May the Fourth it must be paid.'
 'Well, well!' said Peter, with a sigh.
 'Hand me the cash, and I will go.
 I'll form a Joint-Stock Company,
 And turn an honest pound or so.'
 'I'm grieved,' said Paul, 'to seem unkind:
 The money shall of course be lent:
 But, for a week or two, I find
 It will not be convenient.'
 So, week by week, poor Peter came
 And turned in heaviness away;
 For still the answer was the same,
 'I cannot manage it to-day.'
 And now the April showers were dry—
 The five short weeks were nearly spent—
 Yet still he got the old reply,
 'It is not quite convenient!'

The Fourth arrived, and punctual Paul
 Came, with his legal friend, at noon.
 'I thought it best,' said he, 'to call:
 One cannot settle things too soon.'
 Poor Peter shuddered in despair:
 His flowing locks he wildly tore:
 And very soon his yellow hair
 Was lying all about the floor.

The legal friend was standing by,
 With sudden pity half unmanned:
 The tear-drop trembled in his eye,
 The signed agreement in his hand:
 But when at length the legal soul
 Resumed its customary force,
 'The Law,' he said, 'we ca'n't control:
 Pay, or the Law must take its course!'

Said Paul, 'How bitterly I rue
 That fatal morning when I called!
 Consider, Peter, what you do!
 You won't be richer when you're bald!
 Think you, by rending curls away,
 To make your difficulties less?
 Forbear this violence, I pray:
 You do but add to my distress!'

'Not willingly would I inflict,'

'Poor Peter shuddered in despair'

Said Peter, 'on that noble heart
One needless pang. Yet why so strict?
Is *this* to act a friendly part?
However legal it may be
To pay what never has been lent,
This style of business seems to me
Extremely inconvenient!

'No Nobleness of soul have I,
Like *some* that in this Age are found!
(Paul blushed in sheer humility,
And cast his eyes upon the ground.)
'This debt will simply swallow all,
And make my life a life of woe!
'Nay, nay, my Peter!' answered Paul.
'You must not rail on Fortune so!

'You have enough to eat and drink:
You are respected in the world:
And at the barber's, as I think,
You often get your whiskers curled.
Though Nobleness you ca'n't attain—
To any very great extent—
The path of Honesty is plain,
However inconvenient!'

'Tis true,' said Peter, 'I'm alive:
I keep my station in the world:
Once in the week I just contrive
To get my whiskers oiled and curled.
But my assets are very low:
My little income's overspent:
To trench on capital, you know,
Is always inconvenient!'

'But pay your debts!' cried honest Paul.
'My gentle Peter, pay your debts!
What matter if it swallows all
That you describe as your "assets"?
Already you're an hour behind:
Yet Generosity is best.
It pinches me—but never mind!
I will not charge you interest!'

'How good! How great!' poor Peter cried.
'Yet I must sell my Sunday wig—
The scarf-pin that has been my pride—
My grand piano—and my pig!
Full soon his property took wings:
And daily, as each treasure went,
He sighed to find the state of things
Grow less and less convenient.

Weeks grew to months, and months to years:

Peter was worn to skin and bone:
 And once he even said, with tears,
 'Remember, Paul, that promised Loan!'
 Said Paul 'I'll lend you, when I can,
 All the spare money I have got—
 Ah, Peter, you're a happy man!
 Yours is an enviable lot!

'Such boots as this you seldom see'

'I'm getting stout, as you may see:
 It is but seldom I am well:
 I cannot feel my ancient glee
 In listening to the dinner-bell:
 But you, you gambol like a boy,
 Your figure is so spare and light:
 The dinner-bell's a note of joy
 To such a healthy appetite!

Said Peter 'I am well aware
 Mine is a state of happiness:
 And yet how gladly could I spare
 Some of the comforts I possess!
 What *you* call healthy appetite
 I feel as Hunger's savage tooth:

And, when no dinner is in sight,
 The dinner-bell's a sound of ruth!
 'No scare-crow would accept this coat:
 Such boots as these you seldom see.
 Ah, Paul, a single five-pound-note
 Would make another man of me!'

Said Paul 'It fills me with surprise
 To hear you talk in such a tone:
 I fear you scarcely realise
 The blessings that are all your own!
 'You're safe from being overfed:
 You're sweetly picturesque in rags:
 You never know the aching head
 That comes along with money-bags:
 And you have time to cultivate
 That best of qualities, Content—
 For which you'll find your present state
 Remarkably convenient!'

Said Peter 'Though I cannot sound
 The depths of such a man as you,
 Yet in your character I've found
 An inconsistency or two.
 You seem to have long years to spare
 When there's a promise to fulfil:
 And yet how punctual you were
 In calling with that little bill!'

'One can't be too deliberate,'
 Said Paul, 'in parting with one's pelf.
 With bills, as you correctly state,
 I'm punctuality itself.
 A man may surely claim his dues:
 But, when there's money to be *lent*,
 A man must be allowed to choose
 Such times as are convenient!'

It chanced one day, as Peter sat
 Gnawing a crust—his usual meal—
 Paul bustled in to have a chat,
 And grasped his hand with friendly zeal.
 'I knew,' said he, 'your frugal ways:
 So, that I might not wound your pride
 By bringing strangers in to gaze,
 I've left my legal friend outside!

'You well remember, I am sure,
 When first your wealth began to go,
 And people sneered at one so poor,
 I never used my Peter so!
 And when you'd lost your little all,
 And found yourself a thing despised,

I need not ask you to recall
How tenderly I sympathised!
'Then the advice I've poured on you,
So full of wisdom and of wit:
All given gratis, though 'tis true
I might have fairly charged for it!
But I refrain from mentioning
Full many a deed I might relate—
For boasting is a kind of thing
That I particularly hate.

'I will lend you fifty more!'

'How vast the total sum appears
Of all the kindnesses I've done,
From Childhood's half-forgotten years
Down to that Loan of April One!
That Fifty Pounds! You little guessed
How deep it drained my slender store:
But there's a heart within this breast,
And *I will lend you fifty more!*'

'Not so,' was Peter's mild reply,
His cheeks all wet with grateful tears:
'No man recalls, so well as I,

Your services in bygone years:
And this new offer, I admit,
Is very very kindly meant—
Still, to avail myself of it
Would not be quite convenient!

You'll see in a moment what the difference is between 'convenient' and 'inconvenient.' You quite understand it now, don't you?" he added, looking kindly at Bruno, who was sitting, at Sylvie's side, on the floor.

"Yes," said Bruno, very quietly. Such a short speech was very unusual, for him: but just then he seemed, I fancied, a little exhausted. In fact, he climbed up into Sylvie's lap as he spoke, and rested his head against her shoulder. "What a many verses it was!" he whispered.

Chapter XII. A Musical Gardener

The Other Professor regarded him with some anxiety. "The smaller animal ought to go to bed *at once*," he said with an air of authority.

"Why *at once*?" said the Professor.

"Because he can't go at twice," said the Other Professor.

The Professor gently clapped his hands. "Isn't he *wonderful*!" he said to Sylvie. "Nobody else could have thought of the reason, so quick. Why, *of course* he ca'n't go at twice! It would hurt him to be divided."

This remark woke up Bruno, suddenly and completely. "I don't want to be *divided*," he said decisively.

"It does very well on a *diagram*," said the Other Professor. "I could show it you in a minute, only the chalk's a little blunt."

"Take care!" Sylvie anxiously exclaimed, as he began, rather clumsily, to point it. "You'll cut your finger off, if you hold the knife so!"

"If oo cuts it off, will oo give it to *me*, please?" Bruno thoughtfully added.

"It's like this," said the Other Professor, hastily drawing a long line upon the black board, and marking the letters 'A,' 'B,' at the two ends, and 'C' in the middle: "let me explain it to you. If *AB* were to be divided into two parts at *C*——"

"It would be drowned," Bruno pronounced confidently.

The Other Professor gasped. "*What* would be drowned?"

"Why the bumble-bee, of course!" said Bruno. "And the two bits would sink down in the sea!"

Here the Professor interfered, as the Other Professor was evidently too much puzzled to go on with his diagram.

"When I said it would *hurt* him, I was merely referring to the action of the nerves——"

The Other Professor brightened up in a moment. "The action of the nerves," he began eagerly, "is curiously slow in some people. I had a friend, once, that, if you burnt him with a red-hot poker, it would take years and years before he felt it!"

"And if you only *pinched* him?" queried Sylvie.

"Then it would take ever so much longer, of course. In fact, I doubt if the man *himself* would ever feel it, at all. His grandchildren might."

"I wouldn't like to be the grandchild of a pinched grandfather, would *you*, Mister Sir?" Bruno whispered. "It might come just when you wanted to be happy!"

That would be awkward, I admitted, taking it quite as a matter of course that he had so suddenly caught sight of me. "But don't you *always* want to be happy, Bruno?"

"Not *always*," Bruno said thoughtfully. "Sometimes, when I's *too* happy, I wants to be a little miserable. Then I just tell Sylvie about it, oo know, and Sylvie sets me some lessons. Then it's all right."

"I'm sorry you don't like lessons," I said. "You should copy Sylvie. *She's* always as busy as the day is long!"

"Well, so am *I*!" said Bruno.

"No, no!" Sylvie corrected him. "*You're* as busy as the day is *short*!"

"Well, what's the difference?" Bruno asked. "Mister Sir, isn't the day as short as it's long? I mean, isn't it the *same* length?"

Never having considered the question in this light, I suggested that they had better ask the Professor; and they ran off in a moment to appeal to their old friend. The Professor left off polishing his spectacles to consider. "My dears," he said after a minute, "the day is the same length as anything that is the same length as *it*." And he resumed his neverending task of polishing.

The children returned, slowly and thoughtfully, to report his answer. "*Isn't* he wise?" Sylvie asked in an awestruck whisper. "If *I* was as wise as *that*, I should have a head-ache all day long. I *know* I should!"

"You appear to be talking to somebody—that isn't here," the Professor said, turning round to the children. "Who is it?"

Bruno looked puzzled. "I never talks to nobody when he isn't here!" he replied. "It isn't good manners. Oo should always wait till he comes, before oo talks to him!"

The Professor looked anxiously in my direction, and seemed to look through and through me without seeing me. "Then who are you talking to?" he said. "There isn't anybody here, you know, except the Other Professor—and *he* isn't here!" he added wildly, turning round and round like a teetotum. "Children! Help to look for him! Quick! He's got lost again!"

The children were on their feet in a moment.

"Where shall we look?" said Sylvie.

"Anywhere!" shouted the excited Professor. "Only be quick about it!" And he began trotting round and round the room, lifting up the chairs, and shaking them.

Bruno took a very small book out of the bookcase, opened it, and shook it in imitation of the Professor. "He isn't *here*," he said.

"He *ca'n't* be there, Bruno!" Sylvie said indignantly.

"Course he ca'n't!" said Bruno. "I should have shooked him out, if he'd been in there!"

"Has he ever been lost before?" Sylvie enquired, turning up a corner of the hearth-rug, and peeping under it.

"Once before," said the Professor: "he once lost himself in a wood——"

"And couldn't he find his-self again?" said Bruno. "Why didn't he shout? He'd be sure to hear his-self, 'cause he couldn't be far off, oo know."

"Let's try shouting," said the Professor.

"What shall we shout?" said Sylvie.

"On second thoughts, *don't* shout," the Professor replied. "The Vice-Warden might hear you. He's getting awfully strict!"

This reminded the poor children of all the troubles, about which they had come to their old friend. Bruno sat down on the floor and began crying. "He *is* so cruel!" he sobbed. "And he lets Uggug take away *all* my toys! And such horrid meals!"

"What did you have for dinner to-day?" said the Professor.

"A little piece of a dead crow," was Bruno's mournful reply.

"He means rook-pie," Sylvie explained.

"It *were* a dead crow," Bruno persisted. "And there were a apple-pudding—and Uggug ate it all—and I got nuffin but a crust! And I asked for a orange—and—didn't get it!" And the poor little fellow buried his face in Sylvie's lap, who kept gently stroking his hair, as she went on. "It's all true, Professor dear! They *do* treat my darling Bruno very badly! And they're not kind to *me* either," she added in a lower tone, as if *that* were a thing of much less importance.

The Professor got out a large red silk handkerchief, and wiped his eyes. "I wish I could help you, dear children!" he said. "But what *can* I do?"

"We know the way to Fairyland—where Father's gone—quite well," said Sylvie: "if only the Gardener would let us out."

"Won't he open the door for you?" said the Professor.

"Not for *us*," said Sylvie: "but I'm sure he would for *you*. Do come and ask him, Professor dear!"

"I'll come this minute!" said the Professor.

Bruno sat up and dried his eyes. "*Isn't* he kind, Mister Sir?"

"He is *indeed*," said I. But the Professor took no notice of my remark. He had put on a beautiful cap with a long tassel, and was selecting one of the Other Professor's walking-sticks, from a stand in the corner of the room. "A thick stick in one's hand makes people respectful," he was saying to himself. "Come along, dear children!" And we all went out into the garden together.

"I shall address him, first of all," the Professor explained as we went along, "with a few playful remarks on the weather. I shall then question him about the Other Professor. This will have a double advantage. First, it will open the conversation (you can't even drink a bottle of wine without opening it first): and secondly, if he's seen the Other Professor, we shall find him that way: and, if he hasn't, we sha'n't."

On our way, we passed the target, at which Uggug had been made to shoot during the Ambassador's visit.

"See!" said the Professor, pointing out a hole in the middle of the bull's-eye. "His Imperial Fatness had only *one* shot at it; and he went in just *here*!"

Bruno carefully examined the hole. "Couldn't go in *there*," he whispered to me. "He are too *fat*!"

We had no sort of difficulty in *finding* the Gardener. Though he was hidden from us by some trees, that harsh voice of his served to direct us; and, as we drew nearer, the words of his song became more and more plainly audible:—

"He thought he saw an Albatross
That fluttered round the lamp:
He looked again, and found it was
A Penny-Postage-Stamp.
'You'd best be getting home,' he said:

‘The nights are very damp!’”

‘He thought he saw an Albatross’

“Would it be afraid of catching cold?” said Bruno.

“If it got *very* damp,” Sylvie suggested, “it might stick to something, you know.”

“And *that* somefin would have to go by the post, whatever it was!” Bruno eagerly exclaimed. “Suppose it was a cow! Wouldn’t it be *dreadful* for the other things!”

“And all these things happened to *him*,” said the Professor. “That’s what makes the song so interesting.”

“He must have had a very curious life,” said Sylvie.

“You may say that!” the Professor heartily rejoined.

“Of course she may!” cried Bruno.

By this time we had come up to the Gardener, who was standing on one leg, as usual, and busily employed in watering a bed of flowers with an empty watering-can.

“It hasn’t got no water in it!” Bruno explained to him, pulling his sleeve to attract his attention.

“It’s lighter to hold,” said the Gardener. “A lot of water in it makes one’s arms ache.” And he went on with his work, singing softly to himself

“The nights are very damp!”

“In digging things out of the ground—which you probably do now and then,” the Professor began in a loud voice; “in making things into heaps—which no doubt you often do; and in kicking things about with one heel—which you seem never to leave off doing; have you ever happened to notice another Professor, something like me, but different?”

“Never!” shouted the Gardener, so loudly and violently that we all drew back in alarm.

“There ain’t such a thing!”

“We will try a less exciting topic,” the Professor mildly remarked to the children. “You were asking——”

“We asked him to let us through the garden-door,” said Sylvie: “but he wouldn’t: but perhaps he would for *you*!”

The Professor put the request, very humbly and courteously.

“I wouldn’t mind letting *you* out,” said the Gardener. “But I mustn’t open the door for *children*. D’you think I’d disobey the *Rules*? Not for one-and-sixpence!”

The Professor cautiously produced a couple of shillings.

“That’ll do it!” the Gardener shouted, as he hurled the watering-can across the flower-bed, and produced a handful of keys—one large one, and a number of small ones.

“But look here, Professor dear!” whispered Sylvie. “He needn’t open the door for *us*, at all. We can go out with *you*.”

“True, dear child!” the Professor thankfully replied, as he replaced the coins in his pocket. “That saves two shillings!” And he took the children’s hands, that they might all go out together when the door was opened. This, however, did not seem a very likely event, though the Gardener patiently tried all the small keys, over and over again.

At last the Professor ventured on a gentle suggestion. “Why not try the *large* one? I have often observed that a door unlocks *much* more nicely with its *own* key.”

The very first trial of the large key proved a success: the Gardener opened the door, and held out his hand for the money.

The Professor shook his head. “You are acting by *Rule*,” he explained, “in opening the door for *me*. And now it’s open, we are going out by *Rule*—the Rule of *Three*.”

The Gardener looked puzzled, and let us go out; but, as he locked the door behind us, we heard him singing thoughtfully to himself

“He thought he saw a Garden-Door
That opened with a key:
He looked again, and found it was
A Double Rule of Three:
‘And all its mystery,’ he said,
‘Is clear as day to me!’”

“I shall now return,” said the Professor, when we had walked a few yards: “you see, it’s impossible to read *here*, for all my books are in the house.”

But the children still kept fast hold of his hands. “*Do* come with us!” Sylvie entreated with tears in her eyes.

“Well, well!” said the good-natured old man. “Perhaps I’ll come after you, some day soon. But I *must* go back *now*. You see I left off at a comma, and it’s so awkward not knowing how the sentence finishes! Besides, you’ve got to go through Dogland first, and I’m always a little nervous about dogs. But it’ll be quite easy to come, as soon as I’ve completed my new invention—for carrying one’s-*self*, you know. It wants just a *little* more working-out.”

“Won’t that be very tiring, to carry *yourself*?” Sylvie enquired.

“Well, no, my child. You see, whatever fatigue one incurs by *carrying*, one saves by *being carried*! Good-bye, dears! Good-bye, Sir!” he added to my intense surprise, giving my hand an affectionate squeeze.

“Good-bye, Professor!” I replied: but my voice sounded strange and far away, and the children took not the slightest notice of our farewell. Evidently they neither saw me nor heard me, as, with their arms lovingly twined round each other, they marched boldly on.

Chapter XIII. A Visit to Dogland

“There’s a house, away there to the left,” said Sylvie, after we had walked what seemed to me about fifty miles. “Let’s go and ask for a night’s lodging.”

“It looks a very comfable house,” Bruno said, as we turned into the road leading up to it. “I doos hope the Dogs will be kind to us, I *is* so tired and hungry!”

A Mastiff, dressed in a scarlet collar, and carrying a musket, was pacing up and down, like a sentinel, in front of the entrance. He started, on catching sight of the children, and came forwards to meet them, keeping his musket pointed straight at Bruno, who stood quite still, though he turned pale and kept tight hold of Sylvie’s hand, while the Sentinel walked solemnly round and round them, and looked at them from all points of view.

The Mastiff-Sentinel

“Oooh, hoooh boohooyah!” He growled at last. “Woobah yahwah oooh! Bow wahbah woobooyah? Bow wow?” he asked Bruno, severely.

Of course *Bruno* understood all this, easily enough. All Fairies understand Doggee—that is, Dog-language. But, as *you* may find it a little difficult, just at first, I had better put it into English for you. “Humans, I verily believe! A couple of stray Humans! What Dog do you belong to? What do you want?”

“We don’t belong to a *Dog*!” Bruno began, in Doggee. (“Peoples *never* belongs to Dogs!” he whispered to Sylvie.)

But Sylvie hastily checked him, for fear of hurting the Mastiff’s feelings. “Please, we want a little food, and a night’s lodging—if there’s room in the house,” she added timidly. Sylvie spoke Doggee very prettily: but I think it’s almost better, for *you*, to give the conversation in English.

"The *house*, indeed!" growled the Sentinel. "Have you never seen a *Palace* in your life? Come along with me! His Majesty must settle what's to be done with you."

They followed him through the entrance-hall, down a long passage, and into a magnificent Saloon, around which were grouped dogs of all sorts and sizes. Two splendid Blood-hounds were solemnly sitting up, one on each side of the crown-bearer. Two or three Bull-dogs—whom I guessed to be the Body-Guard of the King—were waiting in grim silence: in fact the only voices at all plainly audible were those of two little dogs, who had mounted a settee, and were holding a lively discussion that looked very like a quarrel.

"Lords and Ladies in Waiting, and various Court Officials," our guide gruffly remarked, as he led us in. Of *me* the Courtiers took no notice whatever: but Sylvie and Bruno were the subject of many inquisitive looks, and many whispered remarks, of which I only distinctly caught *one*—made by a sly-looking Dachshund to his friend—"Bah wooh wahyah hoobah Oobooh, *hah bah?*" ("She's not such a bad-looking Human, *is she?*")

Leaving the new arrivals in the centre of the Saloon, the Sentinel advanced to a door, at the further end of it, which bore an inscription, painted on it in Doggee, "Royal Kennel—Scratch and Yell."

Before doing this, the Sentinel turned to the children, and said "Give me your names."

"We'd rather not!" Bruno exclaimed, pulling Sylvie away from the door. "We want them ourselves. Come back, Sylvie! Come quick!"

"Nonsense!" said Sylvie very decidedly: and gave their names in Doggee.

Then the Sentinel scratched violently at the door, and gave a yell that made Bruno shiver from head to foot.

"Hooyah wah!" said a deep voice inside. (That's Doggee for "Come in!")

"It's the King himself!" the Mastiff whispered in an awestruck tone. "Take off your wigs, and lay them humbly at his paws." (What *we* should call "at his *feet*.")

Sylvie was just going to explain, very politely, that really they *couldn't* perform *that* ceremony, because their wigs wouldn't come off, when the door of the Royal Kennel opened, and an enormous Newfoundland Dog put his head out. "Bow wow?" was his first question.

"When His Majesty speaks to you," the Sentinel hastily whispered to Bruno, "you should prick up your ears!"

Bruno looked doubtfully at Sylvie. "I'd rather not, please," he said. "It would hurt."

"It doesn't hurt a bit!" the Sentinel said with some indignation. "Look! It's like this!" And he pricked up his ears like two railway signals.

Sylvie gently explained matters. "I'm afraid we ca'n't manage it," she said in a low voice. "I'm very sorry: but our ears haven't got the right—" she wanted to say "machinery" in Doggee: but she had forgotten the word, and could only think of "steam-engine."

The Sentinel repeated Sylvie's explanation to the King.

"Can't prick up their ears without a steam-engine!" His Majesty exclaimed. "They *must* be curious creatures! I must have a look at them!" And he came out of his Kennel, and walked solemnly up to the children.

What was the amazement—not to say the horror—of the whole assembly, when Sylvie actually *patted His Majesty on the head*, while Bruno seized his

The Dog-King

long ears and pretended to tie them together under his chin!

The Sentinel groaned aloud: a beautiful Greyhound—who appeared to be one of the Ladies in Waiting—fainted away: and all the other Courtiers hastily drew back, and left plenty of room for the huge Newfoundland to spring upon the audacious strangers, and tear them limb from limb.

Only—he didn't. On the contrary his Majesty actually *smiled*—so far as a Dog *can* smile—and (the other Dogs couldn't believe their eyes, but it was true, all the same) his Majesty *wagged his tail!*

“Yah! Hooh hahwooh!” (that is “Well! I never!”) was the universal cry.

His Majesty looked round him severely, and gave a slight growl, which produced instant silence. “Conduct *my friends* to the banqueting-hall!” he said, laying such an emphasis on “*my friends*” that several of the dogs rolled over helplessly on their backs and began to lick Bruno's feet.

A procession was formed, but I only ventured to follow as far as the *door* of the banqueting-hall, so furious was the uproar of barking dogs within. So I sat down by the King, who seemed to have gone to sleep, and waited till the children returned to say good-night, when His Majesty got up and shook himself.

“Time for bed!” he said with a sleepy yawn. “The attendants will show you your room,” he added, aside, to Sylvie and Bruno. “Bring lights!” And, with a dignified air, he held out his paw for them to kiss.

But the children were evidently not well practised in Court-manners. Sylvie simply stroked the great paw: Bruno hugged it: the Master of the Ceremonies looked shocked.

All this time Dog-waiters, in splendid livery, were running up with lighted candles: but, as fast as they put them upon the table, other waiters ran away with them, so that there never seemed to be one for *me*, though the Master kept nudging me with his elbow, and repeating “I ca'n't let you sleep *here!* You're not in *bed*, you know!”

I made a great effort, and just succeeded in getting out the words “I know I'm not. I'm in an arm-chair.”

“Well, forty winks will do you no harm,” the Master said, and left me. I could scarcely hear his words: and no wonder: he was leaning over the side of a ship, that was miles away from the pier on which I stood. The ship passed over

the horizon, and I sank back into the arm-chair.

The next thing I remember is that it was morning: breakfast was just over: Sylvie was lifting Bruno down from a high chair, and saying to a Spaniel, who was regarding them with a most benevolent smile, "Yes, thank you, we've had a *very* nice breakfast. Haven't we, Bruno?"

"There was too many bones in the——" Bruno began, but Sylvie frowned at him, and laid her finger on her lips, for, at this moment, the travelers were waited on by a very dignified officer, the Head-Growler, whose duty it was, first to conduct them to the King to bid him farewell, and then to escort them to the boundary of Dogland. The great Newfoundland received them most affably, but, instead of saying "good-bye," he startled the Head-Growler into giving three savage growls, by announcing that he would escort them himself.

"It is a most unusual proceeding, your Majesty!" the Head-Growler exclaimed, almost choking with vexation at being set aside, for he had put on his best Court-suit, made entirely of cat-skins, for the occasion.

"I shall escort them myself," his Majesty repeated, gently but firmly, laying aside the Royal robes, and changing his crown for a small coronet, "and you may stay at home."

"I *are* glad!" Bruno whispered to Sylvie, when they had got well out of hearing. "He were so *welley* cross!" And he not only patted their Royal escort, but even hugged him round the neck in the exuberance of his delight.

His Majesty calmly wagged the Royal tail. "It's quite a relief," he said, "getting away from that Palace now and then! Royal Dogs have a dull life of it, I can tell you! Would you mind" (this to Sylvie, in a low voice, and looking a little shy and embarrassed) "would you mind the trouble of just throwing that stick for me to fetch?"

Sylvie was too much astonished to do anything for a moment: it sounded such a monstrous impossibility that a *King* should wish to run after a stick. But *Bruno* was equal to the occasion, and with a glad shout of "Hi then! Fetch it, good Doggie!" he hurled it over a clump of bushes. The next moment the Monarch of Dogland had bounded over the bushes, and picked up the stick, and came galloping back to the children with it in his mouth. Bruno took it from him with great decision. "Beg for it!" he insisted; and His Majesty begged. "Paw!" commanded Sylvie; and His Majesty gave his paw. In short, the solemn ceremony of escorting the travelers to the boundaries of Dogland became one long uproarious game of play!

"But business is business!" the Dog-King said at last. "And I must go back to mine. I couldn't come any further," he added, consulting a dog-watch, which hung on a chain round his neck, "not even if there were a *Cat* in sight!"

They took an affectionate farewell of His Majesty, and trudged on.

"That *were* a dear dog!" Bruno exclaimed. "Has we to go far, Sylvie? I's tired!"

"Not much further, darling!" Sylvie gently replied. "Do you see that shining, just beyond those trees? I'm almost *sure* it's the gate of Fairyland! I know it's all golden—Father told me so—and so bright, so bright!" she went on dreamily.

"It dazzles!" said Bruno, shading his eyes with one little hand, while the other clung tightly to Sylvie's hand, as if he were half-alarmed at her strange manner.

For the child moved on as if walking in her sleep, her large eyes gazing into the far distance, and her breath coming and going in quick pantings of eager

delight. I knew, by some mysterious mental light, that a great change was taking place in my sweet little friend (for such I loved to think her) and that she was passing from the condition of a mere Outland Sprite into the true Fairy-nature.

Upon Bruno the change came later: but it was completed in both before they reached the golden gate, through which I knew it would be impossible for *me* to follow. I could but stand outside, and take a last look at the two sweet children, ere they disappeared within, and the golden gate closed with a bang.

And with *such* a bang! "It never *will* shut like any other cupboard-door," Arthur explained. "There's something wrong with the hinge. However, here's the cake and wine. And you've had your forty winks. So you really *must* get off to bed, old man! You're fit for nothing else. Witness my hand, Arthur Forester, M.D."

By this time I was wide-awake again. "Not *quite* yet!" I pleaded. "Really I'm not sleepy now. And it isn't midnight yet."

"Well, I did want to say another word to you," Arthur replied in a relenting tone, as he supplied me with the supper he had prescribed. "Only I thought you were too sleepy for it to-night."

We took our midnight meal almost in silence; for an unusual nervousness seemed to have seized on my old friend.

"What kind of a night is it?" he asked, rising and undrawing the window-curtains, apparently to change the subject for a minute. I followed him to the window, and we stood together, looking out, in silence.

"When I first spoke to you about——" Arthur began, after a long and embarrassing silence, "that is, when we first talked about her—for I think it was *you* that introduced the subject—my own position in life forbade me to do more than worship her from a distance: and I was turning over plans for leaving this place finally, and settling somewhere out of all chance of meeting her again. That seemed to be my only chance of usefulness in life."

"Would that have been wise?" I said. "To leave yourself no hope at all?"

"There *was* no hope to leave," Arthur firmly replied, though his eyes glittered with tears as he gazed upwards into the midnight sky, from which one solitary star, the glorious 'Vega,' blazed out in fitful splendour through the driving clouds. "She was like that star to me—bright, beautiful, and pure, but out of reach, out of reach!"

He drew the curtains again, and we returned to our places by the fireside.

"What I wanted to tell you was this," he resumed. "I heard this evening from my solicitor. I can't go into the details of the business, but the upshot is that my worldly wealth is much more than I thought, and I am (or shall soon be) in a position to offer marriage, without imprudence, to any lady, even if she brought nothing. I doubt if there would be anything on *her* side: the Earl is poor, I believe. But I should have enough for both, even if health failed."

"I wish you all happiness in your married life!" I cried. "Shall you speak to the Earl to-morrow?"

"Not yet awhile," said Arthur. "He is very friendly, but I dare not think he means more than that, as yet. And as for—as for Lady Muriel, try as I may, I *cannot* read her feelings towards me. If there *is* love, she is hiding it! No, I must wait, I must wait!"

I did not like to press any further advice on my friend, whose judgment, I felt, was so much more sober and thoughtful than my own; and we parted

without more words on the subject that had now absorbed his thoughts, nay, his very life.

The next morning a letter from *my* solicitor arrived, summoning me to town on important business.

Chapter XIV. Fairy-Sylvie

For a full month the business, for which I had returned to London, detained me there: and even then it was only the urgent advice of my physician that induced me to leave it unfinished and pay another visit to Elveston.

Arthur had written once or twice during the month; but in none of his letters was there any mention of Lady Muriel. Still, I did not augur ill from his silence: to me it looked like the natural action of a lover, who, even while his heart was singing "She is mine!", would fear to paint his happiness in the cold phrases of a written letter, but would wait to tell it by word of mouth. "Yes," I thought, "I am to hear his song of triumph from his own lips!"

The night I arrived we had much to say on other matters: and, tired with the journey, I went to bed early, leaving the happy secret still untold. Next day, however, as we chatted on over the remains of luncheon, I ventured to put the momentous question. "Well, old friend, you have told me nothing of Lady Muriel—nor when the happy day is to be?"

"The happy day," Arthur said, looking unexpectedly grave, "is yet in the dim future. We need to know—or, rather, *she* needs to know *me* better. I know *her* sweet nature, thoroughly, by this time. But I dare not speak till I am sure that my love is returned."

"Don't wait too long!" I said gaily. "Faint heart never won fair lady!"

"It *is* 'faint heart,' perhaps. But really I *dare* not speak just yet."

"But meanwhile," I pleaded, "you are running a risk that perhaps you have not thought of. Some other man——"

"No," said Arthur firmly. "She is heart-whole: I am sure of that. Yet, if she loves another better than me, so be it! I will not spoil her happiness. The secret shall die with me. But she is my first—and my *only* love!"

"That is all very beautiful *sentiment*," I said, "but it is not *practical*. It is not like *you*."

He either fears his fate too much,
Or his desert is small,
Who dares not put it to the touch,
To win or lose it all."

Quoted from *My
Dear and Only Love*
by James Graham

"I *dare* not ask the question whether there is another!" he said passionately. "It would break my heart to know it!"

"Yet is it wise to leave it unasked? You must not waste your life upon an 'if'!"

"I tell you I *dare* not!"

"May *I* find it out for you?" I asked, with the freedom of an old friend.

"No, no!" he replied with a pained look. "I entreat you to say nothing. Let it wait."

"As you please," I said: and judged it best to say no more just then. "But this evening," I thought, "I will call on the Earl. I may be able to *see* how the land lies, without so much as saying a word!"

It was a very hot afternoon—too hot to go for a walk or do anything—or else it wouldn't have happened, I believe.

Other version:
→ 3.11, p. 667

In the first place, I want to know—dear Child who reads this!—why Fairies should always be teaching *us* to do our duty, and lecturing *us* when we go wrong, and we should never teach *them* anything? You can't mean to say that Fairies are never greedy, or selfish, or cross, or deceitful, because that would be nonsense, you know. Well then, don't you think they might be all the better for a little lecturing and punishing now and then?

I really don't see why it shouldn't be tried, and I'm almost sure that, if you could only catch a Fairy, and put it in the corner, and give it nothing but bread and water for a day or two, you'd find it quite an improved character—it would take down its conceit a little, at all events.

The next question is, what is the best time for seeing Fairies? I believe I can tell you all about that.

The first rule is, that it must be a *very* hot day—that we may consider as settled: and you must be just a *little* sleepy—but not too sleepy to keep your eyes open, mind. Well, and you ought to feel a little—what one may call “fairyish”—the Scotch call it “eerie,” and perhaps that's a prettier word; if you don't know what it means, I'm afraid I can hardly explain it; you must wait till you meet a Fairy, and then you'll know.

And the last rule is, that the crickets should not be chirping. I can't stop to explain that: you must take it on trust for the present.

So, if all these things happen together, you have a good chance of seeing a Fairy—or at least a much better chance than if they didn't.

The first thing I noticed, as I went lazily along through an open place in the wood, was a large Beetle lying struggling on its back, and I went down upon one knee to help the poor thing to its feet again. In some things, you know, you can't be quite sure what an insect would like: for instance, I never could quite settle, supposing I were a moth, whether I would rather be kept out of the candle, or be allowed to fly straight in and get burnt—or again, supposing I were a spider, I'm not sure if I should be *quite* pleased to have my web torn down, and the fly let loose—but I feel quite certain that, if I were a beetle and had rolled over on my back, I should always be glad to be helped up again.

So, as I was saying, I had gone down upon one knee, and was just reaching out a little stick to turn the Beetle over, when I saw a sight that made me draw back hastily and hold my breath, for fear of making any noise and frightening the little creature away.

Not that she looked as if she would be easily frightened: she seemed so good and gentle that I'm sure she would never expect that any one could wish to hurt her. She was only a few inches high, and was dressed in green, so that you really would hardly have noticed her among the long grass; and she was so delicate and graceful that she quite seemed to belong to the place, almost as if she were one of the flowers. I may tell you, besides, that she had no wings (I don't believe in Fairies with wings), and that she had quantities of long brown hair and large earnest brown eyes, and then I shall have done all I can to give you an idea of her.

Sylvie (I found out her name afterwards) had knelt down, just as I was doing, to help the Beetle; but it needed more than a little stick for *her* to get it on its legs again; it was as much as she could do, with both arms, to roll the heavy thing over; and all the while she was talking to it, half scolding and half

Fairy-Sylvie

comforting, as a nurse might do with a child that had fallen down.

“There, there! You needn’t cry so much about it. You’re not killed yet—though if you were, you couldn’t cry, you know, and so it’s a general rule against crying, my dear! And how did you come to tumble over? But I can see well enough how it was—I needn’t ask you that—walking over sand-pits with your chin in the air, as usual. Of course if you go among sand-pits like that, you must expect to tumble. You should look.”

The Beetle murmured something that sounded like “I *did* look,” and Sylvie went on again.

“But I know you didn’t! You never do! You always walk with your chin up—you’re so dreadfully conceited. Well, let’s see how many legs are broken this time. Why, none of them, I declare! And what’s the good of having six legs, my dear, if you can only kick them all about in the air when you tumble? Legs are meant to walk with, you know. Now don’t begin putting out your wings yet; I’ve more to say. Go to the frog that lives behind that buttercup—give him my compliments—Sylvie’s compliments—can you say ‘compliments’?”

The Beetle tried and, I suppose, succeeded.

“Yes, that’s right. And tell him he’s to give you some of that salve I left with him yesterday. And you’d better get him to rub it in for you. He’s got rather cold hands, but you mustn’t mind that.”

I think the Beetle must have shuddered at this idea, for Sylvie went on in a graver tone. “Now you needn’t pretend to be so particular as all that, as if you were too grand to be rubbed by a frog. The fact is, you ought to be very much obliged to him. Suppose you could get nobody but a toad to do it, how would you like *that*?”

There was a little pause, and then Sylvie added “Now you may go. Be a good beetle, and don’t keep your chin in the air.” And then began one of those performances of humming, and whizzing, and restless banging about, such as a beetle indulges in when it has decided on flying, but hasn’t quite made up its mind which way to go. At last, in one of its awkward zig-zags, it managed to fly right into my face, and, by the time I had recovered from the shock, the little

Fairy was gone.

I looked about in all directions for the little creature, but there was no trace of her—and my ‘eerie’ feeling was quite gone off, and the crickets were chirping again merrily—so I knew she was really gone.

And now I’ve got time to tell you the rule about the crickets. They always leave off chirping when a Fairy goes by—because a Fairy’s a kind of queen over them, I suppose—at all events it’s a much grander thing than a cricket—so whenever you’re walking out, and the crickets suddenly leave off chirping, you may be sure that they see a Fairy.

I walked on sadly enough, you may be sure. However, I comforted myself with thinking “It’s been a very wonderful afternoon, so far. I’ll just go quietly on and look about me, and I shouldn’t wonder if I were to come across another Fairy somewhere.”

Peering about in this way, I happened to notice a plant with rounded leaves, and with queer little holes cut in the middle of several of them. “Ah, the leafcutter bee!” I carelessly remarked—you know I am very learned in Natural History (for instance, I can always tell kittens from chickens at one glance)—and I was passing on, when a sudden thought made me stoop down and examine the leaves.

Then a little thrill of delight ran through me—for I noticed that the holes were all arranged so as to form letters; there were three leaves side by side, with “B,” “R,” and “U” marked on them, and after some search I found two more, which contained an “N” and an “O.”

And then, all in a moment, a flash of inner light seemed to illumine a part of my life that had all but faded into oblivion—the strange visions I had experienced during my journey to Elveston: and with a thrill of delight I thought “Those visions are destined to be linked with my waking life!”

By this time the ‘eerie’ feeling had come back again, and I suddenly observed that no crickets were chirping; so I felt quite sure that “Bruno” was somewhere very near.

And so indeed he was—so near that I had very nearly walked over him without seeing him; which would have been dreadful, always supposing that Fairies *can* be walked over—my own belief is that they are something of the nature of Will-o’-the-Wisps: and there’s no walking over *them*.

Think of any pretty little boy you know, with rosy cheeks, large dark eyes, and tangled brown hair, and then fancy him made small enough to go comfortably into a coffee-cup, and you’ll have a very fair idea of him.

“What’s your name, little one?” I began, in as soft a voice as I could manage. And, by the way, why is it we always begin by asking little children their names? Is it because we fancy a name will help to make them a little bigger? You never thought of asking a real large man his name, now, did you? But, however that may be, I felt it quite necessary to know *his* name; so, as he didn’t answer my question, I asked it again a little louder. “What’s your name, my little man?”

“What’s oors?” he said, without looking up.

I told him my name quite gently, for he was much too small to be angry with.

“Duke of Anything?” he asked, just looking at me for a moment, and then going on with his work.

“Not Duke at all,” I said, a little ashamed of having to confess it.

"Oo're big enough to be two Dukes," said the little creature. "I suppose oo're Sir Something, then?"

"No," I said, feeling more and more ashamed. "I haven't got any title."

The Fairy seemed to think that in that case I really wasn't worth the trouble of talking to, for he quietly went on digging, and tearing the flowers to pieces.

After a few minutes I tried again. "*Please* tell me what your name is."

"Bruno," the little fellow answered, very readily. "Why didn't oo say 'please' before?"

"That's something like what we used to be taught in the nursery," I thought to myself, looking back through the long years (about a hundred of them, since you ask the question), to the time when I was a little child. And here an idea came into my head, and I asked him "Aren't you one of the Fairies that teach children to be good?"

"Well, we have to do that sometimes," said Bruno, "and a dreadful bother it is." As he said this, he savagely tore a heartsease in two, and trampled on the pieces.

"What *are* you doing there, Bruno?" I said.

"Spoiling Sylvie's garden," was all the answer Bruno would give at first. But, as he went on tearing up the flowers, he muttered to himself "The nasty cross thing—wouldn't let me go and play this morning,—said I must finish my lessons first—lessons, indeed! I'll vex her finely, though!"

"Oh, Bruno, you shouldn't do that!" I cried. "Don't you know that's revenge? And revenge is a wicked, cruel, dangerous thing!"

"River-edge?" said Bruno. "What a funny word! I suppose oo call it cruel and dangerous 'cause, if oo wented too far and tumbleded in, oo'd get drowned."

"No, not river-edge," I explained: "re-venge" (saying the word very slowly). But I couldn't help thinking that Bruno's explanation did very well for either word.

"Oh!" said Bruno, opening his eyes very wide, but without trying to repeat the word.

"Come! Try and pronounce it, Bruno!" I said, cheerfully. "Re-venge, re-venge."

But Bruno only tossed his little head, and said he couldn't; that his mouth wasn't the right shape for words of that kind. And the more I laughed, the more sulky the little fellow got about it.

"Well, never mind, my little man!" I said. "Shall I help you with that job?"

"Yes, please," Bruno said, quite pacified. "Only I wiss I could think of somefin to vex her more than this. Oo don't know how hard it is to make her angry!"

"Now listen to me, Bruno, and I'll teach you quite a splendid kind of revenge!"

"Somefin that'll vex her finely?" he asked with gleaming eyes.

"Something that will vex her finely. First, we'll get up all the weeds in her garden. See, there are a good many at this end—quite hiding the flowers."

"But *that* won't vex her!" said Bruno.

"After that," I said, without noticing the remark, "we'll water this highest bed—up here. You see it's getting quite dry and dusty."

Bruno looked at me inquisitively, but he said nothing this time.

"Then after that," I went on, "the walks want sweeping a bit; and I think you might cut down that tall nettle—it's so close to the garden that it's quite in the way——"

“What *is* oo talking about?” Bruno impatiently interrupted me. “All that won’t vex her a bit!”

“Won’t it?” I said, innocently. “Then, after that, suppose we put in some of these coloured pebbles—just to mark the divisions between the different kinds of flowers, you know. That’ll have a very pretty effect.”

Bruno turned round and had another good stare at me. At last there came an odd little twinkle into his eyes, and he said, with quite a new meaning in his voice, “That’ll do nicely. Let’s put ’em in rows—all the red together, and all the blue together.”

“That’ll do capitally,” I said; “and then—what kind of flowers does Sylvie like best?”

Bruno had to put his thumb in his mouth and consider a little before he could answer. “Violets,” he said, at last.

“There’s a beautiful bed of violets down by the brook——”

“Oh, let’s fetch ’em!” cried Bruno, giving a little skip into the air. “Here! Catch hold of my hand, and I’ll help oo along. The grass is rather thick down that way.”

I couldn’t help laughing at his having so entirely forgotten what a big creature he was talking to. “No, not yet, Bruno,” I said: “we must consider what’s the right thing to do first. You see we’ve got quite a business before us.”

“Yes, let’s consider,” said Bruno, putting his thumb into his mouth again, and sitting down upon a dead mouse.

“What do you keep that mouse for?” I said. “You should either bury it, or else throw it into the brook.”

“Why, it’s to measure with!” cried Bruno. “How ever would oo do a garden without one? We make each bed three mouses and a half long, and two mouses wide.”

I stopped him, as he was dragging it off by the tail to show me how it was used, for I was half afraid the ‘eerie’ feeling might go off before we had finished the garden, and in that case I should see no more of him or Sylvie. “I think the best way will be for *you* to weed the beds, while *I* sort out these pebbles, ready to mark the walks with.”

“That’s it!” cried Bruno. “And I’ll tell oo about the caterpillars while we work.”

“Ah, let’s hear about the caterpillars,” I said, as I drew the pebbles together into a heap and began dividing them into colours.

And Bruno went on in a low, rapid tone, more as if he were talking to himself. “Yesterday I saw two little caterpillars, when I was sitting by the brook, just where oo go into the wood. They were quite green, and they had yellow eyes, and they didn’t see *me*. And one of them had got a moth’s wing to carry—a great brown moth’s wing, oo know, all dry, with feathers. So he couldn’t want it to eat, I should think—perhaps he meant to make a cloak for the winter?”

“Perhaps,” I said, for Bruno had twisted up the last word into a sort of question, and was looking at me for an answer.

One word was quite enough for the little fellow, and he went on merrily. “Well, and so he didn’t want the other caterpillar to see the moth’s wing, oo know—so what must he do but try to carry it with all his left legs, and he tried to walk on the other set. Of course he toppled over after that.”

“After what?” I said, catching at the last word, for, to tell the truth, I hadn’t been attending much.

“He toppled over,” Bruno repeated, very gravely, “and if *oo* ever saw a caterpillar topple over, *oo*’d know it’s a welly serious thing, and not sit grinning like that—and I sha’n’t tell *oo* no more!”

“Indeed and indeed, Bruno, I didn’t mean to grin. See, I’m quite grave again now.”

But Bruno only folded his arms, and said “Don’t tell *me*. I see a little twinkle in one of *oor* eyes—just like the moon.”

“Why do you think I’m like the moon, Bruno?” I asked.

“*Oor* face is large and round like the moon,” Bruno answered, looking at me thoughtfully. “It doosn’t shine quite so bright—but it’s more cleaner.”

I couldn’t help smiling at this. “You know I sometimes wash *my* face, Bruno. The moon never does that.”

“Oh, doosn’t she though!” cried Bruno; and he leant forwards and added in a solemn whisper, “The moon’s face gets dirtier and dirtier every night, till it’s black all across. And then, when it’s dirty all over—*so*—” (he passed his hand across his own rosy cheeks as he spoke) “then she washes it.”

“Then it’s all clean again, isn’t it?”

“Not all in a moment,” said Bruno. “What a deal of teaching *oo* wants! She washes it little by little—only she begins at the other edge, *oo* know.”

By this time he was sitting quietly on the dead mouse with his arms folded, and the weeding wasn’t getting on a bit: so I had to say “Work first, pleasure afterwards: no more talking till that bed’s finished.”

Chapter XV. Bruno’s Revenge

After that we had a few minutes of silence, while I sorted out the pebbles, and amused myself with watching Bruno’s plan of gardening. It was quite a new plan to me: he always measured each bed before he weeded it, as if he was afraid the weeding would make it shrink; and once, when it came out longer than he wished, he set to work to thump the mouse with his little fist, crying out “There now! It’s all gone wrong again! Why don’t *oo* keep *oor* tail straight when I tell *oo*!”

“I’ll tell you what I’ll do,” Bruno said in a half-whisper, as we worked. “*Oo* like Fairies, don’t *oo*?”

“Yes,” I said: “of course I do, or I shouldn’t have come here. I should have gone to some place where there are no Fairies.”

Bruno laughed contemptuously. “Why, *oo* might as well say *oo*’d go to some place where there wasn’t any air—supposing *oo* didn’t like air!”

This was a rather difficult idea to grasp. I tried a change of subject. “You’re nearly the first Fairy I ever saw. Have *you* ever seen any people besides me?”

“Plenty!” said Bruno. “We see ’em when we walk in the road.”

“But they ca’n’t see *you*. How is it they never tread on you?”

“Ca’n’t *tread* on us,” said Bruno, looking amused at my ignorance. “Why, suppose *oo*’re walking, here—*so*—” (making little marks on the ground) “and suppose there’s a Fairy—that’s me—walking *here*. Very well then, *oo* put one foot here, and one foot here, so *oo* doosn’t tread on the Fairy.”

This was all very well as an explanation, but it didn’t convince me. “Why shouldn’t I put one foot *on* the Fairy?” I asked.

“I don’t know *why*,” the little fellow said in a thoughtful tone. “But I know *oo wouldn’t*. Nobody never walked on the top of a Fairy. Now I’ll tell *oo* what

I'll do, as oo're so fond of Fairies. I'll get oo an invitation to the Fairy-King's dinner-party. I know one of the head-waiters."

I couldn't help laughing at this idea. "Do the waiters invite the guests?" I asked.

"Oh, not *to sit down!*" Bruno said. "But to wait at table. Oo'd like that, wouldn't oo? To hand about plates, and so on."

"Well, but that's not so nice as sitting at the table, is it?"

"Of course it isn't," Bruno said, in a tone as if he rather pitied my ignorance; "but if oo're not even Sir Anything, oo ca'n't expect to be allowed to sit at the table, oo know."

I said, as meekly as I could, that I didn't expect it, but it was the only way of going to a dinner-party that I really enjoyed. And Bruno tossed his head, and said, in a rather offended tone, that I might do as I pleased—there were many he knew that would give their ears to go.

"Have you ever been yourself, Bruno?"

"They invited me once, last week," Bruno said, very gravely. "It was to wash up the soup-plates—no, the cheese-plates I mean—that was grand enough. And I waited at table. And I didn't hardly make only *one* mistake."

"What was it?" I said. "You needn't mind telling *me*."

"Only bringing scissors to cut the beef with," Bruno said carelessly. "But the grandest thing of all was, *I* fetched the King a glass of cider!"

"That *was* grand!" I said, biting my lip to keep myself from laughing.

"Wasn't it?" said Bruno, very earnestly. "Oo know it isn't every one that's had such an honour as *that!*"

This set me thinking of the various queer things we call "an honour" in this world, but which, after all, haven't a bit more honour in them than what Bruno enjoyed, when he took the King a glass of cider.

I don't know how long I might not have dreamed on in this way, if Bruno hadn't suddenly roused me. "Oh, come here quick!" he cried, in a state of the wildest excitement. "Catch hold of his other horn! I ca'n't hold him more than a minute!"

He was struggling desperately with a great snail, clinging to one of its horns, and nearly breaking his poor little back in his efforts to drag it over a blade of grass.

I saw we should have no more gardening if I let this sort of thing go on, so I quietly took the snail away, and put it on a bank where he couldn't reach it. "We'll hunt it afterwards, Bruno," I said, "if you really want to catch it. But what's the use of it when you've got it?"

"What's the use of a fox when oo've got it?" said Bruno. "I know oo big things hunt foxes."

I tried to think of some good reason why "big things" should hunt foxes, and he should not hunt snails, but none came into my head: so I said at last, "Well, I suppose one's as good as the other. I'll go snail-hunting myself some day."

"I should think oo wouldn't be so silly," said Bruno, "as to go snail-hunting by oorself. Why, oo'd never get the snail along, if oo hadn't somebody to hold on to his other horn!"

"Of course I sha'n't go *alone*," I said, quite gravely. "By the way, is that the best kind to hunt, or do you recommend the ones without shells?"

"Oh, no, we never hunt the ones without shells," Bruno said, with a little shudder at the thought of it. "They're always so cross about it; and then, if oo

tumbles over them, they're ever so sticky!"

By this time we had nearly finished the garden. I had fetched some violets, and Bruno was just helping me to put in the last, when he suddenly stopped and said "I'm tired."

"Rest then," I said: "I can go on without you, quite well."

Bruno needed no second invitation: he at once began arranging the dead mouse as a kind of sofa. "And I'll sing oo a little song," he said, as he rolled it about.

"Do," said I: "I like songs very much."

"Which song will oo choose?" Bruno said, as he dragged the mouse into a place where he could get a good view of me. "'Ting, ting, ting' is the nicest."

There was no resisting such a strong hint as this: however, I pretended to think about it for a moment, and then said "Well, I like 'Ting, ting, ting,' best of all."

Bruno's revenge

"That shows oo're a good judge of music," Bruno said, with a pleased look. "How many hare-bells would oo like?" And he put his thumb into his mouth to help me to consider.

As there was only one cluster of hare-bells within easy reach, I said very gravely that I thought one would do *this* time, and I picked it and gave it to him. Bruno ran his hand once or twice up and down the flowers, like a musician trying an instrument, producing a most delicious delicate tinkling as he did so. I had never heard flower-music before—I don't think one can, unless one's in the 'eerie' state—and I don't know quite how to give you an idea of what it was like, except by saying that it sounded like a peal of bells a thousand miles off. When he had satisfied himself that the flowers were in tune, he seated himself on the dead mouse (he never seemed really comfortable anywhere else), and, looking up at me with a merry twinkle in his eyes, he began. By the way, the tune was rather a curious one, and you might like to try it for yourself, so here are the notes.

"Rise, oh, rise! The daylight dies:
 The owls are hooting, ting, ting, ting!
 Wake, oh, wake! Beside the lake
 The elves are fluting, ting, ting, ting!
 Welcoming our Fairy King,
 We sing, sing, sing."

He sang the first four lines briskly and merrily, making the hare-bells chime in time with the music; but the last two he sang quite slowly and gently, and merely waved the flowers backwards and forwards. Then he left off to explain. "The Fairy-King is Oberon, and he lives across the lake—and sometimes he comes in a little boat—and we go and meet him—and then we sing this song, you know."

"And then you go and dine with him?" I said, mischievously.

"Oo shouldn't talk," Bruno hastily said: "it interrupts the song so."

I said I wouldn't do it again.

"I never talk myself when I'm singing," he went on very gravely: "so oo shouldn't either." Then he tuned the hare-bells once more, and sang:—

"Hear, oh, hear! From far and near
 The music stealing, ting, ting, ting!
 Fairy bells adown the dells
 Are merrily pealing, ting, ting, ting!
 Welcoming our Fairy King,
 We ring, ring, ring.

"See, oh, see! On every tree
 What lamps are shining, ting, ting, ting!
 They are eyes of fiery flies
 To light our dining, ting, ting, ting!
 Welcoming our Fairy King
 They swing, swing, swing.

"Haste, oh haste, to take and taste
 The dainties waiting, ting, ting, ting!
 Honey-dew is stored——"

"Hush, Bruno!" I interrupted in a warning whisper. "She's coming!"

Bruno checked his song, and, as she slowly made her way through the long grass, he suddenly rushed out headlong at her like a little bull, shouting "Look the other way! Look the other way!"

"Which way?" Sylvie asked, in rather a frightened tone, as she looked round in all directions to see where the danger could be.

"*That way!*" said Bruno, carefully turning her round with her face to the wood. "Now, walk backwards—walk gently—don't be frightened: oo sha'n't trip!"

But Sylvie *did* trip notwithstanding: in fact he led her, in his hurry, across so many little sticks and stones, that it was really a wonder the poor child could keep on her feet at all. But he was far too much excited to think of what he was doing.

I silently pointed out to Bruno the best place to lead her to, so as to get a view of the whole garden at once: it was a little rising ground, about the height of a potato; and, when they had mounted it, I drew back into the shade, that Sylvie mightn't see me.

I heard Bruno cry out triumphantly "*Now oo may look!*" and then followed a clapping of hands, but it was all done by Bruno himself. Sylvie was silent—she only stood and gazed with her hands clasped together, and I was half afraid she didn't like it after all.

Bruno too was watching her anxiously, and when she jumped down off the mound, and began wandering up and down the little walks, he cautiously followed her about, evidently anxious that she should form her own opinion of it all, without any hint from him. And when at last she drew a long breath, and gave her verdict—in a hurried whisper, and without the slightest regard to grammar—"It's the loveliest thing as I never saw in all my life before!" the little fellow looked as well pleased as if it had been given by all the judges and juries in England put together.

"And did you really do it all by yourself, Bruno?" said Sylvie. "And all for me?"

"I was helped a bit," Bruno began, with a merry little laugh at her surprise. "We've been at it all the afternoon—I thought oo'd like—" and here the poor little fellow's lip began to quiver, and all in a moment he burst out crying, and running up to Sylvie he flung his arms passionately round her neck, and hid his face on her shoulder.

There was a little quiver in Sylvie's voice too, as she whispered "Why, what's the matter, darling?" and tried to lift up his head and kiss him.

But Bruno only clung to her, sobbing, and wouldn't be comforted till he had confessed. "I tried—to spoil oor garden—first—but I'll never—never—" and then came another burst of tears, which drowned the rest of the sentence. At last he got out the words "I liked—putting in the flowers—for oo, Sylvie—and I never was so happy before." And the rosy little face came up at last to be kissed, all wet with tears as it was.

Sylvie was crying too by this time, and she said nothing but "Bruno, dear!" and "*I never was so happy before,*" though why these two children who had never been so happy before should both be crying was a mystery to *me*.

I felt very happy too, but of course I didn't cry: "big things" never do, you know—we leave all that to the Fairies. Only I think it must have been raining a little just then, for I found a drop or two on my cheeks.

After that they went through the whole garden again, flower by flower, as if it were a long sentence they were spelling out, with kisses for commas, and a great hug by way of a full-stop when they got to the end.

"Doos oo know, that was my river-edge, Sylvie?" Bruno solemnly began.

Sylvie laughed merrily. "What *do* you mean?" she said. And she pushed back her heavy brown hair with both hands, and looked at him with dancing eyes in which the big tear-drops were still glittering.

Bruno drew in a long breath, and made up his mouth for a great effort. "I mean re-venge," he said: "now oo under'tand." And he looked so happy and proud at having said the word right at last, that I quite envied him. I rather think Sylvie didn't "under'tand" at all; but she gave him a little kiss on each cheek, which seemed to do just as well.

So they wandered off lovingly together, in among the buttercups, each with an arm twined round the other, whispering and laughing as they went, and never so much as once looked back at poor me. Yes, once, just before I quite lost sight of them, Bruno half turned his head, and nodded me a saucy little good-bye over one shoulder. And that was all the thanks I got for *my* trouble. The very last thing I saw of them was this—Sylvie was stooping down with her arms round Bruno's neck, and saying coaxingly in his ear, "Do you know, Bruno, I've quite forgotten that hard word. Do say it once more. Come! Only this once, dear!"

But Bruno wouldn't try it again.

Chapter XVI. A Changed Crocodile

The Marvellous—the Mysterious—had quite passed out of my life for the moment: and the Common-place reigned supreme. I turned in the direction of the Earl's house, as it was now 'the witching hour' of five, and I knew I should find them ready for a cup of tea and a quiet chat.

Lady Muriel and her father gave me a delightfully warm welcome. They were not of the folk we meet in fashionable drawing-rooms—who conceal all such feelings as they may chance to possess beneath the impenetrable mask of a conventional placidity. 'The Man with the Iron Mask' was, no doubt, a rarity and a marvel in his own age: in modern London no one would turn his head to give him a second look! No, these were *real* people. When they *looked* pleased, it meant that they *were* pleased: and when Lady Muriel said, with a bright smile, "I'm *very* glad to see you again!", I knew that it was *true*.

Still I did not venture to disobey the injunctions—crazy as I felt them to be—of the love-sick young Doctor, by so much as alluding to his existence: and it was only after they had given me full details of a projected picnic, to which they invited me, that Lady Muriel exclaimed, almost as an after-thought, "and *do*, if you can, bring Doctor Forester with you! I'm sure a day in the country would do him good. I'm afraid he studies too much——"

It was 'on the tip of my tongue' to quote the words "His only books are woman's looks!" but I checked myself just in time—with something of the feeling of one who has crossed a street, and has been all but run over by a passing 'Hansom.'

"—and I think he has too lonely a life," she went on, with a gentle earnestness that left no room whatever to suspect a double meaning. "*Do* get him to come! And don't forget the day, Tuesday week. We can drive you over. It would be a

pity to go by rail—there is so much pretty scenery on the road. And our open carriage just holds four.”

“Oh, *I’ll* persuade him to come!” I said with confidence—thinking “it would take all *my* powers of persuasion to keep him away!”

The picnic was to take place in ten days: and though Arthur readily accepted the invitation I brought him, nothing that I could say would induce him to call—either with me or without me—on the Earl and his daughter in the meanwhile. No: he feared to “wear out his welcome;” he said: they had “seen enough of him for one while”: and, when at last the day for the expedition arrived, he was so childishly nervous and uneasy that I thought it best so to arrange our plans that we should go separately to the house—my intention being to arrive some time after him, so as to give him time to get over a meeting.

With this object I purposely made a considerable circuit on my way to the Hall (as we called the Earl’s house): “and if I could only manage to lose my way a bit,” I thought to myself, “that would suit me capitally!”

In this I succeeded better, and sooner, than I had ventured to hope for. The path through the wood had been made familiar to me, by many a solitary stroll, in my former visit to Elveston; and how I could have so suddenly and so entirely lost it—even though I *was* so engrossed in thinking of Arthur and his lady-love that I heeded little else—was a mystery to me. “And this open place,” I said to myself, “seems to have some memory about it I cannot distinctly recall—surely it is the very spot where I saw those Fairy-Children! But I hope there are no snakes about!” I mused aloud, taking my seat on a fallen tree. “I certainly do *not* like snakes—and I don’t suppose *Bruno* likes them, either!”

“No, he *doesn’t* like them!” said a demure little voice at my side. “He’s not *afraid* of them, you know. But he doesn’t *like* them. He says they’re too waggly!”

Words fail me to describe the beauty of the little group—couched on a patch of moss, on the trunk of the fallen tree, that met my eager gaze: Sylvie reclining with her elbow buried in the moss, and her rosy cheek resting in the palm of her hand, and Bruno stretched at her feet with his head in her lap.

Fairies resting

"Too waggly?" was all I could say in so sudden an emergency.

"I'm not particular," Bruno said, carelessly: "but I *do* like straight animals best——"

"But you like a dog when it wags its tail," Sylvie interrupted. "You *know* you do, Bruno!"

"But there's more of a dog, isn't there, Mister Sir?" Bruno appealed to me. "You wouldn't like to have a dog if it hadn't got nuffin but a head and a tail?"

I admitted that a dog of that kind would be uninteresting.

"There *isn't* such a dog as that," Sylvie thoughtfully remarked.

"But there *would* be," cried Bruno, "if the Professor shortened it up for us!"

"Shortened it up?" I said. "That's something new. How does he do it?"

"He's got a curious machine——" Sylvie was beginning to explain.

"A *welley* curious machine," Bruno broke in, not at all willing to have the story thus taken out of his mouth, "and if oo puts in—somefinoruvver—at *one* end, oo know—and he turns the handle—and it comes out at the uvver end, oh, ever so short!"

"As short as short!" Sylvie echoed.

"And one day—when we was in Outland, oo know—before we came to Fairyland—me and Sylvie took him a big Crocodile. And he shortened it up for us. And it *did* look so funny! And it kept looking round, and saying 'wherever *is* the rest of me got to?' And then its eyes looked unhappy——"

"Not *both* its eyes," Sylvie interrupted.

"Course not!" said the little fellow. "Only the eye that *couldn't* see wherever the rest of it had got to. But the eye that *could* see wherever——"

"How short *was* the crocodile?" I asked, as the story was getting a little complicated.

"Half as short again as when we caught it—*so* long," said Bruno, spreading out his arms to their full stretch.

I tried to calculate what this would come to, but it was too hard for me. Please make it out for me, dear Child who reads this!

"But you didn't leave the poor thing so short as that, did you?"

"Well, no. Sylvie and me took it back again and we got it stretched to—to—how much was it, Sylvie?"

"Two times and a half, and a little bit more," said Sylvie.

"It wouldn't like that better than the other way, I'm afraid?"

"Oh, but it did though!" Bruno put in eagerly. "It *were* proud of its new tail! Oo never saw a Crocodile so proud! Why, it could go round and walk on the top of its tail, and along its back, all the way to its head!"

A changed Crocodile

"Not *quite* all the way," said Sylvie. "It couldn't, you know."

“Ah, but it *did*, once!” Bruno cried triumphantly. “Oo weren’t looking—but I watched it. And it walked on tippetly-toe, so as it wouldn’t wake itself, ’cause it thought it were asleep. And it got both its paws on its tail. And it walked and it walked all the way along its back. And it walked and it walked on its forehead. And it walked a tiny little way down its nose! There now!”

This was a good deal worse than the last puzzle. Please, dear Child, help again!

“I don’t believe no Crocodile never walked along its own forehead!” Sylvie cried, too much excited by the controversy to limit the number of her negatives.

“Oo don’t know the *reason* why it did it!” Bruno scornfully retorted. “It had a welly good reason. I *heard* it say ‘Why *shouldn’t* I walk on my own forehead?’ So a course it *did*, oo know!”

“If *that’s* a good reason, Bruno,” I said, “why shouldn’t *you* get up that tree?”

“*Shall*, in a minute,” said Bruno: “soon as we’ve done talking. Only two peoples *ca’n’t* talk comfably togever, when one’s getting up a tree, and the other isn’t!”

It appeared to me that a conversation would scarcely be ‘comfable’ while trees were being climbed, even if *both* the ‘peoples’ were doing it: but it was evidently dangerous to oppose any theory of Bruno’s; so I thought it best to let the question drop, and to ask for an account of the machine that made things *longer*.

This time Bruno was at a loss, and left it to Sylvie. “It’s like a mangle,” she said: “if things are put in, they get squeeze——”

“Squeezeled!” Bruno interrupted.

“Yes.” Sylvie accepted the correction, but did not attempt to pronounce the word, which was evidently new to her. “They get—like that—and they come out, oh, ever so long!”

“Once,” Bruno began again, “Sylvie and me writed——”

“Wrote!” Sylvie whispered.

“Well, we *wroted* a Nursery-Song, and the Professor mangled it longer for us. It were ‘*There was a little Man, And he had a little gun, And the bullets——*’”

“I know the rest,” I interrupted. “But would you say it *long*—I mean the way that it came *out* of the mangle?”

“We’ll get the Professor to *sing* it for you,” said Sylvie. “It would spoil it to *say* it.”

“I would like to meet the Professor,” I said. “And I would like to take you all with me, to see some friends of mine, that live near here. Would you like to come?”

“I don’t think the *Professor* would like to come,” said Sylvie. “He’s *very* shy. But *we’d* like it very much. Only we’d better not come *this* size, you know.”

The difficulty had occurred to me already: and I had felt that perhaps there *would* be a slight awkwardness in introducing two such tiny friends into Society. “What size will you be?” I enquired.

“We’d better come as—common *children*,” Sylvie thoughtfully replied. “That’s the easiest size to manage.”

“Could you come to-day?” I said, thinking “then we could have you at the picnic!”

Sylvie considered a little. “Not *to-day*,” she replied. “We haven’t got the things ready. We’ll come on—Tuesday next, if you like. And now, *really*, Bruno,

Quoted from nursery rhyme

you must come and do your lessons.”

“I *wiss* oo wouldn’t say ‘*really* Bruno!” the little fellow pleaded, with pouting lips that made him look prettier than ever. “It *always* shows there’s something horrid coming! And I won’t kiss you, if you’re so unkind.”

“Ah, but you *have* kissed me!” Sylvie exclaimed in merry triumph.

“Well then, I’ll *unkiss* you!” And he threw his arms round her neck for this novel, but apparently not *very* painful, operation.

“It’s *very* like *kissing*!” Sylvie remarked, as soon as her lips were again free for speech.

“Oo don’t know *nuffin* about it! It were just the *conkery*!” Bruno replied with much severity, as he marched away.

Sylvie turned her laughing face to me. “Shall we come on Tuesday?” she said.

“Very well,” I said: “let it be Tuesday next. But where *is* the Professor? Did he come with you to Fairyland?”

“No,” said Sylvie. “But he promised he’d come and see us, *some* day. He’s getting his Lecture ready. So he has to stay at home.”

“At home?” I said dreamily, not feeling quite sure what she had said.

“Yes, Sir. His Lordship and Lady Muriel *are* at home. Please to walk this way.”

Chapter XVII. The Three Badgers

Still more dreamily I found myself following this imperious voice into a room where the Earl, his daughter, and Arthur, were seated. “So you’re come *at last*!” said Lady Muriel, in a tone of playful reproach.

“I was delayed,” I stammered. Though *what* it was that had delayed me I should have been puzzled to explain! Luckily no questions were asked.

The carriage was ordered round, the hamper, containing our contribution to the Picnic, was duly stowed away, and we set forth.

There was no need for *me* to maintain the conversation. Lady Muriel and Arthur were evidently on those most delightful of terms, where one has no need to check thought after thought, as it rises to the lips, with the fear ‘*this* will not be appreciated—*this* will give offence—*this* will sound too serious—this will sound flippant’: like very old friends, in fullest sympathy, their talk rippled on.

“Why shouldn’t we desert the Picnic and go in some other direction?” she suddenly suggested. “A party of four is surely self-sufficing? And as for *food*, our hamper——”

“Why *shouldn’t* we? What a genuine *lady’s* argument!” laughed Arthur. “A lady never knows on which side the *onus probandi*—the burden of proving—lies!”

“Do *men* always know?” she asked with a pretty assumption of meek docility.

“With *one* exception—the only one I can think of—Dr. Watts, who has asked the senseless question

‘Why should I deprive my neighbour
Of his goods against his will?’

Fancy *that* as an argument for Honesty! His position seems to be ‘I’m only honest because I see no reason to steal.’ And the *thief’s* answer is of course

Quoted from *Why should I deprive my neighbour* by Isaac Watts

complete and crushing. 'I deprive my neighbour of his goods because I want them myself. And I do it against his will because there's no chance of getting him to consent to it!'"

"I can give you one other exception," I said: "an argument I heard only to-day—and *not* by a lady. 'Why shouldn't I walk on my own forehead?'"

"What a curious subject for speculation!" said Lady Muriel, turning to me, with eyes brimming over with laughter. "May we know who propounded the question? And *did* he walk on his own forehead?"

"I ca'n't remember *who* it was that said it!" I faltered. "Nor *where* I heard it!"

"Whoever it was, I hope we shall meet him at the Picnic!" said Lady Muriel. "It's a *far* more interesting question than '*Isn't* this a picturesque ruin?' '*Aren't* those autumn-tints lovely?' I shall have to answer those two questions *ten* times, at least, this afternoon!"

"That's one of the miseries of Society!" said Arthur. "Why ca'n't people let one enjoy the beauties of Nature without having to *say* so every minute? Why should Life be one long Catechism?"

"It's just as bad at a picture-gallery," the Earl remarked. "I went to the R.A. last May, with a conceited young artist: and he *did* torment me! I wouldn't have minded his criticizing the pictures *himself*: but *I* had to agree with him—or else to argue the point, which would have been worse!"

"It was *depreciatory* criticism, of course?" said Arthur.

"I don't see the 'of course' at all."

"Why, did you ever know a conceited man dare to *praise* a picture? The one thing he dreads (next to not being noticed) is *to be proved fallible*! If you once *praise* a picture, your character for *infallibility* hangs by a thread. Suppose it's a figure-picture, and you venture to say 'draws well.' Somebody measures it, and finds one of the proportions an eighth of an inch wrong. *You* are disposed of as a critic! 'Did you say he draws *well*?' your friends enquire sarcastically, while you hang your head and blush. No. The only *safe* course, if any one says 'draws well,' is to shrug your shoulders. '*Draws well*?' you repeat thoughtfully. '*Draws well*? Humph!' That's the way to become a great critic!"

Thus airily chatting, after a pleasant drive through a few miles of beautiful scenery, we reached the *rendezvous*—a ruined castle—where the rest of the picnic-party were already assembled. We spent an hour or two in sauntering about the ruins: gathering at last, by common consent, into a few random groups, seated on the side of a mound, which commanded a good view of the old castle and its surroundings.

The momentary silence, that ensued, was promptly taken possession of—or, more correctly, taken into custody—by a Voice; a voice so smooth, so monotonous, so sonorous, that one felt, with a shudder, that any other conversation was precluded, and that, unless some desperate remedy were adopted, we were fated to listen to a Lecture, of which no man could foresee the end!

The speaker was a broadly-built man, whose large, flat, pale face was bounded on the North by a fringe of hair, on the East and West by a fringe of whisker, and on the South by a fringe of beard—the whole constituting a uniform halo of stubbly whitey-brown bristles. His features were so entirely destitute of expression that I could not help saying to myself—helplessly, as if in the clutches of a night-mare—"they are only penciled in: no final touches as yet!" And he had a way of ending every sentence with a sudden smile, which spread like a

ripple over that vast blank surface, and was gone in a moment, leaving behind it such absolute solemnity that I felt impelled to murmur "it was not *he*: it was somebody else that smiled!"

"Do you observe?" (such was the phrase with which the wretch began each sentence) "Do you observe the way in which that broken arch, at the very top of the ruin, stands out against the clear sky? It is placed *exactly* right: and there is *exactly* enough of it. A little more, or a little less, and all would be utterly spoiled!"

A lecture on Art

"Oh gifted architect!" murmured Arthur, inaudibly to all but Lady Muriel and myself. "Foreseeing the exact effect his work would have, when in ruins, centuries after his death!"

"And do you observe, where those trees slope down the hill," (indicating them with a sweep of the hand, and with all the patronising air of the man who has himself arranged the landscape), "how the mists rising from the river fill up *exactly* those intervals where we *need* indistinctness, for artistic effect? Here, in the foreground, a few clear touches are not amiss: but a *back-ground* without mist, you know! It is simply barbarous! Yes, we *need* indistinctness!"

The orator looked so pointedly at *me* as he uttered these words, that I felt bound to reply, by murmuring something to the effect that I hardly felt the need *myself*—and that I enjoyed looking at a thing, better, when I could *see* it.

"Quite so!" the great man sharply took me up. "From *your* point of view, that is correctly put. But for any one who has a soul for *Art*, such a view is preposterous. *Nature* is one thing. *Art* is another. *Nature* shows us the world as it *is*. But *Art*—as a Latin author tells us—*Art*, you know—the words have escaped my memory——"

“*Ars est celare Naturam*,”¹ Arthur interposed with a delightful promptitude.

“Quite so!” the orator replied with an air of relief. “I thank you! *Ars est celare Naturam*—but that isn’t it.” And, for a few peaceful moments, the orator brooded, frowningly, over the quotation. The welcome opportunity was seized, and *another* voice struck into the silence.

“What a *lovely* old ruin it is!” cried a young lady in spectacles, the very embodiment of the March of Mind, looking at Lady Muriel, as the proper recipient of all really *original* remarks. “And *don’t* you admire those autumn-tints on the trees? *I* do, *intensely!*”

Lady Muriel shot a meaning glance at me; but replied with admirable gravity. “Oh yes indeed, indeed! *So* true!”

“And isn’t it strange,” said the young lady, passing with startling suddenness from Sentiment to Science, “that the mere impact of certain coloured rays upon the Retina should give us such exquisite pleasure?”

“You have studied Physiology, then?” a certain young Doctor courteously enquired.

“Oh, *yes!* Isn’t it a *sweet* Science?”

Arthur slightly smiled. “It seems a paradox, does it not,” he went on, “that the image formed on the Retina should be inverted?”

“It *is* puzzling,” she candidly admitted. “Why is it we do not *see* things upside-down?”

“You have never heard the Theory, then, that the *Brain* also is inverted?”

“No *indeed!* What a *beautiful* fact! But how is it *proved?*”

“*Thus,*” replied Arthur, with all the gravity of ten Professors rolled into one. “What we call the *vertex* of the Brain is really its *base*: and what we call its *base* is really its *vertex*: it is simply a question of *nomenclature.*”

This last polysyllable settled the matter. “How truly delightful!” the fair Scientist exclaimed with enthusiasm. “I shall ask our Physiological Lecturer why he never gave us that *exquisite* Theory!”

“I’d give something to be present when the question is asked!” Arthur whispered to me, as, at a signal from Lady Muriel, we moved on to where the hampers had been collected, and devoted ourselves to the more *substantial* business of the day.

We ‘waited’ on ourselves, as the modern barbarism (combining two good things in such a way as to secure the discomforts of both and the advantages of neither) of having a picnic with servants to wait upon you, had not yet reached this out-of-the-way region—and of course the gentlemen did not even take their places until the ladies had been duly provided with all imaginable creature-comforts. Then I supplied myself with a plate of something solid and a glass of something fluid, and found a place next to Lady Muriel.

It had been left vacant—apparently for Arthur, as a distinguished stranger: but he had turned shy, and had placed himself next to the young lady in spectacles, whose high rasping voice had already cast loose upon Society such ominous phrases as “Man is a bundle of Qualities!”, “the Objective is only attainable through the Subjective!”. Arthur was bearing it bravely: but several faces wore a look of alarm, and I thought it high time to start some less metaphysical topic.

¹Remark: “*Ars est celare Naturam*,”

“In my nursery days,” I began, “when the weather didn’t suit for an out-of-doors picnic, we were allowed to have a peculiar kind, that we enjoyed hugely. The table cloth was laid *under* the table, instead of upon it: we sat round it on the floor: and I believe we really enjoyed that extremely uncomfortable kind of dinner more than we ever did the orthodox arrangement!”

“I’ve no doubt of it,” Lady Muriel replied. “There’s nothing a well-regulated child hates so much as regularity. I believe a really healthy boy would thoroughly enjoy Greek Grammar—if only he might stand on his head to learn it! And your carpet-dinner certainly spared you *one* feature of a picnic, which is to me its chief drawback.”

“The chance of a shower?” I suggested.

“No, the chance—or rather the certainty—of *live* things occurring in combination with one’s food! *Spiders* are *my* bugbear. Now my father has *no* sympathy with that sentiment—*have* you, dear?” For the Earl had caught the word and turned to listen.

“To each his sufferings, all are men,” he replied in the sweet sad tones that seemed natural to him: “each has his pet aversion.”

“But you’ll never guess *his*!” Lady Muriel said, with that delicate silvery laugh that was music to my ears.

I declined to attempt the impossible.

“He doesn’t like *snakes*!” she said, in a stage whisper. “Now, isn’t *that* an unreasonable aversion? Fancy not liking such a dear, coaxingly, *clingingly* affectionate creature as a snake!”

“Not like *snakes*!” I exclaimed. “Is such a thing possible?”

“No, he *doesn’t* like them,” she repeated with a pretty mock-gravity. “He’s not *afraid* of them, you know. But he doesn’t *like* them. He says they’re too waggly!”

I was more startled than I liked to show. There was something so *uncanny* in this echo of the very words I had so lately heard from that little forest-sprite, that it was only by a great effort I succeeded in saying, carelessly, “Let us banish so unpleasant a topic. Won’t you sing us something, Lady Muriel? I know you *do* sing without music.”

“The only songs I know—without music—are *desperately* sentimental, I’m afraid! Are your tears all ready?”

“Quite ready! Quite ready!” came from all sides, and Lady Muriel—not being one of those lady-singers who think it *de rigueur* to decline to sing till they have been petitioned three or four times, and have pleaded failure of memory, loss of voice, and other conclusive reasons for silence—began at once:—

“There be three Badgers on a mossy stone,
Beside a dark and covered way:
Each dreams himself a monarch on his throne,
And so they stay and stay—
Though their old Father languishes alone,
They stay, and stay, and stay.

“There be three Herrings loitering around,
Longing to share that mossy seat:
Each Herring tries to sing what she has found
That makes Life seem so sweet.
Thus, with a grating and uncertain sound,

Quoted from *Ode on a Distant Prospect of Eton College* by Thomas Gray

'Three Badgers on a mossy stone'

They bleat, and bleat, and bleat.
 "The Mother-Herring, on the salt sea-wave,
 Sought vainly for her absent ones:
 The Father-Badger, writhing in a cave,
 Shrieked out 'Return, my sons!
 You shall have buns,' he shrieked, 'if you'll behave!
 Yea, buns, and buns, and buns!'"
 "'I fear,' said she, 'your sons have gone astray?
 My daughters left me while I slept.'
 'Yes 'm,' the Badger said: 'it's as you say.'
 'They should be better kept.'
 Thus the poor parents talked the time away,
 And wept, and wept, and wept."

Here Bruno broke off suddenly. "The Herrings' Song wants anuvver tune, Sylvie," he said. "And I ca'n't sing it—not wizout oo plays it for me!"

Instantly Sylvie seated herself upon a tiny mushroom, that happened to grow in front of a daisy, as if it were the most ordinary musical instrument in the world, and played on the petals as if they were the notes of an organ. And such delicious *tiny* music it was! Such teeny-tiny music!

Bruno held his head on one side, and listened very gravely for a few moments until he had caught the melody. Then the sweet childish voice rang out once more:—

"Oh, dear beyond our dearest dreams,
 Fairer than all that fairest seems!
 To feast the rosy hours away,
 To revel in a roundelay!
 How blest would be
 A life so free—
 Ipwergis-Pudding to consume,

'The Father-Badger, writhing in a cave'

And drink the subtle Azzigoom!
 "And if, in other days and hours,
 Mid other fluffs and other flowers,
 The choice were given me how to dine—
 'Name what thou wilt: it shall be thine!
 Oh, then I see
 The life for me—
 Ipwergis-Pudding to consume,
 And drink the subtle Azzigoom!"

"Oo may leave off playing *now*, Sylvie. I can do the uvver tune much better wizout a compliment."

"He means 'without *accompaniment*,'" Sylvie whispered, smiling at my puzzled look: and she pretended to shut up the stops of the organ.

"The Badgers did not care to talk to Fish:
 They did not dote on Herrings' songs:
 They never had experienced the dish
 To which that name belongs:
 'And oh, to pinch their tails,' (this was their wish,
 'With tongs, yea, tongs, and tongs!'"

I ought to mention that he marked the parenthesis, in the air, with his finger. It seemed to me a very good plan. You know there's no *sound* to represent it—any more than there is for a question.

Suppose you have said to your friend, "You are better to-day," and that you want him to understand that you are asking him a *question*, what can be simpler than just to make a '?' in the air with your finger? He would understand you in a moment!

"And are not these the Fish,' the Eldest sighed,

‘Whose Mother dwells beneath the foam?’
 ‘They *are* the Fish!’ the Second one replied.
 ‘And they have left their home!’
 ‘Oh wicked Fish,’ the Youngest Badger cried,
 ‘To roam, yea, roam, and roam!’

‘Those aged ones waxed gay’

“Gently the Badgers trotted to the shore—
 The sandy shore that fringed the bay:
 Each in his mouth a living Herring bore—
 Those aged ones waxed gay:
 Clear rang their voices through the ocean’s roar,
 ‘Hooray, hooray, hooray!’”

“So they all got safe home again,” Bruno said, after waiting a minute to see if *I* had anything to say: he evidently felt that *some* remark ought to be made. And I couldn’t help wishing there were some such rule in Society, at the conclusion of a song—that the singer *herself* should say the right thing, and not leave it to the audience. Suppose a young lady has just been warbling (‘with a grating and uncertain sound’) Shelley’s exquisite lyric ‘*I arise from dreams of thee*’: how much nicer it would be, instead of *your* having to say “Oh, *thank you, thank you!*” for the young lady herself to remark, as she draws on her gloves, while the impassioned words ‘*Oh, press it to thine own, or it will break at last!*’ are still ringing in your ears, “—but she wouldn’t do it, you know. So it *did* break at last.”

Quoted from *The Indian Serenade* by Percy Bysshe Shelley

“And I *knew* it would!” she added quietly, as I started at the sudden crash of broken glass. “You’ve been holding it sideways for the last minute, and letting all the champagne run out! Were you asleep, I wonder? I’m *so* sorry my singing has such a narcotic effect!”

Chapter XVIII. Queer Street, Number Forty

Lady Muriel was the speaker. And, for the moment, that was the only fact I could clearly realise. But how she came to be there—and how *I* came to be there—and how the glass of champagne came to be there—all these were

questions which I felt it better to think out in silence, and not commit myself to any statement till I understood things a little more clearly.

‘First accumulate a mass of Facts: and *then* construct a Theory.’ *That*, I believe, is the true Scientific Method. I sat up, rubbed my eyes, and began to accumulate Facts.

A smooth grassy slope, bounded, at the upper end, by venerable ruins half buried in ivy, at the lower, by a stream seen through arching trees—a dozen gaily-dressed people, seated in little groups, here and there—some open hampers—the *débris* of a picnic—such were the *Facts* accumulated by the Scientific Researcher. And now, what deep, far-reaching *Theory* was he to construct from them? The Researcher found himself at fault. Yet stay! One Fact had escaped his notice. While all the rest were grouped in twos and in threes, *Arthur* was alone: while all tongues were talking, *his* was silent: while all faces were gay, *his* was gloomy and despondent. Here was a *Fact* indeed! The Researcher felt that a *Theory* must be constructed without delay.

Lady Muriel had just risen and left the party. Could *that* be the cause of his despondency? The Theory hardly rose to the dignity of a Working Hypothesis. Clearly more Facts were needed.

The Researcher looked round him once more: and now the Facts accumulated in such bewildering profusion, that the Theory was lost among them. For Lady Muriel had gone to meet a strange gentleman, just visible in the distance: and now she was returning with him, both of them talking eagerly and joyfully, like old friends who have been long parted: and now she was moving from group to group, introducing the new hero of the hour: and he, young, tall, and handsome, moved gracefully at her side, with the erect bearing and firm tread of a soldier. Verily, the Theory looked gloomy for Arthur! His eye caught mine, and he crossed to me.

“He is very handsome,” I said.

“Abominably handsome!” muttered Arthur: then smiled at his own bitter words. “Lucky no one heard me but you!”

“Doctor Forester,” said Lady Muriel, who had just joined us, “let me introduce to you my cousin Eric Lindon—*Captain* Lindon, I should say.”

Arthur shook off his ill-temper instantly and completely, as he rose and gave the young soldier his hand. “I have heard of you,” he said. “I’m very glad to make the acquaintance of Lady Muriel’s cousin.”

“Yes, that’s all I’m distinguished for, *as yet!*” said Eric (so we soon got to call him) with a winning smile. “And I doubt,” glancing at Lady Muriel, “if it even amounts to a good-conduct-badge! But it’s something to begin with.”

“You must come to my father, Eric,” said Lady Muriel. “I think he’s wandering among the ruins.” And the pair moved on.

The gloomy look returned to Arthur’s face: and I could see it was only to distract his thoughts that he took his place at the side of the metaphysical young lady, and resumed their interrupted discussion.

“Talking of Herbert Spencer,” he began, “do you really find no *logical* difficulty in regarding Nature as a process of involution, passing from definite coherent homogeneity to indefinite incoherent heterogeneity?”

Amused as I was at the ingenious jumble he had made of Spencer’s words, I kept as grave a face as I could.

“No *physical* difficulty,” she confidently replied: “but I haven’t studied *Logic* much. Would you *state* the difficulty?”

“Well,” said Arthur, “do you accept it as self-evident? Is it as obvious, for instance, as that ‘things that are greater than the same are greater than one another’?”

“To *my* mind,” she modestly replied, “it seems *quite* as obvious. I grasp *both* truths by intuition. But *other* minds may need some logical—I forget the technical terms.”

“For a *complete* logical argument,” Arthur began with admirable solemnity, “we need two prim Misses——”

“Of course!” she interrupted. “I remember that word now. And they produce——?”

“A Delusion,” said Arthur.

“Ye—es?” she said dubiously. “I don’t seem to remember that so well. But what is the *whole* argument called?”

“A Sillygism.”

“Ah, yes! I remember now. But I don’t need a Sillygism, you know, to prove that mathematical axiom you mentioned.”

“Nor to prove that ‘all angles are equal’, I suppose?”

“Why, of course not! One takes such a simple truth as that for granted!”

Here I ventured to interpose, and to offer her a plate of strawberries and cream. I felt really uneasy at the thought that she *might* detect the trick: and I contrived, unperceived by her, to shake my head reprovingly at the pseudo-philosopher. Equally unperceived by her, Arthur slightly raised his shoulders, and spread his hands abroad, as who should say “What else can I say to her?” and moved away, leaving her to discuss her strawberries by ‘involution,’ or any other way she preferred.

By this time the carriages, that were to convey the revelers to their respective homes, had begun to assemble outside the Castle-grounds: and it became evident—now that Lady Muriel’s cousin had joined our party—that the problem, how to convey five people to Elveston, with a carriage that would only hold four, must somehow be solved.

The Honorable Eric Lindon, who was at this moment walking up and down with Lady Muriel, might have solved it at once, no doubt, by announcing his intention of returning on foot. Of *this* solution there did not seem to be the very smallest probability.

The next best solution, it seemed to me, was that *I* should walk home: and this I at once proposed.

“You’re sure you don’t mind?” said the Earl. “I’m afraid the carriage won’t take us all, and I don’t like to suggest to Eric to desert his cousin so soon.”

“So far from minding it,” I said, “I should prefer it. It will give me time to sketch this beautiful old ruin.”

“I’ll keep you company,” Arthur suddenly said. And, in answer to what I suppose was a look of surprise on my face, he said in a low voice, “I *really* would rather. I shall be quite *de trop* in the carriage!”

“I think I’ll walk too,” said the Earl. “You’ll have to be content with *Eric* as your escort,” he added, to Lady Muriel, who had joined us while he was speaking.

“You must be as entertaining as Cerberus—‘three gentlemen rolled into one’——” Lady Muriel said to her companion. “It will be a grand military exploit!”

“A sort of Forlorn Hope?” the Captain modestly suggested.

Quoted from *The Rivals* by Richard Brinsley Sheridan

"You *do* pay pretty compliments!" laughed his fair cousin. "Good day to you, gentlemen three—or rather deserters three!" And the two young folk entered the carriage and were driven away.

"How long will your sketch take?" said Arthur.

"Well," I said, "I should like an hour for it. Don't you think you had better go without me? I'll return by train. I know there's one in about an hour's time."

"Perhaps that *would* be best," said the Earl. "The Station is quite close."

So I was left to my own devices, and soon found a comfortable seat, at the foot of a tree, from which I had a good view of the ruins.

"It is a very drowsy day," I said to myself, idly turning over the leaves of the sketch-book to find a blank page. "Why, I thought you were a mile off by this time!" For, to my surprise, the two walkers were back again.

"I came back to remind you," Arthur said, "that the trains go every ten minutes——"

"Nonsense!" I said. "It isn't the Metropolitan Railway!"

"It *is* the Metropolitan Railway," the Earl insisted. "This is a part of Kensington."

"Why do you talk with your eyes shut?" said Arthur. "Wake up!"

"I think it's the heat makes me so drowsy," I said, hoping, but not feeling quite sure, that I was talking sense. "Am I awake now?"

"I think *not*," the Earl judicially pronounced. "What do *you* think, Doctor? He's only got one eye open!"

"And he's snoring like anything!" cried Bruno. "Do wake up, you dear old thing!" And he and Sylvie set to work, rolling the heavy head from side to side, as if its connection with the shoulders was a matter of no sort of importance.

And at last the Professor opened his eyes, and sat up, blinking at us with eyes of utter bewilderment. "Would you have the kindness to mention," he said, addressing me with his usual old-fashioned courtesy, "whereabouts we are just now—and *who* we are, beginning with me?"

I thought it best to begin with the children. "This is Sylvie, Sir; and *this* is Bruno."

"Ah, yes! I know *them* well enough!" the old man murmured. "It's *myself* I'm most anxious about. And perhaps you'll be good enough to mention, at the same time, how I got here?"

"A harder problem occurs to *me*," I ventured to say: "and that is, how you're to get back again."

"True, true!" the Professor replied. "That's *the* Problem, no doubt. Viewed as a Problem, outside of oneself, it is a *most* interesting one. Viewed as a portion of one's own biography, it is, I must admit, very distressing!" He groaned, but instantly added, with a chuckle, "As to *myself*, I think you mentioned that I am——"

"Oo're the *Professor*!" Bruno shouted in his ear. "Didn't oo know *that*? Oo've come from *Outland*! And it's *ever* so far away from here!"

The Professor leapt to his feet with the agility of a boy. "Then there's no time to lose!" he exclaimed anxiously. "I'll just ask this guileless peasant, with his brace of buckets that contain (apparently) water, if he'll be so kind as to direct us. Guileless peasant!" he proceeded in a louder voice. "Would you tell us the way to Outland?"

The guileless peasant turned with a sheepish grin. "Hey?" was all he said.

"The—way—to—Outland!" the Professor repeated.

The guileless peasant set down his buckets and considered. “Ah dunnot——”
“I ought to mention,” the Professor hastily put in, “that whatever you say will be used in evidence against you.”

The guileless peasant instantly resumed his buckets. “Then ah says nowt!” he answered briskly, and walked away at a great pace.

The children gazed sadly at the rapidly vanishing figure. “He goes very quick!” the Professor said with a sigh. “But I *know* that was the right thing to say. I’ve studied your English Laws. However, let’s ask this next man that’s coming. He is *not* guileless, and he is *not* a peasant—but I don’t know that either point is of vital importance.”

It was, in fact, the Honourable Eric Lindon, who had apparently fulfilled his task of escorting Lady Muriel home, and was now strolling leisurely up and down the road outside the house, enjoying a solitary cigar.

“Might I trouble you, Sir, to tell us the nearest way to Outland!” Oddity as he was, in outward appearance, the Professor was, in that essential nature which no outward disguise could conceal, a thorough gentleman.

And, as such, Eric Lindon accepted him instantly. He took the cigar from his mouth, and delicately shook off the ash, while he considered. “The name sounds strange to me,” he said. “I doubt if I can help you.”

“It is not *very* far from *Fairyland*,” the Professor suggested.

Eric Lindon’s eye-brows were slightly raised at these words, and an amused smile, which he courteously tried to repress, flitted across his handsome face. “A trifle *cracked!*” he muttered to himself. “But what a jolly old patriarch it is!” Then he turned to the children. “And ca’n’t *you* help him, little folk?” he said, with a gentleness of tone that seemed to win their hearts at once. “Surely *you* know all about it?”

‘How many miles to Babylon?
Three-score miles and ten.
Can I get there by candlelight?
Yes, and back again!’”

Quoted from nursery rhyme

To my surprise, Bruno ran forwards to him, as if he were some old friend of theirs, seized the disengaged hand and hung on to it with both of his own: and there stood this tall dignified officer in the middle of the road, gravely swinging a little boy to and fro, while Sylvie stood ready to push him, exactly as if a real swing had suddenly been provided for their pastime.

“We don’t want to get to *Babylon*, oo know!” Bruno explained as he swung.

“And it isn’t *candlelight*: it’s *daylight!*” Sylvie added, giving the swing a push of extra vigour, which nearly took the whole machine off its balance.

By this time it was clear to me that Eric Lindon was quite unconscious of my presence. Even the Professor and the children seemed to have lost sight of me: and I stood in the midst of the group, as unconcerned as a ghost, seeing but unseen.

“How perfectly isochronous!” the Professor exclaimed with enthusiasm. He had his watch in his hand, and was carefully counting Bruno’s oscillations. “He measures time quite as accurately as a pendulum!”

“Yet even pendulums,” the good-natured young soldier observed, as he carefully released his hand from Bruno’s grasp, “are not a joy *for ever!* Come, that’s

‘How perfectly isochronous!’

enough for one bout, little man! Next time we meet, you shall have another. Meanwhile you’d better take this old gentleman to Queer Street, Number——”

“We’ll find it!” cried Bruno eagerly, as they dragged the Professor away.

“We are much indebted to you!” the Professor said, looking over his shoulder.

“Don’t mention it!” replied the officer, raising his hat as a parting salute.

“What number did you say!” the Professor called from the distance.

The officer made a trumpet of his two hands. “Forty!” he shouted in stentorian tones. “And not *piano*, by any means!” he added to himself. “It’s a mad world, my masters, a mad world!” He lit another cigar, and strolled on towards his hotel.

“What a lovely evening!” I said, joining him as he passed me.

“Lovely indeed,” he said. “Where did *you* come from? Dropped from the clouds?”

“I’m strolling your way,” I said; and no further explanation seemed necessary.

“Have a cigar?”

“Thanks: I’m not a smoker.”

“Is there a Lunatic Asylum near here?”

“Not that I know of.”

“Thought there might be. Met a lunatic just now. Queer old fish as ever I saw!”

And so, in friendly chat, we took our homeward ways, and wished each other ‘good-night’ at the door of his hotel.

Left to myself, I felt the ‘eerie’ feeling rush over me again, and saw, standing at the door of Number Forty, the three figures I knew so well.

“Then it’s the wrong house?” Bruno was saying.

“No, no! It’s the right *house*,” the Professor cheerfully replied: “but it’s the wrong *street*. *That’s* where we’ve made our mistake! Our best plan, now, will be to——”

It was over. The street was empty. Commonplace life was around me, and the 'eerie' feeling had fled.

Chapter XIX. How to Make a Phlizz.

The week passed without any further communication with the 'Hall,' as Arthur was evidently fearful that we might 'wear out our welcome'; but when, on Sunday morning, we were setting out for church, I gladly agreed to his proposal to go round and enquire after the Earl, who was said to be unwell.

Eric, who was strolling in the garden, gave us a good report of the invalid, who was still in bed, with Lady Muriel in attendance.

"Are you coming with us to church?" I enquired.

"Thanks, no," he courteously replied. "It's not—exactly—in my line, you know. It's an excellent institution—for the *poor*. When I'm with my own folk, I go, just to set them an example. But I'm not known *here*: so I think I'll excuse myself sitting out a sermon. Country-preachers are always so dull!"

Arthur was silent till we were out of hearing. Then he said to himself, almost inaudibly, "*Where two or three are gathered together in my name, there am I in the midst of them.*"

"Yes," I assented: "no doubt that *is* the principle on which church-going rests."

"And when he *does* go," he continued (our thoughts ran so much together, that our conversation was often slightly elliptical), "I suppose he repeats the words '*I believe in the Communion of Saints*'?"

But by this time we had reached the little church, into which a goodly stream of worshippers, consisting mainly of fishermen and their families, was flowing.

The service would have been pronounced by any modern æsthetic religionist—or religious æsthete, which is it?—to be crude and cold: to me, coming fresh from the ever-advancing developments of a London church under a *soi-disant* 'Catholic' Rector, it was unspeakably refreshing.

There was no theatrical procession of demure little choristers, trying their best not to simper under the admiring gaze of the congregation: the people's share in the service was taken by the people themselves, unaided, except that a few good voices, judiciously posted here and there among them, kept the singing from going too far astray.

There was no murdering of the noble music, contained in the Bible and the Liturgy, by its recital in a dead monotone, with no more expression than a mechanical talking-doll.

No, the prayers were *prayed*, the lessons were *read*, and—best of all—the sermon was *talked*; and I found myself repeating, as we left the church, the words of Jacob, when he '*awaked out of his sleep.*' "*Surely the Lord is in this place! This is none other but the house of God, and this is the gate of heaven.*"

"Yes," said Arthur, apparently in answer to my thoughts, "those 'high' services are fast becoming pure Formalism. More and more the people are beginning to regard them as 'performances,' in which they only 'assist' in the French sense. And it is *especially* bad for the little boys. They'd be much less self-conscious as pantomime-fairies. With all that dressing-up, and stage-entrances² and exits, and being always *en evidence*, no wonder if they're eaten

²misprinted "stagy-entrances" in the original

up with vanity, the blatant little coxcombs!”

When we passed the Hall on our return, we found the Earl and Lady Muriel sitting out in the garden. Eric had gone for a stroll.

We joined them, and the conversation soon turned on the sermon we had just heard, the subject of which was ‘selfishness.’

“What a change has come over our pulpits,” Arthur remarked, “since the time when Paley gave that utterly selfish definition of virtue, ‘*the doing good to mankind, in obedience to the will of God, and for the sake of everlasting happiness*’!”

Quoted from
Principles of Moral
and Political
Philosophy by
William Paley

Lady Muriel looked at him enquiringly, but she seemed to have learned by intuition, what years of experience had taught *me*, that the way to elicit Arthur’s deepest thoughts was neither to assent nor dissent, but simply to *listen*.

“At that time,” he went on, “a great tidal wave of selfishness was sweeping over human thought. Right and Wrong had somehow been transformed into Gain and Loss, and Religion had become a sort of commercial transaction. We may be thankful that our preachers are beginning to take a nobler view of life.”

“But is it not taught again and again in the *Bible*?” I ventured to ask.

“Not in the Bible as a *whole*,” said Arthur. “In the Old Testament, no doubt, rewards and punishments are constantly appealed to as motives for action. That teaching is best for *children*, and the Israelites seem to have been, mentally, *utter* children. We guide our children thus, at first: but we appeal, as soon as possible, to their innate sense of Right and Wrong: and, when *that* stage is safely past, we appeal to the highest motive of all, the desire for likeness to, and union with, the Supreme Good. I think you will find that to be the teaching of the Bible, *as a whole*, beginning with ‘*that thy days may be long in the land,*’ and ending with ‘*be ye perfect, even as your Father which is in heaven is perfect.*’”

Quoted from Exodus
20:12

Quoted from
Matthew 5:48

We were silent for awhile, and then Arthur went off on another tack. “Look at the literature of Hymns, now. How cankered it is, through and through, with selfishness! There are few human compositions more utterly degraded than some modern Hymns!”

I quoted the stanza

“Whatever, Lord, we lend to Thee,
Repaid a thousandfold shall be,
Then gladly will we give to Thee,
Giver of all!”

Quoted from *O Lord*
of Heaven and Earth
and Sea by Bishop
Christopher
Wordsworth

“Yes,” he said grimly: “that is the typical stanza. And the very last charity-sermon I heard was infected with it. After giving many good reasons for charity, the preacher wound up with ‘and, for all you give, you will be repaid a thousandfold!’ Oh the utter meanness of such a motive, to be put before men who *do* know what self-sacrifice is, who *can* appreciate generosity and heroism! Talk of Original *Sin*!” he went on with increasing bitterness. “Can you have a stronger proof of the Original Goodness there must be in this nation, than the fact that Religion has been preached to us, as a commercial speculation, for a century, and that we still believe in a God?”

“It couldn’t have gone on so long,” Lady Muriel musingly remarked, “if the Opposition hadn’t been practically silenced—put under what the French call *la clôture*. Surely in any lecture-hall, or in private society, such teaching would soon have been hooted down?”

“I trust so,” said Arthur: “and, though I don’t want to see ‘brawling in church’ legalised, I must say that our preachers enjoy an *enormous* privilege—which they ill deserve, and which they misuse terribly. We put our man into a pulpit, and we virtually tell him ‘Now, you may stand there and talk to us for half-an-hour. We won’t interrupt you by so much as a *word!* You shall have it all your own way!’ And what does he give us in return? Shallow twaddle, that, if it were addressed to you over a dinner-table, you would think ‘Does the man take me for a *fool?*’”

The return of Eric from his walk checked the tide of Arthur’s eloquence, and, after a few minutes’ talk on more conventional topics, we took our leave. Lady Muriel walked with us to the gate. “You have given me much to think about,” she said earnestly, as she gave Arthur her hand. “I’m so glad you came in!” And her words brought a real glow of pleasure into that pale worn face of his.

On the Tuesday, as Arthur did not seem equal to more walking, I took a long stroll by myself, having stipulated that he was not to give the *whole* day to his books, but was to meet me at the Hall at about tea-time. On my way back, I passed the Station just as the afternoon-train came in sight, and sauntered down the stairs to see it come in. But there was little to gratify my idle curiosity: and, when the train was empty, and the platform clear, I found it was about time to be moving on, if I meant to reach the Hall by five.

As I approached the end of the platform, from which a steep irregular wooden staircase conducted to the upper world, I noticed two passengers, who had evidently arrived by the train, but who, oddly enough, had entirely escaped my notice, though the arrivals had been so few. They were a young woman and a little girl: the former, so far as one could judge by appearances, was a nursemaid, or possibly a nursery-governess, in attendance on the child, whose refined face, even more than her dress, distinguished her as of a higher class than her companion.

The child’s face was refined, but it was also a worn and sad one, and told a tale (or so I seemed to read it) of much illness and suffering, sweetly and patiently borne. She had a little crutch to help herself along with: and she was now standing, looking wistfully up the long staircase, and apparently waiting till she could muster courage to begin the toilsome ascent.

There are some things one *says* in life—as well as things one *does*—which come automatically, by *reflex action*, as the physiologists say (meaning, no doubt, action *without* reflection, just as *lucus* is said to be derived ‘*a non lucendo*’). Closing one’s eyelids, when something seems to be flying into the eye, is one of those actions, and saying “May I carry the little girl up the stairs?” was another. It wasn’t that any thought of offering help occurred to me, and that *then* I spoke: the first intimation I had, of being likely to make that offer, was the sound of my own voice, and the discovery that the offer had been made. The servant paused, doubtfully glancing from her charge to me, and then back again to the child. “Would you like it, dear?” she asked her. But no such doubt appeared to cross the child’s mind: she lifted her arms eagerly to be taken up. “Please!” was all she said, while a faint smile flickered on the weary little face. I took her up with scrupulous care, and her little arm was at once clasped trustfully round my neck.

She was a *very* light weight—so light, in fact, that the ridiculous idea crossed my mind that it was rather easier going up, with her in my arms, than it would have been without her: and, when we reached the road above, with its cart-

Quoted from *De institutione oratoria* by Quintilian

The lame child

ruts and loose stones—all formidable obstacles for a lame child—I found that I had said “I’d better carry her over this rough place,” before I had formed any *mental* connection between its roughness and my gentle little burden. “Indeed it’s troubling you too much, Sir!” the maid exclaimed. “She can walk very well on the flat.” But the arm, that was twined about my neck, clung just an atom more closely at the suggestion, and decided me to say “She’s no weight, really. I’ll carry her a little further. I’m going your way.”

The nurse raised no further objection: and the next speaker was a ragged little boy, with bare feet, and a broom over his shoulder, who ran across the road, and pretended to sweep the perfectly dry road in front of us. “Give us a ‘ap’ny!” the little urchin pleaded, with a broad grin on his dirty face.

“*Don’t* give him a ‘ap’ny!” said the little lady in my arms. The *words* sounded harsh: but the *tone* was gentleness itself. “He’s an *idle* little boy!” And she laughed a laugh of such silvery sweetness as I had never yet heard from any lips but Sylvie’s. To my astonishment, the boy actually *joined* in the laugh, as if there were some subtle sympathy between them, as he ran away down the road and vanished through a gap in the hedge.

But he was back in a few moments, having discarded his broom and provided himself, from some mysterious source, with an exquisite bouquet of flowers. “Buy a posy, buy a posy! Only a ‘ap’ny!” he chanted, with the melancholy drawl of a professional beggar.

“*Don’t* buy it!” was Her Majesty’s edict, as she looked down, with a lofty scorn that seemed curiously mixed with tender interest, on the ragged creature at her feet.

But this time I turned rebel, and ignored the royal commands. Such lovely flowers, and of forms so entirely new to me, were not to be abandoned at the bidding of any little maid, however imperious. I bought the bouquet: and the little boy, after popping the halfpenny into his mouth, turned head-over-heels, as if to ascertain whether the human mouth is really adapted to serve as a money-box.

With wonder, that increased every moment, I turned over the flowers, and examined them one by one: there was not a single one among them that I could remember having ever seen before. At last I turned to the nursemaid. “Do these flowers grow wild about here? I never saw——” but the speech died away on my lips. The nursemaid had vanished!

“You can put me down, *now*, if you like,” Sylvie quietly remarked.

I obeyed in silence, and could only ask myself “Is this a *dream*?”, on finding Sylvie and Bruno walking one on either side of me, and clinging to my hands with the ready confidence of childhood.

“You’re larger than when I saw you last!” I began. “Really I think we ought to be introduced again! There’s so much of you that I never met before, you know.”

“Very well!” Sylvie merrily replied. “This is *Bruno*. It doesn’t take long. He’s only got one name!”

“There’s *another* name to me!” Bruno protested, with a reproachful look at the Mistress of the Ceremonies. “And it’s—‘*Esquire*’!”

“Oh, of course. I forgot,” said Sylvie. “Bruno—*Esquire*!”

“And did you come here to meet *me*, my children?” I enquired.

“You know I *said* we’d come on Tuesday,” Sylvie explained. “Are we the proper size for common children?”

"Quite the right size for *children*," I replied, (adding mentally "though not *common* children, by any means!") "But what became of the nursemaid?"

"It are *gone*!" Bruno solemnly replied.

"Then it wasn't solid, like Sylvie and you?"

"No. Oo couldn't *touch* it, oo know. If oo walked *at* it, oo'd go right froo!"

"I quite expected you'd find it out, once," said Sylvie. "Bruno ran it against a telegraph post, by accident. And it went in two halves. But you were looking the other way."

I felt that I had indeed missed an opportunity: to witness such an event as a nursemaid going 'in two halves' does not occur twice in a life-time!

"When did oo guess it were Sylvie?" Bruno enquired.

'It went in two halves'

"I didn't guess it, till it *was* Sylvie," I said. "But how did you manage the nursemaid?"

"*Bruno* managed it," said Sylvie. "It's called a Phlizz."

"And how do you make a Phlizz, Bruno?"

"The Professor teached me how," said Bruno. "First oo takes a lot of air——"

"Oh, *Bruno*!" Sylvie interposed. "The Professor said you weren't to tell!"

"But who did her *voice*?" I asked.

"Indeed it's troubling you too much, Sir! She can walk very well on the flat."

Bruno laughed merrily as I turned hastily from side to side, looking in all

directions for the speaker. "That were *me!*" he gleefully proclaimed, in his own voice.

"She can indeed walk very well on the flat," I said. "And I think *I* was the Flat."

By this time we were near the Hall. "This is where my friends live," I said. "Will you come in and have some tea with them?"

Bruno gave a little jump of joy: and Sylvie said "Yes, please. You'd like some tea, Bruno, wouldn't you? He hasn't tasted *tea*," she explained to me, "since we left Outland."

"And *that* weren't *good* tea!" said Bruno. "It were so *welly* weak!"

Chapter XX. Light Come, Light Go

Lady Muriel's smile of welcome could not *quite* conceal the look of surprise with which she regarded my new companions.

I presented them in due form. "This is *Sylvie*, Lady Muriel. And this is *Bruno*."

"Any surname?" she enquired, her eyes twinkling with fun.

"No," I said gravely. "No surname."

She laughed, evidently thinking I said it in fun; and stooped to kiss the children—a salute to which *Bruno* submitted with reluctance: *Sylvie* returned it with interest.

While she and Arthur (who had arrived before me) supplied the children with tea and cake, I tried to engage the Earl in conversation: but he was restless and *distract*, and we made little progress. At last, by a sudden question, he betrayed the cause of his disquiet.

"*Would* you let me look at those flowers you have in your hand?"

"Willingly!" I said, handing him the bouquet. Botany was, I knew, a favourite study of his: and these flowers were to me so entirely new and mysterious, that I was really curious to see what a botanist would say of them.

They did *not* diminish his disquiet. On the contrary, he became every moment more excited as he turned them over. "*These* are all from Central India!" he said, laying aside part of the bouquet. "They are rare, even there: and I have never seen them in any other part of the world. *These* two are Mexican—*This* one—" (He rose hastily, and carried it to the window, to examine it in a better light, the flush of excitement mounting to his very forehead) "—is, I am nearly sure—but I have a book of Indian Botany here—" He took a volume from the book-shelves, and turned the leaves with trembling fingers. "Yes! Compare it with this picture! It is the exact duplicate! This is the flower of the Upas-tree, which usually grows only in the depths of forests; and the flower fades so quickly after being plucked, that it is scarcely possible to keep its form or colour even so far as the outskirts of the forest! Yet this is in full bloom! *Where* did you get these flowers?" he added with breathless eagerness.

I glanced at Sylvie, who, gravely and silently, laid her finger on her lips, then beckoned to Bruno to follow her, and ran out into the garden; and I found myself in the position of a defendant whose two most important witnesses have been suddenly taken away. "Let me give you the flowers!" I stammered out at last, quite 'at my wit's end' as to how to get out of the difficulty. "You know much more about them than I do!"

“I accept them most gratefully! But you have not yet told me—” the Earl was beginning, when we were interrupted, to my great relief, by the arrival of Eric Lindon.

To *Arthur*, however, the new-comer was, I saw clearly, anything but welcome. His face clouded over: he drew a little back from the circle, and took no further part in the conversation, which was wholly maintained, for some minutes, by Lady Muriel and her lively cousin, who were discussing some new music that had just arrived from London.

“Do just try this one!” he pleaded. “The music looks easy to sing at sight, and the song’s quite appropriate to the occasion.”

“Then I suppose it’s

‘Five o’clock tea!
Ever to thee
Faithful I’ll be,
Five o’clock tea!’”

laughed Lady Muriel, as she sat down to the piano, and lightly struck a few random chords.

“Not quite: and yet it *is* a kind of ‘ever to thee faithful I’ll be!’ It’s a pair of hapless lovers: *he* crosses the briny deep: and *she* is left lamenting.”

“That is *indeed* appropriate!” she replied mockingly, as he placed the song before her.

“And am *I* to do the lamenting? And who for, if you please?”

She played the air once or twice through, first in quick, and finally in slow, time; and then gave us the whole song with as much graceful ease as if she had been familiar with it all her life:—

“He stept so lightly to the land,
All in his manly pride:
He kissed her cheek, he pressed her hand,
Yet still she glanced aside.
‘Too gay he seems,’ she darkly dreams,
‘Too gallant and too gay
To think of me—poor simple me—
When he is far away!’

‘I bring my Love this goodly pearl
Across the seas,’ he said:
‘A gem to deck the dearest girl
That ever sailor wed!’
She clasps it tight: her eyes are bright:
Her throbbing heart would say
‘He thought of me—he thought of me—
When he was far away!’

The ship has sailed into the West:
Her ocean-bird is flown:
A dull dead pain is in her breast,
And she is weak and lone;
Yet there’s a smile upon her face,
A smile that seems to say

‘He’ll think of me—he’ll think of me—
When he is far away!

‘Though waters wide between us glide,
Our lives are warm and near:
No distance parts two faithful hearts—
Two hearts that love so dear:
And I will trust my sailor-lad,
For ever and a day,
To think of me—to think of me—
When he is far away!’”

The look of displeasure, which had begun to come over Arthur’s face when the young Captain spoke of Love so lightly, faded away as the song proceeded, and he listened with evident delight. But his face darkened again when Eric demurely remarked “Don’t you think ‘my *soldier*-lad’ would have fitted the tune just as well!”

“Why, so it would!” Lady Muriel gaily retorted. “Soldiers, sailors, tinkers, tailors, what a lot of words would fit in! I think ‘my *tinker*-lad’ sounds best. Don’t *you*?”

To spare my friend further pain, I rose to go, just as the Earl was beginning to repeat his particularly embarrassing question about the flowers.

“You have not yet——”

“Yes, I’ve *had* some tea, thank you!” I hastily interrupted him. “And now we really *must* be going. Good evening, Lady Muriel!” And we made our adieux, and escaped, while the Earl was still absorbed in examining the mysterious bouquet.

Lady Muriel accompanied us to the door. “You *couldn’t* have given my father a more acceptable present!” she said, warmly. “He is so passionately fond of Botany. I’m afraid *I* know nothing of the *theory* of it, but I keep his *Hortus Siccus* in order. I must get some sheets of blotting-paper, and dry these new treasures for him before they fade.”

“*That* won’t be no good at all!” said Bruno, who was waiting for us in the garden.

“Why won’t it?” said I. “You know I *had* to give the flowers, to stop questions.”

“Yes, it ca’n’t be helped,” said Sylvie: “but they *will* be sorry when they find them gone!”

“But how will they go?”

“Well, I don’t know *how*. But they *will* go. The nosegay was only a *Phlizz*, you know. Bruno made it up.”

These last words were in a whisper, as she evidently did not wish Arthur to hear. But of this there seemed to be little risk: he hardly seemed to notice the children, but paced on, silent and abstracted; and when, at the entrance to the wood, they bid us a hasty farewell and ran off, he seemed to wake out of a day-dream.

The bouquet vanished, as Sylvie had predicted; and when, a day or two afterwards, Arthur and I once more visited the Hall, we found the Earl and his daughter, with the old housekeeper, out in the garden, examining the fastenings of the drawing-room window.

"We are holding an Inquest," Lady Muriel said, advancing to meet us: "and we admit you, as Accessories before the Fact, to tell us all you know about those flowers."

"The Accessories before the Fact decline to answer *any* questions," I gravely replied. "And they reserve their defence."

"Well then, turn Queen's Evidence, please! The flowers have disappeared in the night," she went on, turning to Arthur, "and we are *quite* sure no one in the house has meddled with them. Somebody must have entered by the window——"

"But the fastenings have not been tampered with," said the Earl.

"It must have been while you were dining, my Lady," said the housekeeper.

"That was it," said the Earl. "The thief must have seen you bring the flowers," turning to me, "and have noticed that you did *not* take them away. And he must have known their great value—they are simply *priceless!*" he exclaimed, in sudden excitement.

"And you never told us how you got them!" said Lady Muriel.

"Some day," I stammered, "I may be free to tell you. Just now, would you excuse me?"

The Earl looked disappointed, but kindly said "Very well, we will ask no questions."

Five o'clock tea

"But we consider you a *very* bad Queen's Evidence," Lady Muriel added playfully, as we entered the arbour. "We pronounce you to be an accomplice: and we sentence you to solitary confinement, and to be fed on bread and—butter. Do you take sugar?"

"It is disquieting, certainly," she resumed, when all 'creature-comforts' had been duly supplied, "to find that the house has been entered by a thief—in this out-of-the-way place. If only the flowers had been *eatables*, one might have suspected a thief of quite another shape——"

"You mean that universal explanation for all mysterious disappearances, 'the *cat* did it'?" said Arthur.

"Yes," she replied. "What a convenient thing it would be if all thieves had the same shape! It's so confusing to have some of them quadrupeds and others bipeds!"

"It has occurred to me," said Arthur, "as a curious problem in Teleology—the Science of Final Causes," he added, in answer to an enquiring look from Lady Muriel.

"And a Final Cause is——?"

"Well, suppose we say—the last of a series of connected events—each of the series being the cause of the next—for whose sake the first event takes place."

"But the last event is practically an *effect* of the first, isn't it? And yet you call it a *cause* of it!"

Arthur pondered a moment. "The words are rather confusing, I grant you," he said. "Will this do? The last event is an effect of the first: but the *necessity* for that event is a cause of the *necessity* for the first."

"That seems clear enough," said Lady Muriel. "Now let us have the problem."

"It's merely this. What object can we imagine in the arrangement by which each different size (roughly speaking) of living creatures has its special shape? For instance, the human race has one kind of shape—bipeds. Another set, ranging from the lion to the mouse, are quadrupeds. Go down a step or two further, and you come to insects with six legs—hexapods—a beautiful name, is it not? But beauty, in our sense of the word, seems to diminish as we go down: the creature becomes more—I won't say 'ugly' of any of God's creatures—more uncouth. And, when we take the microscope, and go a few steps lower still, we come upon animalculæ, terribly uncouth, and with a terrible number of legs!"

"The other alternative," said the Earl, "would be a *diminuendo* series of repetitions of the same type. Never mind the monotony of it: let's see how it would work in other ways. Begin with the race of men, and the creatures they require: let us say horses, cattle, sheep, and dogs—we don't exactly require frogs and spiders, do we, Muriel?"

Lady Muriel shuddered perceptibly: it was evidently a painful subject. "We can dispense with *them*," she said gravely.

"Well, then we'll have a second race of men, half-a-yard high——"

"—who would have *one* source of exquisite enjoyment, not possessed by ordinary men!" Arthur interrupted.

"*What* source?" said the Earl.

"Why, the grandeur of scenery! Surely the grandeur of a mountain, to *me*, depends on its *size*, relative to me? Double the height of the mountain, and of course it's twice as grand. Halve *my* height, and you produce the same effect."

"Happy, happy, happy Small!" Lady Muriel murmured rapturously. "None but the Short, none but the Short, none but the Short enjoy the Tall!"

"But let me go on," said the Earl. "We'll have a third race of men, five inches high; a fourth race, an inch high——"

"They couldn't eat common beef and mutton, I'm sure!" Lady Muriel interrupted.

"True, my child, I was forgetting. Each set must have its own cattle and sheep."

"And its own vegetation," I added. "What could a cow, an inch high, do with grass that waved far above its head?"

"That is true. We must have a pasture within a pasture, so to speak. The common grass would serve our inch-high cows as a green forest of palms, while round the root of each tall stem would stretch a tiny carpet of microscopic grass. Yes, I think our scheme will work fairly well. And it would be very interesting,

coming into contact with the races below us. What sweet little things the inch-high bull-dogs would be! I doubt if even *Muriel* would run away from one of them!”

“Don’t you think we ought to have a *crescendo* series, as well?” said Lady Muriel. “Only fancy being a hundred yards high! One could use an elephant as a paper-weight, and a crocodile as a pair of scissors!”

“And would you have races of different sizes communicate with one another?” I enquired. “Would they make war on one another, for instance, or enter into treaties?”

“*War* we must exclude, I think. When you could crush a whole nation with one blow of your fist, you couldn’t conduct war on equal terms. But anything, involving a collision of *minds* only, would be possible in our ideal world—for of course we must allow *mental* powers to all, irrespective of size. Perhaps the fairest rule would be that, the *smaller* the race, the *greater* should be its intellectual development!”

“Do you mean to say,” said Lady Muriel, “that these manikins of an inch high are to *argue* with me?”

“Surely, surely!” said the Earl. “An argument doesn’t depend for its logical force on the *size* of the creature that utters it!”

She tossed her head indignantly. “I would *not* argue with any man less than six inches high!” she cried. “I’d make him *work*!”

“What at?” said Arthur, listening to all this nonsense with an amused smile.

“*Embroidery!*” she readily replied. “What *lovely* embroidery they would do!”

“Yet, if they did it wrong,” I said, “you couldn’t *argue* the question. I don’t know *why*: but I agree that it couldn’t be done.”

“The reason is,” said Lady Muriel, “one couldn’t sacrifice one’s *dignity* so far.”

“Of course one couldn’t!” echoed Arthur. “Any more than one could argue with a potato. It would be altogether—excuse the ancient pun—*infra dig.*!”

“I doubt it,” said I. “Even a pun doesn’t *quite* convince me.”

“Well, if that is *not* the reason,” said Lady Muriel, “what reason would you give?”

I tried hard to understand the meaning of this question: but the persistent humming of the bees confused me, and there was a drowsiness in the air that made every thought stop and go to sleep before it had got well thought out: so all I could say was “That must depend on the *weight* of the potato.”

I felt the remark was not so sensible as I should have liked it to be. But Lady Muriel seemed to take it quite as a matter of course. “In that case——” she began, but suddenly started, and turned away to listen. “Don’t you hear him?” she said. “He’s crying. We must go to him, somehow.”

And I said to myself “That’s very strange! I quite thought it was *Lady Muriel* talking to me. Why, it’s *Sylvie* all the while!” And I made another great effort to say something that should have some meaning in it. “Is it about the potato?”

Chapter XXI. Through the Ivory Door

“I don’t know,” said Sylvie. “Hush! I must think. I could go to him, by myself, well enough. But I want *you* to come too.”

“Let me go with you,” I pleaded. “I can walk as fast as *you* can, I’m sure.”

Sylvie laughed merrily. "What nonsense!" she cried. "Why, you ca'n't walk a bit! You're lying quite flat on your back! You don't understand these things."

"I can walk as well as *you* can," I repeated. And I tried my best to walk a few steps: but the ground slipped away backwards, quite as fast as I could walk, so that I made no progress at all. Sylvie laughed again.

"There, I told you so! You've no idea how funny you look, moving your feet about in the air, as if you were walking! Wait a bit. I'll ask the Professor what we'd better do." And she knocked at his study-door.

The door opened, and the Professor looked out. "What's that crying I heard just now?" he asked. "Is it a human animal?"

"It's a boy," Sylvie said.

"I'm afraid you've been teasing him?"

"No, *indeed* I haven't!" Sylvie said, very earnestly. "I *never* tease him!"

"Well, I must ask the Other Professor about it." He went back into the study, and we heard him whispering "small human animal—says she hasn't been teasing him—the kind that's called Boy——"

"Ask her *which* Boy," said a new voice. The Professor came out again.

"*Which* Boy is it that you haven't been teasing?"

Sylvie looked at me with twinkling eyes. "You dear old thing!" she exclaimed, standing on tiptoe to kiss him, while he gravely stooped to receive the salute. "How you *do* puzzle me! Why, there are *several* boys I haven't been teasing!"

The Professor returned to his friend: and this time the voice said "Tell her to bring them here—*all* of them!"

"I ca'n't, and I won't!" Sylvie exclaimed, the moment he reappeared. "It's *Bruno* that's crying: and he's my brother: and, please, we *both* want to go: he ca'n't walk, you know: he's—he's *dreaming*, you know" (this in a whisper, for fear of hurting my feelings). "*Do* let's go through the Ivory Door!"

"I'll ask him," said the Professor, disappearing again. He returned directly. "He says you may. Follow me, and walk on tip-toe."

The difficulty with me would have been, just then, *not* to walk on tip-toe. It seemed very hard to reach down far enough to just touch the floor, as Sylvie led me through the study.

The Professor went before us to unlock the Ivory Door. I had just time to glance at the Other Professor, who was sitting reading, with his back to us, before the Professor showed us out through the door, and locked it behind us. Bruno was standing with his hands over his face, crying bitterly.

"What's the matter, darling?" said Sylvie, with her arms round his neck.

"Hurted mine self *welley* much!" sobbed the poor little fellow.

"I'm *so* sorry, darling! How ever *did* you manage to hurt yourself so?"

"Course I managed it!" said Bruno, laughing through his tears. "Doos oo think nobody else but oo ca'n't manage things?"

Matters were looking distinctly brighter, now Bruno had begun to argue. "Come, let's hear all about it!" I said.

"My foot took it into its head to slip——" Bruno began.

"A foot hasn't got a head!" Sylvie put in, but all in vain.

"I slipted down the bank. And I tripted over a stone. And the stone hurted my foot! And I trod on a Bee. And the Bee stinged my finger!" Poor Bruno sobbed again. The complete list of woes was too much for his feelings. "And it knewed I didn't *mean* to trod on it!" he added, as the climax.

'What's the matter, darling?'

"That Bee should be ashamed of itself!" I said severely, and Sylvie hugged and kissed the wounded hero till all tears were dried.

"My finger's quite unstung now!" said Bruno. "Why doos there be stones? Mister Sir, doos oo know?"

"They're good for *something*," I said: "even if we don't know *what*. What's the good of *dandelions*, now?"

"Dindledums?" said Bruno. "Oh, they're ever so pretty! And stones aren't pretty, one bit. Would oo like some dindledums, Mister Sir?"

"Bruno!" Sylvie murmured reproachfully. "You mustn't say 'Mister' and 'Sir,' both at once! Remember what I told you!"

"You telled me I were to say 'Mister' when I spoked *about* him, and I were to say 'Sir' when I spoked *to* him!"

"Well, you're not doing *both*, you know."

"Ah, but *I is* doing bofe, Miss Praticular!" Bruno exclaimed triumphantly. "I wishted to speak *about* the Gemplun—and I wishted to speak *to* the Gemplun. So a course I said 'Mister Sir'!"

"That's all right, Bruno," I said.

"*Course* it's all right!" said Bruno. "Sylvie just knows nuffin at all!"

"There never *was* an impertinenter boy!" said Sylvie, frowning till her bright eyes were nearly invisible.

"And there never was an ignoranter girl!" retorted Bruno. "Come along and pick some dindledums. *That's all she's fit for!*" he added in a very loud whisper to me.

"But why do you say 'Dindledums,' Bruno? *Dandelions* is the right word."

"It's because he jumps about so," Sylvie said, laughing.

"Yes, that's it," Bruno assented. "Sylvie tells me the words, and then, when I jump about, they get shoooken up in my head—till they're all froth!"

I expressed myself as perfectly satisfied with this explanation. "But aren't you going to pick me any dindledums, after all?"

"Course we will!" cried Bruno. "Come along, Sylvie!" And the happy children raced away, bounding over the turf with the fleetness and grace of young antelopes.

"Then you didn't find your way back to Outland?" I said to the Professor.

"Oh yes, I did!" he replied, "We never got to Queer Street; but I found another way. I've been backwards and forwards several times since then. I had to be present at the Election, you know, as the author of the new Money-Act. The Emperor was so kind as to wish that *I* should have the credit of it. 'Let come what come may,' (I remember the very words of the Imperial Speech) 'if it *should* turn out that the Warden *is* alive, *you* will bear witness that the change in the coinage is the *Professor's* doing, not *mine!*' I never was so glorified in my life, before!" Tears trickled down his cheeks at the recollection, which apparently was not *wholly* a pleasant one.

"Is the Warden supposed to be *dead*?"

"Well, it's *supposed* so: but, mind you, *I* don't believe it! The evidence is *very* weak—mere hear-say. A wandering Jester, with a Dancing-Bear (they found their way into the Palace, one day) has been telling people he comes from Fairyland, and that the Warden died there. *I* wanted the Vice-Warden to question him, but, most unluckily, he and my Lady were always out walking when the Jester came round. Yes, the Warden's supposed to be dead!" And more tears trickled down the old man's cheeks.

“But what is the new Money-Act?”

The Professor brightened up again. “The Emperor started the thing,” he said. “He wanted to make everybody in Outland twice as rich as he was before—just to make the new Government popular. Only there wasn’t nearly enough money in the Treasury to do it. So *I* suggested that he might do it by doubling the value of every coin and bank-note in Outland. It’s the simplest thing possible. I wonder nobody ever thought of it before! And you never saw such universal joy. The shops are full from morning to night. Everybody’s buying everything!”

“And how was the glorifying done?”

A sudden gloom overcast the Professor’s jolly face. “They did it as I went home after the Election,” he mournfully replied. “It was kindly meant—but I didn’t like it! They waved flags all round me till I was nearly blind: and they rang bells till I was nearly deaf: and they strewed the road so thick with flowers that I lost my way!” And the poor old man sighed deeply.

“How far is it to Outland?” I asked, to change the subject.

“About five days’ march. But one *must* go back—occasionally. You see, as Court-Professor, I have to be *always* in attendance on Prince Uggug. The Empress would be *very* angry if I left him, even for an hour.”

“But surely, every time you come here, you are absent ten days, at least?”

“Oh, more than that!” the Professor exclaimed. “A fortnight, sometimes. But of course I keep a memorandum of the exact time when I started, so that I can put the Court-time back to the very moment!”

“Excuse me,” I said. “I don’t understand.”

Silently the Professor drew from his pocket a square gold watch, with six or eight hands, and held it out for my inspection. “This,” he began, “is an Outlandish Watch——”

“So I should have thought.”

“—which has the peculiar property that, instead of *its* going with the *time*, the *time* goes with *it*. I trust you understand me now?”

“Hardly,” I said.

“Permit me to explain. So long as it is let alone, it takes its own course. Time has *no* effect upon it.”

“I have known such watches,” I remarked.

“It *goes*, of course, at the usual rate. Only the time has to go *with* it. Hence, if I move the hands, I change the time. To move them *forwards*, in *advance* of the true time, is impossible: but I can move them as much as a month *backwards*—that is the limit. And then you have the events all over again—with any alterations experience may suggest.”

“*What* a blessing such a watch would be,” I thought, “in real life! To be able to unsay some heedless word—to undo some reckless deed! Might I see the thing done?”

“With pleasure!” said the good natured Professor. “When I move *this* hand back to *here*,” pointing out the place, “History goes back fifteen minutes!”

Trembling with excitement, I watched him push the hand round as he described.

“Hurted mine self *welly* much!”

Shrilly and suddenly the words rang in my ears, and, more startled than I cared to show, I turned to look for the speaker.

Yes! There was Bruno, standing with the tears running down his cheeks, just as I had seen him a quarter of an hour ago; and there was Sylvie with her arms round his neck!

I had not the heart to make the dear little fellow go through his troubles a second time, so hastily begged the Professor to push the hands round into their former position. In a moment Sylvie and Bruno were gone again, and I could just see them in the far distance, picking ‘dindledums.’

“Wonderful, indeed!” I exclaimed.

“It has another property, yet more wonderful,” said the Professor. “You see this little peg? That is called the ‘Reversal Peg.’ If you push it in, the events of the next hour happen in the reverse order. Do not try it now. I will lend you the Watch for a few days, and you can amuse yourself with experiments.”

“Thank you very much!” I said as he gave me the Watch. “I’ll take the greatest care of it—why, here are the children again!”

“We could only but find *six* dindledums,” said Bruno, putting them into my hands, “‘cause Sylvie said it were time to go back. And here’s a big blackberry for *ooself*! We couldn’t only find but *two*!”

“Thank you: it’s *very* nice,” I said. “And I suppose *you* ate the other, Bruno?”

“No, I didn’t,” Bruno said, carelessly. “*Aren’t* they pretty dindledums, Mister Sir?”

“Yes, very: but what makes you limp so, my child?”

“Mine foot’s come *hurt*ed again!” Bruno mournfully replied. And he sat down on the ground, and began nursing it.

The Professor held his head between his hands—an attitude that I knew indicated distraction of mind. “Better rest a minute,” he said. “It may be better then—or it may be worse. If only I had some of my medicines here! I’m Court-Physician, you know,” he added, aside to me.

“Shall I go and get you some blackberries, darling?” Sylvie whispered, with her arms round his neck; and she kissed away a tear that was trickling down his cheek.

Bruno brightened up in a moment. “That *are* a good plan!” he exclaimed. “I thinks my foot would come *quite* unharmed, if I eated a blackberry—two or three blackberries—six or seven blackberries—”

Sylvie got up hastily. “I’d better go,” she said, aside to me, “before he gets into the double figures!”

“Let me come and help you,” I said. “I can reach higher up than you can.”

“Yes, please,” said Sylvie, putting her hand into mine: and we walked off together.

“Bruno *loves* blackberries,” she said, as we paced slowly along by a tall hedge, that looked a promising place for them, “and it was so *sweet* of him to make me eat the only one!”

“Oh, it was *you* that ate it, then? Bruno didn’t seem to like to tell me about it.”

“No; I saw that,” said Sylvie. “He’s always afraid of being praised. But he *made* me eat it, really! I would much rather he—oh, what’s that?” And she clung to my hand, half-frightened, as we came in sight of a hare, lying on its side with legs stretched out, just in the entrance to the wood.

“It’s a *hare*, my child. Perhaps it’s asleep.”

"No, it isn't asleep," Sylvie said, timidly going nearer to look at it: "it's eyes are open. Is it—is it—" her voice dropped to an awestruck whisper, "is it *dead*, do you think?"

"Yes, it's quite dead," I said, after stooping to examine it. "Poor thing! I think it's been hunted to death. I know the harriers were out yesterday. But they haven't touched it. Perhaps they caught sight of another, and left it to die of fright and exhaustion."

"Hunted to *death*?" Sylvie repeated to herself, very slowly and sadly. "I thought hunting was a thing they *played* at—like a game. Bruno and I hunt snails: but we never hurt them when we catch them!"

"Sweet angel!" I thought. "How am I to get the idea of *Sport* into your innocent mind?" And as we stood, hand-in-hand, looking down at the dead hare, I tried to put the thing into such words as she could understand. "You know what fierce wild-beasts lions and tigers are?" Sylvie nodded. "Well, in some countries men *have* to kill them, to save their own lives, you know."

"Yes," said Sylvie: "if one tried to kill *me*, Bruno would kill *it*—if he could."

"Well, and so the men—the hunters—get to enjoy it, you know: the running, and the fighting, and the shouting, and the danger."

"Yes," said Sylvie. "Bruno likes danger."

"Well, but, in *this* country, there aren't any lions and tigers, loose: so they hunt other creatures, you see." I hoped, but in vain, that this would satisfy her, and that she would ask no more questions.

"They hunt *foxes*," Sylvie said, thoughtfully. "And I think they *kill* them, too. Foxes are very fierce. I daresay men don't love them. Are hares fierce?"

"No," I said. "A hare is a sweet, gentle, timid animal—almost as gentle as a lamb."

"But, if men *love* hares, why—why—" her voice quivered, and her sweet eyes were brimming over with tears.

"I'm afraid they *don't* love them, dear child."

"All *children* love them," Sylvie said. "All ladies love them."

"I'm afraid even *ladies* go to hunt them, sometimes."

Sylvie shuddered. "Oh, no, not *ladies*!" she earnestly pleaded. "Not Lady Muriel!"

"No, *she* never does, I'm sure—but this is too sad a sight for *you*, dear. Let's try and find some—"

But Sylvie was not satisfied yet. In a hushed, solemn tone, with bowed head and clasped hands, she put her final question. "Does GOD love hares?"

"Yes!" I said. "I'm *sure* He does! He loves every living thing. Even sinful *men*. How much more the animals, that cannot sin!"

"I don't know what 'sin' means," said Sylvie. And I didn't try to explain it.

"Come, my child," I said, trying to lead her away. "Wish good-bye to the poor hare, and come and look for blackberries."

"Good-bye, poor hare!" Sylvie obediently repeated, looking over her shoulder at it as we turned away. And then, all in a moment, her self-command gave way. Pulling her hand out of mine, she ran back to where the dead hare was lying, and flung herself down at its side in such an agony of grief as I could hardly have believed possible in so young a child.

"Oh, my darling, my darling!" she moaned, over and over again. "And GOD meant your life to be so beautiful!"

Sometimes, but always keeping her face hidden on the ground, she would reach out one little hand, to stroke the poor dead thing, and then once more bury her face in her hands, and sob as if her heart would break.

The dead hare

I was afraid she would really make herself ill: still I thought it best to let her weep away the first sharp agony of grief: and, after a few minutes, the sobbing gradually ceased, and Sylvie rose to her feet, and looked calmly at me, though tears were still streaming down her cheeks.

I did not dare to speak again, just yet; but simply held out my hand to her, that we might quit the melancholy spot.

“Yes, I’ll come now,” she said. Very reverently she kneeled down, and kissed the dead hare; then rose and gave me her hand, and we moved on in silence.

A child’s sorrow is violent, but short; and it was almost in her usual voice that she said, after a minute, “Oh stop, stop! Here are some *lovely* blackberries!”

We filled our hands with fruit, and returned in all haste to where the Professor and Bruno were seated on a bank, awaiting our return.

Just before we came within hearing-distance, Sylvie checked me. “Please don’t tell *Bruno* about the hare!” she said.

“Very well, my child. But why not?”

Tears again glittered in those sweet eyes, and she turned her head away, so that I could scarcely hear her reply. “He’s—he’s very *fond* of gentle creatures, you know. And he’d—he’d be so sorry! I don’t want him to be made sorry.”

“And *your* agony of sorrow is to count for nothing, then, sweet unselfish child!” I thought to myself. But no more was said till we had reached our friends; and Bruno was far too much engrossed, in the feast we had brought him, to take any notice of Sylvie’s unusually grave manner.

“I’m afraid it’s getting rather late, Professor?” I said.

“Yes, indeed,” said the Professor. “I must take you all through the Ivory Door again. You’ve stayed your full time.”

“Mightn’t we stay a *little* longer!” pleaded Sylvie.

“Just *one* minute!” added Bruno.

But the Professor was unyielding. “It’s a great privilege, coming through at

all," he said. "We must go now." And we followed him obediently to the Ivory Door, which he threw open, and signed to me to go through first.

"You're coming too, aren't you?" I said to Sylvie.

"Yes," she said: "but you won't see us after you've gone through."

"But suppose I wait for you outside?" I asked, as I stepped through the doorway.

"In that case," said Sylvie, "I think the potato would be *quite* justified in asking *your* weight. I can quite imagine a really *superior* kidney-potato declining to argue with any one under *fifteen stone!*"

With a great effort I recovered the thread of my thoughts. "We lapse very quickly into nonsense!" I said.

Chapter XXII. Crossing The Line.

"Let us lapse back again," said Lady Muriel. "Take another cup of tea? I hope *that's* sound common sense?"

"And all that strange adventure," I thought, "has occupied the space of a single comma in Lady Muriel's speech! A single comma, for which grammarians tell us to 'count *one*'!" (I felt no doubt that the Professor had kindly put back the time for me, to the exact point at which I had gone to sleep.)

When, a few minutes afterwards, we left the house, Arthur's first remark was certainly a strange one. "We've been there just *twenty minutes*," he said, "and I've done nothing but listen to you and Lady Muriel talking: and yet, somehow, I feel exactly as if *I* had been talking with her for an *hour* at least!"

And so *he had* been, I felt no doubt: only, as the time had been put back to the beginning of the tête-à-tête he referred to, the whole of it had passed into oblivion, if not into nothingness! But I valued my own reputation for sanity too highly to venture on explaining to *him* what had happened.

For some cause, which I could not at the moment divine, Arthur was unusually grave and silent during our walk home. It could not be connected with Eric Lindon, I thought, as he had for some days been away in London: so that, having Lady Muriel almost 'all to himself'—for *I* was only too glad to hear those two conversing, to have any wish to intrude any remarks of my own—he *ought*, theoretically, to have been specially radiant and contented with life. "Can he have heard any bad news?" I said to myself. And, almost as if he had read my thoughts, he spoke.

"He will be here by the last train," he said, in the tone of one who is continuing a conversation rather than beginning one.

"Captain Lindon, do you mean?"

"Yes—Captain Lindon," said Arthur: "I said 'he,' because I fancied we were talking about him. The Earl told me he comes to-night, though *to-morrow* is the day when he will know about the Commission that he's hoping for. I wonder he doesn't stay another day to hear the result, if he's really so anxious about it as the Earl believes he is."

"He can have a telegram sent after him," I said: "but it's not very soldier-like, running away from possible bad news!"

"He's a very good fellow," said Arthur: "but I confess it would be good news for *me*, if he got his Commission, and his Marching Orders, all at once! I wish him all happiness—with *one* exception. Good night!" (We had reached home by this time.) "I'm not good company to-night—better be alone."

It was much the same, next day. Arthur declared he wasn't fit for Society, and I had to set forth alone for an afternoon-stroll. I took the road to the Station, and, at the point where the road from the 'Hall' joined it, I paused, seeing my friends in the distance, seemingly bound for the same goal.

"Will you join us?" the Earl said, after I had exchanged greetings with him, and Lady Muriel, and Captain Lindon. "This restless young man is expecting a telegram, and we are going to the Station to meet it."

"There is also a restless young woman in the case," Lady Muriel added.

"That goes without saying, my child," said her father. "Women are *always* restless!"

"For generous appreciation of all one's *best* qualities," his daughter impressively remarked, "there's nothing to compare with a father, is there, Eric?"

"Cousins are not 'in it,'" said Eric: and then somehow the conversation lapsed into two duologues, the younger folk taking the lead, and the two old men following with less eager steps.

"And when are we to see your little friends again?" said the Earl. "They are singularly attractive children."

"I shall be delighted to bring them, when I can," I said. "But I don't know, myself, when I am likely to see them again."

"I'm not going to question you," said the Earl: "but there's no harm in mentioning that Muriel is simply tormented with curiosity! We know most of the people about here, and she has been vainly trying to guess what house they can possibly be staying at."

"Some day I may be able to enlighten her: but just at present——"

"Thanks. She must bear it as best she can. *I* tell her it's a grand opportunity for practising *patience*. But she hardly sees it from that point of view. Why, there *are* the children!"

So indeed they were: waiting (for *us*, apparently) at a stile, which they could not have climbed over more than a few moments, as Lady Muriel and her cousin had passed it without seeing them. On catching sight of us, Bruno ran to meet us, and to exhibit to us, with much pride, the handle of a clasp-knife—the blade having been broken off—which he had picked up in the road.

"And what shall you use it for, Bruno?" I said.

"Don't know," Bruno carelessly replied: "must think."

"A child's first view of life," the Earl remarked, with that sweet sad smile of his, "is that it is a period to be spent in accumulating portable property. That view gets modified as the years glide away." And he held out his hand to Sylvie, who had placed herself by me, looking a little shy of him.

But the gentle old man was not one with whom any child, human or fairy, could be shy for long; and she had very soon deserted my hand for his—Bruno alone remaining faithful to his first friend. We overtook the other couple just as they reached the Station, and both Lady Muriel and Eric greeted the children as old friends—the latter with the words "So you got to Babylon by candlelight, after all?"

"Yes, and back again!" cried Bruno.

Lady Muriel looked from one to the other in blank astonishment. "What, *you* know them, Eric?" she exclaimed. "This mystery grows deeper every day!"

"Then we must be somewhere in the Third Act," said Eric. "You don't expect the mystery to be cleared up till the Fifth Act, do you?"

"But it's such a *long* drama!" was the plaintive reply. "We *must* have got to the Fifth Act by this time!"

"*Third* Act, I assure you," said the young soldier mercilessly. "Scene, a railway-platform. Lights down. Enter Prince (in disguise, of course) and faithful Attendant. *This* is the Prince—" (taking Bruno's hand) "and here stands his humble Servant! What is your Royal Highness's next command?" And he made a most courtier-like low bow to his puzzled little friend.

"Oo're *not* a Servant!" Bruno scornfully exclaimed. "Oo're a *Gemplun*!"

"*Servant*, I assure your Royal Highness!" Eric respectfully insisted. "Allow me to mention to your Royal Highness my various situations—past, present, and future."

"What did oo begin wiz?" Bruno asked, beginning to enter into the jest. "Was oo a shoe-black?"

"Lower than that, your Royal Highness! Years ago, I offered myself as a *Slave*—as a '*Confidential Slave*,' I think it's called?" he asked, turning to Lady Muriel.

But Lady Muriel heard him not: something had gone wrong with her glove, which entirely engrossed her attention.

"Did oo get the place?" said Bruno.

"Sad to say, Your Royal Highness, I did *not*! So I had to take a situation as—as *Waiter*, which I have now held for some years—haven't I?" He again glanced at Lady Muriel.

"Sylvie dear, *do* help me to button this glove!" Lady Muriel whispered, hastily stooping down, and failing to hear the question.

"And what will oo be *next*?" said Bruno.

"My next place will, I hope, be that of *Groom*. And after that——"

"Don't puzzle the child so!" Lady Muriel interrupted. "What nonsense you talk!"

"—after that," Eric persisted, "I hope to obtain the situation of *Housekeeper*, which—*Fourth Act*!" he proclaimed, with a sudden change of tone. "Lights turned up. Red lights. Green lights. Distant rumble heard. Enter a passenger-train!"

And in another minute the train drew up alongside of the platform, and a stream of passengers began to flow out from the booking office and waiting-rooms.

"Did you ever make *real* life into a drama?" said the Earl. "Now just try. I've often amused myself that way. Consider this platform as our stage. Good entrances and exits on *both* sides, you see. Capital background scene: real engine moving up and down. All this bustle, and people passing to and fro, must have been most carefully rehearsed! How naturally they do it! With never a glance at the audience! And every grouping is quite fresh, you see. No repetition!"

It really was admirable, as soon as I began to enter into it from this point of view. Even a porter passing, with a barrow piled with luggage, seemed so realistic that one was tempted to applaud. He was followed by an angry mother, with hot red face, dragging along two screaming children, and calling, to some one behind, "John! Come on!" Enter John, very meek, very silent, and loaded with parcels. And he was followed, in his turn, by a frightened little nursemaid, carrying a fat baby, also screaming. All the children screamed.

"Capital byplay!" said the old man aside. "Did you notice the nursemaid's look of terror? It was simply *perfect*!"

“You have struck quite a new vein,” I said. “To most of us Life and its pleasures seem like a mine that is nearly worked out.”

“Worked out!” exclaimed the Earl. “For any one with true dramatic instincts, it is only the Overture that is ended! The real treat has yet to begin. You go to a theatre, and pay your ten shillings for a stall, and what do you get for your money? Perhaps it’s a dialogue between a couple of farmers—unnatural in their overdone caricature of farmers’ dress—more unnatural in their constrained attitudes and gestures—most unnatural in their attempts at ease and geniality in their talk. Go instead and take a seat in a third-class railway-carriage, and you’ll get the same dialogue done *to the life!* Front-seats—no orchestra to block the view—and nothing to pay!”

“Which reminds me,” said Eric. “There is nothing to pay on receiving a telegram! Shall we enquire for one?” And he and Lady Muriel strolled off in the direction of the Telegraph-Office.

“I wonder if Shakespeare had that thought in his mind,” I said, “when he wrote ‘All the world’s a stage’?”

The old man sighed. “And so it is,” he said, “look at it as you will. Life is indeed a drama; a drama with but few *encores*—and no *bouquets!*” he added dreamily. “We spend one half of it in regretting the things we did in the other half!”

“And the secret of *enjoying* it,” he continued, resuming his cheerful tone, “is *intensity!*”

“But not in the modern æsthetic sense, I presume? Like the young lady, in Punch, who begins a conversation with ‘Are you *intense?*’”

“By no means!” replied the Earl. “What I mean is intensity of *thought*—a concentrated *attention*. We lose half the pleasure we might have in Life, by not really *attending*. Take any instance you like: it doesn’t matter *how* trivial the pleasure may be—the principle is the same. Suppose *A* and *B* are reading the same second-rate circulating-library novel. *A* never troubles himself to master the relationships of the characters, on which perhaps all the interest of the story depends: he ‘skips’ over all the descriptions of scenery, and every passage that looks rather dull: he doesn’t half attend to the passages he does read: he goes on reading—merely from want of resolution to find another occupation—for hours after he ought to have put the book aside: and reaches the ‘FINIS’ in a state of utter weariness and depression! *B* puts his whole soul *into* the thing—on the principle that ‘whatever is worth doing is worth doing *well*’: he masters the genealogies: he calls up pictures before his ‘mind’s eye’ as he reads about the scenery: best of all, he resolutely shuts the book at the end of some chapter, while his interest is yet at its keenest, and turns to other subjects; so that, when next he allows himself an hour at it, it is like a hungry man sitting down to dinner: and, when the book is finished, he returns to the work of his daily life like ‘a giant refreshed’!”

“But suppose the book were really *rubbish*—nothing to repay attention?”

“Well, suppose it,” said the Earl. “My theory meets *that* case, I assure you! *A* never finds out that it *is* rubbish, but maunders on to the end, trying to believe he’s enjoying himself. *B* quietly shuts the book, when he’s read a dozen pages, walks off to the Library, and changes it for a better! I have yet *another* theory for adding to the enjoyment of Life—that is, if I have not exhausted your patience? I’m afraid you find me a very garrulous old man.”

Quoted from *As You Like It* by William Shakespeare

Quoted from *Refinements of Modern Speech* in *Punch*, June 14, 1879

Quoted from Psalm 19:5

"No indeed!" I exclaimed earnestly. And indeed I felt as if one *could* not easily tire of the sweet sadness of that gentle voice.

"It is, that we should learn to take our pleasures *quickly*, and our pains *slowly*."

"But why? I should have put it the other way, myself."

"By taking *artificial* pain—which can be as trivial as you please—*slowly*, the result is that, when *real* pain comes, however severe, all you need do is to let it go at its *ordinary* pace, and it's over in a moment!"

"Very true," I said, "but how about the *pleasure*?"

"Why, by taking it quick, you can get so much more into life. It takes *you* three hours and a half to hear and enjoy an opera. Suppose *I* can take it in, and enjoy it, in half-an-hour. Why, I can enjoy *seven* operas, while you are listening to *one*!"

"Always supposing you have an orchestra capable of *playing* them," I said. "And that orchestra has yet to be found!"

The old man smiled. "I have heard an air played," he said, "and by no means a short one—played right through, variations and all, in three seconds!"

"When? And how?" I asked eagerly, with a half-notion that I was dreaming again.

"It was done by a little musical-box," he quietly replied. "After it had been wound up, the regulator, or something, broke, and it ran down, as I said, in about three seconds. But it *must* have played all the notes, you know!"

"Did you *enjoy* it?" I asked, with all the severity of a cross-examining barrister.

"No, I didn't!" he candidly confessed. "But then, you know, I hadn't been trained to that kind of music!"

"I should much like to *try* your plan," I said, and, as Sylvie and Bruno happened to run up to us at the moment, I left them to keep the Earl company, and strolled along the platform, making each person and event play its part in an *extempore* drama for my especial benefit. "What, is the Earl tired of you already?" I said, as the children ran past me.

"No!" Sylvie replied with great emphasis. "He wants the evening-paper. So Bruno's going to be a little news-boy!"

"Mind you charge a good price for it!" I called after them.

Returning up the platform, I came upon Sylvie alone. "Well, child," I said, "where's your little news-boy? Couldn't he get you an evening-paper?"

"He went to get one at the book-stall at the other side," said Sylvie; "and he's coming across the line with it—oh, Bruno, you ought to cross by the bridge!" for the distant thud, thud, of the Express was already audible. Suddenly a look of horror came over her face. "Oh, he's fallen down on the rails!" she cried, and darted past me at a speed that quite defied the hasty effort I made to stop her.

But the wheezy old Station-Master happened to be close behind me: he wasn't good for much, poor old man, but he was good for this; and, before I could turn round, he had the child clasped in his arms, saved from the certain death she was rushing to. So intent was I in watching this scene, that I hardly saw a flying figure in a light grey suit, who shot across from the back of the platform, and was on the line in another second. So far as one could take note of time in such a moment of horror he had about ten clear seconds, before the Express would be upon him, in which to cross the rails and to pick up Bruno. Whether he did so or not it was quite impossible to guess: the next thing one

knew was that the Express had passed, and that, whether for life or death, all was over. When the cloud of dust had cleared away, and the line was once more visible, we saw with thankful hearts that the child and his deliverer were safe.

“All right!” Eric called to us cheerfully, as he recrossed the line. “He’s more frightened than hurt!”

Crossing the line

He lifted the little fellow up into Lady Muriel’s arms, and mounted the platform as gaily as if nothing had happened: but he was as pale as death, and leaned heavily on the arm I hastily offered him, fearing he was about to faint. “I’ll just—sit down a moment—” he said dreamily: “—where’s Sylvie?”

Sylvie ran to him, and flung her arms round his neck, sobbing as if her heart would break. “Don’t do that, my darling!” Eric murmured, with a strange look in his eyes. “Nothing to cry about now, you know. But you very nearly got yourself killed for nothing!”

“For Bruno!” the little maiden sobbed. “And he would have done it for me. Wouldn’t you, Bruno?”

“Course I would!” Bruno said, looking round with a bewildered air.

Lady Muriel kissed him in silence as she put him down out of her arms. Then she beckoned Sylvie to come and take his hand, and signed to the children to go back to where the Earl was seated. “Tell him,” she whispered with quivering lips, “tell him—all is well!” Then she turned to the hero of the day. “I thought it was *death*,” she said. “Thank God, you are safe! Did you see how near it was?”

“I saw there was just time,” Eric said lightly. “A soldier must learn to carry his life in his hand, you know. I’m all right now. Shall we go to the telegraph-office again? I daresay it’s come by this time.”

I went to join the Earl and the children, and we waited—almost in silence, for no one seemed inclined to talk, and Bruno was half-asleep on Sylvie’s lap—till the others joined us. No telegram had come.

"I'll take a stroll with the children," I said, feeling that we were a little *de trop*, "and I'll look in, in the course of the evening."

"We must go back into the wood, now," Sylvie said, as soon as we were out of hearing. "We ca'n't stay this size any longer."

"Then you will be quite tiny Fairies again, next time we meet?"

"Yes," said Sylvie: "but we'll be children again some day—if you'll let us. Bruno's very anxious to see Lady Muriel again."

"She are *welky* nice," said Bruno.

"I shall be very glad to take you to see her again," I said. "Hadn't I better give you back the Professor's Watch? It'll be too large for you to carry when you're Fairies, you know."

Bruno laughed merrily. I was glad to see he had quite recovered from the terrible scene he had gone through. "Oh no, it won't!" he said. "When *we* go small, *it'll* go small!"

"And then it'll go straight to the Professor," Sylvie added, "and you won't be able to use it any more: so you'd better use it all you can, *now*. We *must* go small when the sun sets. Good-bye!"

"Good-bye!" cried Bruno. But their voices sounded very far away, and, when I looked round, both children had disappeared.

"And it wants only two hours to sunset!" I said as I strolled on. "I must make the best of my time!"

Chapter XXIII. An Outlandish Watch.

As I entered the little town, I came upon two of the fishermen's wives interchanging that last word "which never was the last": and it occurred to me, as an experiment with the Magic Watch, to wait till the little scene was over, and then to 'encore' it.

"Well, good night t'ye! And ye winna forget to send us word when your Martha writes?"

"Nay, ah winna forget. An' if she isn't suited, she can but coom back. Good night t'ye!"

A casual observer might have thought "and there ends the dialogue!" That casual observer would have been mistaken.

"Ah, she'll like 'em, I war'n' ye! *They'll* not treat her bad, yer may depend. They're varry canny fowk. Good night!"

"Ay, they *are* that! Good night!"

"Good night! And ye'll send us word if she writes?"

"Aye, ah will, yer may depend! Good night t'ye!"

And at last they parted. I waited till they were some twenty yards apart, and then put the Watch a minute back. The instantaneous change was startling: the two figures seemed to flash back into their former places.

"—isn't suited, she can but coom back. Good night t'ye!" one of them was saying: and so the whole dialogue was repeated, and, when they had parted for the second time, I let them go their several ways, and strolled on through the town.

"But the real usefulness of this magic power," I thought, "would be to undo some harm, some painful event, some accident——" I had not long to wait for an opportunity of testing *this* property also of the Magic Watch, for, even as the thought passed through my mind, the accident I was imagining occurred. A light

cart was standing at the door of the 'Great Millinery Dépôt' of Elveston, laden with card-board packing-cases, which the driver was carrying into the shop, one by one. One of the cases had fallen into the street, but it scarcely seemed worth while to step forward and pick it up, as the man would be back again in a moment. Yet, in that moment, a young man riding a bicycle came sharp round the corner of the street and, in trying to avoid running over the box, upset his machine, and was thrown headlong against the wheel of the spring-cart. The driver ran out to his assistance, and he and I together raised the unfortunate cyclist and carried him into the shop. His head was cut and bleeding; and one knee seemed to be badly injured; and it was speedily settled that he had better be conveyed at once to the only Surgery in the place. I helped them in emptying the cart, and placing in it some pillows for the wounded man to rest on; and it was only when the driver had mounted to his place, and was starting for the Surgery, that I bethought me of the strange power I possessed of undoing all this harm.

"Now is my time!" I said to myself, as I moved back the hand of the Watch, and saw, almost without surprise this time, all things restored to the places they had occupied at the critical moment when I had first noticed the fallen packing-case.

Instantly I stepped out into the street, picked up the box, and replaced it in the cart: in the next moment the bicycle had spun round the corner, passed the cart without let or hindrance, and soon vanished in the distance, in a cloud of dust.

"Delightful power of magic!" I thought. "How much of human suffering I have—not only relieved, but actually annihilated!" And, in a glow of conscious virtue, I stood watching the unloading of the cart, still holding the Magic Watch open in my hand, as I was curious to see what would happen when we again reached the exact time at which I had put back the hand.

The result was one that, if only I had considered the thing carefully, I might have foreseen: as the hand of the Watch touched the mark, the spring-cart—which had driven off, and was by this time half-way down the street, was back again at the door, and in the act of starting, while—oh woe for the golden dream of world-wide benevolence that had dazzled my dreaming fancy!—the wounded youth was once more reclining on the heap of pillows, his pale face set rigidly in the hard lines that told of pain resolutely endured.

"Oh mocking Magic Watch!" I said to myself, as I passed out of the little town, and took the seaward road that led to my lodgings. "The good I fancied I could do is vanished like a dream: the evil of this troublesome world is the only abiding reality!"

And now I must record an experience so strange, that I think it only fair, before beginning to relate it, to release my much-enduring reader from any obligation he may feel to believe this part of my story. *I* would not have believed it, I freely confess, if I had not seen it with my own eyes: then why should I expect it of my reader, who, quite possibly, has never seen anything of the sort?

I was passing a pretty little villa, which stood rather back from the road, in its own grounds, with bright flower-beds in front—creepers wandering over the walls and hanging in festoons about the bow-windows—an easy-chair forgotten on the lawn, with a newspaper lying near it—a small pug-dog "couchant" before it, resolved to guard the treasure even at the sacrifice of life—and a front-door standing invitingly half-open. "Here is my chance," I thought, "for testing the

reverse action of the Magic Watch!" I pressed the 'reversal-peg' and walked in. In *another* house, the entrance of a stranger might cause surprise—perhaps anger, even going so far as to expel the said stranger with violence: but *here*, I knew, nothing of the sort could happen. The *ordinary* course of events—first, to think nothing about me; then, hearing my footsteps to look up and see me; and then to wonder what business I had there—would be reversed by the action of my Watch. They would *first* wonder who I was, *then* see me, then look down, and think no more about me. And as to being expelled with violence, *that* event would necessarily come *first* in this case. "So, if I can once get *in*," I said to myself, "all risk of *expulsion* will be over!"

'The pug-dog sat up'

The pug-dog sat up, as a precautionary measure, as I passed; but, as I took no notice of the treasure he was guarding, he let me go by without even one remonstrant bark. "He that takes my life," he seemed to be saying, wheezily, to himself, "takes trash: But he that takes the *Daily Telegraph*——!" But this awful contingency I did not face.

The party in the drawing-room—I had walked straight in, you understand, without ringing the bell, or giving any notice of my approach—consisted of four laughing rosy children, of ages from about fourteen down to ten, who were, apparently, all coming towards the door (I found they were really walking *backwards*), while their mother, seated by the fire with some needlework on her lap, was saying, just as I entered the room, "Now, girls, you may get your things on for a walk."

To my utter astonishment—for I was not yet accustomed to the action of the Watch—"all smiles ceased" (as Browning says) on the four pretty faces, and they all got out pieces of needle-work, and sat down. No one noticed *me* in the least, as I quietly took a chair and sat down to watch them.

When the needle-work had been unfolded, and they were all ready to begin, their mother said "Come, *that's* done, at last! You may fold up your work, girls."

But the children took no notice whatever of the remark; on the contrary, they set to work at once sewing—if that is the proper word to describe an operation such as *I* had never before witnessed. Each of them threaded her needle with a short end of thread attached to the work, which was instantly pulled by an invisible force through the stuff, dragging the needle after it: the nimble fingers of the little sempstress caught it at the other side, but only to lose it again the next moment. And so the work went on, steadily undoing itself, and the neatly-stitched little dresses, or whatever they were, steadily falling to pieces. Now and then one of the children would pause, as the recovered thread became inconveniently long, wind it on a bobbin, and start again with another short end.

At last all the work was picked to pieces and put away, and the lady led the way into the next room, walking backwards, and making the insane remark “Not yet, dear: we *must* get the sewing done first.” After which, I was not surprised to see the children skipping backwards after her, exclaiming “Oh, mother, it *is* such a lovely day for a walk!”

In the dining-room, the table had only dirty plates and empty dishes on it. However the party—with the addition of a gentleman, as good-natured, and as rosy, as the children—seated themselves at it very contentedly.

You have seen people eating cherry-tart, and every now and then cautiously conveying a cherry-stone from their lips to their plates? Well, something like that went on all through this ghastly—or shall we say ‘ghostly’?—banquet. An empty fork is raised to the lips: there it receives a neatly-cut piece of mutton, and swiftly conveys it to the plate, where it instantly attaches itself to the mutton already there. Soon one of the plates, furnished with a complete slice of mutton and two potatoes, was handed up to the presiding gentleman, who quietly replaced the slice on the joint, and the potatoes in the dish.

Their conversation was, if possible, more bewildering than their mode of dining. It began by the youngest girl suddenly, and without provocation, addressing her eldest sister. “Oh, you *wicked* story-teller!” she said.

I expected a sharp reply from the sister; but, instead of this, she turned laughingly to her father, and said, in a very loud stage-whisper, “To be a bride!”

The father, in order to do *his* part in a conversation that seemed only fit for lunatics, replied “Whisper it to me, dear.”

But she *didn't* whisper (these children never did anything they were told): she said, quite loud, “Of course not! Everybody knows what *Dolly* wants!”

And little Dolly shrugged her shoulders, and said, with a pretty pettishness, “Now, Father, you're not to tease! You know I don't want to be bride's-maid to *anybody*!”

“And Dolly's to be the fourth,” was her father's idiotic reply.

Here Number Three put in her oar. “Oh, it *is* settled, Mother dear, really and truly! Mary told us all about it. It's to be next Tuesday four weeks—and three of her cousins are coming to be bride's-maids—and——”

“*She* doesn't forget it, Minnie!” the Mother laughingly replied. “I do wish they'd get it settled! I don't like long engagements.”

And Minnie wound up the conversation—if so chaotic a series of remarks deserves the name—with “Only think! We passed the Cedars this morning, just exactly as Mary Davenant was standing at the gate, wishing good-bye to Mister—I forget his name. Of course we looked the other way.”

By this time I was so hopelessly confused that I gave up listening, and followed the dinner down into the kitchen.

But to you, O hypercritical reader, resolute to believe no item of this weird adventure, what need to tell how the mutton was placed on the spit, and slowly unroasted—how the potatoes were wrapped in their skins, and handed over to the gardener to be buried—how, when the mutton had at length attained to rawness, the fire, which had gradually changed from red-heat to a mere blaze, died down so suddenly that the cook had only just time to catch its last flicker on the end of a match—or how the maid, having taken the mutton off the spit, carried it (backwards, of course) out of the house, to meet the butcher, who was coming (also backwards) down the road?

The longer I thought over this strange adventure, the more hopelessly tangled the mystery became: and it was a real relief to meet Arthur in the road, and get him to go with me up to the Hall, to learn what news the telegraph had brought. I told him, as we went, what had happened at the Station, but as to my further adventures I thought it best, for the present, to say nothing.

The Earl was sitting alone when we entered. "I am glad you are come in to keep me company," he said. "Muriel is gone to bed—the excitement of that terrible scene was too much for her—and Eric has gone to the hotel to pack his things, to start for London by the early train."

"Then the telegram has come?" I said.

"Did you not hear? Oh, I had forgotten: it came in after you left the Station. Yes, it's all right: Eric has got his commission; and, now that he has arranged matters with Muriel, he has business in town that must be seen to at once."

"What arrangement do you mean?" I asked with a sinking heart, as the thought of Arthur's crushed hopes came to my mind. "Do you mean that they are *engaged*?"

"They have been engaged—in a sense—for two years," the old man gently replied: "that is, he has had my promise to consent to it, so soon as he could secure a permanent and settled line in life. I could never be happy with my child married to a man without an object to live for—without even an object to die for!"

"I hope they will be happy," a strange voice said. The speaker was evidently in the room, but I had not heard the door open, and I looked round in some astonishment. The Earl seemed to share my surprise. "Who spoke?" he exclaimed.

"It was I," said Arthur, looking at us with a worn, haggard face, and eyes from which the light of life seemed suddenly to have faded. "And let me wish *you* joy also, dear friend," he added, looking sadly at the Earl, and speaking in the same hollow tones that had startled us so much.

"Thank you," the old man said, simply and heartily.

A silence followed: then I rose, feeling sure that Arthur would wish to be alone, and bade our gentle host 'Good night': Arthur took his hand, but said nothing: nor did he speak again, as we went home, till we were in the house and had lit our bed-room candles. Then he said, more to himself than to me, "*The heart knoweth its own bitterness*. I never understood those words till now."

Quoted from
Proverbs 14:10

The next few days passed wearily enough. I felt no inclination to call again, by myself, at the Hall; still less to propose that Arthur should go with me: it seemed better to wait till Time—that gentle healer of our bitterest sorrows—should have helped him to recover from the first shock of the disappointment

that had blighted his life.

Business, however, soon demanded my presence in town; and I had to announce to Arthur that I must leave him for a while. "But I hope to run down again in a month," I added. "I would stay now, if I could. I don't think it's good for you to be alone."

"No, I ca'n't face solitude, *here*, for long," said Arthur. "But don't think about *me*. I have made up my mind to accept a post in India, that has been offered me. Out there, I suppose I shall find something to live for; I can't see *anything* at present. '*This life of mine I guard, as God's high gift, from scathe and wrong, Not greatly care to lose!*'"

"Yes," I said: "your name-sake bore as heavy a blow, and lived through it."

"A far heavier one than *mine*," said Arthur. "The woman *he* loved proved false. There is no such cloud as *that* on my memory of—of—" He left the name unuttered, and went on hurriedly. "But *you* will return, will you not?"

"Yes, I shall come back for a short time."

"Do," said Arthur: "and you shall write and tell me of our friends. I'll send you my address when I'm settled down."

Quoted from *Idylls of the King* by Alfred Lord Tennyson

Chapter XXIV. The Frogs' Birthday-Treat.

And so it came to pass that, just a week after the day when my Fairy-friends first appeared as Children, I found myself taking a farewell-stroll through the wood, in the hope of meeting them once more. I had but to stretch myself on the smooth turf, and the 'eerie' feeling was on me in a moment.

"Put oor ear *welly* low down," said Bruno, "and I'll tell oo a secret! It's the Frogs' Birthday-Treat—and we've lost the Baby!"

"*What* Baby?" I said, quite bewildered by this complicated piece of news.

"The *Queen's* Baby, a course!" said Bruno. "Titania's Baby. And we's *welly* sorry. Sylvie, she's—oh so sorry!"

"*How* sorry is she?" I asked, mischievously.

"Three-quarters of a yard," Bruno replied with perfect solemnity. "And *I'm* a little sorry too," he added, shutting his eyes so as not to see that he was smiling.

"And what are you doing about the Baby?"

"Well, the *soldiers* are all looking for it—up and down—everywhere."

"The *soldiers*?" I exclaimed.

"Yes, a course!" said Bruno. "When there's no fighting to be done, the soldiers doos any little odd jobs, oo know."

I was amused at the idea of its being a 'little odd job' to find the Royal Baby. "But how did you come to lose it?" I asked.

"We put it in a flower," Sylvie, who had just joined us, explained with her eyes full of tears. "Only we ca'n't remember *which*!"

"She says *us* put it in a flower," Bruno interrupted, "'cause she doosn't want *I* to get punished. But it were really *me* what put it there. *Sylvie* were picking Dindledums."

"You shouldn't say '*us* put it in a flower'," Sylvie very gravely remarked.

"Well, *hus*, then," said Bruno. "I never *can* remember those horrid H's!"

"Let me help you to look for it," I said. So Sylvie and I made a 'voyage of discovery' among all the flowers; but there was no Baby to be seen.

"What's become of Bruno?" I said, when we had completed our tour.

"He's down in the ditch there," said Sylvie, "amusing a young Frog."

The Queen's Baby

I went down on my hands and knees to look for him, for I felt very curious to know how young Frogs *ought* to be amused. After a minute's search, I found him sitting at the edge of the ditch, by the side of the little Frog, and looking rather disconsolate.

"How are you getting on, Bruno?" I said, nodding to him as he looked up.

"Ca'n't amuse it no more," Bruno answered, very dolefully, "'cause it won't say what it would like to do next! I've showed it all the duck-weeds—and a live caddis-worm—but it won't say nuffin! What—would oo—like?" he shouted into the ear of the Frog; but the little creature sat quite still, and took no notice of him. "It's deaf, I think!" Bruno said, turning away with a sigh. "And it's time to get the Theatre ready."

"Who are the audience to be?"

"Only but Frogs," said Bruno. "But they haven't comed yet. They wants to be drove up, like sheep."

"Would it save time," I suggested, "if *I* were to walk round with Sylvie, to drive up the Frogs, while *you* get the Theatre ready?"

"That *are* a good plan!" cried Bruno. "But where *are* Sylvie?"

"I'm here!" said Sylvie, peeping over the edge of the bank. "I was just watching two Frogs that were having a race."

"Which won it?" Bruno eagerly inquired.

Sylvie was puzzled. "He *does* ask such hard questions!" she confided to me.

"And what's to happen in the Theatre?" I asked.

"First they have their Birthday-Feast," Sylvie said: "then Bruno does some Bits of Shakespeare; then he tells them a Story."

"I should think the Frogs like the Feast best. Don't they?"

"Well, there's generally very few of them that get any. They *will* keep their mouths shut so tight! And it's just as well they *do*," she added, "because Bruno likes to cook it himself: and he cooks *very* queerly. Now they're all in. Would you just help me to put them with their heads the right way?"

We soon managed this part of the business, though the Frogs kept up a most discontented croaking all the time.

"What *are* they saying?" I asked Sylvie.

"They're saying 'Fork! Fork!' It's very silly of them! You're not going to *have* forks!" she announced with some severity. "Those that want any Feast have just got to open their mouths, and Bruno'll put some of it in!"

At this moment Bruno appeared, wearing a little white apron to show that he was a Cook, and carrying a tureen full of very queer-looking soup. I watched very carefully as he moved about among the Frogs; but I could not see that *any* of them opened their mouths to be fed—except one very young one, and I'm nearly sure it did it accidentally, in yawning. However Bruno instantly put a large spoonful of soup into its mouth, and the poor little thing coughed violently for some time.

So Sylvie and I had to share the soup between us, and to *pretend* to enjoy it, for it certainly was *very* queerly cooked.

I only ventured to take *one* spoonful of it ("Sylvie's Summer-Soup," Bruno said it was), and must candidly confess that it was not *at all* nice; and I could not feel surprised that so many of the guests had kept their mouths shut up tight.

"What's the soup *made* of, Bruno?" said Sylvie, who had put a spoonful of it to her lips, and was making a wry face over it.

And Bruno's answer was anything but encouraging. "Bits of things!"

The entertainment was to conclude with "Bits of Shakespeare," as Sylvie expressed it, which were all to be done by Bruno, Sylvie being fully engaged in making the Frogs keep their heads towards the stage: after which Bruno was to appear in his real character, and tell them a Story of his own invention.

"Will the Story have a Moral to it?" I asked Sylvie, while Bruno was away behind the hedge, dressing for the first 'Bit.'

"I *think* so," Sylvie replied doubtfully. "There generally *is* a Moral, only he puts it in too soon."

"And will he *say* all the Bits of Shakespeare?"

"No, he'll only *act* them," said Sylvie. "He knows hardly any of the words. When I see what he's dressed like, I've to tell the Frogs what character it is. They're always in such a hurry to guess! Don't you hear them all saying 'What? What?'" And so indeed they were: it had only sounded like croaking, till Sylvie explained it, but I could now make out the "Wawt? Wawt?" quite distinctly.

"But why do they try to guess it before they see it?"

"I don't know," Sylvie said: "but they always *do*. Sometimes they begin guessing weeks and weeks before the day!"

(So now, when you hear the Frogs croaking in a particularly melancholy way, you may be sure they're trying to guess Bruno's next Shakespeare 'Bit'. Isn't *that* interesting?)

However, the chorus of guessing was cut short by Bruno, who suddenly rushed on from behind the scenes, and took a flying leap down among the Frogs, to re-arrange them.

For the oldest and fattest Frog—who had never been properly arranged so that he could see the stage, and so had no idea what was going on—was getting restless, and had upset several of the Frogs, and turned others round with their heads the wrong way. And it was no good at all, Bruno said, to do a 'Bit' of Shakespeare when there was nobody to look at it (you see he didn't count *me* as anybody). So he set to work with a stick, stirring them up, very much as you would stir up tea in a cup, till most of them had at least *one* great stupid eye gazing at the stage.

"*Oo* must come and sit among them, Sylvie," he said in despair, "I've put these two side-by-side, with their noses the same way, ever so many times, but they *do* squarrel so!"

So Sylvie took her place as 'Mistress of the Ceremonies,' and Bruno vanished again behind the scenes, to dress for the first 'Bit.'

"Hamlet!" was suddenly proclaimed, in the clear sweet tones I knew so well. The croaking all ceased in a moment, and I turned to the stage, in some curiosity to see what Bruno's ideas were as to the behaviour of Shakespeare's greatest Character.

According to this eminent interpreter of the Drama, Hamlet wore a short black cloak (which he chiefly used for muffling up his face, as if he suffered a good deal from toothache), and turned out his toes very much as he walked. "To be or not to be!" Hamlet remarked in a cheerful tone, and then turned head-over-heels several times, his cloak dropping off in the performance.

I felt a little disappointed: Bruno's conception of the part seemed so wanting in dignity. "Won't he say any more of the speech?" I whispered to Sylvie.

"I *think* not," Sylvie whispered in reply. "He generally turns head-over-heels when he doesn't know any more words."

Quoted from *Hamlet*
by William
Shakespeare

Bruno had meanwhile settled the question by disappearing from the stage; and the Frogs instantly began inquiring the name of the next Character.

“You’ll know directly!” cried Sylvie, as she adjusted two or three young Frogs that had struggled round with their backs to the stage. “Macbeth!” she added, as Bruno re-appeared.

Macbeth had something twisted round him, that went over one shoulder and under the other arm, and was meant, I believe, for a Scotch plaid. He had a thorn in his hand, which he held out at arm’s length, as if he were a little afraid of it. “Is this a *dagger*?” Macbeth inquired, in a puzzled sort of tone: and instantly a chorus of “Thorn! Thorn!” arose from the Frogs (I had quite learned to understand their croaking by this time).

Quoted from *Macbeth*
by William
Shakespeare

“It’s a *dagger*!” Sylvie proclaimed in a peremptory tone. “Hold your tongues!” And the croaking ceased at once.

Shakespeare has not told us, so far as I know, that Macbeth had any such eccentric habit as turning head-over-heels in private life: but Bruno evidently considered it quite an essential part of the character, and left the stage in a series of somersaults. However, he was back again in a few moments, having tucked under his chin the end of a tuft of wool (probably left on the thorn by a wandering sheep), which made a magnificent beard, that reached nearly down to his feet.

“Shylock!” Sylvie proclaimed. “No, I beg your pardon!” she hastily corrected herself, “King Lear! I hadn’t noticed the crown.” (Bruno had very cleverly provided one, which fitted him exactly, by cutting out the centre of a dandelion to make room for his head.)

King Lear folded his arms (to the imminent peril of his beard) and said, in a mild explanatory tone, “Ay, every *inch* a king!” and then paused, as if to consider how this could best be proved. And here, with all possible deference to Bruno as a Shakespearian critic, I *must* express my opinion that the poet did *not* mean his three great tragic heroes to be so strangely alike in their personal habits; nor do I believe that he would have accepted the faculty of turning head-over-heels as any proof at all of royal descent. Yet it appeared that King Lear, after deep meditation, could think of no other argument by which to prove his kingship: and, as this was the last of the ‘Bits’ of Shakespeare (“We never do more than *three*,” Sylvie explained in a whisper), Bruno gave the audience quite a long series of somersaults before he finally retired, leaving the enraptured Frogs all crying out “More! More!” which I suppose was their way of encoring a performance. But Bruno wouldn’t appear again, till the proper time came for telling the Story.

Quoted from *King
Lear* by William
Shakespeare

When he appeared at last in his *real* character, I noticed a remarkable change in his behaviour. He tried no more somersaults. It was clearly his opinion that, however suitable the habit of turning head-over-heels might be to such petty individuals as Hamlet and King Lear, it would never do for *Bruno* to sacrifice his dignity to such an extent. But it was equally clear that he did not feel entirely at his ease, standing all alone on the stage, with no costume to disguise him: and though he began, several times, “There were a Mouse—,” he kept glancing up and down, and on all sides, as if in search of more comfortable quarters from which to tell the Story. Standing on one side of the stage, and partly overshadowing it, was a tall fox-glove, which seemed, as the evening breeze gently swayed it hither and thither, to offer exactly the sort of accommodation that the orator desired. Having once decided on his quarters, it needed only a

The Frogs's birthday-treat

second or two for him to run up the stem like a tiny squirrel, and to seat himself astride on the topmost bend, where the fairy-bells clustered most closely, and from whence he could look down on his audience from such a height that all shyness vanished, and he began his Story merrily.

“Once there were a Mouse and a Crocodile and a Man and a Goat and a Lion.” I had never heard the ‘dramatis personæ’ tumbled into a story with such profusion and in such reckless haste; and it fairly took my breath away. Even Sylvie gave a little gasp, and allowed three of the Frogs, who seemed to be getting tired of the entertainment, to hop away into the ditch, without attempting to stop them.

“And the Mouse found a Shoe, and it thought it were a Mouse-trap. So it got right in, and it stayed in ever so long.”

“Why did it *stay* in?” said Sylvie. Her function seemed to be much the same as that of the Chorus in a Greek Play: she had to encourage the orator, and draw him out, by a series of intelligent questions.

“Cause it thought it couldn’t get out again,” Bruno explained. “It were a clever mouse. It knew it couldn’t get out of traps!”

“But why did it go in at all?” said Sylvie.

“—and it jump, and it jump,” Bruno proceeded, ignoring this question, “and at last it got right out again. And it looked at the mark in the Shoe. And the Man’s name were in it. So it knew it wasn’t its own Shoe.”

“Had it thought it *was*?” said Sylvie.

“Why, didn’t I tell oo it thought it were a *Mouse-trap*?” the indignant orator replied. “Please, Mister Sir, will oo make Sylvie attend?” Sylvie was silenced, and was all attention: in fact, she and I were most of the audience now, as the Frogs kept hopping away, and there were very few of them left.

“So the Mouse gave the Man his Shoe. And the Man were welly glad, ’cause he hadn’t got but one Shoe, and he were hopping to get the other.”

Here I ventured on a question. “Do you mean ‘hopping,’ or ‘hoping’?”

“Bofe,” said Bruno. “And the Man took the Goat out of the Sack.” (“We haven’t heard of the *sack* before,” I said. “Nor you won’t hear of it again,” said Bruno). “And he said to the Goat, ‘Oo will walk about here till I comes back.’ And he went and he tumbled into a deep hole. And the Goat walked round and round. And it walked under the Tree. And it wug its tail. And it looked up in the Tree. And it sang a sad little Song. Oo never heard such a sad little Song!”

“Can you sing it, Bruno?” I asked.

“Iss, I can,” Bruno readily replied. “And I sa’n’t. It would make Sylvie cry——”

“It wouldn’t!” Sylvie interrupted in great indignation. “And I don’t believe the Goat sang it at all!”

“It did, though!” said Bruno. “It singed it right froo. I *sawed* it singing with its long beard——”

“It couldn’t sing with its *beard*,” I said, hoping to puzzle the little fellow: “a beard isn’t a *voice*.”

“Well then, oo couldn’t walk with Sylvie!” Bruno cried triumphantly. “Sylvie isn’t a *foot*!”

I thought I had better follow Sylvie’s example, and be silent for a while. Bruno was too sharp for us.

“And when it had singed all the Song, it ran away—for to get along to look for the Man, oo know. And the Crocodile got along after it—for to bite it, oo

know. And the Mouse got along after the Crocodile.”

“Wasn’t the Crocodile *running*?” Sylvie enquired. She appealed to me. “Crocodiles do run, don’t they?”

I suggested “crawling” as the proper word.

“He wasn’t running,” said Bruno, “and he wasn’t crawling. He went struggling along like a portmanteau. And he held his chin ever so high in the air——”

“What did he do *that* for?” said Sylvie.

“Cause he hadn’t got a toofache!” said Bruno. “Ca’n’t oo make out *nuffin* wizout I ’splain it? Why, if he’d had a toofache, a course he’d have held his head down—like this—and he’d have put a lot of warm blankets round it!”

“If he’d *had* any blankets,” Sylvie argued.

“Course he *had* blankets!” retorted her brother. “Doos oo think Crocodiles goes walks wizout blankets? And he frowned with his eyebrows. And the Goat was welly flightened at his eyebrows!”

“I’d never be afraid of *eyebrows*!” exclaimed Sylvie.

“I should think oo *would*, though, if they’d got a Crocodile fastened to them, like these had! And so the Man jump, and he jump, and at last he got right out of the hole.”

Sylvie gave another little gasp: this rapid dodging about among the characters of the Story had taken away her breath.

“And he runned away—for to look for the Goat, oo know. And he heard the Lion grunting——”

“Lions don’t grunt,” said Sylvie.

“This one did,” said Bruno. “And its mouth were like a large cupboard. And it had plenty of room in its mouth. And the Lion runned after the Man—for to eat him, oo know. And the Mouse runned after the Lion.”

“But the Mouse was running after the *Crocodile*,” I said: “he couldn’t run after *both*!”

Bruno sighed over the density of his audience, but explained very patiently. “He *did* runned after *bofe*: ’cause they went the same way! And first he caught the Crocodile, and then he didn’t catch the Lion. And when he’d caught the Crocodile, what doos oo think he did—’cause he’d got pincers in his pocket?”

“I ca’n’t guess,” said Sylvie.

“Nobody couldn’t guess it!” Bruno cried in high glee. “Why, he wrenched out that Crocodile’s toof!”

“*Which* tooth?” I ventured to ask.

But Bruno was not to be puzzled. “The toof he were going to bite the Goat with, a course!”

“He couldn’t be sure about that,” I argued, “unless he wrenched out *all* its teeth.”

Bruno laughed merrily, and half sang, as he swung himself backwards and forwards, “He did—wrenched—out—*all* its teef!”

“Why did the Crocodile wait to have them wrenched out?” said Sylvie.

“It had to wait,” said Bruno.

I ventured on another question. “But what became of the Man who said ‘You may wait here till I come back’?”

“He didn’t say ‘Oo *may*,’” Bruno explained. “He said, ‘Oo *will*.’ Just like Sylvie says to me ‘Oo will do oor lessons till twelve o’clock.’ Oh, I *wiss*,” he added with a little sigh, “I *wiss* Sylvie would say ‘Oo *may* do oor lessons’!”

'He wrenched out that Crocodile's toof!'

This was a dangerous subject for discussion, Sylvie seemed to think. She returned to the Story. "But what became of the Man?"

"Well, the Lion springed at him. But it came so slow, it were three weeks in the air——"

"Did the Man wait for it all that time?" I said.

"Course he didn't!" Bruno replied, gliding head-first down the stem of the fox-glove, for the Story was evidently close to its end. "He sold his house, and he packed up his things, while the Lion were coming. And he went and he lived in another town. So the Lion ate the wrong man."

This was evidently the Moral: so Sylvie made her final proclamation to the Frogs. "The Story's finished! And whatever is to be *learned* from it," she added, aside to me, "I'm sure *I* don't know!"

I did not feel *quite* clear about it myself, so made no suggestion: but the Frogs seemed quite content, Moral or no Moral, and merely raised a husky chorus of "Off! Off!" as they hopped away.

Chapter XXV. Looking Eastward.

"It's just a week," I said, three days later, to Arthur, "since we heard of Lady Muriel's engagement. I think *I* ought to call, at any rate, and offer my congratulations. Won't you come with me?"

A pained expression passed over his face. "When must you leave us?" he asked.

"By the first train on Monday."

"Well—yes, I *will* come with you. It would seem strange and unfriendly if I didn't. But this is only Friday. Give me till Sunday afternoon. I shall be

stronger then.”

Shading his eyes with one hand, as if half-ashamed of the tears that were coursing down his cheeks, he held the other out to me. It trembled as I clasped it.

I tried to frame some words of sympathy; but they seemed poor and cold, and I left them unspoken. “Good night!” was all I said.

“Good night, dear friend!” he replied. There was a manly vigour in his tone that convinced me he was wrestling with, and triumphing over, the great sorrow that had so nearly wrecked his life—and that, on the stepping-stone of his dead self, he would surely rise to higher things!

There was no chance, I was glad to think, as we set out on Sunday afternoon, of meeting *Eric* at the Hall, as he had returned to town the day after his engagement was announced. *His* presence might have disturbed the calm—the almost unnatural calm—with which Arthur met the woman who had won his heart, and murmured the few graceful words of sympathy that the occasion demanded.

Lady Muriel was perfectly radiant with happiness: sadness could not live in the light of such a smile: and even Arthur brightened under it, and, when she remarked “You see I’m watering my flowers, though it *is* the Sabbath-Day,” his voice had almost its old ring of cheerfulness as he replied “Even on the Sabbath-Day works of mercy are allowed. But this *isn’t* the Sabbath-Day. The Sabbath-Day has ceased to exist.”

“I know it’s not *Saturday*,” Lady Muriel replied: “but isn’t Sunday often called ‘the Christian Sabbath’?”

“It is so called, I think, in recognition of the *spirit* of the Jewish institution, that one day in seven should be a day of *rest*. But I hold that Christians are freed from the *literal* observance of the Fourth Commandment.”

“Then where is our *authority* for Sunday observance?”

“We have, first, the fact that the seventh day was ‘sanctified’, when God rested from the work of Creation. That is binding on us as *Theists*. Secondly, we have the fact that ‘the Lord’s Day’ is a *Christian* institution. That is binding on us as *Christians*.”

“And your practical rules would be——?”

“First, as Theists, to keep it *holy* in some special way, and to make it, so far as is reasonably possible, a day of *rest*. Secondly, as *Christians*, to attend public worship.”

“And what of *amusements*?”

“I would say of them, as of all kinds of *work*, whatever is innocent on a week-day, is innocent on Sunday, provided it does not interfere with the duties of the day.”

“Then you would allow children to *play* on Sunday?”

“Certainly I should. Why make the day irksome to their restless natures?”

“I have a letter somewhere,” said Lady Muriel, “from an old friend, describing the way in which Sunday was kept in her younger days. I will fetch it for you.”

“I had a similar description, *vivâ voce*, years ago,” Arthur said when she had left us, “from a little girl. It was really touching to hear the melancholy tone in which she said ‘On Sunday I mustn’t play with my doll! On Sunday I mustn’t run on the sands! On Sunday I mustn’t dig in the garden!’ Poor child! She had indeed abundant cause for hating Sunday!”

“Here is the letter,” said Lady Muriel, returning. “Let me read you a piece of it.”

“*When, as a child, I first opened my eyes on a Sunday-morning, a feeling of dismal anticipation, which began at least on the Friday, culminated. I knew what was before me, and my wish, if not my word, was ‘Would God it were evening!’ It was no day of rest, but a day of texts, of catechisms (Watts’), of tracts about converted swearers, godly char-women, and edifying deaths of sinners saved.*

“*Up with the lark, hymns and portions of Scripture had to be learned by heart till 8 o’clock, when there were family-prayers, then breakfast, which I was never able to enjoy, partly from the fast already undergone, and partly from the outlook I dreaded.*

“*At 9 came Sunday-School; and it made me indignant to be put into the class with the village-children, as well as alarmed lest, by some mistake of mine, I should be put below them.*

“*The Church-Service was a veritable Wilderness of Zin. I wandered in it, pitching the tabernacle of my thoughts on the lining of the square family-pew, the fidgets of my small brothers, and the horror of knowing that, on the Monday, I should have to write out, from memory, jottings of the rambling disconnected extempore sermon, which might have had any text but its own, and to stand or fall by the result.*

“*This was followed by a cold dinner at 1 (servants to have no work), Sunday-School again from 2 to 4, and Evening-Service at 6. The intervals were perhaps the greatest trial of all, from the efforts I had to make, to be less than usually sinful, by reading books and sermons as barren as the Dead Sea. There was but one rosy spot, in the distance, all that day: that was ‘bed-time,’ which never could come too early!*”

“Such teaching was well meant, no doubt,” said Arthur; “but it must have driven many of its victims into deserting the Church-Services altogether.”

“I’m afraid *I* was a deserter this morning,” she gravely said. “I had to write to Eric. Would you—would you mind my telling you something he said about *prayer*? It had never struck me in that light before.”

“In what light?” said Arthur.

“Why, that all Nature goes by fixed, regular laws—Science has proved *that*. So that asking God to *do* anything (except of course praying for *spiritual* blessings) is to expect a miracle: and we’ve no right to do *that*. I’ve not put it as well as *he* did: but that was the outcome of it, and it has confused me. Please tell me what you can say in answer to it.”

“I don’t propose to discuss *Captain Lindon’s* difficulties,” Arthur gravely replied; “specially as he is not present. But, if it is *your* difficulty,” (his voice unconsciously took a tenderer tone) “then I will speak.”

“It *is* my difficulty,” she said anxiously.

“Then I will begin by asking ‘Why did you except *spiritual* blessings?’ Is not your mind a part of Nature?”

“Yes, but Free-Will comes in there—I can *choose* this or that; and God can influence my choice.”

“Then you are not a Fatalist?”

“Oh, no!” she earnestly exclaimed.

“Thank God!” Arthur said to himself, but in so low a whisper that only *I* heard it. “You grant then that I can, by an act of free choice, move this cup,” suiting the action to the word, “*this* way or *that* way?”

“Yes, I grant it.”

“Well, let us see how far the result is produced by fixed laws. The *cup* moves because certain mechanical forces are impressed on it by my *hand*. My *hand* moves because certain forces—electric, magnetic, or whatever ‘nerve-force’ may prove to be—are impressed on it by my *brain*. This nerve-force, stored in the brain, would probably be traceable, if Science were complete, to chemical forces supplied to the brain by the blood, and ultimately derived from the food I eat and the air I breathe.”

“But would not that be Fatalism? Where would Free-Will come in?”

“In *choice* of nerves,” replied Arthur. “The nerve-force in the brain may flow just as naturally down one nerve as down another. We need something more than a fixed Law of Nature to settle *which* nerve shall carry it. That ‘something’ is Free-Will.”

Her eyes sparkled. “I see what you mean!” she exclaimed. “Human Free-Will is an exception to the system of fixed Law. Eric said something like that. And then I think he pointed out that God can only influence Nature by influencing Human Wills. So that we *might* reasonably pray ‘*give us this day our daily bread,*’ because many of the causes that produce bread are under Man’s control. But to pray for rain, or fine weather, would be as unreasonable as—” she checked herself, as if fearful of saying something irreverent.

Quoted from
Matthew 6:11

In a hushed, low tone, that trembled with emotion, and with the solemnity of one in the presence of death, Arthur slowly replied “*Shall he that contendeth with the Almighty instruct him?* Shall we, ‘the swarm that in the noontide beam were born,’ feeling in ourselves the power to direct, this way or that, the forces of Nature—of *Nature*, of which we form so trivial a part—shall we, in our boundless arrogance, in our pitiful conceit, *deny* that power to the Ancient of Days? Saying, to our Creator, ‘Thus far and no further. Thou madest, but thou canst not rule!’?”

Quoted from Job 40:2
Quoted from *The Bard* by Thomas Gray

Quoted from Job
38:11

Lady Muriel had covered her face in her hands, and did not look up. She only murmured “Thanks, thanks!” again and again.

We rose to go. Arthur said, with evident effort, “One word more. If you would *know* the power of Prayer—in anything and everything that Man can need—*try* it. *Ask, and it shall be given you. I—have* tried it. I *know* that God answers prayer!”

Quoted from
Matthew 7:7

Our walk home was a silent one, till we had nearly reached the lodgings: then Arthur murmured—and it was almost an echo of my own thoughts—“*What knowest thou, O wife, whether thou shalt save thy husband?*”

Quoted from 1
Corinthians 7:16

The subject was not touched on again. We sat on, talking, while hour after hour, of this our last night together, glided away unnoticed. He had much to tell me about India, and the new life he was going to, and the *work* he hoped to do. And his great generous soul seemed so filled with noble ambition as to have no space left for any vain regret or selfish repining.

“Come, it is nearly morning!” Arthur said at last, rising and leading the way upstairs. “The sun will be rising in a few minutes: and, though I *have* basely defrauded you of your last chance of a night’s rest here, I’m sure you’ll forgive me: for I really *couldn’t* bring myself to say ‘Good night’ sooner. And God knows whether you’ll ever see me again, or hear of me!”

“*Hear* of you I am certain I shall!” I warmly responded, and quoted the concluding lines of that strange poem ‘Waring’:—

“Oh, never star
Was lost here, but it rose afar!
Look East, where whole new thousands are!
In Vishnu-land what Avatar?”

Quoted from *Waring*
by Robert Browning

“Aye, look Eastward!” Arthur eagerly replied, pausing at the stair-case window, which commanded a fine view of the sea and the eastward horizon. “The West is the fitting tomb for all the sorrow and the sighing, all the errors and the follies of the Past: for all its withered Hopes and all its buried Loves! From the East comes new strength, new ambition, new Hope, new Life, new Love! Look Eastward! Aye, look Eastward!”

His last words were still ringing in my ears as I entered my room, and undrew the window-curtains, just in time to see the sun burst in glory from his ocean-prison, and clothe the world in the light of a new day.

“So may it be for him, and me, and all of us!” I mused. “All that is evil, and dead, and hopeless, fading with the Night that is past! All that is good, and living, and hopeful, rising with the dawn of Day!

“Fading, with the Night, the chilly mists, and the noxious vapours, and the heavy shadows, and the wailing gusts, and the owl’s melancholy hootings: rising, with the Day, the darting shafts of light, and the wholesome morning breeze, and the warmth of a dawning life, and the mad music of the lark! Look Eastward!

“Fading, with the Night, the clouds of ignorance, and the deadly blight of sin, and the silent tears of sorrow: and ever rising, higher, higher, with the Day, the radiant dawn of knowledge, and the sweet breath of purity, and the throb of a world’s ecstasy! Look Eastward!

‘Look Eastward!’

“Fading, with the Night, the memory of a dead love, and the withered leaves of a blighted hope, and the sickly repinings and moody regrets that numb the best energies of the soul: and rising, broadening, rolling upward like a living flood, the manly resolve, and the dauntless will, and the heavenward gaze of faith—the *substance of things hoped for, the evidence of things not seen!*”

Quoted from Hebrews
11:1

“Look Eastward! Aye, look Eastward!”

2.6 Sylvie and Bruno Concluded

Source: Sylvie and Bruno Concluded

Chapter I. Bruno's Lessons.

During the next month or two my solitary town-life seemed, by contrast, unusually dull and tedious. I missed the pleasant friends I had left behind at Elveston—the genial interchange of thought—the sympathy which gave to one's ideas a new and vivid reality: but, perhaps more than all, I missed the companionship of the two Fairies—or Dream-Children, for I had not yet solved the problem as to who or what they were—whose sweet playfulness had shed a magic radiance over my life.

In office-hours—which I suppose reduce most men to the mental condition of a coffee-mill or a mangle—time sped along much as usual: it was in the pauses of life, the desolate hours when books and newspapers palled on the sated appetite, and when, thrown back upon one's own dreary musings, one strove—all in vain—to people the vacant air with the dear faces of absent friends, that the real bitterness of solitude made itself felt.

One evening, feeling my life a little more wearisome than usual, I strolled down to my Club, not so much with the hope of meeting any friend there, for London was now 'out of town,' as with the feeling that here, at least, I should hear 'sweet words of human speech,' and come into contact with human thought.

However, almost the first face I saw there *was* that of a friend. Eric Lindon was lounging, with rather a 'bored' expression of face, over a newspaper; and we fell into conversation with a mutual satisfaction which neither of us tried to conceal.

After a while I ventured to introduce what was just then the main subject of my thoughts. "And so the Doctor" (a name we had adopted by a tacit agreement, as a convenient compromise between the formality of 'Doctor Forester' and the intimacy—to which Eric Lindon hardly seemed entitled—of 'Arthur') "has gone abroad by this time, I suppose? Can you give me his present address?"

"He is still at Elveston—I believe," was the reply. "But I have not been there since I last met you."

I did not know which part of this intelligence to wonder at most. "And might I ask—if it isn't taking too much of a liberty—when your wedding-bells are to—or perhaps they *have* rung, already?"

"No," said Eric, in a steady voice, which betrayed scarcely a trace of emotion: "*that* engagement is at an end. I am still 'Benedick the *unmarried* man.'"

After this, the thick-coming fancies—all radiant with new possibilities of happiness for Arthur—were far too bewildering to admit of any further conversation, and I was only too glad to avail myself of the first decent excuse, that offered itself, for retiring into silence.

The next day I wrote to Arthur, with as much of a reprimand for his long silence as I could bring myself to put into words, begging him to tell me how the world went with him.

Needs must that three or four days—possibly more—should elapse before I could receive his reply; and never had I known days drag their slow length along with a more tedious indolence.

Quoted from *Much Ado About Nothing* by William Shakespeare

To while away the time, I strolled, one afternoon, into Kensington Gardens, and, wandering aimlessly along any path that presented itself, I soon became aware that I had somehow strayed into one that was wholly new to me. Still, my elfish experiences seemed to have so completely faded out of my life that nothing was further from my thoughts than the idea of again meeting my fairy-friends, when I chanced to notice a small creature, moving among the grass that fringed the path, that did not seem to be an insect, or a frog, or any other living thing that I could think of. Cautiously kneeling down, and making an *ex tempore* cage of my two hands, I imprisoned the little wanderer, and felt a sudden thrill of surprise and delight on discovering that my prisoner was no other than *Bruno* himself!

Bruno took the matter *very* coolly, and, when I had replaced him on the ground, where he would be within easy conversational distance, he began talking, just as if it were only a few minutes since last we had met.

"Doos oo know what the *Rule* is," he enquired, "when oo catches a Fairy, withouten its having tolded oo where it was?" (Bruno's notions of English Grammar had certainly *not* improved since our last meeting.)

"No," I said. "I didn't know there was any Rule about it."

"I *think* oo've got a right to *eat* me," said the little fellow, looking up into my face with a winning smile. "But I'm not pruffickly sure. Oo'd better not do it wizout asking."

It did indeed seem reasonable not to take so irrevocable a step as *that*, without due enquiry. "I'll certainly *ask* about it, first," I said. "Besides, I don't know yet whether you would be *worth* eating!"

"I guess I'm *deliciously* good to eat," Bruno remarked in a satisfied tone, as if it were something to be rather proud of.

"And what are you doing here, Bruno?"

"*That's* not my name!" said my cunning little friend. "Don't oo know my name's 'Oh Bruno!'? That's what Sylvie always calls me, when I says mine lessons."

"Well then, what are you doing here, oh Bruno?"

"Doing mine lessons, a-course!" With that roguish twinkle in his eye, that always came when he knew he was talking nonsense.

"Oh, *that's* the way you do your lessons, is it? And do you remember them well?"

"Always can 'member *mine* lessons," said Bruno. "It's *Sylvie's* lessons that's so *drefffully* hard to 'member!" He frowned, as if in agonies of thought, and tapped his forehead with his knuckles. "I *ca'n't* think enough to understand them!" he said despairingly. "It wants *double* thinking, I believe!"

"But where's Sylvie gone?"

"That's just what *I* want to know!" said Bruno disconsolately. "What ever's the good of setting me lessons, when she isn't here to 'splain the hard bits?"

"*I'll* find her for you!" I volunteered; and, getting up, I wandered round the tree under whose shade I had been reclining, looking on all sides for Sylvie. In another minute I *again* noticed some strange thing moving among the grass, and, kneeling down, was immediately confronted with Sylvie's innocent face, lighted up with a joyful surprise at seeing me, and was accosted, in the sweet voice I knew so well, with what seemed to be the *end* of a sentence whose beginning I had failed to catch.

“—and I think he ought to have *finished* them by this time. So I’m going back to him. Will you come too? It’s only just round at the other side of this tree.”

It was but a few steps for *me*; but it was a great many for Sylvie; and I had to be very careful to walk slowly, in order not to leave the little creature so far behind as to lose sight of her.

To find Bruno’s *lessons* was easy enough: they appeared to be neatly written out on large smooth ivy-leaves, which were scattered in some confusion over a little patch of ground where the grass had been worn away; but the pale student, who ought by rights to have been bending over them, was nowhere to be seen: we looked in all directions, for some time, in vain; but at last Sylvie’s sharp eyes detected him, swinging on a tendril of ivy, and Sylvie’s stern voice commanded his instant return to *terra firma* and to the business of Life.

Sylvie’s truant-pupil

“Pleasure first and business afterwards” seemed to be the motto of these tiny folk, so many hugs and kisses had to be interchanged before anything else could be done.

“Now, Bruno,” Sylvie said reproachfully, “didn’t I tell you you were to go on with your lessons, unless you heard to the contrary?”

“But I *did* heard to the contrary!” Bruno insisted, with a mischievous twinkle in his eye.

“*What* did you hear, you wicked boy?”

“It were a sort of noise in the air,” said Bruno: “a sort of a scrambling noise. Didn’t *oo* hear it, Mister Sir?”

“Well, anyhow, you needn’t go to *sleep* over them, you lazy-lazy!” For Bruno had curled himself up, on the largest ‘lesson,’ and was arranging another as a pillow.

“I *wasn’t* asleep!” said Bruno, in a deeply-injured tone. “When I shuts mine eyes, it’s to show that I’m *awake!*”

“Well, how much have you learned, then?”

“I’ve learned a little tiny bit,” said Bruno, modestly, being evidently afraid of overstating his achievement. “*Ca’n’t* learn no more!”

“Oh Bruno! You know you *can*, if you like.”

“Course I can, if I *like*,” the pale student replied; “but I *ca’n’t* if I *don’t* like!”

Sylvie had a way—which I could not too highly admire—of evading Bruno’s logical perplexities by suddenly striking into a new line of thought; and this masterly stratagem she now adopted.

“Well, I must say *one* thing——”

“Did *oo* know, Mister Sir,” Bruno thoughtfully remarked, “that Sylvie *ca’n’t* count? Whenever she says ‘I must say *one* thing,’ I *know* quite well she’ll say *two* things! And she always *doos*.”

“Two heads are better than one, Bruno,” I said, but with no very distinct idea as to what I meant by it.

“I shouldn’t mind having two *heads*,” Bruno said softly to himself: “one head to eat mine dinner, and one head to argue wiz Sylvie—*doos* *oo* think *oo’d* look prettier if *oo’d* got *two* heads, Mister Sir?”

The case did not, I assured him, admit of a doubt.

“The reason why Sylvie’s so cross——” Bruno went on very seriously, almost sadly.

Sylvie’s eyes grew large and round with surprise at this new line of enquiry—her rosy face being perfectly radiant with good humour. But she said nothing.

“Wouldn’t it be better to tell me after the lessons are over?” I suggested.

“Very well,” Bruno said with a resigned air: “only she wo’n’t be cross then.”

“There’s only three lessons to do,” said Sylvie. “Spelling, and Geography, and Singing.”

“Not *Arithmetic*?” I said.

“No, he hasn’t a head for *Arithmetic*——”

“Course I haven’t!” said Bruno. “Mine head’s for *hair*. I haven’t got a *lot* of heads!”

“——and he *ca’n’t* learn his Multiplication-table——”

“I like *History* ever so much better,” Bruno remarked. “*Oo* has to *repeat* that Muddlecome table——”

“Well, and you have to repeat——”

“No, *oo* hasn’t!” Bruno interrupted. “*History* repeats itself. The Professor said so!”

Sylvie was arranging some letters on a board——E—V—I—L. “Now, Bruno,” she said, “what does *that* spell?”

Bruno looked at it, in solemn silence, for a minute. “I *knows* what it *doosn’t* spell!” he said at last.

“That’s no good,” said Sylvie. “What *does* it spell?”

Quoted from *Rob Roy* by Walter Scott

Bruno took another look at the mysterious letters. "Why, it's 'LIVE,' backwards!" he exclaimed. (I thought it was, indeed.)

"How *did* you manage to see that?" said Sylvie.

"I just twiddled my eyes," said Bruno, "and then I saw it directly. Now may I sing the King-fisher Song?"

"Geography next," said Sylvie. "Don't you know the Rules?"

"I think there oughtn't to be such a lot of Rules, Sylvie! I think——"

"Yes, there *ought* to be such a lot of Rules, you wicked, wicked boy! And how dare you *think* at all about it? And shut up that mouth directly!"

So, as 'that mouth' didn't seem inclined to shut up of itself, Sylvie shut it for him—with both hands—and sealed it with a kiss, just as you would fasten up a letter.

"Now that Bruno is fastened up from talking," she went on, turning to me, "I'll show you the Map he does his lessons on."

And there it was, a large Map of the World, spread out on the ground. It was so large that Bruno had to crawl about on it, to point out the places named in the 'King-fisher Lesson.'

"When a King-fisher sees a Lady-bird flying away, he says '*Ceylon*, if you *Candia*!' And when he catches it, he says 'Come to *Media*! And if you're *Hungary* or thirsty, I'll give you some *Nubia*!' When he takes it in his claws, he says '*Europe*!' When he puts it into his beak, he says '*India*!' When he's swallowed it, he says '*Eton*!' That's all."

"That's *quite* perfect," said Sylvie. "Now you may sing the King-fisher Song."

"Will *oo* sing the chorus?" Bruno said to me.

I was just beginning to say "I'm afraid I don't know the *words*," when Sylvie silently turned the map over, and I found the words were all written on the back. In one respect it was a *very* peculiar song: the chorus to each verse came in the *middle*, instead of at the *end* of it. However, the tune was so easy that I soon picked it up, and managed the chorus as well, perhaps, as it is possible for *one* person to manage such a thing. It was in vain that I signed to Sylvie to help me: she only smiled sweetly and shook her head.

"King Fisher courted Lady Bird—

Sing Beans, sing Bones, sing Butterflies!

'Find me my match,' he said,

'With such a noble head—

With such a beard, as white as curd—

With such expressive eyes!

"Yet pins have heads,' said Lady Bird—

Sing Prunes, sing Prawns, sing Primrose-Hill!

'And, where you stick them in,

They stay, and thus a pin

Is very much to be preferred

To one that's never still!

"Oysters have beards,' said Lady Bird—

Sing Flies, sing Frogs, sing Fiddle-strings!

'I love them, for I know

They never chatter so:

They would not say one single word—

Not if you crowned them Kings!
 “‘Needles have eyes,’ said Lady Bird—
Sing Cats, sing Corks, sing Cowslip-tea!
 ‘And they are sharp—just what
 Your Majesty is *not*:
 So get you gone—’tis too absurd
 To come a-courting *me!*’”

King fisher's wooing

“So he went away,” Bruno added as a kind of postscript, when the last note of the song had died away. “Just like he always did.”

“Oh, my *dear* Bruno!” Sylvie exclaimed, with her hands over her ears. “You shouldn’t say ‘like’: you should say ‘*what*.’”

To which Bruno replied, doggedly, “I only says ‘what!’ when oo doesn’t speak loud, so as I can hear oo.”

“Where did he go to?” I asked, hoping to prevent an argument.

“He went more far than he’d never been before,” said Bruno.

“You should never say ‘more far,’” Sylvie corrected him: “you should say ‘*farther*.’”

“Then *oo* shouldn’t say ‘more broth,’ when we’re at dinner,” Bruno retorted: “oo should say ‘*brother*’!”

This time Sylvie evaded an argument by turning away, and beginning to roll up the Map. “Lessons are over!” she proclaimed in her sweetest tones.

“And has there been no *crying* over them?” I enquired. “Little boys *always* cry over their lessons, don’t they?”

“I never cries after twelve o’clock,” said Bruno: “’cause then it’s getting so near to dinner-time.”

“Sometimes, in the morning,” Sylvie said in a low voice; “when it’s Geography-day, and when he’s been disobe——”

“*What* a fellow you are to talk, Sylvie!” Bruno hastily interposed. “Doos oo think the world was *made* for oo to talk in?”

“Why, where would you *have* me talk, then?” Sylvie said, evidently quite ready for an argument.

But Bruno answered resolutely. “I’m not going to argue about it, ’cause it’s getting late, and there wo’n’t be time—but oo’s as ’ong as ever oo can be!” And he rubbed the back of his hand across his eyes, in which tears were beginning to glitter.

Sylvie’s eyes filled with tears in a moment. “I didn’t mean it, Bruno, *darling!*” she whispered; and the rest of the argument was lost ‘amid the tangles of Neæra’s hair,’ while the two disputants hugged and kissed each other.

Quoted from *Lycidas*
by John Milton

But this new form of argument was brought to a sudden end by a flash of lightning, which was closely followed by a peal of thunder, and by a torrent of rain-drops, which came hissing and spitting, almost like live creatures, through the leaves of the tree that sheltered us.

“Why, it’s raining cats and dogs!” I said.

“And all the *dogs* has come down *first*,” said Bruno: “there’s nothing but *cats* coming down now!”

In another minute the pattering ceased, as suddenly as it had begun. I stepped out from under the tree, and found that the storm was over; but I looked in vain, on my return, for my tiny companions. They had vanished with the storm, and there was nothing for it but to make the best of my way home.

On the table lay, awaiting my return, an envelope of that peculiar yellow tint which always announces a telegram, and which must be, in the memories of so many of us, inseparably linked with some great and sudden sorrow—something that has cast a shadow, never in this world to be wholly lifted off, on the brightness of Life. No doubt it has *also* heralded—for many of us—some sudden news of joy; but this, I think, is less common: human life seems, on the whole, to contain more of sorrow than of joy. And yet the world goes on. Who knows why?

This time, however, there was no shock of sorrow to be faced: in fact, the few words it contained (“Could not bring myself to write. Come soon. Always welcome. A letter follows this. Arthur.”) seemed so like Arthur himself speaking, that it gave me quite a thrill of pleasure, and I at once began the preparations needed for the journey.

Chapter II. Love’s Curfew.

“Fayfield Junction! Change for Elveston!”

What subtle memory could there be, linked to these commonplace words, that caused such a flood of happy thoughts to fill my brain? I dismounted from the carriage in a state of joyful excitement for which I could not at first account. True, I had taken this very journey, and at the same hour of the day, six months ago; but many things had happened since then, and an old man’s

memory has but a slender hold on recent events: I sought 'the missing link' in vain. Suddenly I caught sight of a bench—the only one provided on the cheerless platform—with a lady seated on it, and the whole forgotten scene flashed upon me as vividly as if it were happening over again.

"Yes," I thought. "This bare platform is, for me, rich with the memory of a dear friend! She was sitting on that very bench, and invited me to share it, with some quotation from Shakespeare—I forget what. I'll try the Earl's plan for the Dramatisation of Life, and fancy that figure to be Lady Muriel; and I won't undeceive myself too soon!"

So I strolled along the platform, resolutely 'making-believe' (as children say) that the casual passenger, seated on that bench, was the Lady Muriel I remembered so well. She was facing away from me, which aided the elaborate cheaterly I was practising on myself: but, though I was careful, in passing the spot, to look the other way, in order to prolong the pleasant illusion, it was inevitable that, when I turned to walk back again, I should see who it was. It was Lady Muriel herself!

'Spend it all for Minnie'

The whole scene now returned vividly to my memory; and, to make this repetition of it stranger still, there was the same old man, whom I remembered seeing so roughly ordered off, by the Station-Master, to make room for his titled passenger. The same, but 'with a difference': no longer tottering feebly along the platform, but actually seated at Lady Muriel's side, and in conversation with her! "Yes, put it in your purse," she was saying, "and remember you're to spend it all for *Minnie*. And mind you bring her something nice, that'll do her real good! And give her my love!" So intent was she on saying these words, that, although the sound of my footstep had made her lift her head and look at me, she did not at first recognise me.

I raised my hat as I approached, and then there flashed across her face a genuine look of joy, which so exactly recalled the sweet face of Sylvie, when last we met in Kensington Gardens, that I felt quite bewildered.

Rather than disturb the poor old man at her side, she rose from her seat, and joined me in my walk up and down the platform, and for a minute or two our conversation was as utterly trivial and commonplace as if we were merely two casual guests in a London drawing-room. Each of us seemed to shrink, just at first, from touching on the deeper interests which linked our lives together.

The Elveston train had drawn up at the platform, while we talked; and, in obedience to the Station-Master's obsequious hint of "This way, my Lady! Time's up!", we were making the best of our way towards the end which contained the sole first-class carriage, and were just passing the now-empty bench, when Lady Muriel noticed, lying on it, the purse in which her gift had just been so carefully bestowed, the owner of which, all unconscious of his loss, was being helped into a carriage at the other end of the train. She pounced on it instantly. "Poor old man!" she cried. "He mustn't go off, and think he's lost it!"

"Let *me* run with it! I can go quicker than you!" I said. But she was already half-way down the platform, flying ('running' is much too mundane a word for such fairy-like motion) at a pace that left all possible efforts of *mine* hopelessly in the rear.

She was back again before I had well completed my audacious boast of speed in running, and was saying, quite demurely, as we entered our carriage, "and you really think *you* could have done it quicker?"

"No indeed!" I replied. "I plead 'Guilty' of gross exaggeration, and throw myself on the mercy of the Court!"

"The Court will overlook it—for this once!" Then her manner suddenly changed from playfulness to an anxious gravity.

"You are not looking your best!" she said with an anxious glance. "In fact, I think you look *more* of an invalid than when you left us. I very much doubt if London agrees with you?"

"It *may* be the London air," I said, "or it may be the hard work—or my rather lonely life: anyhow, I've *not* been feeling very well, lately. But Elveston will soon set me up again. Arthur's prescription—he's my doctor, you know, and I heard from him this morning—is 'plenty of ozone, and new milk, and *pleasant society*'!"

"Pleasant society?" said Lady Muriel, with a pretty make-believe of considering the question. "Well, really I don't know where we can find *that* for you! We have so few neighbours. But new milk we *can* manage. Do get it of my old friend Mrs. Hunter, up there, on the hill-side. You may rely upon the *quality*. And her little Bessie comes to school every day, and passes your lodgings. So it would be very easy to send it."

"I'll follow your advice, with pleasure," I said; "and I'll go and arrange about it tomorrow. I know Arthur will want a walk."

"You'll find it quite an easy walk—under three miles, I think."

"Well, now that we've settled that point, let me retort your own remark upon yourself. I don't think *you're* looking quite your best!"

"I daresay not," she replied in a low voice; and a sudden shadow seemed to overspread her face. "I've had some troubles lately. It's a matter about which I've been long wishing to consult you, but I couldn't easily write about it. I'm *so* glad to have this opportunity!"

"Do you think," she began again, after a minute's silence, and with a visible embarrassment of manner most unusual in her, "that a promise, deliberately

and solemnly given, is *always* binding—except, of course, where its fulfilment would involve some actual *sin*?”

“I ca’n’t think of any other exception at this moment,” I said. “That branch of casuistry is usually, I believe, treated as a question of truth and untruth——”

“Surely that *is* the principle?” she eagerly interrupted. “I always thought the Bible-teaching about it consisted of such texts as ‘*lie not one to another*’?”

“I have thought about that point,” I replied; “and it seems to me that the essence of *lying* is the intention of *deceiving*. If you give a promise, fully *intending* to fulfil it, you are certainly acting truthfully *then*; and, if you afterwards break it, that does not involve any *deception*. I cannot call it *untruthful*.”

Another pause of silence ensued. Lady Muriel’s face was hard to read: she looked pleased, I thought, but also puzzled; and I felt curious to know whether her question had, as I began to suspect, some bearing on the breaking off of her engagement with Captain (now Major) Lindon.

“You have relieved me from a great fear,” she said; “but the thing is of course *wrong*, somehow. What texts would *you* quote, to prove it wrong?”

“Any that enforce the payment of *debts*. If *A* promises something to *B*, *B* has a claim upon *A*. And *A*’s sin, if he breaks his promise, seems to me more analogous to *stealing* than to *lying*.”

“It’s a new way of looking at it—to me,” she said; “but it seems a *true* way, also. However, I won’t deal in generalities, with an old friend like you! For we *are* old friends, somehow. Do you know, I think we *began* as old friends?” she said with a playfulness of tone that ill accorded with the tears that glistened in her eyes.

“Thank you very much for saying so,” I replied. “I like to think of you as an *old* friend,” (“—though you don’t look it!” would have been the almost necessary sequence, with any other lady; but she and I seemed to have long passed out of the time when compliments, or any such trivialities, were possible.)

Here the train paused at a station, where two or three passengers entered the carriage; so no more was said till we had reached our journey’s end.

On our arrival at Elveston, she readily adopted my suggestion that we should walk up together; so, as soon as our luggage had been duly taken charge of—hers by the servant who met her at the station, and mine by one of the porters—we set out together along the familiar lanes, now linked in my memory with so many delightful associations. Lady Muriel at once recommenced the conversation at the point where it had been interrupted.

“You knew of my engagement to my cousin Eric. Did you also hear——”

“Yes,” I interrupted, anxious to spare her the pain of giving any details. “I heard it had all come to an end.”

“I would like to tell you how it happened,” she said; “as that is the very point I want your advice about. I had long realised that we were not in sympathy in religious belief. His ideas of Christianity are very shadowy; and even as to the existence of a God he lives in a sort of dreamland. But it has not affected his life! I feel sure, now, that the most absolute Atheist *may* be leading, though walking blindfold, a pure and noble life. And if you knew half the good deeds——” she broke off suddenly, and turned away her head.

“I entirely agree with you,” I said. “And have we not our Saviour’s own promise that such a life shall surely lead to the light?”

“Yes, I know it,” she said in a broken voice, still keeping her head turned away. “And so I told him. He said he would believe, for *my* sake, if he could.

Quoted from
Colossians 3:9

And he wished, for *my* sake, he could see things as I did. But that is all wrong!" she went on passionately. "God *cannot* approve such low motives as that! Still it was not *I* that broke it off. I knew he loved me; and I had *promised*; and——"

"Then it was *he* that broke it off?"

"He released me unconditionally." She faced me again now, having quite recovered her usual calmness of manner.

"Then what difficulty remains?"

"It is *this*, that I don't believe he did it of his own free will. Now, supposing he did it *against* his will, merely to satisfy my scruples, would not his claim on me remain just as strong as ever? And would not my promise be as binding as ever? My father says 'no'; but I ca'n't help fearing he is biased by his love for me. And I've asked no one else. I have many friends—friends for the bright sunny weather; not friends for the clouds and storms of life; not *old* friends like you!"

"Let me think a little," I said: and for some minutes we walked on in silence, while, pained to the heart at seeing the bitter trial that had come upon this pure and gentle soul, I strove in vain to see my way through the tangled skein of conflicting motives.

"If she loves him truly," (I seemed at last to grasp the clue to the problem) "is not *that*, for her, the voice of God? May she not hope that she is sent to him, even as Ananias was sent to Saul in his blindness, that he may receive his sight?" Once more I seemed to hear Arthur whispering "*What knowest thou, O wife, whether thou shalt save thy husband?*" and I broke the silence with the words "If you still love him truly——"

"I do *not*!" she hastily interrupted. "At least—not in *that* way. I *believe* I loved him when I promised; but I was very young; it is hard to know. But, whatever the feeling was, it is dead *now*. The motive on *his* side is Love: on *mine* it is—Duty!"

Again there was a long silence. The whole skein of thought was tangled worse than ever. This time *she* broke the silence. "Don't misunderstand me!" she said. "When I said my heart was not *his*, I did not mean it was any one else's! At present I feel bound to *him*; and, till I know I am absolutely free, in the sight of God, to love any other than him, I'll never even *think* of any one else—in *that* way, I mean. I would die sooner!" I had never imagined my gentle friend capable of such passionate utterances.

I ventured on no further remark until we had nearly arrived at the Hall-gate; but, the longer I reflected, the clearer it became to me that no call of Duty demanded the sacrifice—possibly of the happiness of a life—which she seemed ready to make. I tried to make this clear to *her* also, adding some warnings on the dangers that surely awaited a union in which mutual love was wanting. "The only argument for it, worth considering," I said in conclusion, "seems to be his supposed *reluctance* in releasing you from your promise. I have tried to give to that argument its *full* weight, and my conclusion is that it does *not* affect the rights of the case, or invalidate the release he has given you. My belief is that you are *entirely* free to act as *now* seems right."

"I am *very* grateful to you," she said earnestly. "Believe it, please! I ca'n't put it into proper words!" and the subject was dropped by mutual consent: and I only learned, long afterwards, that our discussion had really served to dispel the doubts that had harassed her so long.

We parted at the Hall-gate, and I found Arthur eagerly awaiting my arrival;

Quoted from 1
Corinthians 7:16

and, before we parted for the night, I had heard the whole story—how he had put off his journey from day to day, feeling that he *could* not go away from the place till his fate had been irrevocably settled by the wedding taking place: how the preparations for the wedding, and the excitement in the neighbourhood, had suddenly come to an end, and he had learned (from Major Lindon, who called to wish him good-bye) that the engagement had been broken off by mutual consent: how he had instantly abandoned all his plans for going abroad, and had decided to stay on at Elveston, for a year or two at any rate, till his newly-awakened hopes should prove true or false; and how, since that memorable day, he had avoided all meetings with Lady Muriel, fearing to betray his feelings before he had had any sufficient evidence as to how she regarded him. “But it is nearly six weeks since all that happened,” he said in conclusion, “and we can meet in the ordinary way, now, with no need for any painful allusions. I would have written to tell you all this: only I kept hoping from day to day, that—that there would be *more* to tell!”

“And how should there be *more*, you foolish fellow,” I fondly urged, “if you never even go near her? Do you expect the offer to come from *her*?”

Arthur was betrayed into a smile. “No,” he said, “I hardly expect *that*. But I’m a desperate coward. There’s no doubt about it!”

“And what *reasons* have you heard of for breaking off the engagement?”

“A good many,” Arthur replied, and proceeded to count them on his fingers. “First, it was found that she was dying of—something; so *he* broke it off. Then it was found that *he* was dying of—some other thing; so *she* broke it off. Then the Major turned out to be a confirmed gamester; so the *Earl* broke it off. Then the Earl insulted him; so the *Major* broke it off. It got a good deal broken off, all things considered!”

“You have all this on the very best authority, of course?”

“Oh, certainly! And communicated in the strictest confidence! Whatever defects Elveston society suffers from, *want of information* isn’t one of them!”

“Nor *reticence*, either, it seems. But, seriously, do you know the real reason?”

“No, I’m quite in the dark.”

I did not feel that I had any right to enlighten him; so I changed the subject, to the less engrossing one of “new milk,” and we agreed that I should walk over, next day, to Hunter’s farm, Arthur undertaking to set me part of the way, after which he had to return to keep a business-engagement.

Chapter III. Streaks of Dawn.

Next day proved warm and sunny, and we started early, to enjoy the luxury of a good long chat before he would be obliged to leave me.

“This neighbourhood has more than its due proportion of the *very* poor,” I remarked, as we passed a group of hovels, too dilapidated to deserve the name of “cottages.”

“But the few rich,” Arthur replied, “give more than their due proportion of help in charity. So the balance is kept.”

“I suppose the *Earl* does a good deal?”

“He *gives* liberally; but he has not the health or strength to do more. Lady Muriel does more in the way of school-teaching and cottage-visiting than she would like me to reveal.”

“Then *she*, at least, is not one of the ‘idle mouths’ one so often meets with among the upper classes. I have sometimes thought they would have a hard time of it, if suddenly called on to give their *raison d’être*, and to show cause why they should be allowed to live any longer!”

“The whole subject,” said Arthur, “of what we may call ‘idle mouths’ (I mean persons who absorb some of the material *wealth* of a community—in the form of food, clothes, and so on—without contributing its equivalent in the form of productive *labour*) is a complicated one, no doubt. I’ve tried to think it out. And it seemed to me that the simplest form of the problem, to start with, is a community without *money*, who buy and sell by *barter* only; and it makes it yet simpler to suppose the food and other things to be capable of *keeping* for many years without spoiling.”

“Yours is an excellent plan,” I said. “What is your solution of the problem?”

“The commonest type of ‘idle mouths,’” said Arthur, “is no doubt due to money being left by parents to their own children. So I imagined a man—either exceptionally clever, or exceptionally strong and industrious—who had contributed so much valuable labour to the needs of the community that its equivalent, in clothes, &c., was (say) five times as much as he needed for himself. We cannot deny his *absolute* right to give the superfluous wealth as he chooses. So, if he leaves *four* children behind him (say two sons and two daughters), with enough of all the necessaries of life to last them a life-time, I cannot see that the *community* is in any way wronged if they choose to do nothing in life but to ‘eat, drink, and be merry.’ Most certainly, the community could not fairly say, in reference to *them*, ‘if a man will not work, neither let him eat.’ Their reply would be crushing. ‘The labour has already been *done*, which is a fair equivalent for the food we are eating; and you have had the benefit of it. On what principle of justice can you demand *two* quotas of work for *one* quota of food?’”

Quoted from
Ecclesiastes 8:15
Quoted from 2
Thessalonians 3:10

“Yet surely,” I said, “there is something wrong *somewhere*, if these four people are well able to do useful work, and if that work is actually *needed* by the community, and they elect to sit idle?”

“I think there *is*,” said Arthur: “but it seems to me to arise from a Law of God—that every one shall do as much as he can to help others—and not from any *rights*, on the part of the community, to exact labour as an equivalent for food that has already been fairly earned.”

“I suppose the *second* form of the problem is where the ‘idle mouths’ possess *money* instead of *material* wealth?”

“Yes,” replied Arthur: “and I think the simplest case is that of *paper-money*. *Gold* is itself a form of material wealth; but a bank-note is merely a *promise* to hand over so much *material* wealth when called upon to do so. The father of these four ‘idle mouths,’ had done (let us say) five thousand pounds’ worth of useful work for the community. In return for this, the community had given him what amounted to a written promise to hand over, whenever called upon to do so, five thousand pounds’ worth of food, &c. Then, if he only uses *one* thousand pounds’ worth himself, and leaves the rest of the notes to his children, surely they have a full right to *present* these written promises, and to say ‘hand over the food, for which the equivalent labour has been already done.’ Now I think *this* case well worth stating, publicly and clearly. I should like to drive it into the heads of those Socialists who are priming our ignorant paupers with such sentiments as ‘Look at them bloated haristocrats! Doing not a stroke o’ work for

themselves, and living on the sweat of *our* brows!' I should like to *force* them to see that the *money*, which those 'haristocrats' are spending, represents so much labour *already done* for the community, and whose equivalent, in *material* wealth, is *due from the community*."

"Might not the Socialists reply 'Much of this money does not represent *honest* labour *at all*. If you could trace it back, from owner to owner, though you might begin with several legitimate steps, such as gift, or bequeathing by will, or 'value received,' you would soon reach an owner who had no moral right to it, but had got it by fraud or other crimes; and of course his successors in the line would have no better right to it than *he* had.'"

"No doubt, no doubt," Arthur replied. "But surely that involves the logical fallacy of *proving too much*? It is *quite* as applicable to *material* wealth, as it is to *money*. If we once begin to go back beyond the fact that the *present* owner of certain property came by it honestly, and to ask whether any previous owner, in past ages, got it by fraud, would *any* property be secure?"

After a minute's thought, I felt obliged to admit the truth of this.

"My general conclusion," Arthur continued, "from the mere standpoint of human *rights*, man against man, was this—that if some wealthy 'idle mouth,' who has come by his money in a lawful way, even though not one atom of the labour it represents has been his own doing, chooses to spend it on his own needs, without contributing any labour to the community from whom he buys his food and clothes, that community has no *right* to interfere with him. But it's quite another thing, when we come to consider the *divine* law. Measured by *that* standard, such a man is undoubtedly doing wrong, if he fails to use, for the good of those in need, the strength or the skill, that God has given him. That strength and skill do *not* belong to the community, to be paid to *them* as a *debt*: they do *not* belong to the man *himself*, to be used for his *own* enjoyment: they *do* belong to God, to be used according to *His* will; and we are not left in doubt as to what that will is. '*Do good, and lend, hoping for nothing again.*'"

"Anyhow," I said, "an 'idle mouth' very often gives away a great deal in charity."

"In *so-called* 'charity,'" he corrected me. "Excuse me if I seem to speak *uncharitably*. I would not dream of *applying* the term to any *individual*. But I would say, *generally*, that a man who gratifies every fancy that occurs to him—denying himself in *nothing*—and merely gives to the poor some part, or even *all*, of his *superfluous* wealth, is only deceiving himself if he calls it *charity*."

"But, even in giving away *superfluous* wealth, he *may* be denying himself the miser's pleasure in hoarding?"

"I grant you that, gladly," said Arthur. "Given that he *has* that morbid craving, he is doing a good deed in restraining it."

"But, even in spending on *himself*," I persisted, "our typical rich man often does good, by employing people who would otherwise be out of work: and that is often better than pauperising them by *giving* the money."

"I'm glad you've said that!" said Arthur. "I would not like to quit the subject without exposing the *two* fallacies of that statement—which have gone so long uncontradicted that Society now accepts it as an axiom!"

"What are they?" I said. "I don't even see *one*, myself."

"One is merely the fallacy of *ambiguity*—the assumption that '*doing good*' (that is, benefiting somebody) is necessarily *a good thing to do* (that is, a *right* thing). The other is the assumption that, if one of two specified acts is *better*

Quoted from Luke
6:35

than another, it is necessarily a *good* act in itself. I should like to call this the fallacy of *comparison*—meaning that it assumes that what is *comparatively* good is therefore *positively* good.”

“Then what is *your* test of a good act?”

“That it shall be *our best*,” Arthur confidently replied. “And even *then* ‘*we are unprofitable servants.*’ But let me illustrate the two fallacies. Nothing illustrates a fallacy so well as an extreme case, which fairly comes under it. Suppose I find two children drowning in a pond. I rush in, and save one of the children, and then walk away, leaving the other to drown. Clearly I have ‘*done good*,’ in saving a child’s life? But——. Again, supposing I meet an inoffensive stranger, and knock him down, and walk on. Clearly that is ‘*better*’ than if I had proceeded to jump upon him and break his ribs? But——”

“Those ‘buts’ are quite unanswerable,” I said. “But I should like an instance from *real* life.”

“Well, let us take one of those abominations of modern Society, a Charity-Bazaar. It’s an interesting question to think out—how much of the money, that reaches the object in view, is *genuine* charity; and whether even *that* is spent in the *best* way. But the subject needs regular classification, and analysis, to understand it properly.”

“I should be glad to *have* it analysed,” I said: “it has often puzzled me.”

“Well, if I am really not boring you. Let us suppose our Charity-Bazaar to have been organised to aid the funds of some Hospital: and that A, B, C *give* their services in making articles to sell, and in acting as salesmen, while X, Y, Z buy the articles, and the money so paid goes to the Hospital.

“There are two distinct species of such Bazaars: one, where the payment exacted is merely the *market-value* of the goods supplied, that is, exactly what you would have to pay at a shop: the other, where *fancy-prices* are asked. We must take these separately.

“First, the ‘market-value’ case. Here A, B, C are exactly in the same position as ordinary shopkeepers; the only difference being that they give the proceeds to the Hospital. Practically, they are *giving their skilled labour* for the benefit of the Hospital. This seems to me to be genuine charity. And I don’t see how they could use it better. But X, Y, Z, are exactly in the same position as any ordinary purchasers of goods. To talk of ‘charity’ in connection with *their* share of the business, is sheer nonsense. Yet they are very likely to do so.

“Secondly, the case of ‘fancy-prices.’ Here I think the simplest plan is to divide the payment into two parts, the ‘market-value’ and the excess over that. The ‘market-value’ part is on the same footing as in the first case: the *excess* is all we have to consider. Well, A, B, C do not *earn* it; so we may put *them* out of the question: it is a *gift*, from X, Y, Z, to the Hospital. And my opinion is that it is not given in the best way: far better buy what they choose to *buy*, and give what they choose to *give*, as two *separate* transactions: then there is *some* chance that their motive in giving may be real charity, instead of a mixed motive—half charity, half self-pleasing. ‘The trail of the serpent is over it all.’ And *therefore* it is that I hold all such spurious ‘Charities’ in *utter* abomination!” He ended with unusual energy, and savagely beheaded, with his stick, a tall thistle at the road-side, behind which I was startled to see Sylvie and Bruno standing. I caught at his arm, but too late to stop him. Whether the stick reached them, or not, I could not feel sure: at any rate they took not the smallest notice of it, but smiled gaily, and nodded to me; and I saw at once that

Quoted from Luke
17:10

Quoted from *Lalla
Rookh* by Thomas
Moore

they were only visible to *me*: the ‘erie’ influence had not reached to *Arthur*.

“Why did you try to save it?” he said. “*That’s* not the wheedling Secretary of a Charity-Bazaar! I only wish it were!” he added grimly.

“Doos oo know, that stick went right froo my head!” said Bruno. (They had run round to me by this time, and each had secured a hand.) “Just under my chin! I *are* glad I aren’t a thistle!”

“Well, we’ve threshed *that* subject out, anyhow!” Arthur resumed. “I’m afraid I’ve been talking too much, for *your* patience and for my strength. I must be turning soon. This is about the end of my tether.”

“Take, O boatman, thrice thy fee;
Take, I give it willingly;
For, invisible to thee,
Spirits twain have crossed with me!”

Quoted from *The Passage (Auf der Überfahrt)* by Ludwig Uhland

I quoted, involuntarily.

“For utterly inappropriate and irrelevant quotations,” laughed Arthur, “you are ‘ekalled by few, and excelled by none’!” And we strolled on.

As we passed the head of the lane that led down to the beach, I noticed a single figure, moving slowly along it, seawards. She was a good way off, and had her back to us: but it was Lady Muriel, unmistakably. Knowing that Arthur had not seen her, as he had been looking, in the other direction, at a gathering rain-cloud, I made no remark, but tried to think of some plausible pretext for sending him back by the sea.

The opportunity instantly presented itself. “I’m getting tired,” he said. “I don’t think it would be prudent to go further. I had better turn here.”

I turned with him, for a few steps, and as we again approached the head of the lane, I said, as carelessly as I could, “Don’t go back by the road. It’s too hot and dusty. Down this lane, and along the beach, is nearly as short; and you’ll get a breeze off the sea.”

“Yes, I think I will,” Arthur began; but at that moment we came into sight of Lady Muriel, and he checked himself. “No, it’s too far round. Yet it certainly *would* be cooler——” He stood, hesitating, looking first one way and then the other—a melancholy picture of utter infirmity of purpose!

How long this humiliating scene would have continued, if *I* had been the only external influence, it is impossible to say; for at this moment Sylvie, with a swift decision worthy of Napoleon himself, took the matter into her own hands. “You go and drive *her*, up this way,” she said to Bruno. “I’ll get *him* along!” And she took hold of the stick that Arthur was carrying, and gently pulled him down the lane.

He was totally unconscious that any will but his own was acting on the stick, and appeared to think it had taken a horizontal position simply because he was pointing with it. “Are not those *orchises* under the hedge there?” he said. “I think that decides me. I’ll gather some as I go along.”

Meanwhile Bruno had run on beyond Lady Muriel, and, with much jumping about and shouting (shouts audible to no one but Sylvie and myself), much as if he were driving sheep, he managed to turn her round and make her walk, with eyes demurely cast upon the ground, in our direction.

The victory was ours! And, since it was evident that the lovers, thus urged together, *must* meet in another minute, I turned and walked on, hoping that

Quoted from *Dombey and Son* by Charles Dickens

'Are not those orchises?'

Sylvie and Bruno would follow my example, as I felt sure that the fewer the spectators the better it would be for Arthur and his good angel.

“And what sort of meeting was it?” I wondered, as I paced dreamily on.

Chapter IV. The Dog-King.

“They shook hands,” said Bruno, who was trotting at my side, in answer to the unspoken question.

“And they looked *ever* so pleased!” Sylvie added from the other side.

“Well, we must get on, now, as quick as we can,” I said. “If only I knew the best way to Hunter’s farm!”

“They’ll be sure to know in this cottage,” said Sylvie.

“Yes, I suppose they will. Bruno, would you run in and ask?”

Sylvie stopped him, laughingly, as he ran off. “Wait a minute,” she said. “I must make you *visible* first, you know.”

“And *audible* too, I suppose?” I said, as she took the jewel, that hung round her neck, and waved it over his head, and touched his eyes and lips with it.

“Yes,” said Sylvie: “and *once*, do you know, I made him *audible*, and forgot to make him *visible*! And he went to buy some sweeties in a shop. And the man *was* so frightened! A voice seemed to come out of the air, ‘Please, I want two ounces of barley-sugar drops!’ And a shilling came *bang* down upon the counter! And the man said ‘I ca’n’t *see* you!’ And Bruno said ‘It doosn’t sinnify seeing *me*, so long as oo can see the *shilling*!’ But the man said he never sold barley-sugar drops to people he couldn’t *see*. So we had to—*Now*, Bruno, you’re ready!’ And away he trotted.

Sylvie spent the time, while we were waiting for him, in making *herself* visible also. “It’s rather awkward, you know,” she explained to me, “when we meet people, and they can see *one* of us, and ca’n’t see the *other*!”

In a minute or two Bruno returned, looking rather disconsolate. “He’d got friends with him, and he were *cross*!” he said. “He asked me who I were. And I said ‘I’m Bruno: who is *these* peoples?’ And he said ‘One’s my half-brother, and t’other’s my half-sister: and I don’t want no more company! Go along with yer!’ And I said ‘I ca’n’t go along *wizout* mine self!’ And I said ‘Oo shouldn’t have *bits* of peoples lying about like that! It’s welly untidy!’ And he said ‘Oh, don’t talk to *me*!’ And he pushted me outside! And he shutted the door!”

“And you never asked where Hunter’s farm was?” queried Sylvie.

“Hadn’t room for any questions,” said Bruno. “The room were so crowded.”

“Three people *couldn’t* crowd a room,” said Sylvie.

“They *did*, though,” Bruno persisted. “*He* crowded it most. He’s such a welly *thick* man—so as oo couldn’t knock him down.”

I failed to see the drift of Bruno’s argument. “Surely *anybody* could be knocked down,” I said: “thick or thin wouldn’t matter.”

“Oo couldn’t knock *him* down,” said Bruno. “He’s more wider than he’s high: so, when he’s lying down, he’s more higher than when he’s standing: so a-course oo couldn’t knock him *down*!”

“Here’s another cottage,” I said: “*I’ll* ask the way, *this* time.”

There was no need to go in, this time, as the woman was standing in the doorway, with a baby in her arms, talking to a respectably dressed man—a farmer, as I guessed—who seemed to be on his way to the town.

“—and when there’s *drink* to be had,” he was saying, “he’s just the worst o’ the lot, is your Willie. So they tell me. He gets fairly mad wi’ it!”

“I’d have given ’em the lie to their faces, a twelvemonth back!” the woman said in a broken voice. “But a’ canna noo! A’ canna noo!” She checked herself, on catching sight of us, and hastily retreated into the house, shutting the door after her.

“Perhaps you can tell me where Hunter’s farm is?” I said to the man, as he turned away from the house.

“I can *that*, Sir!” he replied with a smile. “I’m John Hunter hissel, at your sarvice. It’s nobbut half a mile further—the only house in sight, when you get round bend o’ the road yonder. You’ll find my good woman within, if so be you’ve business wi’ *her*. Or mebbe I’ll do as well?”

“Thanks,” I said. “I want to order some milk. Perhaps I had better arrange it with your wife?”

“Aye,” said the man. “*She* minds all *that*. Good day t’ye, Master—and to your bonnie childer, as well!” And he trudged on.

“He should have said ‘*child*,’ not ‘*childer*,’” said Bruno. “Sylvie’s not a *childer*!”

“He meant *both* of us,” said Sylvie.

“No, he didn’t!” Bruno persisted. “’cause he said ‘bonnie’, oo know!”

“Well, at any rate he *looked* at us both,” Sylvie maintained.

“Well, then he *must* have seen we’re not *both* bonnie!” Bruno retorted. “*A-course* I’m much uglier than *oo*! Didn’t he mean *Sylvie*, Mister Sir?” he shouted over his shoulder, as he ran off.

But there was no use in replying, as he had already vanished round the bend of the road. When we overtook him he was climbing a gate, and was gazing earnestly into the field, where a horse, a cow, and a kid were browsing amicably together. “For its father, a *Horse*,” he murmured to himself. “For its mother, a *Cow*. For their dear little child, a *little* Goat, is the most curiousest thing I ever seen in my world!”

“Bruno’s World!” I pondered. “Yes, I suppose every child has a world of his own—and every man, too, for the matter of that. I wonder if *that’s* the cause for all the misunderstanding there is in Life?”

“That *must* be Hunter’s farm!” said Sylvie, pointing to a house on the brow of the hill, led up to by a cart-road. “There’s no other farm in sight, *this* way; and you *said* we must be nearly there by this time.”

I had *thought* it, while Bruno was climbing the gate, but I couldn’t remember having *said* it. However, Sylvie was evidently in the right. “Get down, Bruno,” I said, “and open the gate for us.”

“It’s a good thing we’s with oo, *isn’t* it, Mister Sir?” said Bruno, as we entered the field. “That big dog might have bited oo, if oo’d been alone! Oo needn’t be *frightened* of it!” he whispered, clinging tight to my hand to encourage me. “It aren’t fierce!”

“Fierce!” Sylvie scornfully echoed, as the dog—a magnificent Newfoundland—that had come galloping down the field to meet us, began curveting round us, in gambols full of graceful beauty, and welcoming us with short joyful barks. “Fierce! Why, it’s as gentle as a lamb! It’s—why, Bruno, don’t you know it? It’s——”

“So it *are*!” cried Bruno, rushing forwards and throwing his arms round its neck. “Oh, you *dear* dog!” And it seemed as if the two children would never

have done hugging and stroking it.

“And how *ever* did he get *here*?” said Bruno. “Ask him, Sylvie. I doosn’t know how.”

And then began an eager talk in Doggee, which of course was lost upon *me*; and I could only *guess*, when the beautiful creature, with a sly glance at me, whispered something in Sylvie’s ear, that *I* was now the subject of conversation. Sylvie looked round laughingly.

“He asked me who you are,” she explained. “And I said ‘He’s our *friend*.’ And he said ‘What’s his name?’ And I said ‘It’s *Mister Sir*.’ And he said ‘Bosh!’”

“What is ‘Bosh!’ in Doggee?” I enquired.

“It’s the same as in English,” said Sylvie. “Only, when a *dog* says it, it’s a sort of a whisper, that’s half a *cough* and half a *bark*. Nero, say ‘*Bosh!*’”

And Nero, who had now begun gamboling round us again, said “*Bosh!*” several times; and I found that Sylvie’s description of the sound was perfectly accurate.

“I wonder what’s behind this long wall?” I said, as we walked on.

“It’s the *Orchard*,” Sylvie replied, after a consultation with Nero. “See, there’s a boy getting down off the wall, at that far corner. And now he’s running away across the field. I do believe he’s been stealing the apples!”

Bruno set off after him, but returned to us in a few moments, as he had evidently no chance of overtaking the young rascal.

“I couldn’t catch him!” he said. “I wiss I’d started a little sooner. His pockets *was* full of apples!”

The Dog-King looked up at Sylvie, and said something in Doggee.

“Why, of *course* you can!” Sylvie exclaimed. “How stupid not to think of it! *Nero*’ll hold him for us, Bruno! But I’d better make him invisible, first.” And she hastily got out the Magic Jewel, and began waving it over Nero’s head, and down along his back.

“That’ll do!” cried Bruno, impatiently. “After him, good Doggie!”

“Oh, Bruno!” Sylvie exclaimed reproachfully. “You shouldn’t have sent him off so quick! I hadn’t done the tail!”

Meanwhile Nero was coursing like a greyhound down the field: so at least I concluded from all *I* could see of him—the long feathery tail, which floated like a meteor through the air—and in a very few seconds he had come up with the little thief.

“He’s got him safe, by one foot!” cried Sylvie, who was eagerly watching the chase. “Now there’s no hurry, Bruno!”

So we walked, quite leisurely, down the field, to where the frightened lad stood. A more curious sight I had seldom seen, in all my ‘eerie’ experiences. Every bit of him was in violent action, except the left foot, which was apparently glued to the ground—there being nothing visibly holding it: while, at some little distance, the long feathery tail was waving gracefully from side to side, showing that Nero, at least, regarded the whole affair as nothing but a magnificent game of play.

“What’s the matter with you?” I said, as gravely as I could.

“Got the crahmp in me ahnkle!” the thief groaned in reply. “An’ me fut’s gone to sleep!” And he began to blubber aloud.

“Now, look here!” Bruno said in a commanding tone, getting in front of him. “Oo’ve got to give up those apples!”

The lad glanced at me, but didn't seem to reckon *my* interference as worth anything. Then he glanced at Sylvie: *she* clearly didn't count for very much, either. Then he took courage. "It'll take a better man than any of *yer* to get 'em!" he retorted defiantly.

A royal thief-taker

Sylvie stooped and patted the invisible Nero. "A *little* tighter!" she whispered. And a sharp yell from the ragged boy showed how promptly the Dog-King had taken the hint.

"What's the matter *now*?" I said. "Is your ankle worse?"

"And it'll get worse, and worse, and worse," Bruno solemnly assured him, "till oo gives up those apples!"

Apparently the thief was convinced of this at last, and he sulkily began emptying his pockets of the apples. The children watched from a little distance, Bruno dancing with delight at every fresh yell extracted from Nero's terrified prisoner.

"That's all," the boy said at last.

"It *isn't* all!" cried Bruno. "There's three more in that pocket!"

Another hint from Sylvie to the Dog-King—another sharp yell from the thief, now convicted of lying also—and the remaining three apples were surrendered.

"Let him go, please," Sylvie said in Doggee, and the lad limped away at a great pace, stooping now and then to rub the ailing ankle, in fear, seemingly, that the 'crahmp' might attack it again.

Bruno ran back, with his booty, to the orchard wall, and pitched the apples over it one by one. "I's welly afraid *some* of them's gone under the wrong trees!" he panted, on overtaking us again.

"The *wrong* trees!" laughed Sylvie. "Trees *ca'n't* do wrong! There's no such things as *wrong* trees!"

"Then there's no such things as *right* trees, neither!" cried Bruno. And Sylvie gave up the point.

"Wait a minute, please!" she said to me. "I must make Nero *visible*, you know!"

"No, *please* don't!" cried Bruno, who had by this time mounted on the Royal back, and was twisting the Royal hair into a bridle. "It'll be *such* fun to have him like this!"

'Summat wrong wi' my spectacles!

"Well, it *does* look funny," Sylvie admitted, and led the way to the farmhouse, where the farmer's wife stood, evidently much perplexed at the weird procession now approaching her. "It's summat gone wrong wi' my spectacles, I doubt!" she murmured, as she took them off, and began diligently rubbing them with a corner of her apron.

Meanwhile Sylvie had hastily pulled Bruno down from his steed, and had just time to make His Majesty wholly visible before the spectacles were resumed.

All was natural, now; but the good woman still looked a little uneasy about it. "My eyesight's getting bad," she said, "but I see you *now*, my darlings! You'll give me a kiss, wo'n't you?"

Bruno got behind me, in a moment: however Sylvie put up *her* face, to be kissed, as representative of *both*, and we all went in together.

Chapter V. Matilda Jane.

"Come to me, my little gentleman," said our hostess, lifting Bruno into her lap, "and tell me everything."

"I ca'n't," said Bruno. "There wouldn't be time. Besides, I don't *know* everything."

The good woman looked a little puzzled, and turned to Sylvie for help. "Does he like *riding*?" she asked.

"Yes, I *think* so," Sylvie gently replied. "He's just had a ride on *Nero*."

"Ah, Nero's a grand dog, isn't he? Were you ever outside a *horse*, my little man?"

"*Always!*" Bruno said with great decision. "Never was *inside* one. Was *oo*?"

Here I thought it well to interpose, and to mention the business on which we had come, and so relieved her, for a few minutes, from Bruno's perplexing questions.

"And those dear children will like a bit of cake, *I'll* warrant!" said the farmer's hospitable wife, when the business was concluded, as she opened her cupboard, and brought out a cake. "And don't you waste the crust, little gentleman!" she added, as she handed a good slice of it to Bruno. "You know what the poetry-book says about wilful waste?"

"No, I don't," said Bruno. "What does he say about it?"

"Tell him, Bessie!" And the mother looked down, proudly and lovingly, on a rosy little maiden, who had just crept shyly into the room, and was leaning against her knee. "What's that your poetry-book says about wilful waste?"

"*For wilful waste makes woeful want,*" Bessie recited, in an almost inaudible whisper: "*and you may live to say 'How much I wish I had the crust that then I threw away!'*"

"Now try if *you* can say it, my dear! *For wilful—*"

"*For wifful—sumfinoruvver—*" Bruno began, readily enough; and then there came a dead pause. "Ca'n't remember no more!"

"Well, what do you *learn* from it, then? You can tell us *that*, at any rate?"

Bruno ate a little more cake, and considered: but the moral did not seem to him to be a very obvious one.

"Always to——" Sylvie prompted him in a whisper.

"Always to——" Bruno softly repeated: and then, with sudden inspiration, "always to look where it goes to!"

"Where *what* goes to, darling?"

"Why the *crust*, a course!" said Bruno. "Then, if I lived to say '*How much I wiss I had the crust—*' (and all that), I'd know where I frew it to!"

This new interpretation quite puzzled the good woman. She returned to the subject of 'Bessie.' "Wouldn't you like to see Bessie's doll, my dears! Bessie, take the little lady and gentleman to see Matilda Jane!"

Bessie's shyness thawed away in a moment. "Matilda Jane has just woke up," she stated, confidentially, to Sylvie. "Wo'n't you help me on with her frock? Them strings *is* such a bother to tie!"

"I can tie *strings*," we heard, in Sylvie's gentle voice, as the two little girls left the room together. Bruno ignored the whole proceeding, and strolled to the window, quite with the air of a fashionable gentleman. Little girls, and dolls, were not at all in his line.

And forthwith the fond mother proceeded to tell me (as what mother is not ready to do?) of all Bessie's virtues (and vices too, for the matter of that) and of the many fearful maladies which, notwithstanding those ruddy cheeks and that plump little figure, had nearly, time and again, swept her from the face of the earth.

When the full stream of loving memories had nearly run itself out, I began to question her about the working men of that neighbourhood, and specially the 'Willie,' whom we had heard of at his cottage. "He was a good fellow once," said my kind hostess: "but it's the drink has ruined him! Not that I'd rob them of the drink—it's good for the most of them—but there's some as is too weak to stand agin' temptations: it's a thousand pities, for *them*, as they ever built the Golden Lion at the corner there!"

"The Golden Lion?" I repeated.

"It's the new Public," my hostess explained. "And it stands right in the way, and handy for the workmen, as they come back from the brickfields, as it might be to-day, with their week's wages. A deal of money gets wasted that way. And some of 'em gets drunk."

"If only they could have it in their own houses——" I mused, hardly knowing I had said the words out loud.

"That's it!" she eagerly exclaimed. It was evidently a solution, of the problem, that she had already thought out. "If only you could manage, so's each

Quoted from *The Crust of Bread* by James Currie

man to have his own little barrel in his own house—there'd hardly be a drunken man in the length and breadth of the land!"

And then I told her the old story—about a certain cottager who bought himself a little barrel of beer, and installed his wife as bar-keeper: and how, every time he wanted his mug of beer, he regularly paid her over the counter for it: and how she never would let him go on 'tick,' and was a perfectly inflexible bar-keeper in never letting him have more than his proper allowance: and how, every time the barrel needed refilling, she had plenty to do it with, and something over for her money-box: and how, at the end of the year, he not only found himself in first-rate health and spirits, with that undefinable but quite unmistakeable air which always distinguishes the sober man from the one who takes 'a drop too much,' but had quite a box full of money, all saved out of his own pence!

"If only they'd all do like that!" said the good woman, wiping her eyes, which were overflowing with kindly sympathy. "Drink hadn't need to be the curse it is to some——"

"Only a *curse*," I said, "when it is used wrongly. Any of God's gifts may be turned into a curse, unless we use it wisely. But we must be getting home. Would you call the little girls? Matilda Jane has seen enough of company, for *one* day, I'm sure!"

"I'll find 'em in a minute," said my hostess, as she rose to leave the room. "Maybe that young gentleman saw which way they went?"

"Where are they, Bruno?" I said.

"They ain't in the field," was Bruno's rather evasive reply, "'cause there's nothing but *pigs* there, and Sylvie isn't a pig. Now don't imperrupt me any more, 'cause I'm telling a story to this fly; and it won't attend!"

"They're among the apples, I'll warrant 'em!" said the Farmer's wife. So we left Bruno to finish his story, and went out into the orchard, where we soon came upon the children, walking sedately side by side, Sylvie carrying the doll, while little Bess carefully shaded its face, with a large cabbage-leaf for a parasol.

As soon as they caught sight of us, little Bess dropped her cabbage-leaf and came running to meet us, Sylvie following more slowly, as her precious charge evidently needed great care and attention.

"I'm its Mamma, and Sylvie's the Head-Nurse," Bessie explained: "and Sylvie's taught me ever such a pretty song, for me to sing to Matilda Jane!"

"Let's hear it once more, Sylvie," I said, delighted at getting the chance I had long wished for, of hearing her sing. But Sylvie turned shy and frightened in a moment. "No, *please* not!" she said, in an earnest 'aside' to me. "Bessie knows it quite perfect now. Bessie can sing it!"

"Aye, aye! Let Bessie sing it!" said the proud mother. "Bessie has a bonny voice of her own," (this again was an 'aside' to me) "though I say it as shouldn't!"

Bessie was only too happy to accept the 'encore.' So the plump little Mamma sat down at our feet, with her hideous daughter reclining stiffly across her lap (it was one of a kind that wo'n't sit down, under *any* amount of persuasion), and, with a face simply beaming with delight, began the lullaby, in a shout that *ought* to have frightened the poor baby into fits. The Head-Nurse crouched down behind her, keeping herself respectfully in the back-ground, with her hands on the shoulders of her little mistress, so as to be ready to act as Prompter, if required, and to supply '*each gap in faithless memory void.*'

The shout, with which she began, proved to be only a momentary effort. After a very few notes, Bessie toned down, and sang on in a small but very

Quoted from *The Lay of the Last Minstrel*
by Walter Scott

Bessie's song

sweet voice. At first her great black eyes were fixed on her mother, but soon her gaze wandered upwards, among the apples, and she seemed to have quite forgotten that she had any other audience than her Baby, and her Head-Nurse, who once or twice supplied, almost inaudibly, the right note, when the singer was getting a little 'flat.'

"Matilda Jane, you never look
At any toy or picture-book:
I show you pretty things in vain—
You must be blind, Matilda Jane!

"I ask you riddles, tell you tales,
But *all* our conversation fails:
You *never* answer me again—
I fear you're dumb, Matilda Jane!

"Matilda, darling, when I call,
You never seem to hear at all:
I shout with all my might and main—
But you're *so* deaf, Matilda Jane!

"Matilda Jane, you needn't mind;
For, though you're deaf, and dumb, and blind,
There's *some one* loves you, it is plain—
And that is *me*, Matilda Jane!"

She sang three of the verses in a rather perfunctory style, but the last stanza evidently excited the little maiden. Her voice rose, ever clearer and louder: she had a rapt look on her face, as if suddenly inspired, and, as she sang the last few words, she clasped to her heart the inattentive Matilda Jane.

"Kiss it now!" prompted the Head-Nurse. And in a moment the simpering meaningless face of the Baby was covered with a shower of passionate kisses.

"What a bonny song!" cried the Farmer's wife. "Who made the words, dearie?"

"I—I think I'll look for Bruno," Sylvie said demurely, and left us hastily. The curious child seemed always afraid of being praised, or even noticed.

"Sylvie planned the words," Bessie informed us, proud of her superior information: "and Bruno planned the music—and *I* sang it!" (this last circumstance, by the way, we did not need to be told).

So we followed Sylvie, and all entered the parlour together. Bruno was still standing at the window, with his elbows on the sill. He had, apparently, finished the story that he was telling to the fly, and had found a new occupation. "Don't interrupt!" he said as we came in. "I'm counting the Pigs in the field!"

"How many are there?" I enquired.

"About a thousand and four," said Bruno.

"You mean 'about a thousand,'" Sylvie corrected him. "There's no good saying '*and four*': you *ca'n't* be sure about the four!"

"And you're as wrong as ever!" Bruno exclaimed triumphantly. "It's just the *four* I *can* be sure about; 'cause they're here, grubbling under the window! It's the *thousand* I isn't pruffickly sure about!"

"But some of them have gone into the sty," Sylvie said, leaning over him to look out of the window.

"Yes," said Bruno; "but they went so slowly and so fewly, I didn't care to count *them*."

"We must be going, children," I said. "Wish Bessie good-bye." Sylvie flung her arms round the little maiden's neck, and kissed her: but Bruno stood aloof, looking unusually shy. ("I never kiss *nobody* but Sylvie!" he explained to me afterwards.) The farmer's wife showed us out: and we were soon on our way back to Elveston.

"And that's the new public-house that we were talking about, I suppose?" I said, as we came in sight of a long low building, with the words 'THE GOLDEN LION' over the door.

"Yes, that's it," said Sylvie. "I wonder if *her* Willie's inside? Run in, Bruno, and see if he's there."

I interposed, feeling that Bruno was, in a sort of way, in *my* care. "That's not a place to send a child into." For already the revelers were getting noisy: and a wild discord of singing, shouting, and meaningless laughter came to us through the open windows.

"They wo'n't *see* him, you know," Sylvie explained. "Wait a minute, Bruno!" She clasped the jewel, that always hung round her neck, between the palms of her hands, and muttered a few words to herself. What they were I could not at all make out, but some mysterious change seemed instantly to pass over us. My feet seemed to me no longer to press the ground, and the dream-like feeling came upon me, that I was suddenly endowed with the power of floating in the air. I could still just *see* the children: but their forms were shadowy and unsubstantial, and their voices sounded as if they came from some distant

place and time, they were so unreal. However, I offered no further opposition to Bruno's going into the house. He was back again in a few moments. "No, he isn't come yet," he said. "They're talking about him inside, and saying how drunk he was last week."

While he was speaking, one of the men lounged out through the door, a pipe in one hand and a mug of beer in the other, and crossed to where we were standing, so as to get a better view along the road. Two or three others leaned out through the open window, each holding his mug of beer, with red faces and sleepy eyes. "Canst see him, lad?" one of them asked.

"I dunnot know," the man said, taking a step forwards, which brought us nearly face to face. Sylvie hastily pulled me out of his way. "Thanks, child," I said. "I had forgotten he couldn't see us. What would have happened if I had staid in his way?"

"I don't know," Sylvie said gravely. "It wouldn't matter to *us*; but *you* may be different." She said this in her usual voice, but the man took no sort of notice, though she was standing close in front of him, and looking up into his face as she spoke.

"He's coming now!" cried Bruno, pointing down the road.

"He be a-coomin noo!" echoed the man, stretching out his arm exactly over Bruno's head, and pointing with his pipe.

"Then *chorus* agin!" was shouted out by one of the red-faced men in the window: and forthwith a dozen voices yelled, to a harsh discordant melody, the refrain:—

"There's him, an' yo' an' me,
Roarin' laddies!
We loves a bit o' spree,
Roarin' laddies we,
Roarin' laddies
Roarin' laddies!"

The man lounged back again to the house, joining lustily in the chorus as he went: so that only the children and I were in the road when 'Willie' came up.

Chapter VI. Willie's Wife.

He made for the door of the public-house, but the children intercepted him. Sylvie clung to one arm; while Bruno, on the opposite side, was pushing him with all his strength, with many inarticulate cries of "Gee-up! Gee-back! Woah then!" which he had picked up from the waggoners.

'Willie' took not the least notice of them: he was simply conscious that *something* had checked him: and, for want of any other way of accounting for it, he seemed to regard it as his own act.

"I wunnut coom in," he said: "not to-day."

"A mug o' beer wunnut hurt 'ee!" his friends shouted in chorus. "*Two* mugs wunnut hurt 'ee! Nor a dozen mugs!"

"Nay," said Willie. "I'm agoan whoam."

"What, withouten thy drink, Willie man?" shouted the others. But 'Willie man' would have no more discussion, and turned doggedly away, the children keeping one on each side of him, to guard him against any change in his sudden resolution.

The rescue of Willie

For a while he walked on stoutly enough, keeping his hands in his pockets, and softly whistling a tune, in time to his heavy tread: his success, in appearing entirely at his ease, was *almost* complete; but a careful observer would have noted that he had forgotten the second part of the air, and that, when it broke down, he instantly began it again, being too nervous to think of another, and too restless to endure silence.

It was not the old fear that possessed him now—the old fear, that had been his dreary companion every Saturday night he could remember, as he had reeled along, steadying himself against gates and garden-palings, and when the shrill reproaches of his wife had seemed to his dazed brain only the echo of a yet more piercing voice within, the intolerable wail of a hopeless remorse: it was a wholly new fear that had come to him now: life had taken on itself a new set of colours, and was lighted up with a new and dazzling radiance, and he did not see, as yet, how his home-life, and his wife and child, would fit into the new order of things: the very novelty of it all was, to his simple mind, a perplexity and an overwhelming terror.

And now the tune died into sudden silence on the trembling lips, as he turned a sharp corner, and came in sight of his own cottage, where his wife stood, leaning with folded arms on the wicket-gate, and looking up the road with a pale face, that had in it no glimmer of the light of hope—only the heavy shadow of a deep stony despair.

“Fine an’ early, lad! Fine an’ early!” The words might have been words of welcoming, but oh, the bitterness of the tone in which she said it! “What brings thee from thy merry mates, and all the fiddling and the jigging? Pockets empty, I doubt? Or thou’st come, mebbe, for to see thy little one die? The bairnie’s clemmed, and I’ve nor bite nor sup to gie her. But what does *thou* care?” She flung the gate open, and met him with blazing eyes of fury.

The man said no word. Slowly, and with downcast eyes, he passed into the house, while she, half terrified at his strange silence, followed him in without another word; and it was not till he had sunk into a chair, with his arms crossed on the table and with drooping head, that she found her voice again.

It seemed entirely natural for us to go in with them: at another time one would have asked leave for this, but I felt, I knew not why, that we were in some mysterious way invisible, and as free to come and to go as disembodied spirits.

The child in the cradle woke up, and raised a piteous cry, which in a moment brought the children to its side: Bruno rocked the cradle, while Sylvie tenderly replaced the little head on the pillow from which it had slipped. But the mother took no heed of the cry, nor yet of the satisfied ‘*coo*’ that it set up when Sylvie had made it happy again: she only stood gazing at her husband, and vainly trying, with white quivering lips (I believe she thought he was mad), to speak in the old tones of shrill upbraiding that he knew so well.

“And thou’st spent all thy wages—I’ll swear thou hast—on the devil’s own drink—and thou’st been and made thysen a beast again—as thou allus dost—
—”

“Hasna!” the man muttered, his voice hardly rising above a whisper, as he slowly emptied his pockets on the table. “There’s th’ wage, Missus, every penny on’t.”

The woman gasped, and put one hand to her heart, as if under some great shock of surprise. “Then *how*’s thee gotten th’ drink?”

“*Hasna* gotten it,” he answered her, in a tone more sad than sullen. “I hanna

touched a drop this blessed day. No!" he cried aloud, bringing his clenched fist heavily down upon the table, and looking up at her with gleaming eyes, "nor I'll never touch another drop o' the cursed drink—till I die—so help me God my Maker!" His voice, which had suddenly risen to a hoarse shout, dropped again as suddenly: and once more he bowed his head, and buried his face in his folded arms.

Willie's wife

The woman had dropped upon her knees by the cradle, while he was speaking. She neither looked at him nor seemed to hear him. With hands clasped above her head, she rocked herself wildly to and fro. "Oh my God! Oh my God!" was all she said, over and over again.

Sylvie and Bruno gently unclasped her hands and drew them down—till she had an arm round each of them, though she took no notice of them, but knelt on with eyes gazing upwards, and lips that moved as if in silent thanksgiving. The man kept his face hidden, and uttered no sound: but one could *see* the sobs that shook him from head to foot.

After a while he raised his head—his face all wet with tears. "Polly!" he said softly; and then, louder, "Old Poll!"

Then she rose from her knees and came to him, with a dazed look, as if she were walking in her sleep. "Who was it called me old Poll?" she asked: her voice took on it a tender playfulness: her eyes sparkled; and the rosy light of Youth flushed her pale cheeks, till she looked more like a happy girl of seventeen than a worn woman of forty. "Was that my own lad, my Willie, a-waiting for me at the stile?"

His face too was transformed, in the same magic light, to the likeness of a bashful boy: and boy and girl they seemed, as he wound an arm about her, and drew her to his side, while with the other hand he thrust from him the heap of money, as though it were something hateful to the touch. "Tak it, lass," he said, "tak it all! An' fetch us summat to eat: but get a sup o' milk, first, for t' bairn."

"My *little* bairn!" she murmured as she gathered up the coins. "My own little lassie!" Then she moved to the door, and was passing out, but a sudden thought seemed to arrest her: she hastily returned—first to kneel down and kiss the sleeping child, and then to throw herself into her husband's arms and be

strained to his heart. The next moment she was on her way, taking with her a jug that hung on a peg near the door: we followed close behind.

We had not gone far before we came in sight of a swinging sign-board bearing the word 'DAIRY' on it, and here she went in, welcomed by a little curly white dog, who, not being under the 'erie' influence, saw the children, and received them with the most effusive affection. When I got inside, the dairyman was in the act of taking the money. "Is't for thysen, Missus, or for t' bairn?" he asked, when he had filled the jug, pausing with it in his hand.

"For t' *bairn*!" she said, almost reproachfully. "Think'st tha I'd touch a drop *mysen*, while as *she* hadna got her fill?"

"All right, Missus," the man replied, turning away with the jug in his hand. "Let's just mak sure it's good measure." He went back among his shelves of milk-bowls, carefully keeping his back towards her while he emptied a little measure of cream into the jug, muttering to himself "mebbe it'll hearten her up a bit, the little lassie!"

The woman never noticed the kind deed, but took back the jug with a simple "Good evening, Master," and went her way: but the children had been more observant, and, as we followed her out, Bruno remarked "That were *welly* kind: and I loves that man: and if I was welly rich I'd give him a hundred pounds—and a bun. That little grummeling dog doosn't know its business!" He referred to the dairyman's little dog, who had apparently quite forgotten the affectionate welcome he had given us on our arrival, and was now following at a respectful distance, doing his best to '*speed the parting guest*' with a shower of little shrill barks, that seemed to tread on one another's heels.

"What *is* a dog's business?" laughed Sylvie. "Dogs ca'n't keep shops and give change!"

"Sisters' businesses *isn't* to laugh at their brothers," Bruno replied with perfect gravity. "And dogs' businesses is to *bark*—not like that: it should finish one bark before it begins another: and it should—Oh Sylvie, there's some dindledums!"

And in another moment the happy children were flying across the common, racing for the patch of dandelions.

While I stood watching them, a strange dreamy feeling came upon me: a railway-platform seemed to take the place of the green sward, and, instead of the light figure of Sylvie bounding along, I seemed to see the flying form of Lady Muriel; but whether Bruno had also undergone a transformation, and had become the old man whom she was running to overtake, I was unable to judge, so instantaneously did the feeling come and go.

When I re-entered the little sitting-room which I shared with Arthur, he was standing with his back to me, looking out of the open window, and evidently had not heard me enter. A cup of tea, apparently just tasted and pushed aside, stood on the table, on the opposite side of which was a letter, just begun, with the pen lying across it: an open book lay on the sofa: the London paper occupied the easy chair; and on the little table, which stood by it, I noticed an unlighted cigar and an open box of cigar-lights: all things betokened that the Doctor, usually so methodical and so self-contained, had been trying every form of occupation, and could settle to none!

"This is very unlike *you*, Doctor!" I was beginning, but checked myself, as he turned at the sound of my voice, in sheer amazement at the wonderful change that had taken place in his appearance. Never had I seen a face so radiant

Quoted from *The Odyssey* by Homer, translated by Alexander Pope

with happiness, or eyes that sparkled with such unearthly light! “Even thus,” I thought, “must the herald-angel have looked, who brought to the shepherds, watching over their flocks by night, that sweet message of ‘*peace on earth, goodwill to men*’!”

Quoted from Luke 2:14

“Yes, dear friend!” he said, as if in answer to the question that I suppose he read in my face. “It is true! It is true!”

No need to ask *what* was true. “God bless you both!” I said, as I felt the happy tears brimming to my eyes. “You were made for each other!”

“Yes,” he said, simply, “I believe we were. And *what* a change it makes in one’s life! This isn’t the same world! That isn’t the sky I saw yesterday! Those clouds—I never saw such clouds in all my life before! They look like troops of hovering angels!”

To *me* they looked very ordinary clouds indeed: but then *I* had not fed ‘*on honey-dew, And drunk the milk of Paradise*’!

Quoted from *Kubla Khan* by Samuel Taylor Coleridge

“She wants to see you—at once,” he continued, descending suddenly to the things of earth. “She says *that* is the *one* drop yet wanting in her cup of happiness!”

“I’ll go at once,” I said, as I turned to leave the room. “Wo’n’t you come with me?”

“No, Sir!” said the Doctor, with a sudden effort—which proved an utter failure—to resume his professional manner. “Do I *look* like coming with you? Have you never heard that two is company, and——”

“Yes,” I said, “I *have* heard it: and I’m painfully aware that *I* am *Number Three*! But, *when* shall we three meet again?”

Quoted from *Macbeth* by William Shakespeare

“*When the hurly-burly’s done!*” he answered with a happy laugh, such as I had not heard from him for many a year.

Quoted from *Macbeth* by William Shakespeare

Chapter VII. Mein Herr.

So I went on my lonely way, and, on reaching the Hall, I found Lady Muriel standing at the garden-gate waiting for me.

“No need to *give* you joy, or to *wish* you joy?” I began.

“None *whatever!*” she replied, with the joyous laugh of a child. “We *give* people what they haven’t got: we *wish* for something that is yet to come. For *me*, it’s all *here!* It’s all *mine!* Dear friend,” she suddenly broke off, “do you think Heaven ever begins on *Earth*, for any of us?”

“For *some*,” I said. “For some, perhaps, who are simple and childlike. You know He said ‘of such is the Kingdom of Heaven.’”

Quoted from Matthew 19:14

Lady Muriel clasped her hands, and gazed up into the cloudless sky, with a look I had often seen in Sylvie’s eyes. “I feel as if it had begun for *me*,” she almost whispered. “I feel as if *I* were one of the happy children, whom He bid them bring near to Him, though the people would have kept them back. Yes, He has seen me in the throng. He has read the wistful longing in my eyes. He has beckoned me to Him. They have *had* to make way for me. He has taken me up in His arms. He has put His hands upon me and blessed me!” She paused, breathless in her perfect happiness.

“Yes,” I said. “I think He has!”

“You must come and speak to my father,” she went on, as we stood side by side at the gate, looking down the shady lane. But, even as she said the words, the ‘eerie’ sensation came over me like a flood: I saw the dear old Professor

approaching us, and also saw, what was stranger still, that he was visible to *Lady Muriel!*

What was to be done? Had the fairy-life been merged in the real life? Or was Lady Muriel 'eerie' also, and thus able to enter into the fairy-world along with me? The words were on my lips ("I see an old friend of mine in the lane: if you don't know him, may I introduce him to you?") when the strangest thing of all happened: Lady Muriel spoke.

"I see an old friend of mine in the lane," she said: "if you don't know him, may I introduce him to you?"

I seemed to wake out of a dream: for the 'eerie' feeling was still strong upon me, and the figure outside seemed to be changing at every moment, like one of the shapes in a kaleidoscope: now he was the *Professor*, and now he was somebody else! By the time he had reached the gate, he certainly was somebody else: and I felt that the proper course was for *Lady Muriel*, not for *me*, to introduce him. She greeted him kindly, and, opening the gate, admitted the venerable old man—a German, obviously—who looked about him with dazed eyes, as if *he*, too, had but just awaked from a dream!

No, it was certainly *not* the Professor! My old friend *could* not have grown that magnificent beard since last we met: moreover, he would have recognised *me*, for I was certain that *I* had not changed much in the time.

As it was, he simply looked at me vaguely, and took off his hat in response to Lady Muriel's words "Let me introduce Mein Herr to you"; while in the words, spoken in a strong German accent, "proud to make your acquaintance, Sir!" I could detect no trace of an idea that we had ever met before.

Lady Muriel led us to the well-known shady nook, where preparations for afternoon tea had already been made, and, while she went in to look for the Earl, we seated ourselves in two easy-chairs, and 'Mein Herr' took up Lady Muriel's work, and examined it through his large spectacles (one of the adjuncts that made him so provokingly like the Professor). "Hemming pocket-handkerchiefs?" he said, musingly. "So *that* is what the English miladies occupy themselves with, is it?"

"It is the one accomplishment," I said, "in which Man has never yet rivaled Woman!"

Here Lady Muriel returned with her father; and, after he had exchanged some friendly words with 'Mein Herr,' and we had all been supplied with the needful 'creature-comforts,' the newcomer returned to the suggestive subject of Pocket-handkerchiefs.

"You have heard of Fortunatus's Purse, Miladi? Ah, so! Would you be surprised to hear that, with three of these leetle handkerchiefs, you shall make the Purse of Fortunatus, quite soon, quite easily?"

"Shall I indeed?" Lady Muriel eagerly replied, as she took a heap of them into her lap, and threaded her needle. "*Please* tell me how, Mein Herr! I'll make one before I touch another drop of tea!"

"You shall first," said Mein Herr, possessing himself of two of the handkerchiefs, spreading one upon the other, and holding them up by two corners, "you shall first join together these upper corners, the right to the right, the left to the left; and the opening between them shall be the *mouth* of the Purse."

A very few stitches sufficed to carry out *this* direction. "Now, if I sew the other three edges together," she suggested, "the bag is complete?"

“Not so, Miladi: the *lower* edges shall *first* be joined—ah, not so!” (as she was beginning to sew them together). “Turn one of them over, and join the *right* lower corner of the one to the *left* lower corner of the other, and sew the lower edges together in what you would call *the wrong way*.”

“*I see!*” said Lady Muriel, as she deftly executed the order. “And a very twisted, uncomfortable, uncanny-looking bag it makes! But the *moral* is a lovely one. Unlimited wealth can only be attained by doing things *in the wrong way!* And how are we to join up these mysterious—no, I mean *this* mysterious opening?” (twisting the thing round and round with a puzzled air.) “Yes, it *is* one opening. I thought it was *two*, at first.”

“You have seen the puzzle of the Paper Ring?” Mein Herr said, addressing the Earl. “Where you take a slip of paper, and join its ends together, first twisting one, so as to join the *upper* corner of *one* end to the *lower* corner of the *other*?”

“I saw one made, only yesterday,” the Earl replied. “Muriel, my child, were you not making one, to amuse those children you had to tea?”

“Yes, I know that Puzzle,” said Lady Muriel. “The Ring has only *one* surface, and only *one* edge. It’s very mysterious!”

“The *bag* is just like that, isn’t it?” I suggested. “Is not the *outer* surface of one side of it continuous with the *inner* surface of the other side?”

“So it is!” she exclaimed. “Only it *isn’t* a bag, just yet. How shall we fill up this opening, Mein Herr?”

“Thus!” said the old man impressively, taking the bag from her, and rising to his feet in the excitement of the explanation. “The edge of the opening consists of *four* handkerchief-edges, and you can trace it continuously, round and round the opening: down the right edge of *one* handkerchief, up the left edge of the *other*, and then down the left edge of the *one*, and up the right edge of the *other*!”

“So you can!” Lady Muriel murmured thoughtfully, leaning her head on her hand, and earnestly watching the old man. “And that *proves* it to be only *one* opening!”

Fortunatus' Purse

She looked so strangely like a child, puzzling over a difficult lesson, and Mein Herr had become, for the moment, so strangely like the old Professor, that I felt utterly bewildered: the 'eerie' feeling was on me in its full force, and I felt almost *impelled* to say "Do you understand it, Sylvie?" However I checked myself by a great effort, and let the dream (if indeed it *was* a dream) go on to its end.

"Now, this *third* handkerchief," Mein Herr proceeded, "has *also* four edges, which you can trace continuously round and round: all you need do is to join its four edges to the four edges of the opening. The Purse is then complete, and its outer surface——"

"*I see!*" Lady Muriel eagerly interrupted. "Its *outer* surface will be continuous with its *inner* surface! But it will take time. I'll sew it up after tea." She laid aside the bag and resumed her cup of tea. "But why do you call it Fortunatus's Purse, Mein Herr?"

The dear old man beamed upon her, with a jolly smile, looking more exactly like the Professor than ever. "Don't you see, my child—I should say *Miladi*? Whatever is *inside* that Purse, is *outside* it; and whatever is *outside* it, is *inside* it. So you have all the wealth of the world in that leetle Purse!"

His pupil clapped her hands, in unrestrained delight. "I'll certainly sew the third handkerchief in—*some* time," she said: "but I wo'n't take up your time by trying it now. Tell us some more wonderful things, please!" And her face and her voice so *exactly* recalled Sylvie, that I could not help glancing round, half-expecting to see *Bruno* also!

Mein Herr began thoughtfully balancing his spoon on the edge of his teacup, while he pondered over this request. "Something wonderful—like Fortunatus's Purse? *That* will give you—when it is made—wealth beyond your wildest dreams: but it will not give you *Time!*"

A pause of silence ensued—utilised by Lady Muriel for the very practical purpose of refilling the teacups.

"In *your* country," Mein Herr began with a startling abruptness, "what becomes of all the wasted Time?"

Lady Muriel looked grave. "Who can tell?" she half-whispered to herself. "All one knows is that it is gone—past recall!"

"Well, in *my*—I mean in a country *I* have visited," said the old man, "they store it up: and it comes in *very* useful, years afterwards! For example, suppose you have a long tedious evening before you: nobody to talk to: nothing you care to do: and yet hours too soon to go to bed. How do *you* behave then?"

"I get *very* cross," she frankly admitted: "and I want to throw things about the room!"

"When that happens to—to the people I have visited, they never act *so*. By a short and simple process—which I cannot explain to you—they store up the useless hours: and, on some *other* occasion, when they happen to *need* extra time, they get them out again!"

The Earl was listening with a slightly incredulous smile. "Why cannot you *explain* the process?" he enquired.

Mein Herr was ready with a quite unanswerable reason. "Because you have no *words*, in *your* language, to convey the ideas which are needed. I could explain it in—in—but you would not understand it!"

"No indeed!" said Lady Muriel, graciously dispensing with the *name* of the unknown language. "I never learnt it—at least, not to speak it *fluently*, you know. *Please* tell us some more wonderful things!"

"They run their railway-trains without any engines—nothing is needed but machinery to *stop* them with. Is *that* wonderful enough, Miladi?"

"But where does the *force* come from?" I ventured to ask.

Mein Herr turned quickly round, to look at the new speaker. Then he took off his spectacles, and polished them, and looked at me again, in evident bewilderment. I could see he was thinking—as indeed *I* was also—that we *must* have met before.

"They use the force of *gravity*," he said. "It is a force known also in *your* country, I believe?"

"But that would need a railway going *down-hill*," the Earl remarked. "You ca'n't have *all* your railways going down-hill?"

"They *all* do," said Mein Herr.

"Not from *both* ends?"

"From *both* ends."

"Then I give it up!" said the Earl.

"Can you explain the process?" said Lady Muriel. "Without using that language, that I ca'n't speak fluently?"

"Easily," said Mein Herr. "Each railway is in a long tunnel, perfectly straight: so of course the *middle* of it is nearer the centre of the globe than the two ends: so every train runs half-way *down-hill*, and that gives it force enough to run the *other* half *up-hill*."

"Thank you. I understand that perfectly," said Lady Muriel. "But the velocity, in the *middle* of the tunnel, must be something *fearful*!"

'Mein Herr' was evidently much gratified at the intelligent interest Lady Muriel took in his remarks. At every moment the old man seemed to grow more chatty and more fluent. "You would like to know our methods of *driving*?" he smilingly enquired. "To us, a run-away horse is of no import at all!"

Lady Muriel slightly shuddered. "To *us* it is a very real danger," she said.

"That is because your carriage is wholly *behind* your horse. Your horse runs. Your carriage follows. Perhaps your horse has the bit in his teeth. Who shall stop him? You fly, ever faster and faster! Finally comes the inevitable upset!"

"But suppose *your* horse manages to get the bit in his teeth?"

"No matter! We would not concern ourselves. Our horse is harnessed in the very centre of our carriage. Two wheels are in front of him, and two behind. To the roof is attached one end of a broad belt. This goes under the horse's body, and the other end is attached to a leetle—what you call a 'windlass,' I think. The horse takes the bit in his teeth. He runs away. We are flying at ten miles an hour! We turn our little windlass, five turns, six turns, seven turns, and—poof! Our horse is off the ground! *Now* let him gallop in the air, as much as he pleases: our *carriage* stands still. We sit round him, and watch him till he is tired. Then we let him down. Our horse is glad, very much glad, when his feet once more touch the ground!"

"Capital!" said the Earl, who had been listening attentively. "Are there any other peculiarities in your carriages?"

"In the *wheels*, sometimes, my Lord. For your health, *you* go to sea: to be pitched, to be rolled, occasionally to be drowned. *We* do all that on land: we are pitched, as you; we are rolled, as you; but *drowned*, no! There is no water!"

"What are the wheels like, then?"

"They are *oval*, my Lord. Therefore the carriages rise and fall."

“Yes, and pitch the carriage backwards and forwards: but how do they make it *roll*?”

“They do not match, my Lord. The *end* of one wheel answers to the *side* of the opposite wheel. So first one side of the carriage rises, then the other. And it pitches all the while. Ah, you must be a good sailor, to drive in our boat-carriages!”

“I can easily believe it,” said the Earl.

Mein Herr rose to his feet. “I must leave you now, Miladi,” he said, consulting his watch. “I have another engagement.”

“I only wish we had stored up some extra time!” Lady Muriel said, as she shook hands with him. “Then we could have kept you a little longer!”

“In *that* case I would gladly stay,” replied Mein Herr. “As it is—I fear I must say good-bye!”

“Where did you first meet him?” I asked Lady Muriel, when Mein Herr had left us. “And where does he live? And what is his real name?”

“We first—met—him——” she musingly replied, “really, I ca’n’t remember *where*! And I’ve no idea where he lives! And I never heard any other name! It’s very curious. It never occurred to me before to consider what a mystery he is!”

“I hope we shall meet again,” I said: “he interests me very much.”

“He will be at our farewell-party, this day fortnight,” said the Earl. “Of course you will come? Muriel is anxious to gather all our friends around us once more, before we leave the place.”

And then he explained to me—as Lady Muriel had left us together—that he was so anxious to get his daughter away from a place full of so many painful memories connected with the now-canceled engagement with Major Lindon, that they had arranged to have the wedding in a months time, after which Arthur and his wife were to go on a foreign tour.

“Don’t forget Tuesday week!” he said as we shook hands at parting. “I only wish you could bring with you those charming children, that you introduced to us in the summer. Talk of the mystery of Mein Herr! That’s *nothing* to the mystery that seems to attend *them*! I shall never forget those marvellous flowers!”

“I will bring them if I possibly can,” I said. But how to *fulfil* such a promise, I mused to myself on my way back to our lodgings, was a problem entirely beyond my skill!

Chapter VIII. In a Shady Place.

The ten days glided swiftly away: and, the day before the great party was to take place, Arthur proposed that we should stroll down to the Hall, in time for afternoon-tea.

“Hadn’t you better go *alone*?” I suggested. “Surely *I* shall be very much *de trop*?”

“Well, it’ll be a kind of *experiment*,” he said. “*Fiat experimentum in corpore vili!*” he added, with a graceful bow of mock politeness towards the unfortunate victim. “You see I shall have to bear the sight, to-morrow night, of my lady-love making herself agreeable to everybody *except* the right person, and I shall bear the agony all the better if we have a dress-rehearsal beforehand!”

“*My* part in the play being, apparently, that of the sample *wrong* person?”

"Well, no," Arthur said musingly, as we set forth: "there's no such part in a regular company. 'Heavy Father'? *That* won't do: that's filled already. 'Singing Chambermaid'? Well, the 'First Lady' doubles *that* part. 'Comic Old Man'? You're not comic enough. After all, I'm afraid there's no part for you but the 'Well-dressed Villain': only," with a critical side-glance, "I'm a *leetle* uncertain about the dress!"

We found Lady Muriel alone, the Earl having gone out to make a call, and at once resumed old terms of intimacy, in the shady arbour where the tea-things seemed to be always waiting. The only novelty in the arrangements (one which Lady Muriel seemed to regard as *entirely* a matter of course), was that two of the chairs were placed *quite* close together, side by side. Strange to say, *I* was not invited to occupy *either* of them!

"We have been arranging, as we came along, about letter-writing," Arthur began. "He will want to know how we're enjoying our Swiss tour: and of course we must pretend we *are*?"

"Of course," she meekly assented.

"And the skeleton-in-the-cupboard——" I suggested.

"—is always a difficulty," she quickly put in, "when you're traveling about, and when there are no cupboards in the hotels. However, *ours* is a *very* portable one; and will be neatly packed, in a nice leather case——"

"But please don't think about *writing*," I said, "when you've anything more attractive on hand. I delight in *reading* letters, but I know well how tiring it is to *write* them."

"It *is*, sometimes," Arthur assented. "For instance, when you're very shy of the person you have to write to."

"Does that show itself in the *letter*?" Lady Muriel enquired. "Of course, when I hear any one *talking—you*, for instance—I can see how *desperately* shy he is! But can you see that in a *letter*?"

"Well, of course, when you hear any one talk *fluently—you*, for instance—you can see how desperately *un-shy* she is—not to say saucy! But the shyest and most intermittent talker must *seem* fluent in letter-writing. He may have taken half-an-hour to *compose* his second sentence; but there it is, close after the first!"

"Then letters don't express all that they *might* express?"

"That's merely because our system of letter-writing is incomplete. A shy writer *ought* to be able to show that he is so. Why shouldn't he make *pauses* in writing, just as he would do in speaking? He might leave blank spaces—say half a page at a time. And a *very* shy girl—if there *is* such a thing—might write a sentence on the *first* sheet of her letter—then put in a couple of *blank* sheets—then a sentence on the *fourth* sheet: and so on."

"I quite foresee that *we*—I mean this clever little boy and myself——" Lady Muriel said to me, evidently with the kind wish to bring me into the conversation, "—are going to become famous—of course all our inventions are common property now—for a new Code of Rules for Letter-writing! Please invent some more, little boy!"

"Well, another thing *greatly* needed, little girl, is some way of expressing that we *don't* mean anything."

"Explain yourself, little boy! Surely *you* can find no difficulty in expressing a *total* absence of meaning?"

"I mean that you should be able, when you *don't* mean a thing to be taken seriously, to express that wish. For human nature is so constituted that whatever you write seriously is taken as a joke, and whatever you mean as a joke is taken seriously! At any rate, it is so in writing to a *lady!*"

"Ah! you're not used to writing to ladies!" Lady Muriel remarked, leaning back in her chair, and gazing thoughtfully into the sky. "You should try."

"Very good," said Arthur. "How many ladies may I begin writing to? As many as I can count on the fingers of both hands?"

"As many as you can count on the *thumbs* of *one* hand!" his lady-love replied with much severity. "What a *very* naughty little boy he is! *Isn't* he?" (with an appealing glance at me).

"He's a little fractious," I said. "Perhaps he's cutting a tooth." While to myself I said "How *exactly* like Sylvie talking to Bruno!"

"He wants his tea." (The naughty little boy volunteered the information.) "He's getting very tired, at the mere *prospect* of the great party to-morrow!"

"Then he shall have a good rest beforehand!" she soothingly replied. "The tea isn't made yet. Come, little boy, lean well back in your chair, and think about nothing—or about *me*, whichever you prefer!"

"All the same, all the same!" Arthur sleepily murmured, watching her with loving eyes, as she moved her chair away to the tea table, and began to make the tea. "Then he'll wait for his tea, like a good, patient little boy!"

"Shall I bring you the London Papers?" said Lady Muriel. "I saw them lying on the table as I came out, but my father said there was nothing in them, except that horrid murder-trial." (Society was just then enjoying its daily thrill of excitement in studying the details of a specially sensational murder in a thieves' den in the East of London.)

"I have no appetite for horrors," Arthur replied. "But I hope we have learned the lesson they should teach us—though we are very apt to read it backwards!"

'I am sitting at your feet'

"You speak in riddles," said Lady Muriel. "Please explain yourself. See now," suiting the action to the word, "I am sitting at your feet, just as if you were a second Gamaliel! Thanks, no." (This was to me, who had risen to bring her

chair back to its former place.) “Pray don’t disturb yourself. This tree and the grass make a very nice easy-chair. *What* is the lesson that one always reads wrong?”

Arthur was silent for a minute. “I would like to be clear what it *is* I mean,” he said, slowly and thoughtfully, “before I say anything to *you*—because you *think* about it.”

Anything approaching to a compliment was so unusual an utterance for Arthur, that it brought a flush of pleasure to her cheek, as she replied “It is *you*, that give me the ideas to think about.”

“One’s first thought,” Arthur proceeded, “in reading of anything specially vile or barbarous, as done by a fellow-creature, is apt to be that we see a new depth of Sin revealed *beneath* us: and we seem to gaze down into that abyss from some higher ground, far apart from it.”

“I think I understand you now. You mean that one ought to think—not ‘God, I thank Thee that I am not as other men are’—but ‘God, be merciful to me also, who might be, but for Thy grace, a sinner as vile as he!’”

“No,” said Arthur. “I meant a great deal more than that.”

She looked up quickly, but checked herself, and waited in silence.

“One must begin further back, I think. Think of some other man, the same age as this poor wretch. Look back to the time when they both began life—before they had sense enough to know Right from Wrong. *Then*, at any rate, they were equal in God’s sight?”

She nodded assent.

“We have, then, two distinct epochs at which we may contemplate the two men whose lives we are comparing. At the first epoch they are, so far as moral responsibility is concerned, on precisely the same footing: they are alike incapable of doing right or wrong. At the second epoch the one man—I am taking an extreme case, for contrast—has won the esteem and love of all around him: his character is stainless, and his name will be held in honour hereafter: the other man’s history is one unvaried record of crime, and his life is at last forfeited to the outraged laws of his country. Now what have been the causes, in each case, of each man’s condition being what it is at the second epoch? They are of two kinds—one acting from within, the other from without. These two kinds need to be discussed separately—that is, if I have not already tired you with my prosing?”

“On the contrary,” said Lady Muriel, “it is a special delight to me to have a question discussed in this way—analysed and arranged, so that one can understand it. Some books, that profess to argue out a question, are to me intolerably wearisome, simply because the ideas are all arranged hap-hazard—a sort of ‘first come, first served.’”

“You are very encouraging,” Arthur replied, with a pleased look. “The causes, acting from *within*, which make a man’s character what it is at any given moment, are his successive acts of volition—that is, his acts of choosing whether he will do this or that.”

“We are to assume the existence of Free-Will?” I said, in order to have that point made quite clear.

“If not,” was the quiet reply, “*cadit quaestio*: and I have no more to say.”

“We *will* assume it!” the rest of the audience—the majority, I may say, looking at it from Arthur’s point of view—imperiously proclaimed. The orator proceeded.

Quoted from Luke
18:11

Quoted from Luke
18:13

“The causes, acting from *without*, are his surroundings—what Mr. Herbert Spencer calls his ‘environment.’ Now the point I want to make clear is this, that a man is responsible for his acts of choosing, but *not* responsible for his environment. Hence, if these two men make, on some given occasion, when they are exposed to equal temptation, equal efforts to resist and to choose the right, their condition, in the sight of God, must be the same. If He is pleased in the one case, so will He be in the other; if displeased in the one case, so also in the other.”

“That is so, no doubt: I see it quite clearly,” Lady Muriel put in.

“And yet, owing to their different environments, the one may win a great victory over the temptation, while the other falls into some black abyss of crime.”

“But surely you would not say those men were equally guilty in the sight of God?”

“Either that,” said Arthur, “or else I must give up my belief in God’s perfect justice. But let me put one more case, which will show my meaning even more forcibly. Let the one man be in a high social position—the other, say, a common thief. Let the one be tempted to some trivial act of unfair dealing—something which he can do with the absolute certainty that it will never be discovered—something which he can with perfect ease forbear from doing—and which he distinctly knows to be a sin. Let the other be tempted to some terrible crime—as men would consider it—but under an almost overwhelming pressure of motives—of course not *quite* overwhelming, as that would destroy all responsibility. Now, in this case, let the second man make a *greater* effort at resistance than the first. Also suppose *both* to fall under the temptation—I say that the second man is, in God’s sight, *less* guilty than the other.”

Lady Muriel drew a long breath. “It upsets all one’s ideas of Right and Wrong—just at first! Why, in that dreadful murder-trial, you would say, I suppose, that it was possible that the least guilty man in the Court was the murderer, and that possibly the judge who tried him, by yielding to the temptation of making one unfair remark, had committed a crime outweighing the criminal’s whole career!”

“Certainly I should,” Arthur firmly replied. “It sounds like a paradox, I admit. But just think what a grievous sin it must be, in God’s sight, to yield to some very slight temptation, which we could have resisted with perfect ease, and to do it deliberately, and in the full light of God’s Law. What penance can atone for a sin like *that*?”

“I ca’n’t reject your theory,” I said. “But how it seems to widen the possible area of Sin in the world!”

“Is that so?” Lady Muriel anxiously enquired.

“Oh, not so, not so!” was the eager reply. “To me it seems to clear away much of the cloud that hangs over the world’s history. When this view first made itself clear to me, I remember walking out into the fields, repeating to myself that line of Tennyson ‘*There seemed no room for sense of wrong!*’ The thought, that perhaps the real guilt of the human race was infinitely less than I fancied it—that the millions, whom I had thought of as sunk in hopeless depths of sin, were perhaps, in God’s sight, scarcely sinning at all—was more sweet than words can tell! Life seemed more bright and beautiful, when once that thought had come! ‘*A livelier emerald twinkles in the grass, A purer sapphire melts into the sea!*’” His voice trembled as he concluded, and the tears stood in his eyes.

Quoted from *The Two Voices* by Alfred Lord Tennyson

Quoted from *Maud* by Alfred Lord Tennyson

Lady Muriel shaded her face with her hand, and was silent for a minute. "It is a beautiful thought," she said, looking up at last. "Thank you—Arthur, for putting it into my head!"

The Earl returned in time to join us at tea, and to give us the very unwelcome tidings that a fever had broken out in the little harbour-town that lay below us—a fever of so malignant a type that, though it had only appeared a day or two ago, there were already more than a dozen down in it, two or three of whom were reported to be in imminent danger.

In answer to the eager questions of Arthur—who of course took a deep scientific interest in the matter—he could give very few *technical* details, though he had met the local doctor. It appeared, however, that it was an almost *new* disease—at least in *this* century, though it *might* prove to be identical with the 'Plague' recorded in History—*very* infectious, and frightfully rapid in its action. "It will not, however, prevent our party to-morrow," he said in conclusion. "None of the guests belong to the infected district, which is, as you know, exclusively peopled by fishermen: so you may come without any fear."

Arthur was very silent, all the way back, and, on reaching our lodgings, immediately plunged into medical studies, connected with the alarming malady of whose arrival we had just heard.

Chapter IX. The Farewell-Party.

On the following day, Arthur and I reached the Hall in good time, as only a few of the guests—it was to be a party of eighteen—had as yet arrived; and these were talking with the Earl, leaving us the opportunity of a few words apart with our hostess.

"Who is that *very* learned-looking man with the large spectacles?" Arthur enquired. "I haven't met him here before, have I?"

"No, he's a new friend of ours," said Lady Muriel: "a German, I believe. He *is* such a dear old thing! And quite the most learned man I ever met—with *one* exception, of course!" she added humbly, as Arthur drew himself up with an air of offended dignity.

"And the young lady in blue, just beyond him, talking to that foreign-looking man. Is *she* learned, too?"

"I don't know," said Lady Muriel. "But I'm told she's a wonderful piano-forte-player. I hope you'll hear her to-night. I asked that foreigner to take her in, because *he's* very musical, too. He's a French Count, I believe; and he sings *splendidly!*"

"Science—music—singing—you have indeed got a complete party!" said Arthur. "I feel quite a privileged person, meeting all these stars. I *do* love music!"

"But the party isn't *quite* complete!" said Lady Muriel. "You haven't brought us those two beautiful children," she went on, turning to me. "He brought them here to tea, you know, one day last summer," again addressing Arthur; "and they *are* such darlings!"

"They are, *indeed*," I assented.

"But why haven't you brought them with you? You promised my father you *would*."

"I'm very sorry," I said; "but really it was impossible to bring them with me." Here I most certainly *meant* to conclude the sentence: and it was with a feeling of utter amazement, which I cannot adequately describe, that I heard myself

going on speaking. “—but they are to join me here in the course of the evening” were the words, uttered in *my* voice, and seeming to come from *my* lips.

“I’m *so* glad!” Lady Muriel joyfully replied. “I *shall* enjoy introducing them to some of my friends here! When do you expect them?”

I took refuge in silence. The only *honest* reply would have been “That was not *my* remark. I didn’t say it, and *it isn’t true!*” But I had not the moral courage to make such a confession. The character of a ‘lunatic’ is not, I believe, very difficult to *acquire*: but it is amazingly difficult to *get rid of*: and it seemed quite certain that any such speech as *that* would *quite* justify the issue of a writ ‘*de lunatico inquirendo.*’

Lady Muriel evidently thought I had failed to hear her question, and turned to Arthur with a remark on some other subject; and I had time to recover from my shock of surprise—or to awake out of my momentary ‘eerie’ condition, whichever it was.

When things around me seemed once more to be real, Arthur was saying “I’m afraid there’s no help for it: they *must* be finite in number.”

“I should be sorry to have to believe it,” said Lady Muriel. “Yet, when one comes to think of it, there *are* no new melodies, now-a-days. What people talk of as ‘the last new song’ always recalls to *me* some tune I’ve known as a child!”

“The day must come—if the world lasts long enough——” said Arthur, “when every possible tune will have been composed—every possible pun perpetrated——” (Lady Muriel wrung her hands, like a tragedy-queen) “and, worse than that, every possible *book* written! For the number of *words* is finite.”

“It’ll make very little difference to the *authors*,” I suggested. “Instead of saying ‘*what* book shall I write?’ an author will ask himself ‘*which* book shall I write?’ A mere verbal distinction!”

Lady Muriel gave me an approving smile. “But *lunatics* would always write new books, surely?” she went on. “They *couldn’t* write the sane books over again!”

“True,” said Arthur. “But *their* books would come to an end, also. The number of lunatic *books* is as finite as the number of lunatics.”

“And *that* number is becoming greater every year,” said a pompous man, whom I recognised as the self-appointed showman on the day of the picnic.

“So they say,” replied Arthur. “And, when ninety per cent. of us are lunatics,” (he seemed to be in a wildly nonsensical mood) “the asylums will be put to their proper use.”

“And that is——?” the pompous man gravely enquired.

“*To shelter the sane!*” said Arthur. “*We* shall bar ourselves in. The lunatics will have it all their own way, *outside*. They’ll do it a little queerly, no doubt. Railway-collisions will be always happening: steamers always blowing up: most of the towns will be burnt down: most of the ships sunk——”

“And most of the men *killed!*” murmured the pompous man, who was evidently hopelessly bewildered.

“Certainly,” Arthur assented. “Till at last there will be *fewer* lunatics than sane men. Then *we* come out: *they* go in: and things return to their normal condition!”

The pompous man frowned darkly, and bit his lip, and folded his arms, vainly trying to think it out. “He is *jesting!*” he muttered to himself at last, in a tone of withering contempt, as he stalked away.

By this time the other guests had arrived; and dinner was announced. Arthur of course took down Lady Muriel: and *I* was pleased to find myself seated at her other side, with a severe-looking old lady (whom I had not met before, and whose name I had, as is usual in introductions, entirely failed to catch, merely gathering that it sounded like a compound-name) as my partner for the banquet.

She appeared, however, to be acquainted with Arthur, and confided to me in a low voice her opinion that he was “a very argumentative young man.” Arthur, for his part, seemed well inclined to show himself worthy of the character she had given him, and, hearing her say “I never take wine with my soup!” (this was *not* a confidence to me, but was launched upon Society, as a matter of general interest), he at once challenged a combat by asking her “*when* would you say that property *commence* in a plate of soup?”

“This is *my* soup,” she sternly replied: “and what is before you is *yours*.”

“No doubt,” said Arthur: “but *when* did I begin to own it? Up to the moment of its being put into the plate, it was the property of our host: while being offered round the table, it was, let us say, held in trust by the waiter: did it become mine when I accepted it? Or when it was placed before me? Or when I took the first spoonful?”

“He is a *very* argumentative young man!” was all the old lady would say: but she said it audibly, this time, feeling that Society had a right to know it.

Arthur smiled mischievously. “I shouldn’t mind betting you a shilling,” he said, “that the Eminent Barrister next you” (It certainly *is* possible to say words so as to make them begin with capitals!) “ca’n’t answer me!”

“I *never* bet,” she sternly replied.

“Not even sixpenny points at *whist*?”

“*Never!*” she repeated. “*Whist* is innocent enough: but whist played for *money!*” She shuddered.

Arthur became serious again. “I’m afraid I ca’n’t take that view,” he said. “I consider that the introduction of small stakes for card-playing was one of the most *moral* acts Society ever did, *as* Society.”

“How was it so?” said Lady Muriel.

“Because it took Cards, once for all, out of the category of games at which *cheating* is possible. Look at the way Croquet is demoralising Society. Ladies are beginning to cheat at it, terribly: and, if they’re found out, they only laugh, and call it fun. But when there’s *money* at stake, that is out of the question. The swindler is *not* accepted as a wit. When a man sits down to cards, and cheats his friends out of their money, he doesn’t get much *fun* out of it—unless he thinks it fun to be kicked down stairs!”

“If all gentlemen thought as badly of ladies as *you* do,” my neighbour remarked with some bitterness, “there would be very few—very few——.” She seemed doubtful how to end her sentence, but at last took “honeymoons” as a safe word.

“On the contrary,” said Arthur, the mischievous smile returning to his face, “if only people would adopt *my* theory, the number of honeymoons—quite of a new kind—would be greatly increased!”

“May we hear about this new kind of honeymoon?” said Lady Muriel.

“Let *X* be the gentleman,” Arthur began, in a slightly raised voice, as he now found himself with an audience of *six*, including ‘Mein Herr,’ who was seated at the other side of my polynomial partner. “Let *X* be the gentleman, and *Y* the lady to whom he thinks of proposing. He applies for an Experimental

Honeymoon. It is granted. Forthwith the young couple—accompanied by the great-aunt of Y, to act as chaperone—start for a month's tour, during which they have many a moonlight-walk, and many a *tête-à-tête* conversation, and each can form a more correct estimate of the other's character, in four *weeks*, than would have been possible in as many *years*, when meeting under the ordinary restrictions of Society. And it is only after their *return* that X finally decides whether he will, or will not, put the momentous question to Y!"

"In nine cases out of ten," the pompous man proclaimed, "he would decide to break it off!"

"Then, in nine cases out of ten," Arthur rejoined, "an unsuitable match would be prevented, and *both* parties saved from misery!"

"The only really *unsuitable* matches," the old lady remarked, "are those made without sufficient *Money*. Love may come *afterwards*. Money is needed *to begin with!*"

This remark was cast loose upon Society, as a sort of general challenge; and, as such, it was at once accepted by several of those within hearing: *Money* became the key-note of the conversation for some time; and a fitful echo of it was again heard, when the dessert had been placed upon the table, the servants had left the room, and the Earl had started the wine in its welcome progress round the table.

"I'm very glad to see you keep up the old customs," I said to Lady Muriel as I filled her glass. "It's really delightful to experience, once more, the peaceful feeling that comes over one when the waiters have left the room—when one can converse without the feeling of being overheard, and without having dishes constantly thrust over one's shoulder. How much more sociable it is to be able to pour out the wine for the ladies, and to hand the dishes to those who wish for them!"

"In that case, kindly send those peaches down here," said a fat red-faced man, who was seated beyond our pompous friend. "I've been wishing for them—diagonally—for some time!"

"Yes, it *is* a ghastly innovation," Lady Muriel replied, "letting the waiters carry round the wine at dessert. For one thing, they *always* take it the wrong way round—which of course brings bad luck to *everybody* present!"

"Better go the *wrong* way than not go *at all!*" said our host. "Would you kindly help yourself?" (This was to the fat red-faced man.) "You are not a teetotaler, I think?"

"Indeed but I *am!*" he replied, as he pushed on the bottles. "Nearly twice as much money is spent in England on *Drink*, as on any other article of food. Read this card." (What faddist ever goes about without a pocketful of the appropriate literature?) "The stripes of different colours represent the amounts spent on various articles of food. Look at the highest three. Money spent on butter and on cheese, thirty-five millions: on bread, seventy millions: on *intoxicating liquors*, one hundred and thirty-six millions! If I had my way, I would close every public-house in the land! Look at that card, and read the motto. *That's where all the money goes to!*"

"Have you seen the *Anti-Teetotal Card?*" Arthur innocently enquired.

"No, Sir, I have not!" the orator savagely replied. "What is it like?"

"Almost exactly like this one. The coloured stripes are the same. Only, instead of the words 'Money spent on,' it has 'Incomes derived from sale of';

and, instead of 'That's where all the money goes to,' its motto is '*That's where all the money comes from!*'"

The red-faced man scowled, but evidently considered Arthur beneath his notice. So Lady Muriel took up the cudgels. "Do you hold the theory," she enquired, "that people can preach teetotalism more effectually by being teetotalers themselves?"

"Certainly I do!" replied the red-faced man. "Now, here is a case in point," unfolding a newspaper-cutting: "let me read you this letter from a teetotaler. *To the Editor. Sir, I was once a moderate drinker, and knew a man who drank to excess. I went to him. 'Give up this drink,' I said. 'It will ruin your health!' 'You drink,' he said: 'why shouldn't I?' 'Yes,' I said, 'but I know when to leave off.' He turned away from me. 'You drink in your way,' he said: 'let me drink in mine. Be off!' Then I saw that, to do any good with him, I must forswear drink. From that hour I haven't touched a drop!*"

"There! What do you say to *that*?" He looked round triumphantly, while the cutting was handed round for inspection.

"How very curious!" exclaimed Arthur, when it had reached him. "Did you happen to see a letter, last week, about early rising? It was strangely like this one."

The red-faced man's curiosity was roused. "Where did it appear?" he asked.

"Let me read it to you," said Arthur. He took some papers from his pocket, opened one of them, and read as follows. "*To the Editor. Sir, I was once a moderate sleeper, and knew a man who slept to excess. I pleaded with him. 'Give up this lying in bed,' I said, 'It will ruin your health!' 'You go to bed,' he said: 'why shouldn't I?' 'Yes,' I said, 'but I know when to get up in the morning.' He turned away from me. 'You sleep in your way,' he said: 'let me sleep in mine. Be off!' Then I saw that to do any good with him, I must forswear sleep. From that hour I haven't been to bed!*"

Arthur folded and pocketed his paper, and passed on the newspaper-cutting. None of us dared to laugh, the red-faced man was evidently so angry. "Your parallel doesn't run on all fours!" he snarled.

"*Moderate* drinkers never do so!" Arthur quietly replied. Even the stern old lady laughed at this.

"But it needs many other things to make a *perfect* dinner!" said Lady Muriel, evidently anxious to change the subject. "Mein Herr! What is *your* idea of a perfect dinner-party?"

The old man looked round smilingly, and his gigantic spectacles seemed more gigantic than ever. "A *perfect* dinner-party?" he repeated. "First, it must be presided over by our present hostess!"

"That, of *course!*" she gaily interposed. "But what *else*, Mein Herr?"

"I can but tell you what I have seen," said Mein Herr, "in mine own—in the country I have traveled in."

He paused for a full minute, and gazed steadily at the ceiling—with so dreamy an expression on his face, that I feared he was going off into a reverie, which seemed to be his normal state. However, after a minute, he suddenly began again.

"That which chiefly causes the failure of a dinner-party, is the running-short—not of meat, nor yet of drink, but of *conversation.*"

"In an *English* dinner-party," I remarked, "I have never known *small-talk* run short!"

"Pardon me," Mein Herr respectfully replied, "I did not say 'small-talk.' I said 'conversation.' All such topics as the weather, or politics, or local gossip, are unknown among us. They are either vapid or controversial. What we need for *conversation* is a topic of *interest* and of *novelty*. To secure these things we have tried various plans—Moving-Pictures, Wild-Creatures, Moving-Guests, and a Revolving-Humorist. But this last is only adapted to *small* parties."

"Let us have it in four separate Chapters, please!" said Lady Muriel, who was evidently deeply interested—as, indeed, most of the party were, by this time: and, all down the table, talk had ceased, and heads were leaning forwards, eager to catch fragments of Mein Herr's oration.

"Chapter One! Moving-Pictures!" was proclaimed in the silvery voice of our hostess.

"The dining-table is shaped like a circular ring," Mein Herr began, in low dreamy tones, which, however, were perfectly audible in the silence. "The guests are seated at the inner side as well as the outer, having ascended to their places by a winding-staircase, from the room below. Along the middle of the table runs a little railway; and there is an endless train of trucks, worked round by machinery; and on each truck there are two pictures, leaning back to back. The train makes two circuits during dinner; and, when it has been *once* round, the waiters turn the pictures round in each truck, making them face the other way. Thus *every* guest sees *every* picture!"

He paused, and the silence seemed deader than ever. Lady Muriel looked aghast. "Really, if this goes on," she exclaimed, "I shall have to drop a pin! Oh, it's *my* fault, is it?" (In answer to an appealing look from Mein Herr.) "I was forgetting my duty. Chapter Two! Wild-Creatures!"

"We found the Moving-Pictures a *little* monotonous," said Mein Herr. "People didn't care to talk Art through a whole dinner; so we tried Wild-Creatures. Among the flowers, which we laid (just as *you* do) about the table, were to be seen, here a mouse, there a beetle; here a spider," (Lady Muriel shuddered) "there a wasp; here a toad, there a snake;" ("Father!" said Lady Muriel, plaintively. "Did you hear *that*?") "so we had plenty to talk about!"

"And when you got stung——" the old lady began.

"They were all chained-up, dear Madam!"

And the old lady gave a satisfied nod.

There was no silence to follow, *this* time. "Third Chapter!" Lady Muriel proclaimed at once, "Moving-Guests!"

"Even the Wild-Creatures proved monotonous," the orator proceeded. "So we left the guests to choose their own subjects; and, to avoid monotony, we changed *them*. We made the table of *two* rings; and the inner ring moved slowly round, all the time, along with the floor in the middle and the inner row of guests. Thus *every* inner guest was brought face-to-face with *every* outer guest. It was a little confusing, sometimes, to have to *begin* a story to one friend and *finish* it to another; but *every* plan has its faults, you know."

"Fourth Chapter!" Lady Muriel hastened to announce. "The Revolving-Humorist!"

"For a *small* party we found it an excellent plan to have a round table, with a hole cut in the middle large enough to hold *one* guest. Here we placed our *best* talker. He revolved slowly, facing every other guest in turn: and he told lively anecdotes the whole time!"

"I shouldn't like it!" murmured the pompous man. "It would make me giddy, revolving like that! I should decline to——" here it appeared to dawn upon him that perhaps the assumption he was making was not warranted by the circumstances: he took a hasty gulp of wine, and choked himself.

But Mein Herr had relapsed into reverie, and made no further remark. Lady Muriel gave the signal, and the ladies left the room.

Chapter X. Jabbering and Jam.

When the last lady had disappeared, and the Earl, taking his place at the head of the table, had issued the military order "Gentlemen! Close up the ranks, if you please!", and when, in obedience to his command, we had gathered ourselves compactly round him, the pompous man gave a deep sigh of relief, filled his glass to the brim, pushed on the wine, and began one of his favorite orations. "They are charming, no doubt! Charming, but very frivolous. They drag us down, so to speak, to a lower level. They——"

"Do not all pronouns require antecedent *nouns*?" the Earl gently enquired.

"Pardon me," said the pompous man, with lofty condescension. "I had overlooked the noun. The ladies. We regret their absence. Yet we console ourselves. *Thought is free*. With them, we are limited to *trivial* topics—Art, Literature, Politics, and so forth. One can bear to discuss *such* paltry matters with a lady. But no man, in his senses——" (he looked sternly round the table, as if defying contradiction) "——ever yet discussed *WINE* with a lady!" He sipped his glass of port, leaned back in his chair, and slowly raised it up to his eye, so as to look through it at the lamp. "The vintage, my Lord?" he enquired, glancing at his host.

The Earl named the date.

"So I had supposed. But one likes to be certain. The *tint* is, perhaps, slightly pale. But the *body* is unquestionable. And as for the *bouquet*——"

Ah, that magic Bouquet! How vividly that single word recalled the scene! The little beggar-boy turning his somersault in the road—the sweet little crippled maiden in my arms—the mysterious evanescent nurse-maid—all rushed tumultuously into my mind, like the creatures of a dream: and through this mental haze there still boomed on, like the tolling of a bell, the solemn voice of the great connoisseur of *WINE*!

Even *his* utterances had taken on themselves a strange and dream-like form. "No," he resumed—and *why* is it, I pause to ask, that, in taking up the broken thread of a dialogue, one *always* begins with this cheerless monosyllable? After much anxious thought, I have come to the conclusion that the object in view is the same as that of the schoolboy, when the sum he is working has got into a hopeless muddle, and when in despair he takes the sponge, washes it all out, and begins again. Just in the same way the bewildered orator, by the simple process of denying *everything* that has been hitherto asserted, makes a clean sweep of the whole discussion, and can 'start fair' with a fresh theory. "No," he resumed: "there's nothing like cherry-jam, after all. That's what *I* say!"

"Not for *all* qualities!" an eager little man shrilly interposed. "For *richness* of general tone I don't say that it *has* a rival. But for *delicacy* of modulation—for what one may call the '*harmonics*' of flavour—give *me* good old *raspberry-jam*!"

"Allow me one word!" The fat red-faced man, quite hoarse with excitement, broke into the dialogue. "It's too important a question to be settled by Ama-

Quoted from *The Tempest* by William Shakespeare

teurs! I can give you the views of a *Professional*—perhaps the most experienced jam-taster now living. Why, I’ve known him fix the age of strawberry-jam, to a *day*—and we all know what a difficult jam it is to give a date to—on a single tasting! Well, I put to him the *very* question you are discussing. His words were ‘*cherry-jam* is best, for mere *chiaroscuro* of flavour: *raspberry-jam* lends itself best to those resolved discords that linger so lovingly on the tongue: but, for rapturous *utterness* of saccharine perfection, it’s *apricot-jam first and the rest nowhere!*’ That was well put, *wasn’t* it?”

“Consummately put!” shrieked the eager little man.

“I know your friend well,” said the pompous man. “As a jam-taster, he has no rival! Yet I scarcely think——”

But here the discussion became general: and his words were lost in a confused medley of names, every guest sounding the praises of his own favorite jam. At length, through the din, our host’s voice made itself heard. “Let us join the ladies!” These words seemed to recall me to waking life; and I felt sure that, for the last few minutes, I had relapsed into the ‘eerie’ state.

“A strange dream!” I said to myself as we trooped upstairs. “Grown men discussing, as seriously as if they were matters of life and death, the hopelessly trivial details of mere *delicacies*, that appeal to no higher human function than the nerves of the tongue and palate! What a humiliating spectacle such a discussion would be in waking life!”

When, on our way to the drawing-room, I received from the housekeeper my little friends, clad in the daintiest of evening costumes, and looking, in the flush of expectant delight, more radiantly beautiful than I had ever seen them before, I felt no shock of surprise, but accepted the fact with the same unreasoning apathy with which one meets the events of a dream, and was merely conscious of a vague anxiety as to how they would acquit themselves in so novel a scene—forgetting that Court-life in Outland was as good training as they could need for Society in the more substantial world.

It would be best, I thought, to introduce them as soon as possible to some good-natured lady-guest, and I selected the young lady whose piano-forte-playing had been so much talked of. “I am sure you like children,” I said. “May I introduce two little friends of mine? This is Sylvie—and this is Bruno.”

The young lady kissed Sylvie very graciously. She would have done the same for *Bruno*, but he hastily drew back out of reach. “Their faces are new to me,” she said. “Where do you come from, my dear?”

I had not anticipated so inconvenient a question; and, fearing that it might embarrass Sylvie, I answered for her. “They come from some distance. They are only here just for this one evening.”

“How far have you come, dear?” the young lady persisted.

Sylvie looked puzzled. “A mile or two, I *think*,” she said doubtfully.

“A mile or *three*,” said Bruno.

“You shouldn’t say ‘a mile or *three*,’” Sylvie corrected him.

The young lady nodded approval. “Sylvie’s quite right. It isn’t usual to say ‘a mile or *three*.’”

“It would be usual—if we said it often enough,” said Bruno.

It was the young lady’s turn to look puzzled now. “He’s very quick, for his age!” she murmured. “You’re not more than seven, are you, dear?” she added aloud.

"I'm not so many as *that*," said Bruno. "I'm *one*. Sylvie's *one*. Sylvie and me is *two*. *Sylvie* taught me to count."

"Oh, I wasn't *counting* you, you know!" the young lady laughingly replied.

"Hasn't oo *learnt* to count?" said Bruno.

The young lady bit her lip. "Dear! What embarrassing questions he *does* ask!" she said in a half-audible 'aside.'

"Bruno, you shouldn't!" Sylvie said reprovingly.

"Shouldn't *what*?" said Bruno.

"You shouldn't ask—that sort of questions."

"*What* sort of questions?" Bruno mischievously persisted.

"What *she* told you not," Sylvie replied, with a shy glance at the young lady, and losing all sense of grammar in her confusion.

"Oo ca'n't pronounce it!" Bruno triumphantly cried. And he turned to the young lady, for sympathy in his victory. "I *knewed* she couldn't pronounce 'umbrella-sting'!"

The young lady thought it best to return to the arithmetical problem. "When I asked if you were *seven*, you know, I didn't mean 'how many *children*?' I meant 'how many *years*——'"

"Only got *two* ears," said Bruno. "Nobody's got *seven* ears."

"And you belong to this little girl?" the young lady continued, skilfully evading the anatomical problem.

"No, I doosn't belong to *her*!" said Bruno. "Sylvie belongs to *me*!" And he clasped his arms round her as he added "She are my very mine!"

"And, do you know," said the young lady, "I've a little sister at home, exactly like *your* sister? I'm sure they'd love each other."

"They'd be very extremely useful to each other," Bruno said, thoughtfully. "And they wouldn't want no looking-glasses to brush their hair wiz."

"Why not, my child?"

"Why, each one would do for the other one's looking-glass, a-course!" cried Bruno.

But here Lady Muriel, who had been standing by, listening to this bewildering dialogue, interrupted it to ask if the young lady would favour us with some music; and the children followed their new friend to the piano.

Arthur came and sat down by me. "If rumour speaks truly," he whispered, "we are to have a real treat!" And then, amid a breathless silence, the performance began.

She was one of those players whom Society talks of as 'brilliant,' and she dashed into the loveliest of Haydn's Symphonies in a style that was clearly the outcome of years of patient study under the best masters. At first it seemed to be the perfection of piano-forte-playing; but in a few minutes I began to ask myself, wearily, "*What* is it that is wanting? *Why* does one get no pleasure from it?"

Then I set myself to listen intently to every note; and the mystery explained itself. There *was* an almost-perfect mechanical *correctness*—and there was nothing else! False notes, of course, did not occur: she knew the piece too well for *that*; but there was just enough irregularity of *time* to betray that the player had no real 'ear' for music—just enough inarticulateness in the more elaborate passages to show that she did not think her audience worth taking real pains for—just enough mechanical monotony of accent to take all *soul* out of the heavenly modulations she was profaning—in short, it was simply irritating;

and, when she had rattled off the finale and had struck the final chord as if, the instrument being now done with, it didn't matter how many wires she broke, I could not even *affect* to join in the stereotyped "Oh, *thank* you!" which was chorused around me.

Lady Muriel joined us for a moment. "Isn't it *beautiful*?" she whispered, to Arthur, with a mischievous smile.

"No, it isn't!" said Arthur. But the gentle sweetness of his face quite neutralised the apparent rudeness of the reply.

"Such execution, you know!" she persisted.

"That's what she *deserves*," Arthur doggedly replied: "but people are so prejudiced against capital——"

"Now you're beginning to talk nonsense!" Lady Muriel cried. "But you *do* like Music, don't you? You said so just now."

"Do I like *Music*?" the Doctor repeated softly to himself. "My dear Lady Muriel, there is Music and Music. Your question is painfully vague. You might as well ask 'Do you like *People*?'"

Lady Muriel bit her lip, frowned, and stamped with one tiny foot. As a dramatic representation of ill-temper, it was distinctly *not* a success. However, it took in *one* of her audience, and Bruno hastened to interpose, as peacemaker in a rising quarrel, with the remark "*I* likes Peoples!"

Arthur laid a loving hand on the little curly head. "What? *All* Peoples?" he enquired.

"Not *all* Peoples," Bruno explained. "Only but Sylvie—and Lady Muriel—and him—" (pointing to the Earl) "and oo—and oo!"

"You shouldn't point at people," said Sylvie. "It's very rude."

"In Bruno's World," I said, "there are only *four* People—worth mentioning!"

"In Bruno's World!" Lady Muriel repeated thoughtfully. "A bright and flowery world. Where the grass is always green, where the breezes always blow softly, and the rain-clouds never gather; where there are no wild beasts, and no deserts——"

"There *must* be deserts," Arthur decisively remarked. "At least if it was *my* ideal world."

"But what possible use is there in a *desert*?" said Lady Muriel. "*Surely* you would have no wilderness in your ideal world?"

Arthur smiled. "But indeed I *would*!" he said. "A wilderness would be more necessary than a railway; and *far* more conducive to general happiness than church-bells!"

"But what would you use it for?"

"*To practise music in*," he replied. "All the young ladies, that have no ear for music, but insist on learning it, should be conveyed, every morning, two or three miles into the wilderness. There each would find a comfortable room provided for her, and also a cheap second-hand piano-forte, on which she might play for hours, without adding one needless pang to the sum of human misery!"

Lady Muriel glanced round in alarm, lest these barbarous sentiments should be overheard. But the fair musician was at a safe distance. "At any rate you must allow that she's a sweet girl?" she resumed.

"Oh, certainly. As sweet as *eau sucrée*, if you choose—and nearly as interesting!"

"You are incorrigible!" said Lady Muriel, and turned to me. "I hope you found Mrs. Mills an interesting companion?"

“Oh, *that’s* her name, is it?” I said. “I fancied there was *more* of it.”

“So there is: and it will be ‘at your proper peril’ (whatever that may mean) if you ever presume to address her as ‘Mrs. Mills.’ She is ‘Mrs. Ernest—Atkinson—Mills’!”

“She is one of those would-be grandees,” said Arthur, “who think that, by tacking on to their surname all their spare Christian-names, with hyphens between, they can give it an aristocratic flavour. As if it wasn’t trouble enough to remember *one* surname!”

By this time the room was getting crowded, as the guests, invited for the evening-party, were beginning to arrive, and Lady Muriel had to devote herself to the task of welcoming them, which she did with the sweetest grace imaginable. Sylvie and Bruno stood by her, deeply interested in the process.

“I hope you like my friends?” she said to them. “Specially my dear old friend, Mein Herr (What’s become of him, I wonder? Oh, there he is!), that old gentleman in spectacles, with a long beard?”

“He’s a grand old gentleman!” Sylvie said, gazing admiringly at ‘Mein Herr,’ who had settled down in a corner, from which his mild eyes beamed on us through a gigantic pair of spectacles. “And what a lovely beard!”

“What does he call his-self?” Bruno whispered.

“He calls himself ‘Mein Herr,’” Sylvie whispered in reply.

Bruno shook his head impatiently. “That’s what he calls his *hair*, not his *self*, oo silly!” He appealed to me. “What does he call his *self*, Mister Sir?”

“That’s the only name *I* know of,” I said. “But he looks very lonely. Don’t you pity his grey hairs?”

“I pities his *self*,” said Bruno, still harping on the misnomer; “but I doosn’t pity his *hair*, one bit. His *hair* ca’n’t feel!”

“We met him this afternoon,” said Sylvie. “We’d been to see Nero, and we’d had *such* fun with him, making him invisible again! And we saw that nice old gentleman as we came back.”

“Well, let’s go and talk to him, and cheer him up a little,” I said: “and perhaps we shall find out what he calls himself.”

Chapter XI. The Man in the Moon.

The children came willingly. With one of them on each side of me, I approached the corner occupied by ‘Mein Herr.’ “You don’t object to *children*, I hope?” I began.

“*Crabbed age and youth cannot live together!*” the old man cheerfully replied, with a most genial smile. “Now take a good look at me, my children! You would guess me to be an *old* man, wouldn’t you?”

At first sight, though his face had reminded me so mysteriously of “the Professor,” he had seemed to be decidedly a *younger* man: but, when I came to look into the wonderful depth of those large dreamy eyes, I felt, with a strange sense of awe, that he was incalculably *older*: he seemed to gaze at us out of some by-gone age, centuries away.

“I don’t know if oo’re an *old* man,” Bruno answered, as the children, won over by the gentle voice, crept a little closer to him. “I thinks oo’re *eighty-three*.”

“He is very exact!” said Mein Herr.

“Is he anything like right?” I said.

Quoted from *The Passionate Pilgrim* by William Shakespeare

Mein Herr's fairy-friends

"There are reasons," Mein Herr gently replied, "reasons which I am not at liberty to explain, for not mentioning *definitely* any Persons, Places, or Dates. One remark only I will permit myself to make—that the period of life, between the ages of a hundred-and-sixty-five and a hundred-and-seventy-five, is a specially *safe* one."

"How do you make that out?" I said.

"Thus. You would consider swimming to be a very safe amusement, if you scarcely ever heard of any one dying of it. Am I not right in thinking that you never heard of any one dying between those two ages?"

"I see what you mean," I said: "but I'm afraid you ca'n't prove *swimming* to be safe, on the same principle. It is no uncommon thing to hear of some one being *drowned*."

"In *my* country," said Mein Herr, "no one is *ever* drowned."

"Is there no water deep enough?"

"Plenty! But we ca'n't *sink*. We are all *lighter than water*. Let me explain," he added, seeing my look of surprise. "Suppose you desire a race of *pigeons* of a particular shape or colour, do you not select, from year to year, those that are nearest to the shape or colour you want, and keep those, and part with the others?"

"We do," I replied. "We call it 'Artificial Selection.'"

"Exactly so," said Mein Herr. "Well, *we* have practised that for some centuries—constantly selecting the *lightest* people: so that, now, *everybody* is lighter than water."

"Then you never can be drowned at *sea*?"

"Never! It is only on the *land*—for instance, when attending a play in a theatre—that we are in such a danger."

"How can that happen at a *theatre*?"

"Our theatres are all *underground*. Large tanks of water are placed above. If

a fire breaks out, the taps are turned, and in one minute the theatre is flooded, up to the very roof! Thus the fire is extinguished.”

“And the audience, I presume?”

“That is a minor matter,” Mein Herr carelessly replied. “But they have the comfort of knowing that, whether drowned or not, they are all *lighter than water*. We have not yet reached the standard of making people lighter than *air*: but we are *aiming* at it; and, in another thousand years or so——”

“What doos oo do wiz the peoples that’s too heavy?” Bruno solemnly enquired.

“We have applied the same process,” Mein Herr continued, not noticing Bruno’s question, “to many other purposes. We have gone on selecting *walking-sticks*—always keeping those that walked *best*—till we have obtained some, that can walk by themselves! We have gone on selecting *cotton-wool*, till we have got some lighter than air! You’ve no idea what a useful material it is! We call it ‘Imponderal.’”

“What do you use it for?”

“Well, chiefly for *packing* articles, to go by Parcel-Post. It makes them weigh *less than nothing*, you know.”

“And how do the Post-Office people know what you have to pay?”

“That’s the beauty of the new system!” Mein Herr cried exultingly. “They pay *us*: we don’t pay *them*! I’ve often got as much as five shillings for sending a parcel.”

“But doesn’t your Government object?”

“Well, they *do* object, a little. They say it comes so expensive, in the long run. But the thing’s as clear as daylight, by their own rules. If I send a parcel, that weighs a pound *more* than nothing, I *pay* three-pence: so, of course, if it weighs a pound *less* than nothing, I ought to *receive* three-pence.”

“It is *indeed* a useful article!” I said.

“Yet even ‘Imponderal’ has its disadvantages,” he resumed. “I bought some, a few days ago, and put it into my *hat*, to carry it home, and the hat simply floated away!”

“Had oo some of that funny stuff in oor hat *today*?” Bruno enquired. “Sylvie and me saw oo in the road, and oor hat were ever so high up! Weren’t it, Sylvie?”

“No, that was quite another thing.” said Mein Herr. “There was a drop or two of rain falling: so I put my hat on the top of my stick—as an umbrella, you know. As I came along the road,” he continued, turning to me, “I was overtaken by——”

“——a shower of rain?” said Bruno.

“Well, it *looked* more like the tail of a dog,” Mein Herr replied. “It was the most curious thing! Something rubbed affectionately against my knee. And I looked down. And I could see *nothing*! Only, about a yard off, there was a dog’s tail, wagging, all by itself!”

“Oh, *Sylvie*!” Bruno murmured reproachfully. “Oo didn’t finish making him visible!”

“I’m *so* sorry!” Sylvie said, looking very penitent. “I meant to rub it along his back, but we were in such a hurry. We’ll go and finish him tomorrow. Poor thing! Perhaps he’ll get no supper tonight!”

“*Course* he won’t!” said Bruno. “Nobody never gives bones to a dog’s tail!”

Mein Herr looked from one to the other in blank astonishment. "I do not understand you," he said. "I had lost my way, and I was consulting a pocket-map, and somehow I had dropped one of my gloves, and this invisible *Something*, that had rubbed against my knee, actually brought it back to me!"

"Course he did!" said Bruno. "He's *welley* fond of fetching things."

Mein Herr looked so thoroughly bewildered that I thought it best to change the subject. "What a useful thing a pocket-map is!" I remarked.

"That's another thing we've learned from *your* Nation," said Mein Herr, "map-making. But we've carried it much further than *you*. What do you consider the *largest* map that would be really useful?"

"About six inches to the mile."

"Only *six inches!*" exclaimed Mein Herr. "We very soon got to six *yards* to the mile. Then we tried a *hundred* yards to the mile. And then came the grandest idea of all! We actually made a map of the country, on the scale of a *mile to the mile!*"

"Have you used it much?" I enquired.

"It has never been spread out, yet," said Mein Herr: "the farmers objected: they said it would cover the whole country, and shut out the sunlight! So we now use the country itself, as its own map, and I assure you it does nearly as well. Now let me ask you *another* question. What is the smallest *world* you would care to inhabit?"

"*I know!*" cried Bruno, who was listening intently. "I'd like a little teeny-tiny world, just big enough for Sylvie and me!"

"Then you would have to stand on opposite sides of it," said Mein Herr. "And so you would never see your sister *at all!*"

"And I'd have no *lessons*," said Bruno.

"You don't mean to say you've been trying experiments in *that* direction!" I said.

"Well, not *experiments* exactly. We do not profess to *construct* planets. But a scientific friend of mine, who has made several balloon-voyages, assures me he has visited a planet so small that he could walk right round it in twenty minutes! There had been a great battle, just before his visit, which had ended rather oddly: the vanquished army ran away at full speed, and in a very few minutes found themselves face-to-face with the victorious army, who were marching home again, and who were so frightened at finding themselves between *two* armies, that they surrendered at once! Of course that lost them the battle, though, as a matter of fact, they had killed *all* the soldiers on the other side."

"Killed soldiers *ca'n't* run away," Bruno thoughtfully remarked.

"'Killed' is a technical word," replied Mein Herr. "In the little planet I speak of, the bullets were made of soft black stuff, which marked everything it touched. So, after a battle, all you had to do was to count how many soldiers on each side were 'killed'—that means 'marked on the *back*,' for marks in *front* didn't count."

"Then you couldn't 'kill' any, unless they ran away?" I said.

"My scientific friend found out a better plan than *that*. He pointed out that, if only the bullets were sent *the other way round the world*, they would hit the enemy in the *back*. After that, the *worst* marksmen were considered the *best* soldiers; and *the very worst of all* always got First Prize."

"And how did you decide which was *the very worst of all?*"

“Easily. The *best* possible shooting is, you know, to hit what is exactly in *front* of you: so of course the *worst* possible is to hit what is exactly *behind* you.”

“They were strange people in that little planet!” I said.

“They were indeed! Perhaps their method of *government* was the strangest of all. In *this* planet, I am told, a Nation consists of a number of Subjects, and one King: but, in the little planet I speak of, it consisted of a number of *Kings*, and one *Subject*!”

“You say you are ‘told’ what happens in *this* planet,” I said. “May I venture to guess that you yourself are a visitor from some *other* planet?”

Bruno clapped his hands in his excitement. “Is oo the Man-in-the-Moon?” he cried.

Mein Herr looked uneasy. “I am *not* in the Moon, my child,” he said evasively. “To return to what I was saying. I think *that* method of government ought to answer *well*. You see, the Kings would be sure to make Laws contradicting each other: so the Subject could never be punished, because, *whatever* he did, he’d be obeying *some* Law.”

“And, whatever he did, he’d be *disobeying some* Law!” cried Bruno. “So he’d *always* be punished!”

Lady Muriel was passing at the moment, and caught the last word. “Nobody’s going to be punished *here*!” she said, taking Bruno in her arms. “This is Liberty-Hall! Would you lend me the children for a minute?”

“The children desert us, you see,” I said to Mein Herr, as she carried them off: “so we old folk must keep each other company!”

The old man sighed. “Ah, well! We’re old folk *now*; and yet I was a child myself, once—at least I fancy so.”

It *did* seem a rather unlikely fancy, I could not help owning to myself—looking at the shaggy white hair, and the long beard—that he could *ever* have been a child. “You are fond of young people?” I said.

“Young *men*,” he replied. “Not of *children* exactly. I used to teach young men—many a year ago—in my dear old University!”

“I didn’t quite catch its *name*?” I hinted.

“I did not name it,” the old man replied mildly. “Nor would you know the name if I did. Strange tales I could tell you of all the changes I have witnessed there! But it would weary you, I fear.”

“No, *indeed*!” I said. “Pray go on. What kind of changes?”

But the old man seemed to be more in a humour for questions than for answers. “Tell me,” he said, laying his hand impressively on my arm, “tell me something. For I am a stranger in your land, and I know little of *your* modes of education: yet something tells me *we* are further on than *you* in the eternal cycle of change—and that many a theory *we* have tried and found to fail, *you* also will try, with a wilder enthusiasm: you also will find to fail, with a bitterer despair!”

It was strange to see how, as he talked, and his words flowed more and more freely, with a certain rhythmic eloquence, his features seemed to glow with an inner light, and the whole man seemed to be transformed, as if he had grown fifty years younger in a moment of time.

Chapter XII. Fairy-Music.

The silence that ensued was broken by the voice of the musical young lady, who had seated herself near us, and was conversing with one of the newly-arrived guests. "Well!" she said in a tone of scornful surprise. "We *are* to have something new in the way of music, it appears!"

I looked round for an explanation, and was nearly as much astonished as the speaker herself: it was *Sylvie* whom Lady Muriel was leading to the piano!

"Do try it, my darling!" she was saying. "I'm sure you can play very nicely!"

Sylvie looked round at me, with tears in her eyes. I tried to give her an encouraging smile, but it was evidently a great strain on the nerves of a child so wholly unused to be made an exhibition of, and she was frightened and unhappy. Yet here came out the perfect sweetness of her disposition: I could see that she was resolved to forget herself, and do her best to give pleasure to Lady Muriel and her friends. She seated herself at the instrument, and began instantly. Time and expression, so far as one could judge, were perfect: but her touch was one of such extraordinary lightness that it was at first scarcely possible, through the hum of conversation which still continued, to catch a note of what she was playing.

But in a minute the hum had died away into absolute silence, and we all sat, entranced and breathless, to listen to such heavenly music as none then present could ever forget.

Hardly touching the notes at first, she played a sort of introduction in a minor key—like an embodied twilight; one felt as though the lights were growing dim, and a mist were creeping through the room. Then there flashed through the gathering gloom the first few notes of a melody so lovely, so delicate, that one held one's breath, fearful to lose a single note of it. Ever and again the music dropped into the pathetic minor key with which it had begun, and, each time that the melody forced its way, so to speak, through the enshrouding gloom into the light of day, it was more entrancing, more magically sweet. Under the airy touch of the child, the instrument actually seemed to *warble*, like a bird. "*Rise up, my love, my fair one,*" it seemed to sing, "*and come away! For lo, the winter is past, the rain is over and gone; the flowers appear on the earth; the time of the singing of birds is come!*" One could fancy one heard the tinkle of the last few drops, shaken from the trees by a passing gust—that one saw the first glittering rays of the sun, breaking through the clouds.

The Count hurried across the room in great excitement. "I *cannot* remember myself," he exclaimed, "of the name of this so charming an air! It is of an opera, most surely. Yet not even will the *opera* remind his name to me! What you call him, dear child?"

Sylvie looked round at him with a rapt expression of face. She had ceased playing, but her fingers still wandered fitfully over the keys. All fear and shyness had quite passed away now, and nothing remained but the pure joy of the music that had thrilled our hearts.

"The title of it!" the Count repeated impatiently. "How call you the opera?"

"I don't know what an opera *is*," Sylvie half-whispered.

"How, then, call you the *air*?"

"I don't know any name for it," Sylvie replied, as she rose from the instrument.

Quoted from Song of Solomon 2:10-12

‘How call you the opera?’

“But this is marvellous!” exclaimed the Count, following the child, and addressing himself to me, as if I were the proprietor of this musical prodigy, and so *must* know the origin of her music. “You have heard her play this, sooner—I would say ‘before this occasion’? How call you the air?”

I shook my head; but was saved from more questions by Lady Muriel, who came up to petition the Count for a song.

The Count spread out his hands apologetically, and ducked his head. “But, Milady, I have already respected—I would say prospected—all your songs; and there shall be none fitted to my voice! They are not for basso voices!”

“Wo’n’t you look at them again?” Lady Muriel implored.

“Let’s help him!” Bruno whispered to Sylvie. “Let’s get him—*you* know!”

Sylvie nodded. “Shall *we* look for a song for you?” she said sweetly to the Count.

“Mais *oui*!” the little man exclaimed.

“Of course we may!” said Bruno, while, each taking a hand of the delighted Count, they led him to the music-stand.

“There is still hope!” said Lady Muriel over her shoulder, as she followed them.

I turned to ‘Mein Herr,’ hoping to resume our interrupted conversation. “You were remarking——” I began: but at this moment Sylvie came to call Bruno, who had returned to my side, looking unusually serious. “*Do* come, Bruno!” she entreated. “You know we’ve nearly found it!” Then, in a whisper, “The locket’s in my *hand*, now. I couldn’t get it out while they were looking!”

But Bruno drew back. “The man called me names,” he said with dignity.

“What names?” I enquired with some curiosity.

“I asked him,” said Bruno, “which sort of song he liked. And he said ‘A song of a man, not of a lady.’ And I said ‘Shall Sylvie and me find you the song of Mister Tottles?’ And he said ‘Wait, eel!’ And I’m *not* an eel, oo know!”

"I'm *sure* he didn't mean it!" Sylvie said earnestly. "It's something French—you know he ca'n't talk English so well as——"

Bruno relented visibly. "Course he knows no better, if he's Flench! Flenchmen *never* can speak English so goodly as *us*!" And Sylvie led him away, a willing captive.

"Nice children!" said the old man, taking off his spectacles and rubbing them carefully. Then he put them on again, and watched with an approving smile, while the children tossed over the heap of music, and we just caught Sylvie's reproving words, "We're *not* making hay, Bruno!"

"This has been a long interruption to our conversation," I said. "Pray let us go on!"

"Willingly!" replied the gentle old man.

"I was much interested in what you——" He paused a moment, and passed his hand uneasily across his brow. "One forgets," he murmured. "What was I saying? Oh! Something you were to tell me. Yes. Which of your teachers do you value the most highly, those whose words are easily understood, or those who puzzle you at every turn?"

I felt obliged to admit that we generally admired most the teachers we couldn't quite understand.

"Just so," said Mein Herr. "That's the way it begins. Well, *we* were at that stage some eighty years ago—or was it ninety? Our favourite teacher got more obscure every year; and every year we admired him more—just as *your* Art-fanciers call *mist* the fairest feature in a landscape, and admire a view with frantic delight when they can see nothing! Now I'll tell you how it ended. It was Moral Philosophy that our idol lectured on. Well, his pupils couldn't make head or tail of it, but they got it all by heart; and, when Examination-time came, they wrote it down; and the Examiners said 'Beautiful! What depth!'"

"But what good was it to the young men *afterwards*?"

"Why, don't you see?" replied Mein Herr. "*They* became teachers in their turn, and *they* said all these things over again; and *their* pupils wrote it all down; and the Examiners accepted it; and nobody had the ghost of an idea what it all meant!"

"And how did it end?"

"It ended this way. We woke up one fine day, and found there was no one in the place that knew *anything* about Moral Philosophy. So we abolished it, teachers, classes, examiners, and all. And if any one wanted to learn anything about it, he had to make it out for himself; and after another twenty years or so there were several men that really knew something about it! Now tell me another thing. How long do you teach a youth before you examine him, in your Universities?"

I told him, three or four years.

"Just so, just what *we* did!" he exclaimed. "We taught 'em a bit, and, just as they were beginning to take it in, we took it all out again! We pumped our wells dry before they were a quarter full—we stripped our orchards while the apples were still in blossom—we applied the severe logic of arithmetic to our chickens, while peacefully slumbering in their shells! Doubtless it's the early bird that picks up the worm—but if the bird gets up so outrageously early that the worm is still deep underground, what *then* is its chance of a breakfast?"

Not much, I admitted.

“Now see how that works!” he went on eagerly. “If you want to pump your wells so soon—and I suppose you tell me that is what you *must* do?”

“We must,” I said. “In an over-crowded country like this, nothing but Competitive Examinations——”

Mein Herr threw up his hands wildly. “What, *again?*” he cried. “I thought it was dead, fifty years ago! Oh this Upas tree of Competitive Examinations! Beneath whose deadly shade all the original genius, all the exhaustive research, all the untiring life-long diligence by which our fore-fathers have so advanced human knowledge, must slowly but surely wither away, and give place to a system of Cookery, in which the human mind is a sausage, and all we ask is, how much indigestible stuff can be crammed into it!”

Always, after these bursts of eloquence, he seemed to forget himself for a moment, and only to hold on to the thread of thought by some single word. “Yes, *crammed,*” he repeated. “We went through all that stage of the disease—had it bad, I warrant you! Of course, as the Examination was all in all, we tried to put in just what was wanted—and the *great* thing to aim at was, that the Candidate should know absolutely *nothing* beyond the needs of the Examination! I don’t say it was ever *quite* achieved: but one of my own pupils (pardon an old man’s egotism) came very near it. After the Examination, he mentioned to me the few facts which he knew but had *not* been able to bring in, and I can assure you they were trivial, Sir, absolutely trivial!”

I feebly expressed my surprise and delight.

The old man bowed, with a gratified smile, and proceeded. “At that time, no one had hit on the much more rational plan of watching for the individual scintillations of genius, and rewarding them as they occurred. As it was, we made our unfortunate pupil into a Leyden-jar, charged him up to the eyelids—then applied the knob of a Competitive Examination, and drew off one magnificent spark, which very often cracked the jar! What mattered *that?* We labeled it ‘First Class Spark,’ and put it away on the shelf.”

“But the more rational system——?” I suggested.

“Ah, yes! *that* came next. Instead of giving the whole reward of learning in one lump, we used to pay for every good answer as it occurred. How well I remember lecturing in those days, with a heap of small coins at my elbow! It was ‘A *very* good answer, Mr. Jones!’ (that meant a shilling, mostly). ‘Bravo, Mr. Robinson!’ (that meant half-a-crown). Now I’ll tell you how *that* worked. Not one single fact would any of them take in, without a fee! And when a clever boy came up from school, he got paid more for learning than we got paid for teaching him! Then came the wildest craze of all.”

“What, *another* craze?” I said.

“It’s the last one,” said the old man. “I must have tired you out with my long story. Each College wanted to get the clever boys: so we adopted a system which we had heard was very popular in England: the Colleges competed against each other, and the boys let themselves out to the highest bidder! What geese we were! Why, they were bound to come to the University *somehow*. We needn’t have paid ’em! And all our money went in getting clever boys to come to one College rather than another! The competition was so keen, that at last mere money-payments were not enough. Any College, that wished to secure some specially clever young man, had to waylay him at the Station, and hunt him through the streets. The first who touched him was allowed to have him.”

"That hunting-down of the scholars, as they arrived, must have been a curious business," I said. "Could you give me some idea of what it was like?"

"Willingly!" said the old man. "I will describe to you the very last Hunt that took place, before that form of Sport (for it was actually reckoned among the *Sports* of the day: we called it 'Cub-Hunting') was finally abandoned. I witnessed it myself, as I happened to be passing by at the moment, and was what we called 'in at the death.' I can see it now!" he went on in an excited tone, gazing into vacancy with those large dreamy eyes of his. "It seems like yesterday; and yet it happened——" He checked himself hastily, and the remaining words died away into a whisper.

Scholar-hunting: The persued

"How many years ago did you say?" I asked, much interested in the prospect of at last learning *some* definite fact in his history.

"Many years ago," he replied. "The scene at the Railway-Station had been (so they told me) one of wild excitement. Eight or nine Heads of Colleges had assembled at the gates (no one was allowed inside), and the Station-Master had drawn a line on the pavement, and insisted on their all standing behind it. The gates were flung open! The young man darted through them, and fled like lightning down the street, while the Heads of Colleges actually *yelled* with excitement on catching sight of him! The Proctor gave the word, in the old statutory form, '*Semel! Bis! Ter! Currite!*', and the Hunt began! Oh, it was a fine sight, believe me! At the first corner he dropped his Greek Lexicon: further on, his railway-rug: then various small articles: then his umbrella: lastly, what I suppose he prized most, his hand-bag: but the game was up: the spherical Principal of—of——"

"Of *which* College?" I said.

"—of *one* of the Colleges," he resumed, "had put into operation the Theory—his own discovery—of Accelerated Velocity, and captured him just opposite to where I stood. I shall never forget that wild breathless struggle! But it was soon over. Once in those great bony hands, escape was impossible!"

"May I ask why you speak of him as the '*spherical*' Principal?" I said.

"The epithet referred to his *shape*, which was a perfect *sphere*. You are aware that a bullet, another instance of a perfect sphere, when falling in a perfectly straight line, moves with Accelerated Velocity?"

Scholar-hunting: The persuers

I bowed assent.

“Well, my spherical friend (as I am proud to call him) set himself to investigate the *causes* of this. He found them to be *three*. One; that it is a perfect *sphere*. Two; that it moves in a *straight line*. Three; that its direction is *not upwards*. When these three conditions are fulfilled, you get Accelerated Velocity.”

“Hardly,” I said: “if you will excuse my differing from you. Suppose we apply the theory to *horizontal* motion. If a bullet is fired *horizontally*, it——”

“—it does *not* move in a *straight line*,” he quietly finished my sentence for me.

“I yield the point,” I said. “What did your friend do next?”

“The next thing was to apply the theory, as you rightly suggest, to *horizontal* motion. But the moving body, ever tending to *fall*, needs *constant support*, if it is to move in a true horizontal line. ‘What, then,’ he asked himself, ‘will *give constant support to a moving body?*’ And his answer was ‘*Human legs!*’ That was the discovery that immortalised his name!”

“His name being——?” I suggested.

“I had not mentioned it,” was the gentle reply of my most unsatisfactory informant. “His next step was an obvious one. He took to a diet of suet-dumplings, until his body had become a perfect sphere. *Then* he went out for his first experimental run—which nearly cost him his life!”

“How was *that?*”

“Well, you see, he had no idea of the *tremendous* new Force in Nature that he was calling into play. He began too fast. In a very few minutes he found himself moving at a hundred miles an hour! And, if he had not had the presence of mind to charge into the middle of a haystack (which he scattered to the four winds) there can be no doubt that he would have left the Planet he belonged to, and gone right away into Space!”

“And how came that to be the *last* of the Cub-Hunts?” I enquired.

“Well, you see, it led to a rather scandalous dispute between two of the Colleges. *Another* Principal had laid his hand on the young man, so nearly at the same moment as the *spherical* one, that there was no knowing which had touched him first. The dispute got into print, and did us no credit, and, in short, Cub-Hunts came to an end. Now I’ll tell you what cured us of that wild craze of ours, the bidding against each other, for the clever scholars, just as if they were articles to be sold by auction! Just when the craze had reached its highest point, and when one of the Colleges had actually advertised a Scholarship of one thousand pounds *per annum*, one of our tourists brought us the manuscript of an old African legend—I happen to have a copy of it in my pocket. Shall I translate it for you?”

“Pray go on,” I said, though I felt I was getting *very* sleepy.

Chapter XIII. What Tottles Meant.

Mein Herr unrolled the manuscript, but, to my great surprise, instead of *reading* it, he began to *sing* it, in a rich mellow voice that seemed to ring through the room.

“One thousand pounds per annum
Is not so bad a figure, come!”
Cried Tottles. “And I tell you, flat,
A man may marry well on that!
To say ‘the Husband needs the Wife’
Is not the way to represent it.
The crowning joy of Woman’s life
Is *Man!*” said Tottles (and he meant it).
The blissful Honey-moon is past:
The Pair have settled down at last:
Mamma-in-law their home will share,
And make their happiness her care.
“Your income is an ample one;
Go it, my children!” (And they went it).
“I rayther think this kind of fun
Won’t last!” said Tottles (and he meant it).
They took a little country-box—
A box at Covent Garden also:
They lived a life of double-knocks,
Acquaintances began to call so:
Their London house was much the same
(It took three hundred, clear, to rent it):
“Life is a very jolly game!”
Cried happy Tottles (and he meant it).
‘Contented with a frugal lot’
(He always used that phrase at Gunter’s),
He bought a handy little yacht—
A dozen serviceable hunters—
The fishing of a Highland Loch—

A sailing-boat to circumvent it—
“The sounding of that Gaelic ‘och’
Beats *me!*” said Tottles (and he meant it).

Here, with one of those convulsive starts that wake one up in the very act of dropping off to sleep, I became conscious that the deep musical tones that thrilled me did *not* belong to Mein Herr, but to the French Count. The old man was still conning the manuscript.

“I *beg* your pardon for keeping you waiting!” he said. “I was just making sure that I knew the English for all the words. I am quite ready now.” And he read me the following Legend:—

“In a city that stands in the very centre of Africa, and is rarely visited by the casual tourist, the people had always bought eggs—a daily necessary in a climate where egg-flip was the usual diet—from a Merchant who came to their gates once a week. And the people always bid wildly against each other: so there was quite a lively auction every time the Merchant came, and the last egg in his basket used to fetch the value of two or three camels, or thereabouts. And eggs got dearer every week. And still they drank their egg-flip, and wondered where all their money went to.

The egg-merchant

“And there came a day when they put their heads together. And they understood what donkeys they had been.

“And next day, when the Merchant came, only *one* Man went forth. And he said ‘Oh, thou of the hook-nose and the goggle-eyes, thou of the measureless beard, how much for that lot of eggs?’

“And the Merchant answered him ‘I *could* let thee have that lot at ten thousand piastres the dozen.’

“And the Man chuckled inwardly, and said ‘*Ten* piastres the dozen I offer thee, and no more, oh descendant of a distinguished grandfather!’

“And the Merchant stroked his beard, and said ‘Hum! I will await the coming of thy friends,’ So he waited. And the Man waited with him. And they waited both together.”

“The manuscript breaks off here,” said Mein Herr, as he rolled it up again; “but it was enough to open our eyes. We saw what simpletons we had been—buying our Scholars much as those ignorant savages bought their eggs—and the ruinous system was abandoned. If only we could have abandoned, along with it, all the *other* fashions we had borrowed from you, instead of carrying them to their logical results! But it was not to be. What ruined my country, and drove me from my home, was the introduction—into the *Army*, of all places—of your theory of Political Dichotomy!”

“Shall I trouble you too much,” I said, “if I ask you to explain what you mean by ‘the Theory of Political Dichotomy’?”

“No trouble at all!” was Mein Herr’s most courteous reply. “I quite enjoy talking, when I get so good a listener. What started the thing, with us, was the report brought to us, by one of our most eminent statesmen, who had stayed some time in England, of the way affairs were managed there. It was a political necessity (so he assured us, and we believed him, though we had never discovered it till that moment) that there should be *two* Parties, in every affair and on every subject. In *Politics*, the two Parties, which you had found it necessary to institute, were called, he told us, ‘Whigs’ and ‘Tories’.”

“That must have been some time ago?” I remarked.

“It *was* some time ago,” he admitted. “And this was the way the affairs of the British Nation were managed. (You will correct me if I misrepresent it. I do but repeat what our traveler told us.) These two Parties—which were in chronic hostility to each other—took turns in conducting the Government; and the Party, that happened *not* to be in power, was called the ‘Opposition’, I believe?”

“That is the right name,” I said. “There have always been, so long as we have had a Parliament at all, *two* Parties, one ‘in’, and one ‘out’.”

“Well, the function of the ‘Ins’ (if I may so call them) was to do the best they could for the national welfare—in such things as making war or peace, commercial treaties, and so forth?”

“Undoubtedly,” I said.

“And the function of the ‘Outs’ was (so our traveller assured us, though we were very incredulous at first) to *prevent* the ‘Ins’ from succeeding in any of these things?”

“To *criticize* and to *amend* their proceedings,” I corrected him. “It would be *unpatriotic* to *hinder* the Government in doing what was for the good of the Nation! We have always held a *Patriot* to be the greatest of heroes, and an *unpatriotic* spirit to be one of the worst of human ills!”

“Excuse me for a moment,” the old gentleman courteously replied, taking out his pocket-book. “I have a few memoranda here, of a correspondence I had with

our tourist, and, if you will allow me, I'll just refresh my memory—although I quite agree with you—it is, as you say, one of the worst of human ills—” And, here Mein Herr began singing again:—

But oh, the worst of human ills
(Poor Tottles found) are ‘little bills’!
And, with no balance in the Bank,
What wonder that his spirits sank?
Still, as the money flowed away,
He wondered how on earth she spent it.
“You cost me twenty pounds a day,
At least!” cried Tottles (and he meant it).
She sighed. “Those Drawing Rooms, you know!
I really never thought about it:
Mamma declared we ought to go—
We should be Nobodies without it.
That diamond-circlet for my brow—
I quite believed that *she* had sent it,
Until the Bill came in just now——”
“*Viper!*” cried Tottles (and he meant it).

Poor Mrs. T. could bear no more,
But fainted flat upon the floor.
Mamma-in-law, with anguish wild,
Seeks, all in vain, to rouse her child.
“Quick! Take this box of smelling-salts!
Don’t scold her, James, or you’ll repent it,
She’s a *dear* girl, with all her faults——”
“*She is!*” groaned Tottles (and he meant it).

“I was a donkey,” Tottles cried,
“To choose your daughter for my bride!
'Twas *you* that bid us cut a dash!
'Tis *you* have brought us to this smash!
You don’t suggest one single thing
That can in any way prevent it——
Then what’s the use of arguing?
Shut up!” cried Tottles (and he meant it).

Once more I started into wakefulness, and realised that Mein Herr was not the singer. He was still consulting his memoranda.

“It is exactly what my friend told me,” he resumed, after conning over various papers. “‘*Unpatriotic*’ is the very word I had used, in writing to him, and ‘*hinder*’ is the very word he used in his reply! Allow me to read you a portion of his letter:—

“‘*I can assure you,*’ he writes, ‘*that, unpatriotic as you may think it, the recognised function of the ‘Opposition’ is to hinder, in every manner not forbidden by the Law, the action of the Government. This process is called ‘Legitimate Obstruction’: and the greatest triumph the ‘Opposition’ can ever enjoy, is when they are able to point out that, owing to their ‘Obstruction’, the Government have failed in everything they have tried to do for the good of the Nation!*’”

"Your friend has not put it *quite* correctly," I said. "The Opposition would no doubt be glad to point out that the Government had failed *through their own fault*; but *not* that they had failed on account of *Obstruction!*"

"You think so?" he gently replied. "Allow me now to read to you this newspaper-cutting, which my friend enclosed in his letter. It is part of the report of a public speech, made by a Statesman who was at the time a member of the 'Opposition':—

"*At the close of the Session, he thought they had no reason to be discontented with the fortunes of the campaign. They had routed the enemy at every point. But the pursuit must be continued. They had only to follow up a disordered and dispirited foe.*"

"Now to what portion of your national history would you guess that the speaker was referring?"

"Really, the number of *successful* wars we have waged during the last century," I replied, with a glow of British pride, "is *far* too great for me to guess, with any chance of success, *which* it was we were then engaged in. However, I will name '*India*' as the most probable. The Mutiny was no doubt, all but crushed, at the time that speech was made. What a fine, manly, *patriotic* speech it must have been!" I exclaimed in an outburst of enthusiasm.

"You think so?" he replied, in a tone of gentle pity. "Yet my friend tells me that the '*disordered and dispirited foe*' simply meant the Statesmen who happened to be in power at the moment; that the '*pursuit*' simply meant '*Obstruction*'; and that the words '*they had routed the enemy*' simply meant that the 'Opposition' had succeeded in hindering the Government from doing any of the work which the Nation had empowered them to do!"

I thought it best to say nothing.

"It seemed queer to *us*, just at first," he resumed, after courteously waiting a minute for me to speak: "but, when once we had mastered the idea, our respect for your Nation was so great that we carried it into every department of life! It was '*the beginning of the end*' with us. My country never held up its head again!" And the poor old gentleman sighed deeply.

"Let us change the subject," I said. "Do not distress yourself, I beg!"

"No, no!" he said, with an effort to recover himself. "I had rather finish my story! The next step (after reducing our Government to impotence, and putting a stop to all useful legislation, which did not take us long to do) was to introduce what we called '*the glorious British Principle of Dichotomy*' into *Agriculture*. We persuaded many of the well-to-do farmers to divide their staff of labourers into two Parties, and to set them one against the other. They were called, like our political Parties, the '*Ins*' and the '*Outs*': the business of the '*Ins*' was to do as much of ploughing, sowing, or whatever might be needed, as they could manage in a day, and at night they were paid according to the amount they had *done*: the business of the '*Outs*' was to hinder them, and *they* were paid for the amount they had *hindered*. The farmers found they had to pay only *half* as much wages as they did before, and they didn't observe that the amount of work done was only a *quarter* as much as was done before: so they took it up quite enthusiastically, *at first*."

"And *afterwards*—?" I enquired.

"Well, *afterwards* they didn't like it quite so well. In a very short time, things settled down into a regular routine. No work *at all* was done. So the '*Ins*' got no wages, and the '*Outs*' got full pay. And the farmers never discovered, till

most of them were ruined, that the rascals had agreed to manage it so, and had shared the pay between them! While the thing lasted, there were funny sights to be seen! Why, I've often watched a ploughman, with two horses harnessed to the plough, doing his best to get it *forwards*; while the opposition-ploughman, with three donkeys harnessed at the *other* end, was doing *his* best to get it *backwards*! And the plough never moving an inch, *either* way!"

"But *we* never did anything like *that*!" I exclaimed.

"Simply because you were less *logical* than we were," replied Mein Herr. "There is *sometimes* an advantage in being a donk—Excuse me! No *personal* allusion intended. All this happened *long ago*, you know!"

"Did the Dichotomy-Principle succeed in *any* direction?" I enquired.

"In *none*," Mein Herr candidly confessed. "It had a *very* short trial in *Commerce*. The shop-keepers *wouldn't* take it up, after once trying the plan of having half the attendants busy in folding up and carrying away the goods which the other half were trying to spread out upon the counters. They said the Public didn't like it!"

"I don't wonder at it," I remarked.

"Well, we tried 'the British Principle' for some years. And the end of it all was—" His voice suddenly dropped, almost to a whisper; and large tears began to roll down his cheeks. "—the end was that we got involved in a war; and there was a great battle, in which we far out-numbered the enemy. But what could one expect, when only *half* of our soldiers were fighting, and the other half pulling them back? It ended in a crushing defeat—an utter rout. This caused a Revolution; and most of the Government were banished. I myself was accused of Treason, for having so strongly advocated 'the British Principle.' My property was all forfeited, and—and—I was driven into exile! 'Now the mischief's done,' they said, 'perhaps you'll kindly leave the country?' It nearly broke my heart, but I had to go!"

The melancholy tone became a wail: the wail became a chant: the chant became a song—though whether it was *Mein Herr* that was singing, this time, or somebody else, I could not feel certain.

"And, now the mischief's done, perhaps
You'll kindly go and pack your traps?
Since *two* (your daughter and your son)
Are Company, but *three* are none.
A course of saving we'll begin:
When change is needed, *I'll* invent it:
Don't think to put *your* finger in
This pie!" cried Tottles (and he meant it).

The music seemed to die away. Mein Herr was again speaking in his ordinary voice. "Now tell me one thing more," he said. "Am I right in thinking that in *your* Universities, though a man may reside some thirty or forty years, you examine him, once for all, at the end of the first three or four?"

"That is so, undoubtedly," I admitted.

"Practically, then, you examine a man at the *beginning* of his career!" the old man said to himself rather than to me. "And what guarantee have you that he *retains* the knowledge for which you have rewarded him—beforehand, as *we* should say?"

"None," I admitted, feeling a little puzzled at the drift of his remarks. "How do *you* secure that object?"

"By examining him at the *end* of his thirty or forty years—not at the beginning," he gently replied. "On an average, the knowledge then found is about one-fifth of what it was at first—the process of forgetting going on at a very steady uniform rate—and he, who forgets *least*, gets *most* honour, and most rewards."

"Then you give him the money when he needs it no longer? And you make him live most of his life on *nothing*!"

"Hardly that. He gives his orders to the tradesmen: they supply him, for forty, sometimes fifty, years, at their own risk: then he gets his Fellowship—which pays him in *one* year as much as *your* Fellowships pay in fifty—and then he can easily pay all his bills, with interest."

"But suppose he fails to get his Fellowship? That must occasionally happen."

"That occasionally happens." It was Mein Herr's turn, now, to make admissions.

"And what becomes of the tradesmen?"

"They calculate accordingly. When a man appears to be getting alarmingly ignorant, or stupid, they will sometimes refuse to supply him any longer. You have no idea with what enthusiasm a man will begin to rub up his forgotten sciences or languages, when his butcher has cut off the supply of beef and mutton!"

"And who are the Examiners?"

"The young men who have just come, brimming over with knowledge. You would think it a curious sight," he went on, "to see mere boys examining such old men. I have known a man set to examine his own grandfather. It was a little painful for both of them, no doubt. The old gentleman was as bald as a coot——"

"How bald would that be?" I've no idea why I asked this question. I felt I was getting foolish.

Chapter XIV. Bruno's Picnic.

"As bald as bald," was the bewildering reply. "Now, Bruno, I'll tell you a story."

"And I'll tell *oo* a story," said Bruno, beginning in a great hurry for fear of Sylvie getting the start of him: "once there were a Mouse—a little tiny Mouse—such a tiny little Mouse! Oo never saw such a tiny Mouse——"

"Did nothing ever happen to it, Bruno?" I asked. "Haven't you anything more to tell us, besides its being so tiny?"

"Nothing never happened to it," Bruno solemnly replied.

"Why did nothing never happen to it?" said Sylvie, who was sitting, with her head on Bruno's shoulder, patiently waiting for a chance of beginning *her* story.

"It were too tiny," Bruno explained.

"*That's* no reason!" I said. "However tiny it was, things might happen to it."

Bruno looked pityingly at me, as if he thought me very stupid. "It were too tiny," he repeated. "If anything happened to it, it would die—it were so *very* tiny!"

"Really that's enough about its being tiny!" Sylvie put in. "Haven't you invented any more about it?"

"Haven't invented no more yet."

"Well then, you shouldn't begin a story till you've invented more! Now be quiet, there's a good boy, and listen to *my* story."

And Bruno, having quite exhausted all his inventive faculty, by beginning in too great a hurry, quietly resigned himself to listening. "Tell about the other Bruno, please," he said coaxingly.

Sylvie put her arms round his neck, and began:—

"The wind was whispering among the trees," ("That wasn't good manners!" Bruno interrupted. "Never mind about manners," said Sylvie) "and it was evening—a nice moony evening, and the Owls were hooting——"

"Pretend they weren't Owls!" Bruno pleaded, stroking her cheek with his fat little hand. "I don't like Owls. Owls have such great big eyes. Pretend they were Chickens!"

"Are you afraid of their great big eyes, Bruno?" I said.

"Aren't *'fraid* of nothing," Bruno answered in as careless a tone as he could manage: "they're ugly with their great big eyes. I think if they cried, the tears would be as big—oh, as big as the moon!" And he laughed merrily. "Doos Owls cry ever, Mister Sir?"

"Owls cry never," I said gravely, trying to copy Bruno's way of speaking: "they've got nothing to be sorry for, you know."

"Oh, but they have!" Bruno exclaimed. "They're ever so sorry, 'cause they killed the poor little Mouses!"

"But they're not sorry when they're *hungry*, I suppose?"

"Oo don't know nothing about Owls!" Bruno scornfully remarked. "When they're hungry, they're very, *very* sorry they killed the little Mouses, 'cause if they *hadn't* killed them there'd be sumfin for supper, oo know!"

Bruno was evidently getting into a dangerously inventive state of mind, so Sylvie broke in with "Now I'm going on with the story. So the Owls—the Chickens, I mean—were looking to see if they could find a nice fat Mouse for their supper——"

"Pretend it was a nice 'abbit!" said Bruno.

"But it *wasn't* a nice habit, to kill Mouses," Sylvie argued. "I can't pretend *that!*"

"I didn't say '*habit*,' oo silly fellow!" Bruno replied with a merry twinkle in his eye. "'*abbits*—that runs about in the fields!"

"Rabbit? Well it can be a Rabbit, if you like. But you mustn't alter my story so much, Bruno. A Chicken *couldn't* eat a Rabbit!"

"But it might have wished to see if it could try to eat it."

"Well, it wished to see if it could try—oh, really, Bruno, that's nonsense! I shall go back to the Owls."

"Well then, pretend they hadn't great eyes!"

"And they saw a little Boy," Sylvie went on, disdaining to make any further corrections. "And he asked them to tell him a story. And the Owls hooted and flew away——" ("Oo shouldn't say '*flewed*;' oo should say '*flied*,'" Bruno whispered. But Sylvie wouldn't hear.) "And he met a Lion. And he asked the Lion to tell him a story. And the Lion said 'yes,' it would. And, while the Lion was telling him the story, it nibbled some of his head off——"

"Don't say 'nibbled'!" Bruno entreated. "Only little things nibble—little thin sharp things, with edges——"

“Well then, it ‘*nubbled*,’” said Sylvie. “And when it had nubbled *all* his head off, he went away, and he never said ‘thank you’!”

“That were very rude,” said Bruno. “If he couldn’t speak, he might have nodded—no, he couldn’t nod. Well, he might have shaken *hands* with the Lion!”

“Oh, I’d forgotten that part!” said Sylvie. “He *did* shake hands with it. He came back again, you know, and he thanked the Lion very much, for telling him the story.”

“Then his head had growed up again?” said Bruno.

“Oh yes, it grew up in a minute. And the Lion begged pardon, and said it wouldn’t nubble off little boys’ heads—not never no more!”

Bruno looked much pleased at this change of events. “Now that are a *really* nice story!” he said. “*Aren’t* it a nice story, Mister Sir?”

“Very,” I said. “I would like to hear another story about that Boy.”

“So would *I*,” said Bruno, stroking Sylvie’s cheek again. “*Please* tell about Bruno’s Picnic; and don’t talk about *nubbly* Lions!”

“I won’t, if it frightens you,” said Sylvie.

“*Flightens* me!” Bruno exclaimed indignantly. “It isn’t *that*! It’s ‘cause ‘nubbly’ ’s such a grumbly word to say—when one person’s got her head on another person’s shoulder. When she talks like that,” he explained to me, “the talking goes down bofe sides of my face—all the way to my chin—and it *doos* tickle so! It’s enough to make a beard grow, that it is!”

He said this with great severity, but it was evidently meant for a joke: so Sylvie laughed—a delicious musical little laugh, and laid her soft cheek on the top of her brother’s curly head, as if it were a pillow, while she went on with the story. “So this Boy——”

“But it wasn’t *me*, oo know!” Bruno interrupted. “And oo needn’t try to look as if it was, Mister Sir!”

I represented, respectfully, that I was trying to look as if it wasn’t.

“—he was a middling good Boy——”

“He were a *welly* good Boy!” Bruno corrected her. “And he never did nothing he wasn’t told to do——”

“*That* doesn’t make a good Boy!” Sylvie said contemptuously.

“That *do* make a good Boy!” Bruno insisted.

Sylvie gave up the point. “Well, he was a *very* good Boy, and he always kept his promises, and he had a big cupboard——”

“—for to keep all his promises in!” cried Bruno.

“If he kept *all* his promises,” Sylvie said, with a mischievous look in her eyes, “he wasn’t like *some* Boys I know of!”

“He had to put *salt* with them, a-course,” Bruno said gravely: “oo ca’n’t keep promises when there isn’t any salt. And he kept his birthday on the second shelf.”

“How long did he keep his birthday?” I asked. “I never can keep *mine* more than twenty-four hours.”

“Why, a birthday *stays* that long by itself!” cried Bruno. “Oo doosn’t know how to keep birthdays! This Boy kept *his* a whole year!”

“And then the next birthday would begin,” said Sylvie. “So it would be his birthday *always*.”

“So it were,” said Bruno. “Doos *oo* have treats on *oor* birthday, Mister Sir?”

“Sometimes,” I said.

"When oo're *good*, I suppose?"

"Why, it *is* a sort of treat, being good, isn't it?" I said.

"A sort of *treat*!" Bruno repeated. "It's a sort of *punishment*, I think!"

"Oh, Bruno!" Sylvie interrupted, almost sadly. "How *can* you?"

"Well, but it *is*," Bruno persisted. "Why, look here, Mister Sir! *This* is being good!" And he sat bolt upright, and put on an absurdly solemn face. "First oo must sit up as straight as pokers——"

"—as *a* poker," Sylvie corrected him.

"—as straight as *pokers*," Bruno firmly repeated. "Then oo must clasp oor hands—*so*. Then—'Why hasn't oo brushed oor hair? Go and brush it *toreckly*!' Then—'Oh, Bruno, oo mustn't dog's-ear the daisies!' Did oo learn *oor* spelling wiz daisies, Mister Sir?"

"I want to hear about that Boy's *Birthday*," I said.

Bruno returned to the story instantly. "Well, so this Boy said 'Now it's my Birthday!' And so—I'm tired!" he suddenly broke off, laying his head in Sylvie's lap. "Sylvie knows it best. Sylvie's grown-upper than me. Go on, Sylvie!"

Sylvie patiently took up the thread of the story again. "So he said 'Now it's my Birthday. Whatever shall I do to keep my Birthday? All *good* little Boys——'" (Sylvie turned away from Bruno, and made a great pretence of whispering to *me*) "—all *good* little Boys—Boys that learn their lessons quite perfect—they always keep their birthdays, you know. So of course *this* little Boy kept *his* Birthday."

"Oo may call him Bruno, if oo like," the little fellow carelessly remarked. "It weren't *me*, but it makes it more interesting."

"So Bruno said to himself 'The properest thing to do is to have a Picnic, all by myself, on the top of the hill. And I'll take some Milk, and some Bread, and some Apples: and first and foremost, I want some *Milk*!' So, first and foremost, Bruno took a milk-pail——"

"And he went and milked the Cow!" Bruno put in.

"Yes," said Sylvie, meekly accepting the new verb. "And the Cow said 'Moo! What are you going to do with all that Milk?' And Bruno said 'Please'm, I want it for my Picnic.' And the Cow said 'Moo! But I hope you wo'n't *boil* any of it?' And Bruno said 'No, *indeed* I won't! New Milk's so nice and so warm, it wants no boiling!'"

"It doesn't want no boiling," Bruno offered as an amended version.

"So Bruno put the Milk in a bottle. And then Bruno said 'Now I want some Bread!' So he went to the Oven, and he took out a delicious new Loaf. And the Oven——"

"—ever so light and so puffy!" Bruno impatiently corrected her. "Oo shouldn't leave out so many words!"

Sylvie humbly apologised. "—a delicious new Loaf, ever so light and so puffy. And the Oven said——" Here Sylvie made a long pause. "Really I don't know *what* an Oven begins with, when it wants to speak!"

Both children looked appealingly at me; but I could only say, helplessly, "I haven't the least idea! *I* never heard an Oven speak!"

For a minute or two we all sat silent; and then Bruno said, very softly, "Oven begins wiz 'O'."

"*Good* little boy!" Sylvie exclaimed. "He does his spelling *very* nicely. *He's cleverer than he knows!*" she added, aside, to *me*. "So the Oven said 'O! What

are you going to do with all that Bread?' And Bruno said 'Please——' Is an Oven 'Sir' or 'm,' would you say?' She looked to me for a reply.

"Both, I think," seemed to me the safest thing to say.

Sylvie adopted the suggestion instantly. "So Bruno said 'Please, Sirm, I want it for my Picnic.' And the Oven said 'O! But I hope you wo'n't *toast* any of it?' And Bruno said 'No, *indeed* I wo'n't! New Bread's so light and so puffy, it wants no toasting!'"

"It never doesn't want no toasting," said Bruno. "I *wiss* oo wouldn't say it so short!"

"So Bruno put the Bread in the hamper. Then Bruno said 'Now I want some Apples!' So he took the hamper, and he went to the Apple-Tree, and he picked some lovely ripe Apples. And the Apple-Tree said——" Here followed another long pause.

Bruno adopted his favourite expedient of tapping his forehead; while Sylvie gazed earnestly upwards, as if she hoped for some suggestion from the birds, who were singing merrily among the branches overhead. But no result followed.

"What *does* an Apple-tree begin with, when it wants to speak?" Sylvie murmured despairingly, to the irresponsible birds.

At last, taking a leaf out of Bruno's book, I ventured on a remark. "Doesn't 'Apple-tree' always begin with 'Eh!'"

"Why, of *course* it does! How *clever* of you!" Sylvie cried delightedly.

Bruno jumped up, and patted me on the head. I tried not to feel conceited.

"So the Apple Tree said 'Eh! What are you going to do with all those Apples?' And Bruno said 'Please, Sir, I want them for my Picnic,' And the Apple-Tree said 'Eh! But I hope you wo'n't *bake* any of them?' And Bruno said 'No, *indeed* I wo'n't! Ripe Apples are so nice and so sweet, they want no baking!'"

"They never doesn't——" Bruno was beginning, but Sylvie corrected herself before he could get the words out.

"They never doesn't nonow want no baking.' So Bruno put the Apples in the hamper, along with the Bread, and the bottle of Milk. And he set off to have a Picnic, on the top of the hill, all by himself——"

"He wasn't greedy, oo know, to have it all by himself," Bruno said, patting me on the cheek to call my attention; "cause he hadn't got no brothers and sisters."

"It was very sad to have no *sisters*, wasn't it?" I said.

"Well, I don't know," Bruno said thoughtfully; "cause he hadn't no lessons to do. So he didn't mind."

Sylvie went on. "So, as he was walking along the road, he heard behind him such a curious sort of noise—a sort of a Thump! Thump! Thump! 'Whatever *is* that?' said Bruno. 'Oh, I know!' said Bruno. 'Why, it's only my Watch a-ticking!'"

"*Were* it his Watch a-ticking?" Bruno asked me, with eyes that fairly sparkled with mischievous delight.

"No doubt of it!" I replied. And Bruno laughed exultingly.

"Then Bruno thought a little harder. And he said 'No! It *ca'n't* be my Watch a-ticking; because I haven't *got* a Watch!'"

Bruno peered up anxiously into my face, to see how I took it. I hung my head, and put a thumb into my mouth, to the evident delight of the little fellow.

“So Bruno went a little further along the road. And then he heard it again, that queer noise—Thump! Thump! Thump! ‘What ever *is* that?’ said Bruno. ‘Oh, I know!’ said Bruno. ‘Why, it’s only the Carpenter a-mending my Wheelbarrow!’”

“*Were* it the Carterpenter a-mending his Wheelbarrow?” Bruno asked me.

I brightened up, and said “It *must* have been!” in a tone of absolute conviction.

Bruno threw his arms round Sylvie’s neck. “Sylvie!” he said, in a perfectly audible whisper. “He says it *must* have been!”

“Then Bruno thought a little harder. And he said ‘No! It *ca’n’t* be the Carpenter amending my Wheelbarrow, because I haven’t *got* a Wheelbarrow!’”

This time I hid my face in my hands, quite unable to meet Bruno’s look of triumph.

“So Bruno went a little further along the road. And then he heard that queer noise again—Thump! Thump! Thump! So he thought he’d look round, *this* time, just to *see* what it was. And what should it be but a great Lion!”

“A great big Lion,” Bruno corrected her.

“A great big Lion. And Bruno was ever so frightened, and he ran——”

“No, he wasn’t *frightened* a bit!” Bruno interrupted. (He was evidently anxious for the reputation of his namesake.) “He runned away to get a good look at the Lion; ’cause he wanted to see if it were the same Lion what used to nubble little Boys’ heads off; and he wanted to know how big it was!”

“Well, he ran away, to get a good look at the Lion. And the Lion trotted slowly after him. And the Lion called after him, in a very gentle voice, ‘Little Boy, little Boy! You needn’t be afraid of *me*! I’m a very *gentle* old Lion now. I *never* nubble little Boys’ heads off, as I used to do.’ And so Bruno said ‘Don’t you *really*, Sir? Then what do you live on?’ And the Lion——”

“Oo *see* he weren’t a bit frightened!” Bruno said to me, patting my cheek again. “’cause he remembered to call it ‘Sir,’ oo know.”

I said that no doubt that was the *real* test whether a person was frightened or not.

“And the Lion said ‘Oh, I live on bread-and-butter, and cherries, and marmalade, and plum-cake——’”

“—and *apples*!” Bruno put in.

“Yes, ‘and apples.’ And Bruno said ‘Won’t you come with me to my Picnic?’ And the Lion said ‘Oh, I should like it *very much indeed*!’ And Bruno and the Lion went away together.” Sylvie stopped suddenly.

“Is that *all*?” I asked, despondingly.

“Not *quite* all,” Sylvie slyly replied. “There’s a sentence or two more. Isn’t there, Bruno?”

“Yes,” with a carelessness that was evidently put on: “just a sentence or two more.”

“And, as they were walking along, they looked over a hedge, and who should they see but a little black Lamb! And the Lamb was ever so frightened. And it ran——”

“It were *really* frightened!” Bruno put in.

“It ran away. And Bruno ran after it. And he called ‘Little Lamb! You needn’t be afraid of *this* Lion! It *never* kills things! It lives on cherries, and marmalade——’”

“—and *apples*!” said Bruno. “Oo *always* forgets the apples!”

“And Bruno said ‘Wo’n’t you come with us to my Picnic?’ And the Lamb said ‘Oh, I should like it *very much indeed*, if my Ma will let me!’ And Bruno said ‘Let’s go and ask your Ma!’ And they went to the old Sheep. And Bruno said ‘Please, may your little Lamb come to my Picnic?’ And the Sheep said ‘Yes, if it’s learnt all its lessons.’ And the Lamb said ‘Oh yes, Ma! I’ve learnt *all* my lessons!’”

“Pretend it hadn’t any lessons!” Bruno earnestly pleaded.

“Oh, that would never do!” said Sylvie. “I ca’n’t leave out all about the lessons! And the old Sheep said ‘Do you know your A B C yet? Have you learnt A?’ And the Lamb said ‘Oh yes, Ma! I went to the A-field, and I helped them to make A!’ ‘Very good, my child! And have you learnt B?’ ‘Oh yes, Ma! I went to the B-hive, and the B gave me some honey!’ ‘Very good, my child! And have you learnt C?’ ‘Oh yes, Ma! I went to the C-side, and I saw the ships sailing on the C!’ ‘Very good, my child! You may go to Bruno’s Picnic.’”

Starting for Bruno’s Picnic

“So they set off. And Bruno walked in the middle, so that the Lamb mightn’t see the Lion——”

“It were *frightened*,” Bruno explained.

“Yes, and it trembled so; and it got paler and paler; and, before they’d got to the top of the hill, it was a *white* little Lamb—as white as snow!”

“But *Bruno* weren’t frightened!” said the owner of that name. “So *he* staid black!”

“No, he *didn’t* stay black! He staid *pink*!” laughed Sylvie. “I shouldn’t kiss you like this, you know, if you were *black*!”

“Oo’d *have* to!” Bruno said with great decision. “Besides, Bruno wasn’t

Bruno, oo know—I mean, Bruno wasn't *me*—I mean—don't talk nonsense, Sylvie!"

"I won't do it again!" Sylvie said very humbly. "And so, as they went along, the Lion said 'Oh, I'll tell you what I used to do when I was a young Lion. I used to hide behind trees, to watch for little Boys.'" (Bruno cuddled a little closer to her.) "'And, if a little thin scraggy Boy came by, why, I used to let him go. But, if a little fat juicy——'"

Bruno could bear no more. "Pretend he wasn't juicy!" he pleaded, half-sobbing.

"Nonsense, Bruno!" Sylvie briskly replied. "It'll be done in a moment! '—if a little fat juicy Boy came by, why, I used to spring out and gobble him up! Oh, you've no *idea* what a delicious thing it is—a little juicy Boy!' And Bruno said 'Oh, if you please, Sir, *don't* talk about eating little boys! It makes me so *shivery!*'"

The real Bruno shivered, in sympathy with the hero.

"And the Lion said 'Oh, well, we won't talk about it, then! I'll tell you what happened on my wedding-day——'"

"I like *this* part better," said Bruno, patting my cheek to keep me awake.

"'There was, oh, such a lovely wedding-breakfast! At *one* end of the table there was a large plum-pudding. And at the other end there was a nice roasted *Lamb!* Oh, you've no *idea* what a delicious thing it is—a nice roasted Lamb!' And the Lamb said 'Oh, if you please, Sir, *don't* talk about eating Lambs! It makes me so *shivery!*' And the Lion said 'Oh, well, we won't talk about it, then!'"

Chapter XV. The Little Foxes.

"So, when they got to the top of the hill, Bruno opened the hamper: and he took out the Bread, and the Apples, and the Milk: and they ate, and they drank. And when they'd finished the Milk, and eaten half the Bread and half the Apples, the Lamb said 'Oh, my paws is so sticky! I want to wash my paws!' And the Lion said 'Well, go down the hill, and wash them in the brook, yonder. We'll wait for you!'"

"It never comed back!" Bruno solemnly whispered to me.

But Sylvie overheard him. "You're not to whisper, Bruno! It spoils the story! And when the Lamb had been gone a long time, the Lion said to Bruno 'Do go and see after that silly little Lamb! It must have lost its way.' And Bruno went down the hill. And when he got to the brook, he saw the Lamb sitting on the bank: and who should be sitting by it but an old Fox!"

"Don't know who *should* be sitting by it," Bruno said thoughtfully to himself. "A old Fox *were* sitting by it."

"And the old Fox were saying," Sylvie went on, for once conceding the grammatical point, "'Yes, my dear, you'll be ever so happy with us, if you'll only come and see us! I've got three little Foxes there, and we do love little Lambs so dearly!' And the Lamb said 'But you never *eat* them, do you, Sir?' And the Fox said 'Oh, no! What, *eat* a Lamb? We never *dream* of doing such a thing!' So the Lamb said 'Then I'll come with you.' And off they went, hand in hand."

"That Fox were welly extremely wicked, *weren't* it?" said Bruno.

"No, no!" said Sylvie, rather shocked at such violent language. "It wasn't quite so bad as that!"

“Well, I mean, it wasn’t nice,” the little fellow corrected himself.

“And so Bruno went back to the Lion. ‘Oh, come quick!’ he said. ‘The Fox has taken the Lamb to his house with him! I’m *sure* he means to eat it!’ And the Lion said ‘I’ll come as quick as ever I can!’ And they trotted down the hill.”

“Do oo think he caught the Fox, Mister Sir?” said Bruno. I shook my head, not liking to speak: and Sylvie went on.

“And when they got to the house, Bruno looked in at the window. And there he saw the three little Foxes sitting round the table, with their clean pinafores on, and spoons in their hands——”

“Spoons in their hands!” Bruno repeated in an ecstasy of delight.

“And the Fox had got a great big knife—all ready to kill the poor little Lamb——” (“Oo needn’t be flightened, Mister Sir!” Bruno put in, in a hasty whisper.)

‘Enter the Lion’

“And just as he was going to do it, Bruno heard a great ROAR——” (The real Bruno put his hand into mine, and held tight), “and the Lion came *bang* through the door, and the next moment it had bitten off the old Fox’s head! And Bruno jumped in at the window, and went leaping round the room, and crying out ‘Hooray! Hooray! The old Fox is dead! The old Fox is dead!’”

Bruno got up in some excitement. “May I do it now?” he enquired.

Sylvie was quite decided on this point. “Wait till afterwards,” she said. “The speeches come next, don’t you know? You always love the speeches, *don’t* you?”

“Yes, I doos,” said Bruno: and sat down again.

“The Lion’s speech. ‘Now, you silly little Lamb, go home to your mother, and never listen to old Foxes again. And be very good and obedient.’”

“The Lamb’s speech. ‘Oh, indeed, Sir, I will, Sir!’ and the Lamb went away.” (“But oo needn’t go away!” Bruno explained. “It’s quite the nicest part—what’s coming now!” Sylvie smiled. She liked having an appreciative audience.)

“The Lion’s speech to Bruno. ‘Now, Bruno, take those little Foxes home with you, and teach them to be good obedient little Foxes! Not like that wicked old thing there, that’s got no head!’” (“That hasn’t got no head,” Bruno repeated.)

“Bruno’s speech to the Lion. ‘Oh, indeed, Sir, I will, Sir!’ And the Lion went away.” (“It gets betterer and betterer, now,” Bruno whispered to me, “right away to the end!”)

“Bruno’s speech to the little Foxes. ‘Now, little Foxes, you’re going to have your first lesson in being good. I’m going to put you into the hamper, along with the Apples and the Bread: and you’re not to eat the Apples: and you’re not to eat the Bread: and you’re not to eat *anything*—till we get to my house: and then you’ll have your supper.’

“The little Foxes’ speech to Bruno. The little Foxes said nothing.

“So Bruno put the Apples into the hamper—and the little Foxes—and the Bread——” (“They had picnicked all the Milk,” Bruno explained in a whisper) “—and he set off to go to his house.” (“We’re getting near the end now,” said Bruno.)

“And, when he had got a little way, he thought he would look into the hamper, and see how the little Foxes were getting on.”

“So he opened the door——” said Bruno.

“Oh, Bruno!” Sylvie exclaimed, “*you’re* not telling the story! So he opened the door, and behold, there were no Apples! So Bruno said ‘Eldest little Fox, have *you* been eating the Apples?’ And the eldest little Fox said ‘No no no!’” (It is impossible to give the tone in which Sylvie repeated this rapid little ‘No no no!’ The nearest I can come to it is to say that it was much as if a young and excited duck had tried to quack the words. It was too quick for a quack, and yet too harsh to be anything else.) “Then he said ‘Second little Fox, have *you* been eating the Apples?’ And the second little Fox said ‘No no no!’ Then he said ‘Youngest little Fox, have *you* been eating the Apples?’ And the youngest little Fox *tried* to say ‘No no no!’ but its mouth was so full, it couldn’t, and it only said ‘Wauch! Wauch! Wauch!’ And Bruno looked into its mouth. And its mouth was full of Apples! And Bruno shook his head, and he said ‘Oh dear, oh dear! What bad creatures these Foxes are!’”

Bruno was listening intently: and, when Sylvie paused to take breath, he could only just gasp out the words “About the Bread?”

“Yes,” said Sylvie, “the Bread comes next. So he shut the door again; and he went a little further; and then he thought he’d just peep in once more. And behold, there was no Bread!” (“What do ‘behold’ *mean*?” said Bruno. “Hush!” said Sylvie.) “And he said ‘Eldest little Fox, have *you* been eating the Bread?’ And the eldest little Fox said ‘No no no!’ ‘Second little Fox, have *you* been eating the Bread?’ And the second little Fox only said ‘Wauch! Wauch! Wauch!’ And Bruno looked into its mouth, and its mouth was full of Bread!” (“It might have chokeded it,” said Bruno.) “So he said ‘Oh dear, oh dear! What *shall* I do with these Foxes?’ And he went a little further.” (“Now comes the most interesting part,” Bruno whispered.)

“And when Bruno opened the hamper again, what do you think he saw?” (“Only *two* Foxes!” Bruno cried in a great hurry.) “You shouldn’t tell it so quick. However, he *did* see only *two* Foxes. And he said ‘Eldest little Fox, have you been eating the youngest little Fox?’ And the eldest little Fox said ‘No no no!’ ‘Second little Fox, have *you* been eating the youngest little Fox?’ And the second little Fox did its very best to say ‘No no no!’ but it could only say ‘Weuchk! Weuchk! Weuchk!’ And when Bruno looked into its mouth, it was half full of Bread, and half full of Fox!” (Bruno said nothing in the pause this time. He was beginning to pant a little, as he knew the crisis was coming.)

“And when he’d got nearly home, he looked once more into the hamper, and he saw——”

“Only——” Bruno began, but a generous thought struck him, and he looked

at me. "Oo may say it, *this* time, Mister Sir!" he whispered. It was a noble offer, but I wouldn't rob him of the treat. "Go on, Bruno," I said, "you say it much the best." "Only—but—*one*—Fox!" Bruno said with great solemnity.

'Whihuauch! Whihuauch!'

"Eldest little Fox," Sylvie said, dropping the narrative-form in her eagerness, "you've been *so* good that I can hardly believe *you've* been disobedient: but I'm *afraid* you've been eating your little sister?" And the eldest little Fox said 'Whihuauch! Whihuauch!' and then it choked. And Bruno looked into its mouth, and it *was* full!" (Sylvie paused to take breath, and Bruno lay back among the daisies, and looked at me triumphantly. "Isn't it *grand*, Mister Sir?" said he. I tried hard to assume a critical tone. "It's grand," I said: "but it frightens one so!" "Oo may sit a little closer to *me*, if oo like," said Bruno.)

"And so Bruno went home: and took the hamper into the kitchen, and opened it. And he saw——" Sylvie looked at *me*, this time, as if she thought I had been rather neglected and ought to be allowed *one* guess, at any rate.

"He ca'n't guess!" Bruno cried eagerly. "I 'fraid I *must* tell him! There

weren't—*nuffin* in the hamper!" I shivered in terror, and Bruno clapped his hands with delight. "He *is* frightened, Sylvie! Tell the rest!"

"So Bruno said 'Eldest little Fox, have you been eating *yourself*, you wicked little Fox?' And the eldest little Fox said 'Whihuauch!' And then Bruno saw there was only its *mouth* in the hamper! So he took the mouth, and he opened it, and shook, and shook! And at last he shook the little Fox out of its own mouth! And then he said 'Open your mouth again, you wicked little thing!' And he shook, and shook! And he shook out the second little Fox! And he said 'Now open *your* mouth!' And he shook, and shook! And he shook out the youngest little Fox, and all the Apples, and all the Bread!"

"And then Bruno stood the little Foxes up against the wall: and he made them a little speech. 'Now, little Foxes, you've begun very wickedly—and you'll have to be punished. First you'll go up to the nursery, and wash your faces, and put on clean pinafores. Then you'll hear the bell ring for supper. Then you'll come down: and *you won't have any supper*: but you'll have a good *whipping*! Then you'll go to bed. Then in the morning you'll hear the bell ring for breakfast. *But you won't have any breakfast*! You'll have a good *whipping*! Then you'll have your lessons. And, perhaps, if you're *very* good, when dinner-time comes, you'll have a little dinner, and no more whipping!' ("How *very* kind he was!" I whispered to Bruno. "*Middling* kind," Bruno corrected me gravely.)

"So the little Foxes ran up to the nursery. And soon Bruno went into the hall, and rang the big bell. 'Tingle, tingle, tingle! Supper, supper, supper!' Down came the little Foxes, in such a hurry for their supper! Clean pinafores! Spoons in their hands! And, when they got into the dining-room, there was ever such a white table-cloth on the table! But there was nothing on it but a big whip. And they had *such* a whipping!" (I put my handkerchief to my eyes, and Bruno hastily climbed upon my knee and stroked my face. "Only *one* more whipping, Mister Sir!" he whispered. "Don't cry more than oo ca'n't help!")

"And the next morning early, Bruno rang the big bell again. 'Tingle, tingle, tingle! Breakfast, breakfast, breakfast!' Down came the little Foxes! Clean pinafores! Spoons in their hands! No breakfast! Only the big whip! Then came lessons," Sylvie hurried on, for I still had my handkerchief to my eyes. "And the little Foxes were ever so good! And they learned their lessons backwards, and forwards, and upside-down. And at last Bruno rang the big bell again. 'Tingle, tingle, tingle! Dinner, dinner, dinner!' And when the little Foxes came down—" ("Had they clean pinafores on?" Bruno enquired. "Of course!" said Sylvie. "And spoons?" "Why, you *know* they had!" "Couldn't be *certain*," said Bruno.) "—they came as slow as slow! And they said 'Oh! There'll be no dinner! There'll only be the big whip!' But, when they got into the room, they saw the most *lovely* dinner!" ("Buns?" cried Bruno, clapping his hands.) "Buns, and cake, and—" ("—and jam?" said Bruno.) "Yes, jam—and soup—and—" ("—and *sugar plums*!" Bruno put in once more; and Sylvie seemed satisfied.)

"And ever after that, they *were* such good little Foxes! They did their lessons as good as gold—and they never did what Bruno told them not to—and they never ate each other any more—and *they never ate themselves*!"

The story came to an end so suddenly, it almost took my breath away; however I did my best to make a pretty speech of thanks. "I'm sure it's very—very—very much so, I'm sure!" I seemed to hear myself say.

Chapter XVI. Beyond These Voices.

“I didn’t quite catch what you said!” were the next words that reached my ear, but certainly *not* in the voice either of Sylvie or of Bruno, whom I could just see, through the crowd of guests, standing by the piano, and listening to the Count’s song. Mein Herr was the speaker. “I didn’t quite catch what you said!” he repeated. “But I’ve no doubt you take *my* view of it. Thank you *very* much for your kind attention. There is only but *one* verse left to be sung!” These last words were not in the gentle voice of Mein Herr, but in the deep bass of the French Count. And, in the silence that followed, the final stanza of ‘Tottles’ rang through the room.

‘Never!’ yelled Tottles

See now this couple settled down
In quiet lodgings, out of town:
Submissively the tearful wife
Accepts a plain and humble life:
Yet begs one boon on bended knee:
‘My ducky-darling, don’t resent it!
Mamma might come for two or three——’
‘NEVER!’ yelled Tottles. And he meant it.

The conclusion of the song was followed by quite a chorus of thanks and compliments from all parts of the room, which the gratified singer responded to by bowing low in all directions. “It is to me a great privilege,” he said to Lady Muriel, “to have met with this so marvellous a song. The accompaniment to him is so strange, so mysterious: it is as if a new music were to be invented! I will play him once again so as that to show you what I mean.” He returned to the piano, but the song had vanished.

The bewildered singer searched through the heap of music lying on an adjoining table, but it was not there, either. Lady Muriel helped in the search:

others soon joined: the excitement grew. "What *can* have become of it?" exclaimed Lady Muriel. Nobody knew: one thing only was certain, that no one had been near the piano since the Count had sung the last verse of the song.

"Nevare mind him!" he said, most good-naturedly. "I shall give it you with memory alone!" He sat down, and began vaguely fingering the notes; but nothing resembling the tune came out. Then he, too, grew excited. "But what oddness! How much of singularity! That I might lose, not the words alone, but the tune also—that is quite curious, I suppose?"

We all supposed it, heartily.

"It was that sweet little boy, who found it for me," the Count suggested. "Quite perhaps *he* is the thief?"

"Of course he is!" cried Lady Muriel. "Bruno! Where are you, my darling?"

But no Bruno replied: it seemed that the two children had vanished as suddenly, and as mysteriously, as the song.

"They are playing us a trick!" Lady Muriel gaily exclaimed. "This is only an *ex tempore* game of Hide-and-Seek! That little Bruno is an embodied Mischief!"

The suggestion was a welcome one to most of us, for some of the guests were beginning to look decidedly uneasy. A general search was set on foot with much enthusiasm: curtains were thrown back and shaken, cupboards opened, and ottomans turned over; but the number of possible hiding-places proved to be strictly limited; and the search came to an end almost as soon as it had begun.

"They must have run out, while we were wrapped up in the song," Lady Muriel said, addressing herself to the Count, who seemed more agitated than the others; "and no doubt they've found their way back to the housekeeper's room."

"Not by *this* door!" was the earnest protest of a knot of two or three gentlemen, who had been grouped round the door (one of them actually leaning against it) for the last half-hour, as they declared. "*This* door has not been opened since the song began!"

An uncomfortable silence followed this announcement. Lady Muriel ventured no further conjectures, but quietly examined the fastenings of the windows, which opened as doors. They all proved to be well fastened, *inside*.

Not yet at the end of her resources, Lady Muriel rang the bell. "Ask the housekeeper to step here," she said, "and to bring the children's walking-things with her."

"I've brought them, my Lady," said the obsequious housekeeper, entering after another minute of silence. "I thought the young lady would have come to my room to put on her boots. Here's your boots, my love!" she added cheerfully, looking in all directions for the children. There was no answer, and she turned to Lady Muriel with a puzzled smile. "Have the little darlings hid themselves?"

"I don't see them, just now," Lady Muriel replied, rather evasively. "You can leave their things here, Wilson. *I'll* dress them, when they're ready to go."

The two little hats, and Sylvie's walking-jacket, were handed round among the ladies, with many exclamations of delight. There certainly was a sort of witchery of beauty about them. Even the little boots did not miss their share of favorable criticism. "Such natty little things!" the musical young lady exclaimed, almost fondling them as she spoke. "And what tiny tiny feet they must have!"

Finally, the things were piled together on the centre-ottoman, and the guests, despairing of seeing the children again, began to wish good-night and leave the

house.

There were only some eight or nine left—to whom the Count was explaining, for the twentieth time, how he had had his eye on the children during the last verse of the song; how he had then glanced round the room, to see what effect “de great chest-note” had had upon his audience; and how, when he looked back again, they had both disappeared—when exclamations of dismay began to be heard on all sides, the Count hastily bringing his story to an end to join in the outcry.

The walking-things had all disappeared!

After the utter failure of the search for the *children*, there was a very half-hearted search made for their *apparel*. The remaining guests seemed only too glad to get away, leaving only the Count and our four selves.

The Count sank into an easy-chair, and panted a little.

“Who then *are* these dear children, I pray you?” he said. “Why come they, why go they, in this so little ordinary a fashion? That the music should make itself to vanish—that the hats, the boots, should make themselves to vanish—how is it, I pray you?”

“I’ve no idea where they are!” was all I could say, on finding myself appealed to, by general consent, for an explanation.

The Count seemed about to ask further questions, but checked himself.

“The hour makes himself to become late,” he said. “I wish to you a very good night, my Lady. I betake myself to my bed—to dream—if that indeed I be not dreaming now!” And he hastily left the room.

“Stay awhile, stay awhile!” said the Earl, as I was about to follow the Count. “*You* are not a guest, you know! Arthur’s friend is at *home* here!”

“Thanks!” I said, as, with true English instincts, we drew our chairs together round the fire-place, though no fire was burning—Lady Muriel having taken the heap of music on her knee, to have one more search for the strangely-vanished song.

“Don’t you sometimes feel a wild longing,” she said, addressing herself to me, “to have something more to do with your hands, while you talk, than just holding a cigar, and now and then knocking off the ash? Oh, I know all that you’re going to say!” (This was to Arthur, who appeared about to interrupt her.) “The Majesty of Thought supersedes the work of the fingers. A Man’s severe thinking, *plus* the shaking-off a cigar-ash, comes to the same total as a Woman’s trivial fancies, *plus* the most elaborate embroidery. *That’s* your sentiment, isn’t it, only better expressed?”

Arthur looked into the radiant, mischievous face, with a grave and very tender smile. “Yes,” he said resignedly: “that is my sentiment, exactly.”

“Rest of body, and activity of mind,” I put in. “Some writer tells us *that* is the acme of human happiness.”

“Plenty of *bodily* rest, at any rate!” Lady Muriel replied, glancing at the three recumbent figures around her. “But what you call activity of *mind*——”

“—is the privilege of young Physicians *only*,” said the Earl. “We old men have no claim to be active! *What can an old man do but die?*”

“A good many other things, I should *hope*,” Arthur said earnestly.

“Well, maybe. Still you have the advantage of me in many ways, dear boy! Not only that *your* day is dawning while *mine* is setting, but your *interest* in Life—somehow I ca’n’t help envying you *that*. It will be many a year before you lose your hold of *that*.”

Quoted from *What can an old man do but die?* by Thomas Hood

“Yet surely many human interests *survive* human Life?” I said.

“Many do, no doubt. And *some* forms of Science; but only *some*, I think. Mathematics, for instance: *that* seems to possess an endless interest: one ca’n’t imagine *any* form of Life, or *any* race of intelligent beings, where Mathematical truth would lose its meaning. But I fear *Medicine* stands on a different footing. Suppose you discover a remedy for some disease hitherto supposed to be incurable. Well, it is delightful for the moment, no doubt—full of interest—perhaps it brings you fame and fortune. But what then? Look on, a few years, into a life where disease has no existence. What is your discovery worth, *then*? Milton makes Jove promise too much. ‘*Of so much fame in heaven expect thy meed.*’ Poor comfort, when one’s ‘fame’ concerns matters that will have ceased to have a meaning!”

Quoted from *Lycidas*
by John Milton

“At any rate, one wouldn’t care to make any *fresh* medical discoveries,” said Arthur. “I see no help for *that*—though I shall be sorry to give up my favorite studies. Still, medicine, disease, pain, sorrow, sin—I fear they’re all linked together. Banish sin, and you banish them all!”

“*Military* science is a yet stronger instance,” said the Earl. “Without sin, *war* would surely be impossible. Still any mind, that has had in this life any keen interest, not in *itself* sinful, will surely find itself *some* congenial line of work hereafter. Wellington may have no more *battles* to fight—and yet—

‘We doubt not that, for one so true,
There must be other, nobler work to do,
Than when he fought at Waterloo,
And Victor he must ever be!’”

Quoted from *Ode on
the Death of the Duke
of Wellington* by
Alfred Lord Tennyson

He lingered over the beautiful words, as if he loved them: and his voice, like distant music, died away into silence.

After a minute or two he began again. “If I’m not wearying you, I would like to tell you an idea of the future Life which has haunted me for years, like a sort of waking nightmare—I ca’n’t reason myself out of it.”

“Pray do,” Arthur and I replied, almost in a breath. Lady Muriel put aside the heap of music, and folded her hands together.

“The one idea,” the Earl resumed, “that has seemed to me to overshadow all the rest, is that of *Eternity*—involving, as it seems to do, the necessary *exhaustion* of all subjects of human interest. Take Pure Mathematics, for instance—a Science independent of our present surroundings. I have studied it, myself, a little. Take the subject of circles and ellipses—what we call ‘curves of the second degree.’ In a future Life, it would only be a question of so many years (or *hundreds* of years, if you like), for a man to work out *all* their properties. Then he *might* go to curves of the third degree. Say *that* took ten times as long (you see we have *unlimited* time to deal with). I can hardly imagine his *interest* in the subject holding out even for those; and, though there is no limit to the *degree* of the curves he might study, yet surely the time, needed to exhaust *all* the novelty and interest of the subject, would be absolutely *finite*? And so of all other branches of Science. And, when I transport myself, in thought, through some thousands or millions of years, and fancy myself possessed of as much Science as one created reason can carry, I ask myself ‘What then? With nothing more to learn, can one rest content on *knowledge*, for the eternity yet to be lived through?’ It has been a very wearying thought to me. I have sometimes fancied

one *might*, in that event, say ‘It is better *not* to be,’ and pray for personal *annihilation*—the Nirvana of the Buddhists.”

“But that is only half the picture,” I said. “Besides working for *oneself*, may there not be the helping of *others*?”

“Surely, surely!” Lady Muriel exclaimed in a tone of relief, looking at her father with sparkling eyes.

“Yes,” said the Earl, “so long as there *were* any others needing help. But, given ages and ages more, surely all created reasons would at length reach the same dead level of *satiety*. And *then* what is there to look forward to?”

“I know that weary feeling,” said the young Doctor. “I have gone through it all, more than once. Now let me tell you how I have put it to myself. I have imagined a little child, playing with toys on his nursery-floor, and yet able to *reason*, and to look on, thirty years ahead. Might he not say to himself ‘By that time I shall have had enough of bricks and ninepins. How weary Life will be!’ Yet, if we look forward through those thirty years, we find him a great statesman, full of interests and joys far more intense than his baby-life could give—joys wholly inconceivable to his baby-mind—joys such as no baby-language could in the faintest degree describe. Now, may not our life, a million years hence, have the same relation, to our life now, that the man’s life has to the child’s? And, just as one might try, all in vain, to express to that child, in the language of bricks and ninepins, the meaning of ‘politics,’ so perhaps all those descriptions of Heaven, with its music, and its feasts, and its streets of gold, may be only attempts to describe, in *our* words, things for which we *really* have no words at all. Don’t you think that, in *your* picture of another life, you are in fact transplanting that child into political life, without making any allowance for his growing up?”

“I think I understand you,” said the Earl. “The music of Heaven *may* be something beyond our powers of thought. Yet the music of Earth is sweet! Muriel, my child, sing us something before we go to bed!”

“Do,” said Arthur, as he rose and lit the candles on the cottage-piano, lately banished from the drawing-room to make room for a ‘semi-grand.’ “There is a song here, that I have never heard you sing.

‘Hail to thee, blithe spirit!
Bird thou never wert,
That from Heaven, or near it,
Pourest thy full heart!’”

Quoted from *To a Skylark* by Percy Shelley

he read from the page he had spread open before her.

“And our little life here,” the Earl went on, “is, to that grand time, like a child’s summer-day! One gets tired as night draws on,” he added, with a touch of sadness in his voice, “and one gets to long for bed! For those welcome words ‘Come, child, ’tis bed-time!’”

Chapter XVII. To the Rescue!

“It *isn’t* bed-time!” said a sleepy little voice. “The owls hasn’t gone to bed, and I s’a’n’t go to seep wizout oo sings to me!”

“Oh, Bruno!” cried Sylvie. “Don’t you know the owls have only just got up? But the *frogs* have gone to bed, ages ago.”

“Well, *I* aren’t a frog,” said Bruno.

“What shall I sing?” said Sylvie, skilfully avoiding the argument.

“Ask Mister Sir,” Bruno lazily replied, clasping his hands behind his curly head, and lying back on his fern-leaf, till it almost bent over with his weight. “This aren’t a comfable leaf, Sylvie. Find me a comfabler—please!” he added, as an after-thought, in obedience to a warning finger held up by Sylvie. “I doosn’t like being feet-upwards!”

It was a pretty sight to see—the motherly way in which the fairy-child gathered up her little brother in her arms, and laid him on a stronger leaf. She gave it just a touch to set it rocking, and it went on vigorously by itself, as if it contained some hidden machinery. It certainly wasn’t the wind, for the evening-breeze had quite died away again, and not a leaf was stirring over our heads.

“Why does that one leaf rock so, without the others?” I asked Sylvie. She only smiled sweetly and shook her head. “I don’t know *why*,” she said. “It always does, if it’s got a fairy-child on it. It *has* to, you know.”

“And can people see the leaf rock, who ca’n’t see the Fairy on it?”

“Why, of course!” cried Sylvie. “A leaf’s a leaf, and everybody can see it; but Bruno’s Bruno, and they ca’n’t see *him*, unless they’re eerie, like you.”

Then I understood how it was that one sometimes sees—going through the woods in a still evening—one fern-leaf rocking steadily on, all by itself. Haven’t you ever seen that? Try if you can see the fairy-sleeper on it, next time; but don’t *pick* the leaf, whatever you do; let the little one sleep on!

But all this time Bruno was getting sleepier and sleepier. “Sing, sing!” he murmured fretfully. Sylvie looked to me for instructions. “What shall it be?” she said.

“Could you sing him the nursery-song you once told me of?” I suggested. “The one that had been put through the mind-mangle, you know. ‘*The little man that had a little gun*,’ I think it was.”

“Why, that are one of the *Professor’s* songs!” cried Bruno. “I likes the little man; and I likes the way they spinned him—like a teetle-totle-tum.” And he turned a loving look on the gentle old man who was sitting at the other side of his leaf-bed, and who instantly began to sing, accompanying himself on his Outlandish guitar, while the snail, on which he sat, waved its horns in time to the music.

In stature the Manlet was dwarfish—
No burly big Blunderbore he:
And he wearily gazed on the crawfish
His Wifelet had dressed for his tea.

“Now reach me, sweet Atom, my gunlet,
And hurl the old shoelet for luck:
Let me hie to the bank of the runlet,
And shoot thee a Duck!”

She has reached him his minikin gunlet:
She has hurled the old shoelet for luck:
She is busily baking a bunlet,
To welcome him home with his Duck.

On he speeds, never wasting a wordlet,

Bruno's bed-time

Though thoughtlets cling, closely as wax,
To the spot where the beautiful birdlet
So quietly quacks.

'Long ceremonious calls'

Where the Lobsterlet lurks, and the Crablet
So slowly and sleepily crawls:
Where the Dolphin's at home, and the Dablet
Pays long ceremonious calls:

Where the Grublet is sought by the Froglet:
Where the Frog is pursued by the Duck:
Where the Ducklet is chased by the Doglet——
So runs the world's luck!

He has loaded with bullet and powder:
His footfall is noiseless as air:

The voices

But the Voices grow louder and louder,
And bellow, and bluster, and blare.

They bristle before him and after,
They flutter above and below,
Shrill shriekings of lubberly laughter,
Weird wailings of woe!

They echo without him, within him:
They thrill through his whiskers and beard:
Like a teetotum seeming to spin him,
With sneers never hitherto sneered.

“Avengement,” they cry, “on our Foelet!
Let the Manikin weep for our wrongs!
Let us drench him, from toplet to tolet,
With Nursery-Songs!

‘His soul shall be sad for the Spider’

“He shall muse upon ‘Hey! Diddle! Diddle!’

On the Cow that surmounted the Moon:
He shall rave of the Cat and the Fiddle,
And the Dish that eloped with the Spoon:
And his soul shall be sad for the Spider,
When Miss Muffet was sipping her whey,
That so tenderly sat down beside her,
And scared her away!

“The music of Midsummer-madness
Shall sting him with many a bite,
Till, in rapture of rollicking sadness,
He shall groan with a gloomy delight:
He shall swathe him, like mists of the morning,
In platitudes luscious and limp,
Such as deck, with a deathless adorning,
The Song of the Shrimp!

“When the Ducklet’s dark doom is decided,
We will trundle him home in a trice:
And the banquet, so plainly provided,
Shall round into rose-buds and rice:

In a blaze of pragmatic invention
He shall wrestle with Fate, and shall reign:
But he has not a friend fit to mention,
So hit him again!”

He has shot it, the delicate darling!
And the Voices have ceased from their strife:
Not a whisper of sneering or snarling;
As he carries it home to his wife:

Then, cheerily champing the bunlet
His spouse was so skilful to bake,
He hies him once more to the runlet,
To fetch her the Drake!

“He’s sound asleep now,” said Sylvie, carefully tucking in the edge of a violet-leaf, which she had been spreading over him as a sort of blanket: “good night!”

“Good night!” I echoed.

“You may well say ‘good night’!” laughed Lady Muriel, rising and shutting up the piano as she spoke. “When you’ve been nid—nid—nodding all the time I’ve been singing for your benefit! What was it all about, now?” she demanded imperiously.

“Something about a duck?” I hazarded. “Well, a bird of some kind?” I corrected myself, perceiving at once that *that* guess was wrong, at any rate.

“*Something about a bird of some kind!*” Lady Muriel repeated, with as much withering scorn as her sweet face was capable of conveying. “And that’s the way he speaks of Shelley’s Sky-Lark, is it? When the Poet particularly says ‘*Hail to thee, blithe spirit! Bird thou never wert!*’”

She led the way to the smoking-room, where, ignoring all the usages of Society and all the instincts of Chivalry, the three Lords of the Creation reposed at their ease in low rocking-chairs, and permitted the one lady who was present

Lords of the creation

to glide gracefully about among us, supplying our wants in the form of cooling drinks, cigarettes, and lights. Nay, it was only *one* of the three who had the chivalry to go beyond the common-place “thank you,” and to quote the Poet’s exquisite description of how Geraint, when waited on by Enid, was moved

“To stoop and kiss the tender little thumb
That crossed the platter as she laid it down,”

Quoted from *Idylls of the King* by Alfred Lord Tennyson

and to suit the action to the word—an audacious liberty for which, I feel bound to report, he was *not* duly reprimanded.

As no topic of conversation seemed to occur to any one, and as we were, all four, on those delightful terms with one another (the only terms, I think, on which any friendship, that deserves the name of *intimacy*, can be maintained) which involve no sort of necessity for *speaking* for mere speaking’s sake, we sat in silence for some minutes.

At length I broke the silence by asking “Is there any fresh news from the harbour about the Fever?”

“None since this morning,” the Earl said, looking very grave. “But that was alarming enough. The Fever is spreading fast: the London doctor has taken fright and left the place, and the only one now available isn’t a regular doctor at all: he is apothecary, and doctor, and dentist, and I don’t know what other trades, all in one. It’s a bad outlook for those poor fishermen—and a worse one for all the women and children.”

“How many are there of them altogether?” Arthur asked.

"There were nearly one hundred, a week ago," said the Earl: "but there have been twenty or thirty deaths since then."

"And what religious ministrations are there to be had?"

"There are three brave men down there," the Earl replied, his voice trembling with emotion, "gallant heroes as ever won the Victoria Cross! I am certain that no one of the three will ever leave the place merely to save his own life. There's the Curate: his wife is with him: they have no children. Then there's the Roman Catholic Priest. And there's the Wesleyan Minister. They go amongst their own flocks, mostly; but I'm told that those who are dying like to have *any* of the three with them. How slight the barriers seem to be that part Christian from Christian, when one has to deal with the great facts of Life and the reality of Death!"

"So it must be, and so it should be——" Arthur was beginning, when the front-door bell rang, suddenly and violently.

We heard the front-door hastily opened, and voices outside: then a knock at the door of the smoking-room, and the old house-keeper appeared, looking a little scared.

"Two persons, my Lord, to speak with Dr. Forester."

Arthur stepped outside at once, and we heard his cheery "Well, my men?" but the answer was less audible, the only words I could distinctly catch being "ten since morning, and two more just——"

"But there *is* a doctor there?" we heard Arthur say: and a deep voice, that we had not heard before, replied "Dead, Sir. Died three hours ago."

Lady Muriel shuddered, and hid her face in her hands: but at this moment the front-door was quietly closed, and we heard no more.

For a few minutes we sat quite silent: then the Earl left the room, and soon returned to tell us that Arthur had gone away with the two fishermen, leaving word that he would be back in about an hour. And, true enough, at the end of that interval—during which very little was said, none of us seeming to have the heart to talk—the front-door once more creaked on its rusty hinges, and a step was heard in the passage, hardly to be recognised as Arthur's, so slow and uncertain was it, like a blind man feeling his way.

He came in, and stood before Lady Muriel, resting one hand heavily on the table, and with a strange look in his eyes, as if he were walking in his sleep.

"Muriel—my love——" he paused, and his lips quivered: but after a minute he went on more steadily. "Muriel—my darling—they—*want* me—down in the harbour."

"*Must* you go?" she pleaded, rising and laying her hands on his shoulders, and looking up into his face with her great eyes brimming over with tears. "Must *you* go, Arthur? It may mean—death!"

He met her gaze without flinching. "It *does* mean death," he said, in a husky whisper: "but—darling—I am *called*. And even my life itself——" His voice failed him, and he said no more.

For a minute she stood quite silent, looking upwards with a helpless gaze, as if even prayer were now useless, while her features worked and quivered with the great agony she was enduring. Then a sudden inspiration seemed to come upon her and light up her face with a strange sweet smile. "*Your* life?" she repeated. "It is not *yours* to give!"

Arthur had recovered himself by this time, and could reply quite firmly, "That is true," he said. "It is not *mine* to give. It is *yours*, now, my—wife that

is to be! And you—do *you* forbid me to go? Will you not spare me, my own beloved one?"

Still clinging to him, she laid her head softly on his breast. She had never done such a thing in my presence before, and I knew how deeply she must be moved. "I *will* spare you," she said, calmly and quietly, "to God."

"And to God's poor," he whispered.

"And to God's poor," she added. "When must it be, sweet love?"

'Will you not spare me?'

"To-morrow morning," he replied. "And I have much to do before then."

And then he told us how he had spent his hour of absence. He had been to the Vicarage, and had arranged for the wedding to take place at eight the next morning (there was no legal obstacle, as he had, some time before this, obtained a Special License) in the little church we knew so well. "My old friend here," indicating me, "will act as 'Best Man,' I know: your father will be there to give you away: and—and—you will dispense with bride's-maids, my darling?"

She nodded: no words came.

“And then I can go with a willing heart—to do God’s work—knowing that we are *one*—and that we are together in *spirit*, though not in bodily presence—and are most of all together when we pray! Our *prayers* will go up together——”

“Yes, yes!” sobbed Lady Muriel. “But you must not stay longer now, my darling! Go home and take some rest. You will need all your strength to-morrow——”

“Well, I will go,” said Arthur. “We will be here in good time to-morrow. Good night, my own own darling!”

I followed his example, and we two left the house together. As we walked back to our lodgings, Arthur sighed deeply once or twice, and seemed about to speak—but no words came, till we had entered the house, and had lit our candles, and were at our bedroom-doors. Then Arthur said “Good night, old fellow! God bless you!”

“God bless you!” I echoed, from the very depths of my heart.

We were back again at the Hall by eight in the morning, and found Lady Muriel and the Earl, and the old Vicar, waiting for us. It was a strangely sad and silent party that walked up to the little church and back; and I could not help feeling that it was much more like a funeral than a wedding: to Lady Muriel it *was* in fact, a funeral rather than a wedding, so heavily did the presentiment weigh upon her (as she told us afterwards) that her newly-won husband was going forth to his death.

Then we had breakfast; and, all too soon, the vehicle was at the door, which was to convey Arthur, first to his lodgings, to pick up the things he was taking with him, and then as far towards the death-stricken hamlet as it was considered safe to go. One or two of the fishermen were to meet him on the road, to carry his things the rest of the way.

“And are you quite sure you are taking all that you will need?” Lady Muriel asked.

“All that I shall need as a *doctor*, certainly. And my own personal needs are few: I shall not even take any of my own wardrobe—there is a fisherman’s suit, ready-made, that is waiting for me at my lodgings. I shall only take my watch, and a few books, and—stay—there *is* one book I should like to add, a pocket-Testament—to use at the bedsides of the sick and dying——”

“Take mine!” said Lady Muriel: and she ran upstairs to fetch it. “It has nothing written in it but ‘Muriel,’” she said as she returned with it: “shall I inscribe——”

“No, my own one,” said Arthur, taking it from her. “What *could* you inscribe better than that? Could any human name mark it more clearly as my own individual property? Are *you* not mine? Are you not,” (with all the old playfulness of manner) “as Bruno would say, ‘my *very mine*’?”

He bade a long and loving adieu to the Earl and to me, and left the room, accompanied only by his wife, who was bearing up bravely, and was—*outwardly*, at least—less overcome than her old father. We waited in the room a minute or two, till the sound of wheels had told us that Arthur had driven away; and even then we waited still, for the step of Lady Muriel, going upstairs to her room, to die away in the distance. Her step, usually so light and joyous, now sounded slow and weary, like one who plods on under a load of hopeless misery; and I felt almost as hopeless, and almost as wretched, as she. “Are we four destined

ever to meet again, on this side the grave?" I asked myself, as I walked to my home. And the tolling of a distant bell seemed to answer me, "No! No! No!"

Chapter XVIII. A Newspaper-Cutting.

EXTRACT FROM THE "FAYFIELD CHRONICLE."

Our readers will have followed with painful interest, the accounts we have from time to time published of the terrible epidemic which has, during the last two months, carried off most of the inhabitants of the little fishing-harbour adjoining the village of Elveston. The last survivors, numbering twenty-three only, out of a population which, three short months ago, exceeded one hundred and twenty, were removed on Wednesday last, under the authority of the Local Board, and safely lodged in the County Hospital: and the place is now veritably 'a city of the dead,' without a single human voice to break its silence.

The rescuing party consisted of six sturdy fellows—fishermen from the neighbourhood—directed by the resident Physician of the Hospital, who came over for that purpose, heading a train of hospital-ambulances. The six men had been selected—from a much larger number who had volunteered for this peaceful 'forlorn hope'—for their strength and robust health, as the expedition was considered to be, even now, when the malady has expended its chief force, not unattended with danger.

Every precaution that science could suggest, against the risk of infection, was adopted: and the sufferers were tenderly carried on litters, one by one, up the steep hill, and placed in the ambulances which, each provided with a hospital nurse, were waiting on the level road. The fifteen miles, to the Hospital, were done at a walking-pace, as some of the patients were in too prostrate a condition to bear jolting, and the journey occupied the whole afternoon.

The twenty-three patients consist of nine men, six women, and eight children. It has not been found possible to identify them all, as some of the children—left with no surviving relatives—are infants; and two men and one woman are not yet able to make rational replies, the brain-powers being entirely in abeyance. Among a more well-to-do-race, there would no doubt have been names marked on the clothes; but here no such evidence is forthcoming.

Besides the poor fishermen and their families, there were but five persons to be accounted for: and it was ascertained, beyond a doubt, that all five are numbered with the dead. It is a melancholy pleasure to place on record the names of these genuine martyrs—than whom none, surely, are more worthy to be entered on the glory-roll of England's heroes! They are as follows:—

The Rev. James Burgess, M.A., and Emma his wife. He was the Curate at the Harbour, not thirty years old, and had been married only two years. A written record was found in their house, of the dates of their deaths.

Next to theirs we will place the honoured name of Dr. Arthur Forester, who, on the death of the local physician, nobly faced the imminent peril of death, rather than leave these poor folk uncared for in their last extremity. No record of his name, or of the date of his death, was found: but the corpse was easily identified, although dressed in the ordinary fisherman's suit (which he was known to have adopted when he went down there), by a copy of the New Testament, the gift of his wife, which was found, placed next his heart, with his hands crossed over it. It was not thought prudent to remove the body, for burial elsewhere: and accordingly it was at once committed to the ground, along with four others

found in different houses, with all due reverence. His wife, whose maiden name was Lady Muriel Orme, had been married to him on the very morning on which he undertook his self-sacrificing mission.

Next we record the Rev. Walter Saunders, Wesleyan Minister. His death is believed to have taken place two or three weeks ago, as the words 'Died October 5' were found written on the wall of the room which he is known to have occupied—the house being shut up, and apparently not having been entered for some time.

Last—though not a whit behind the other four in glorious self-denial and devotion to duty—let us record the name of Father Francis, a young Jesuit Priest who had been only a few months in the place. He had not been dead many hours when the exploring party came upon the body, which was identified, beyond the possibility of doubt, by the dress, and by the crucifix which was, like the young Doctor's Testament, clasped closely to his heart.

Since reaching the hospital, two of the men and one of the children have died. Hope is entertained for all the others: though there are two or three cases where the vital powers seem to be so entirely exhausted that it is but 'hoping against hope' to regard ultimate recovery as even possible.

Chapter XIX. A Fairy-Duet.

The year—what an eventful year it had been for me!—was drawing to a close, and the brief wintry day hardly gave light enough to recognise the old familiar objects, bound up with so many happy memories, as the train glided round the last bend into the station, and the hoarse cry of "Elveston! Elveston!" resounded along the platform.

It was sad to return to the place, and to feel that I should never again see the glad smile of welcome, that had awaited me here so few months ago. "And yet, if I were to find him here," I muttered, as in solitary state I followed the porter, who was wheeling my luggage on a barrow, "and if he *were* to 'strike a sudden hand in mine, And ask a thousand things of home,' I should not—no, 'I should not feel it to be strange'!"

Quoted from *In Memoriam* by Alfred Lord Tennyson

Having given directions to have my luggage taken to my old lodgings, I strolled off alone, to pay a visit, before settling down in my own quarters, to my dear old friends—for such I indeed felt them to be, though it was barely half a year since first we met—the Earl and his widowed daughter.

The shortest way, as I well remembered, was to cross through the churchyard. I pushed open the little wicket-gate and slowly took my way among the solemn memorials of the quiet dead, thinking of the many who had, during the past year, disappeared from the place, and had gone to 'join the majority.' A very few steps brought me in sight of the object of my search. Lady Muriel, dressed in the deepest mourning, her face hidden by a long crape veil, was kneeling before a little marble cross, round which she was fastening a wreath of flowers.

The cross stood on a piece of level turf, unbroken by any mound, and I knew that it was simply a memorial-cross, for one whose dust reposed elsewhere, even before reading the simple inscription:—

In loving Memory of
ARTHUR FORESTER, M.D.
whose mortal remains lie buried by the sea:
whose spirit has returned to God who gave it.
"Greater love hath no man than this, that

Quoted from John 15:13

a man lay down his life for his friends."

She threw back her veil on seeing me approach, and came forwards to meet me, with a quiet smile, and far more self-possessed than I could have expected.

"It is quite like old times, seeing *you* here again!" she said, in tones of genuine pleasure. "Have you been to see my father?"

"No," I said: "I was on my way there, and came through here as the shortest way. I hope he is well, and you also?"

"Thanks, we are both quite well. And you? Are you any better yet?"

"Not much better, I fear: but no worse, I am thankful to say."

"Let us sit here awhile, and have a quiet chat," she said. The calmness—almost indifference—of her manner quite took me by surprise. I little guessed what a fierce restraint she was putting upon herself.

"One can be so quiet here," she resumed. "I come here every—every day."

"It is very peaceful," I said.

"You got my letter?"

"Yes, but I delayed writing. It is so hard to say—on *paper*—"

"I know. It was kind of you. You were with us when we saw the last of——"

She paused a moment, and went on more hurriedly. "I went down to the harbour several times, but no one knows which of those vast graves it is. However, they showed me the house he died in: that was some comfort. I stood in the very room where—where——." She struggled in vain to go on. The flood-gates had given way at last, and the outburst of grief was the most terrible I had ever witnessed. Totally regardless of my presence, she flung herself down on the turf, burying her face in the grass, and with her hands clasped round the little marble cross, "Oh, my darling, my darling!" she sobbed. "And God meant your life to be so beautiful!"

In the church-yard

I was startled to hear, thus repeated by Lady Muriel, the very words of the

darling child whom I had seen weeping so bitterly over the dead hare. Had some mysterious influence passed, from that sweet fairy-spirit, ere she went back to Fairyland, into the human spirit that loved her so dearly? The idea seemed too wild for belief. And yet, are there not '*more things in heaven and earth than are dreamt of in our philosophy*'?

"God *meant* it to be beautiful," I whispered, "and surely it *was* beautiful? God's purpose never fails!" I dared say no more, but rose and left her. At the entrance-gate to the Earl's house I waited, leaning on the gate and watching the sun set, revolving many memories—some happy, some sorrowful—until Lady Muriel joined me.

She was quite calm again now. "Do come in," she said. "My father will be so pleased to see you!"

The old man rose from his chair, with a smile, to welcome me; but his self-command was far less than his daughter's, and the tears coursed down his face as he grasped both my hands in his, and pressed them warmly.

My heart was too full to speak; and we all sat silent for a minute or two. Then Lady Muriel rang the bell for tea. "You *do* take five o'clock tea, I know!" she said to me, with the sweet playfulness of manner I remembered so well, "even though you *ca'n't* work your wicked will on the Law of Gravity, and make the teacups descend into Infinite Space, a little faster than the tea!"

This remark gave the tone to our conversation. By a tacit mutual consent, we avoided, during this our first meeting after her great sorrow, the painful topics that filled our thoughts, and talked like light-hearted children who had never known a care.

"Did you ever ask yourself the question," Lady Muriel began, *à propos* of nothing, "what is the *chief* advantage of being a Man instead of a Dog?"

"No, indeed," I said: "but I think there are advantages on the *Dog's* side of the question, as well."

"No doubt," she replied, with that pretty mock-gravity that became her so well: "but, on *Man's* side, the chief advantage seems to me to consist in *having pockets*! It was borne in upon me—upon *us*, I should say; for my father and I were returning from a walk—only yesterday. We met a dog carrying home a bone. What it wanted it for, I've no idea: certainly there was no *meat* on it——"

A strange sensation came over me, that I had heard all this, or something exactly like it, before: and I almost expected her next words to be "perhaps he meant to make a cloak for the winter?" However what she really said was "and my father tried to account for it by some wretched joke about *pro bono publico*. Well, the dog laid down the bone—*not* in disgust with the pun, which would have shown it to be a dog of taste—but simply to rest its jaws, poor thing! I *did* pity it so! Won't you join my *Charitable Association for supplying dogs with pockets*? How would *you* like to have to carry your walking-stick in your mouth?"

Ignoring the difficult question as to the *raison d'être* of a walking-stick, supposing one had no *hands*, I mentioned a curious instance, I had once witnessed, of reasoning by a dog. A gentleman, with a lady, and child, and a large dog, were down at the end of a pier on which I was walking. To amuse his child, I suppose, the gentleman put down on the ground his umbrella and the lady's parasol, and then led the way to the other end of the pier, from which he sent the dog back for the deserted articles. I was watching with some curiosity. The

Quoted from *Hamlet*
by William
Shakespeare

dog came racing back to where I stood, but found an unexpected difficulty in picking up the things it had come for. With the umbrella in its mouth, its jaws were so far apart that it could get no firm grip on the parasol. After two or three failures, it paused and considered the matter.

Then it put down the umbrella and began with the parasol. Of course that didn't open its jaws nearly so wide, and it was able to get a good hold of the umbrella, and galloped off in triumph. One couldn't doubt that it had gone through a real train of logical thought.

"I entirely agree with you," said Lady Muriel: "but don't orthodox writers condemn that view, as putting Man on the level of the lower animals? Don't they draw a sharp boundary-line between Reason and Instinct?"

"That certainly *was* the orthodox view, a generation ago," said the Earl. "The truth of Religion seemed ready to stand or fall with the assertion that Man was the only reasoning animal. But that is at an end now. Man can still claim *certain* monopolies—for instance, such a use of *language* as enables us to utilise the work of many, by 'division of labour.' But the belief, that we have a monopoly of *Reason*, has long been swept away. Yet no catastrophe has followed. As some old poet says, '*God is where he was.*'"

"Most religious believers would *now* agree with Bishop Butler," said I, "and not reject a line of argument, even if it led straight to the conclusion that animals have some kind of *soul*, which survives their bodily death."

"I *would* like to know *that* to be true!" Lady Muriel exclaimed. "If only for the sake of the poor horses. Sometimes I've thought that, if anything *could* make me cease to believe in a God of perfect justice, it would be the sufferings of horses—without guilt to deserve it, and without any compensation!"

"It is only part of the great Riddle," said the Earl, "why innocent beings *ever* suffer. It *is* a great strain on Faith—but not a *breaking* strain, I think."

"The sufferings of *horses*," I said, "are chiefly caused by *Man's* cruelty. So *that* is merely one of the many instances of Sin causing suffering to others than the Sinner himself. But don't you find a *greater* difficulty in sufferings inflicted by animals upon each other? For instance, a cat playing with a mouse. Assuming it to have no *moral* responsibility, isn't that a greater mystery than a man over-driving a horse?"

"I think it *is*," said Lady Muriel, looking a mute appeal to her father.

"What right have we to make that assumption?" said the Earl. "*Many* of our religious difficulties are merely deductions from unwarranted assumptions. The wisest answer to most of them, is, I think, '*behold, we know not anything.*'"

"You mentioned 'division of labour,' just now," I said. "Surely it is carried to a wonderful perfection in a hive of bees?"

"So wonderful—so entirely super-human—" said the Earl, "and so entirely inconsistent with the intelligence they show in other ways—that I feel no doubt at all that it is *pure* Instinct, and *not*, as some hold, a very high order of Reason. Look at the utter stupidity of a bee, trying to find its way out of an open window! It *doesn't* try, in any reasonable sense of the word: it simply bangs itself about! We should call a puppy *imbecile*, that behaved so. And yet we are asked to believe that its intellectual level is above Sir Isaac Newton!"

"Then you hold that *pure* Instinct contains no *Reason* at all?"

"On the contrary," said the Earl, "I hold that the work of a bee-hive involves Reason of the *highest* order. But none of it is done by the *Bee*. *God* has reasoned

Quoted from
Elizabeth of York on
the sudden death of
her eldest son Arthur

Quoted from *In
Memoriam* by Alfred
Lord Tennyson

it all out, and has put into the mind of the Bee the *conclusions*, only, of the reasoning process.”

“But how do their minds come to work *together*?” I asked.

“What right have we to assume that they *have* minds?”

“Special pleading, special pleading!” Lady Muriel cried, in a most unfilial tone of triumph. “Why, you yourself said, just now, ‘the mind of the Bee’!”

“But I did *not* say ‘*minds*,’ my child,” the Earl gently replied. “It has occurred to me, as the most probable solution of the ‘Bee’-mystery, that a swarm of Bees *have only one mind among them*. We often see one mind animating a most complex collection of limbs and organs, *when joined together*. How do we know that any material connection is necessary? May not mere neighbourhood be enough? If so, a swarm of bees is simply a single animal whose many limbs are not quite close together!”

“It is a bewildering thought,” I said, “and needs a night’s rest to grasp it properly. Reason and Instinct *both* tell me I ought to go home. So, good-night!”

“I’ll ‘set’ you part of the way,” said Lady Muriel. “I’ve had no walk to-day. It will do me good, and I have more to say to you. Shall we go through the wood? It will be pleasanter than over the common, even though it *is* getting a little dark.”

We turned aside into the shade of interlacing boughs, which formed an architecture of almost perfect symmetry, grouped into lovely groined arches, or running out, far as the eye could follow, into endless aisles, and chancels, and naves, like some ghostly cathedral, fashioned out of the dream of a moon-struck poet.

“Always, in this wood,” she began after a pause (silence seemed natural in this dim solitude), “I begin thinking of Fairies! May I ask you a question?” she added hesitatingly. “Do you believe in Fairies?”

The momentary impulse was so strong to tell her of my experiences in this very wood, that I had to make a real effort to keep back the words that rushed to my lips. “If you mean, by ‘believe,’ ‘believe in their *possible* existence,’ I say ‘Yes.’ For their *actual* existence, of course, one would need *evidence*.”

“You were saying, the other day,” she went on, “that you would accept *anything*, on good evidence, that was not *à priori* impossible. And I think you named *Ghosts* as an instance of a *provable* phenomenon. Would *Fairies* be another instance?”

“Yes, I think so.” And again it was hard to check the wish to say more: but I was not yet sure of a sympathetic listener.

“And have you any theory as to what sort of place they would occupy in Creation? Do tell me what you think about them! Would they, for instance (supposing such beings to exist), would they have any moral responsibility? I mean” (and the light bantering tone suddenly changed to one of deep seriousness) “would they be capable of *sin*?”

“They can reason—on a lower level, perhaps, than men and women—never rising, I think, above the faculties of a child; and they have a moral sense, most surely. Such a being, without *free will*, would be an absurdity. So I am driven to the conclusion that they *are* capable of sin.”

“You believe in them?” she cried delightedly, with a sudden motion as if about to clap her hands. “Now tell me, have you any reason for it?”

And still I strove to keep back the revelation I felt sure was coming. “I believe that there is *life* everywhere—not *material* only, not merely what is palpable

to our senses—but immaterial and invisible as well. We believe in our own immaterial essence—call it ‘soul,’ or ‘spirit,’ or what you will. Why should not other similar essences exist around us, *not* linked on to a visible and *material* body? Did not God make this swarm of happy insects, to dance in this sunbeam for one hour of bliss, for no other object, that we can imagine, than to swell the sum of conscious happiness? And where shall we dare to draw the line, and say ‘He has made all these and no more’?”

“Yes, yes!” she assented, watching me with sparkling eyes. “But these are only reasons for not *denying*. You have more reasons than this, have you not?”

“Well, yes,” I said, feeling I might safely tell all now. “And I could not find a fitter time or place to say it. I have *seen* them—and in this very wood!”

Lady Muriel asked no more questions. Silently she paced at my side, with head bowed down and hands clasped tightly together. Only, as my tale went on, she drew a little short quick breath now and then, like a child panting with delight. And I told her what I had never yet breathed to any other listener, of my double life, and, more than that (for *mine* might have been but a noonday-dream), of the double life of those two dear children.

And when I told her of Bruno’s wild gambols, she laughed merrily; and when I spoke of Sylvie’s sweetness and her utter unselfishness and trustful love, she drew a deep breath, like one who hears at last some precious tidings for which the heart has ached for a long while; and the happy tears chased one another down her cheeks.

“I have often longed to meet an angel,” she whispered, so low that I could hardly catch the words. “I’m *so* glad I’ve seen Sylvie! My heart went out to the child the first moment that I saw her—Listen!” she broke off suddenly. “That’s Sylvie singing! I’m sure of it! Don’t you know her voice?”

“I have heard *Bruno* sing, more than once,” I said: “but I never heard Sylvie.”

“I have only heard her *once*,” said Lady Muriel. “It was that day when you brought us those mysterious flowers. The children had run out into the garden; and I saw Eric coming in that way, and went to the window to meet him: and Sylvie was singing, under the trees, a song I had never heard before. The words were something like ‘I think it is Love, I feel it is Love.’ Her voice sounded far away, like a dream, but it was beautiful beyond all words—as sweet as an infant’s first smile, or the first gleam of the white cliffs when one is coming *home* after weary years—a voice that seemed to fill one’s whole being with peace and heavenly thoughts—Listen!” she cried, breaking off again in her excitement. “That *is* her voice, and that’s the very song!”

I could distinguish no words, but there was a dreamy sense of music in the air that seemed to grow ever louder and louder, as if coming nearer to us. We stood quite silent, and in another minute the two children appeared, coming straight towards us through an arched opening among the trees. Each had an arm round the other, and the setting sun shed a golden halo round their heads, like what one sees in pictures of saints. They were looking in our direction, but evidently did not see us, and I soon made out that Lady Muriel had for once passed into a condition familiar to *me*, that we were both of us ‘eerie,’ and that, though we could see the children so plainly, we were quite invisible to *them*.

The song ceased just as they came into sight: but, to my delight, Bruno instantly said “Let’s sing it all again, Sylvie! It *did* sound so pretty!” And Sylvie replied “Very well. It’s *you* to begin, you know.”

So Bruno began, in the sweet childish treble I knew so well:—

A fairy-duett (Frontispiece)

“Say, what is the spell, when her fledgelings are cheeping,
That lures the bird home to her nest?
Or wakes the tired mother, whose infant is weeping,
To cuddle and croon it to rest?
What’s the magic that charms the glad babe in her arms,
Till it cooes with the voice of the dove?”

And now ensued quite the strangest of all the strange experiences that marked the wonderful year whose history I am writing—the experience of *first* hearing Sylvie’s voice in song. Her part was a very short one—only a few words—and she sang it timidly, and very low indeed, scarcely audibly, but the *sweetness* of her voice was simply indescribable; I have never heard any earthly music like it.

“Tis a secret, and so let us whisper it low—
And the name of the secret is Love!”

On me the first effect of her voice was a sudden sharp pang that seemed to pierce through one’s very heart. (I had felt such a pang only once before in my life, and it had been from *seeing* what, at the moment, realised one’s idea of perfect beauty—it was in a London exhibition, where, in making my way through a crowd, I suddenly met, face to face, a child of quite unearthly beauty.) Then came a rush of burning tears to the eyes, as though one could weep one’s soul away for pure delight. And lastly there fell on me a sense of awe that was almost terror—some such feeling as Moses must have had when he heard the words “*Put off thy shoes from off thy feet, for the place whereon thou standest is holy ground.*” The figures of the children became vague and shadowy, like glimmering meteors: while their voices rang together in exquisite harmony as they sang:—

Quoted from Exodus
3:5

“For I think it is Love,
For I feel it is Love,
For I’m sure it is nothing but Love!”

By this time I could see them clearly once more. Bruno again sang by himself:—

“Say, whence is the voice that, when anger is burning,
Bids the whirl of the tempest to cease?
That stirs the vexed soul with an aching—a yearning
For the brotherly hand-grip of peace?
Whence the music that fills all our being—that thrills
Around us, beneath, and above?”

Sylvie sang more courageously, this time: the words seemed to carry her away, out of herself:—

“Tis a secret: none knows how it comes, how it goes:
But the name of the secret is Love!”

And clear and strong the chorus rang out:—

“For I think it is Love,
For I feel it is Love,
For I’m sure it is nothing but Love!”

Once more we heard Bruno’s delicate little voice alone:—

“Say whose is the skill that paints valley and hill,
Like a picture so fair to the sight?
That flecks the green meadow with sunshine and shadow,
Till the little lambs leap with delight?”

And again uprose that silvery voice, whose angelic sweetness I could hardly bear:—

“’Tis a secret untold to hearts cruel and cold,
Though ’tis sung, by the angels above,
In notes that ring clear for the ears that can hear—
And the name of the secret is Love!”

And then Bruno joined in again with

“For I think it is Love,
For I feel it is Love,
For I’m sure it is nothing but Love!”

“That *are* pretty!” the little fellow exclaimed, as the children passed us—so closely that we drew back a little to make room for them, and it seemed we had only to reach out a hand to touch them: but this we did not attempt.

“No use to try and stop them!” I said, as they passed away into the shadows. “Why, they could not even *see* us!”

“No use at all,” Lady Muriel echoed with a sigh. “One would *like* to meet them again, in living form! But I feel, somehow, *that* can never be. They have passed out of *our* lives!” She sighed again; and no more was said, till we came out into the main road, at a point near my lodgings.

“Well, I will leave you here,” she said. “I want to get back before dark: and I have a cottage-friend to visit, first. Good night, dear friend! Let us see you soon—and often!” she added, with an affectionate warmth that went to my very heart. “*For those are few we hold as dear!*”

“Good night!” I answered. “Tennyson said that of a worthier friend than me.”

“Tennyson didn’t know what he was talking about!” she saucily rejoined, with a touch of her old childish gaiety; and we parted.

Quoted from
Farringford To The
Rev. F. D. Maurice
by Alfred Lord
Tennyson

Chapter XX. Gammon and Spinach.

My landlady’s welcome had an extra heartiness about it: and though, with a rare delicacy of feeling, she made no direct allusion to the friend whose companionship had done so much to brighten life for me, I felt sure that it was a kindly sympathy with my solitary state that made her so specially anxious to do all she could think of to ensure my comfort, and make me feel at home.

The lonely evening seemed long and tedious: yet I lingered on, watching the dying fire, and letting Fancy mould the red embers into the forms and faces

belonging to bygone scenes. Now it seemed to be Bruno's roguish smile that sparkled for a moment, and died away: now it was Sylvie's rosy cheek: and now the Professor's jolly round face, beaming with delight. "You're welcome, my little ones!" he seemed to say. And then the red coal, which for the moment embodied the dear old Professor, began to wax dim, and with its dying lustre the words seemed to die away into silence. I seized the poker, and with an artful touch or two revived the waning glow, while Fancy—no coy minstrel she—sang me once again the magic strain I loved to hear.

"You're welcome, little ones!" the cheery voice repeated. "I told them you were coming. Your rooms are all ready for you. And the Emperor and the Empress—well, I think they're rather pleased than otherwise! In fact, Her Highness said 'I hope they'll be in time for the Banquet!' Those were her very words, I assure you!"

"Will Uggug be at the Banquet?" Bruno asked. And both children looked uneasy at the dismal suggestion.

"Why, of course he will!" chuckled the Professor. "Why, it's his *birthday*, don't you know? And his health will be drunk, and all that sort of thing. What would the Banquet be without *him*?"

"Ever so much nicer," said Bruno. But he said it in a *very* low voice, and nobody but Sylvie heard him.

The Professor chuckled again. "It'll be a jolly Banquet, now *you've* come, my little man! I *am* so glad to see you again!"

"I 'fraid we've been very long in coming," Bruno politely remarked.

"Well, yes," the Professor assented. "However, you're very short now you're come: that's *some* comfort." And he went on to enumerate the plans for the day. "The Lecture comes first," he said. "*That* the Empress *insists* on. She says people will eat so much at the Banquet, they'll be too sleepy to attend to the Lecture afterwards—and perhaps she's right. There'll just be a little *refreshment*, when the people first arrive—as a kind of surprise for the Empress, you know. Ever since she's been—well, not *quite* so clever as she once was—we've found it desirable to concoct little surprises for her. *Then* comes the Lecture——"

"What? The Lecture you were getting ready—ever so long ago?" Sylvie enquired.

"Yes—that's the one," the Professor rather reluctantly admitted. "It *has* taken a goodish time to prepare. I've got so many other things to attend to. For instance, I'm Court-Physician. I have to keep all the Royal Servants in good health—and that reminds me!" he cried, ringing the bell in a great hurry. "This is Medicine-Day! We only give Medicine once a week. If we were to begin giving it every day, the bottles would *soon* be empty!"

"But if they were ill on the *other* days?" Sylvie suggested.

"What, ill on the wrong *day*!" exclaimed the Professor. "Oh, that would never do! A Servant would be dismissed *at once*, who was ill on the wrong day! This is the Medicine for *today*," he went on, taking down a large jug from a shelf. "I mixed it, myself, first thing this morning. Taste it!" he said, holding out the jug to Bruno. "Dip in your finger, and taste it!"

Bruno did so, and made such an excruciatingly wry face that Sylvie exclaimed, in alarm, "Oh, Bruno, you mustn't!"

"It's welly extremely nasty!" Bruno said, as his face resumed its natural shape.

"Nasty?" said the Professor. "Why, of *course* it is! What would Medicine be, if it wasn't *nasty*?"

"Nice," said Bruno.

"I was going to say—" the Professor faltered, rather taken aback by the promptness of Bruno's reply, "—that *that* would never do! Medicine *has* to be nasty, you know. Be good enough to take this jug, down into the Servants' Hall," he said to the footman who answered the bell: "and tell them it's their Medicine for *today*."

"Which of them is to drink it?" the footman asked, as he carried off the jug.

"Oh, I've not settled *that* yet!" the Professor briskly replied. "I'll come and settle that, soon. Tell them not to begin, on any account, till I come! It's really *wonderful*," he said, turning to the children, "the success I've had in curing Diseases! Here are some of my memoranda." He took down from the shelf a heap of little bits of paper, pinned together in twos and threes. "Just look at *this* set, now. '*Under-Cook Number Thirteen recovered from Common Fever—Febris Communis.*' And now see what's pinned to it. '*Gave Under-Cook Number Thirteen a Double Dose of Medicine.*' *That's* something to be proud of, *isn't* it?"

"But which happened *first*?" said Sylvie, looking very much puzzled.

The Professor examined the papers carefully. "They are not *dated*, I find," he said with a slightly dejected air: "so I fear I ca'n't tell you. But they *both* happened: there's no doubt of *that*. The *Medicine's* the great thing, you know. The *Diseases* are much less important. You can keep a *Medicine*, for years and years: but nobody ever wants to keep a *Disease*! By the way, come and look at the platform. The Gardener asked me to come and see if it would do. We may as well go before it gets dark."

"We'd like to, very much!" Sylvie replied. "Come, Bruno, put on your hat. Don't keep the dear Professor waiting!"

"Ca'n't find my hat!" the little fellow sadly replied. "I were rolling it about. And it's rolled itself away!"

"Maybe it's rolled in *there*," Sylvie suggested, pointing to a dark recess, the door of which stood half open: and Bruno ran in to look. After a minute he came slowly out again, looking very grave, and carefully shut the cupboard-door after him.

"It aren't in there," he said, with such unusual solemnity, that Sylvie's curiosity was roused.

"What *is* in there, Bruno?"

"There's cobwebs—and two spiders—" Bruno thoughtfully replied, checking off the catalogue on his fingers, "—and the cover of a picture-book—and a tortoise—and a dish of nuts—and an old man."

"An old man!" cried the Professor, trotting across the room in great excitement. "Why, it must be the Other Professor, that's been lost for ever so long!"

He opened the door of the cupboard wide: and there he was, the Other Professor, sitting in a chair, with a book on his knee, and in the act of helping himself to a nut from a dish, which he had taken down off a shelf just within his reach. He looked round at us, but said nothing till he had cracked and eaten the nut. Then he asked the old question. "Is the Lecture all ready?"

"It'll begin in an hour," the Professor said, evading the question. "First, we

The Other Professor found

must have something to surprise the Empress. And then comes the Banquet—
—”

“The Banquet!” cried the Other Professor, springing up, and filling the room with a cloud of dust. “Then I’d better go and—and brush myself a little. What a state I’m in!”

“He *does* want brushing!” the Professor said, with a critical air, “Here’s your hat, little man! I had put it on by mistake. I’d quite forgotten I had *one* on, already. Let’s go and look at the platform.”

“And there’s that nice old Gardener singing still!” Bruno exclaimed in delight, as we went out into the garden. “I do believe he’s been singing that very song ever since we went away!”

“Why, of course he has!” replied the Professor. “It wouldn’t be the thing to leave off, you know.”

“Wouldn’t be *what* thing?” said Bruno: but the Professor thought it best not to hear the question. “What are you doing with that hedgehog?” he shouted at the Gardener, whom they found standing upon one foot, singing softly to himself, and rolling a hedgehog up and down with the other foot.

“Well, I wanted fur to know what hedgehogs lives on: so I be a-keeping this here hedgehog—fur to see if it eats potatoes——”

“Much better keep a potato,” said the Professor; “and see if hedgehogs eat it!”

“That be the roight way, sure-ly!” the delighted Gardener exclaimed. “Be you come to see the platform?”

“Aye, aye!” the Professor cheerily replied. “And the children have come back, you see!”

The Gardener looked round at them with a grin. Then he led the way to the Pavilion; and as he went he sang:—

“He looked again, and found it was
A Double Rule of Three:
‘And all its Mystery,’ he said,
‘Is clear as day to me!’”

“You’ve been *months* over that song,” said the Professor. “Isn’t it finished yet?”

“There be only one verse more,” the Gardener sadly replied. And, with tears streaming down his cheeks, he sang the last verse:—

“He thought he saw an Argument
That proved he was the Pope:
He looked again, and found it was
A Bar of Mottled Soap.
‘A fact so dread,’ he faintly said,
‘Extinguishes all hope!’”

Choking with sobs, the Gardener hastily stepped on a few yards ahead of the party, to conceal his emotion.

“Did *he* see the Bar of Mottled Soap?” Sylvie enquired, as we followed.

“Oh, certainly!” said the Professor. “That song is his own history, you know.”

Tears of an ever-ready sympathy glittered in Bruno’s eyes. “I’s *welly* sorry he isn’t the Pope!” he said. “Aren’t *you* sorry, Sylvie?”

"Well—I hardly know," Sylvie replied in the vaguest manner. "Would it make him any happier?" she asked the Professor.

"It wouldn't make the *Pope* any happier," said the Professor. "Isn't the platform *lovely*?" he asked, as we entered the Pavilion.

"I've put an extra beam under it!" said the Gardener, patting it affectionately as he spoke. "And now it's that strong, as—as a mad elephant might dance upon it!"

"Thank you *very* much!" the Professor heartily rejoined. "I don't know that we shall exactly require—but it's convenient to know." And he led the children upon the platform, to explain the arrangements to them. "Here are three seats, you see, for the Emperor and the Empress and Prince Uggug. But there must be two more chairs here!" he said, looking down at the Gardener. "One for Lady Sylvie, and one for the smaller animal!"

"And may I help in the Lecture?" said Bruno. "I can do some conjuring-tricks."

"Well, it's not exactly a *conjuring* lecture," the Professor said, as he arranged some curious-looking machines on the table. "However, what can you do? Did you ever go through a table, for instance?"

"Often!" said Bruno. "*Haven't* I, Sylvie?"

The Professor was evidently surprised, though he tried not to show it. "This must be looked into," he muttered to himself, taking out a note-book. "And first—what kind of table?"

"Tell him!" Bruno whispered to Sylvie, putting his arms round her neck.

"Tell him yourself," said Sylvie.

"Ca'n't," said Bruno. "It's a *bony* word."

"Nonsense!" laughed Sylvie. "You can say it well enough, if you only try. Come!"

"Muddle—" said Bruno. "That's a bit of it."

"*What* does he say?" cried the bewildered Professor.

"He means the multiplication-table," Sylvie explained.

The Professor looked annoyed, and shut up his note-book again. "Oh, that's *quite* another thing," he said.

"It are ever so many other things," said Bruno. "*Aren't* it, Sylvie?"

A loud blast of trumpets interrupted this conversation. "Why, the entertainment has *begun*!" the Professor exclaimed, as he hurried the children into the Reception-Saloon. "I had no idea it was so late!"

A small table, containing cake and wine, stood in a corner of the Saloon; and here we found the Emperor and Empress waiting for us. The rest of the Saloon had been cleared of furniture, to make room for the guests. I was much struck by the great change a few months had made in the faces of the Imperial Pair. A vacant stare was now the *Emperor's* usual expression; while over the face of the *Empress* there flitted, ever and anon, a meaningless smile.

"So you're come at last!" the Emperor sulkily remarked, as the Professor and the children took their places. It was evident that he was *very* much out of temper: and we were not long in learning the cause of this. He did not consider the preparations, made for the Imperial party, to be such as suited their rank. "A common mahogany table!" he growled, pointing to it contemptuously with his thumb. "Why wasn't it made of gold, I should like to know?"

"It would have taken a very long——" the Professor began, but the Emperor cut the sentence short.

"Then the cake! Ordinary plum! Why wasn't it made of—of——" He broke off again. "Then the wine! Merely old Madeira! Why wasn't it——? Then this chair! That's worst of all. Why wasn't it a throne? One *might* excuse the other omissions, but I *ca'n't* get over the chair!"

"What *I* ca'n't get over," said the Empress, in eager sympathy with her angry husband, "is the *table*!"

"Pooh!" said the Emperor.

"It is much to be regretted!" the Professor mildly replied, as soon as he had a chance of speaking. After a moment's thought he strengthened the remark. "*Everything*," he said, addressing Society in general, "is *very much* to be regretted!"

A murmur of "Hear, hear!" rose from the crowded Saloon.

There was a rather awkward pause: the Professor evidently didn't know how to begin. The Empress leant forwards, and whispered to him. "A few jokes, you know, Professor—just to put people at their ease!"

"True, true, Madam!" the Professor meekly replied. "This little boy——"

"*Please* don't make any jokes about *me*!" Bruno exclaimed, his eyes filling with tears.

"I won't if you'd rather I didn't," said the kind-hearted Professor. "It was only something about a Ship's Buoy: a harmless pun—but it doesn't matter." Here he turned to the crowd and addressed them in a loud voice. "Learn your A's!" he shouted. "Your B's! Your C's! And your D's! *Then* you'll be at your ease!"

There was a roar of laughter from all the assembly, and then a great deal of confused whispering. "*What* was it he said? Something about bees, I fancy——"

The Empress smiled in her meaningless way, and fanned herself. The poor Professor looked at her timidly: he was clearly at his wits' end again, and hoping for another hint. The Empress whispered again.

"Some spinach, you know, Professor, as a surprise."

The Professor beckoned to the Head-Cook, and said something to him in a low voice. Then the Head-Cook left the room, followed by all the other cooks.

"It's difficult to get things started," the Professor remarked to Bruno. "When once we get started, it'll go on all right, you'll see."

"If oo want to startle people," said Bruno, "oo should put live frogs on their backs."

Here the cooks all came in again, in a procession, the Head-Cook coming last and carrying something, which the others tried to hide by waving flags all round it. "Nothing but flags, Your Imperial Highness! Nothing but flags!" he kept repeating, as he set it before her. Then all the flags were dropped in a moment, as the Head-Cook raised the cover from an enormous dish.

"What is it?" the Empress said faintly, as she put her spy-glass to her eye. "Why, it's *Spinach*, I declare!"

"Her Imperial Highness is surprised," the Professor explained to the attendants: and some of them clapped their hands. The Head-Cook made a low bow, and in doing so dropped a spoon on the table, as if by accident, just within reach of the Empress, who looked the other way and pretended not to see it.

"I *am* surprised!" the Empress said to Bruno. "Aren't you?"

"Not a bit," said Bruno. "I heard——" but Sylvie put her hand over his mouth, and spoke for him. "He's rather tired, I think. He wants the Lecture to

‘Her Imperial Highness is surprised!’

begin.”

“I want the *supper* to begin,” Bruno corrected her.

The Empress took up the spoon in an absent manner, and tried to balance it across the back of her hand, and in doing this she dropped it into the dish: and, when she took it out again, it was full of spinach. “How curious!” she said, and put it into her mouth. “It tastes just like *real* spinach! I thought it was an imitation—but I do believe it’s real!” And she took another spoonful.

“It wo’n’t be real much longer,” said Bruno.

But the Empress had had enough spinach by this time, and somehow—I failed to notice the exact process—we all found ourselves in the Pavilion, and the Professor in the act of beginning the long-expected Lecture.

Chapter XXI. The Professor’s Lecture.

“In Science—in fact, in most things—it is usually best *to begin at the beginning*. In *some* things, of course, it’s better to begin at the *other* end. For instance, if you wanted to paint a dog green, it *might* be best to begin with the *tail*, as it doesn’t bite at *that* end. And so——”

“May *I* help oo?” Bruno interrupted.

“Help me to do *what*?” said the puzzled Professor, looking up for a moment, but keeping his finger on the book he was reading from, so as not to lose his place.

“To paint a dog green!” cried Bruno. “*Oo* can begin wiz its *mouf*, and I’ll—
—”

“No, no!” said the Professor. “We haven’t got to the *Experiments* yet. And so,” returning to his note-book, “I’ll give you the Axioms of Science. After that I shall exhibit some Specimens. Then I shall explain a Process or two. And I shall conclude with a few Experiments. An *Axiom*, you know, is a thing that you accept without contradiction. For instance, if I were to say ‘Here we are!’, that would be accepted without any contradiction, and it’s a nice sort of remark to *begin* a conversation with. So it would be an *Axiom*. Or again, supposing I were to say ‘Here we are not!’ *that* would be——”

“—a fib!” cried Bruno.

"Oh, *Bruno!*" said Sylvie in a warning whisper. "Of course it would be an *Axiom*, if the Professor said it!"

"—that would be accepted, if people were civil," continued the Professor; "so it would be *another* Axiom."

"It *might* be an Axledum," Bruno said: "but it wouldn't be *true!*"

"Ignorance of Axioms," the Lecturer continued, "is a great drawback in life. It wastes so much time to have to say them over and over again. For instance, take the Axiom '*Nothing is greater than itself*'; that is, '*Nothing can contain itself*.' How often you hear people say 'He was so excited, he was quite unable to contain himself,' Why, *of course* he was unable! The *excitement* had nothing to do with it!"

"I say, look here, you know!" said the Emperor, who was getting a little restless. "How many Axioms are you going to give us? At *this* rate, we sha'n't get to the *Experiments* till to-morrow-week!"

"Oh, sooner than *that*, I assure you!" the Professor replied, looking up in alarm. "There are only," (he referred to his notes again) "only *two* more, that are really *necessary*."

"Read 'em out, and get on to the *Specimens*," grumbled the Emperor.

"The *First* Axiom," the Professor read out in a great hurry, "consists of these words, '*Whatever is, is*.' And the *Second* consists of *these* words, '*Whatever isn't, isn't*.' We will now go on to the *Specimens*. The first tray contains Crystals and other Things." He drew it towards him, and again referred to his note-book. "Some of the labels—owing to insufficient adhesion——" Here he stopped again, and carefully examined the page with his eyeglass. "I ca'n't quite read the rest of the sentence," he said at last, "but it *means* that the labels have come loose, and the Things have got mixed——"

"Let *me* stick 'em on again!" cried Bruno eagerly, and began licking them, like postage-stamps, and dabbing them down upon the Crystals and the other Things. But the Professor hastily moved the tray out of his reach. "They *might* get fixed to the *wrong* Specimens, you know!" he said.

"Oo shouldn't have any *wrong* peppermints in the tray!" Bruno boldly replied. "Should he, Sylvie?"

But Sylvie only shook her head.

The Professor heard him not. He had taken up one of the bottles, and was carefully reading the label through his eye-glass. "Our first Specimen——" he announced, as he placed the bottle in front of the other Things, "is—that is, it is called——" here he took it up, and examined the label again, as if he thought it might have changed since he last saw it, "is called Aqua Pura—common water—the fluid that cheers——"

"Hip! Hip! Hip!" the Head-Cook began enthusiastically.

"—but *not* inebriates!" the Professor went on quickly, but only just in time to check the "Hooroar!" which was beginning.

"Our second Specimen," he went on, carefully opening a small jar, "is——" here he removed the lid, and a large beetle instantly darted out, and with an angry buzz went straight out of the Pavilion, "—is—or rather, I should say," looking sadly into the empty jar, "it *was*—a curious kind of Blue Beetle. Did any one happen to remark—as it went past—three blue spots under each wing?"

Nobody had remarked them.

"Ah, well!" the Professor said with a sigh. "It's a pity. Unless you remark that kind of thing *at the moment*, it's very apt to get overlooked! The *next*

Specimen, at any rate, will not fly away! It is—in short, or perhaps, more correctly, at *length*—an *Elephant*. You will observe——.” Here he beckoned to the Gardener to come up on the platform, and with his help began putting together what looked like an enormous dog-kennel, with short tubes projecting out of it on both sides.

“But we’ve seen *Elephants* before,” the Emperor grumbled.

“Yes, but not through a *Megaloscope!*” the Professor eagerly replied. “You know you can’t see a *Flea*, properly, without a *magnifying-glass*—what we call a *Microscope*. Well, just in the same way, you can’t see an *Elephant*, properly, without a *minimifying-glass*. There’s one in each of these little tubes. And *this* is a *Megaloscope!* The Gardener will now bring in the next Specimen. Please open *both* curtains, down at the end there, and make way for the Elephant!”

There was a general rush to the sides of the Pavilion, and all eyes were turned to the open end, watching for the return of the Gardener, who had gone away singing “*He thought he saw an Elephant That practised on a Fife!*” There was silence for a minute: and then his harsh voice was heard again in the distance. “*He looked again—come up, then! He looked again, and found it was—woa back! and, found it was A letter from his—make way there! He’s a-coming!*”

‘He thought he saw an Elephant’

And in marched, or waddled—it is hard to say which is the right word—an Elephant, on its hind-legs, and playing on an enormous fife which it held with its fore-feet.

The Professor hastily threw open a large door at the end of the Megaloscope, and the huge animal, at a signal from the Gardener, dropped the fife, and obediently trotted into the machine, the door of which was at once shut by the Professor. “The Specimen is now ready for observation!” he proclaimed. “It is exactly the size of the Common Mouse—*Mus Communis!*”

There was a general rush to the tubes, and the spectators watched with delight the minikin creature, as it playfully coiled its trunk round the Professor’s extended finger, finally taking its stand upon the palm of his hand, while he

carefully lifted it out, and carried it off to exhibit to the Imperial party.

"Isn't it a *darling*?" cried Bruno. "May I stroke it, please? I'll touch it *wel*ly gently!"

The Empress inspected it solemnly with her eye-glass. "It is very small," she said in a deep voice. "Smaller than elephants usually are, I believe?"

The Professor gave a start of delighted surprise. "Why, that's *true*!" he murmured to himself. Then louder, turning to the audience, "Her Imperial Highness has made a remark which is perfectly sensible!" And a wild cheer arose from that vast multitude.

"The next Specimen," the Professor proclaimed, after carefully placing the little Elephant in the tray, among the Crystals and other Things, "is a *Flea*, which we will enlarge for the purposes of observation." Taking a small pill-box from the tray, he advanced to the Megaloscope, and reversed all the tubes. "The Specimen is ready!" he cried, with his eye at one of the tubes, while he carefully emptied the pill-box through a little hole at the side. "It is now the size of the Common Horse—*Equus Communis*!"

There was another general rush, to look through the tubes, and the Pavilion rang with shouts of delight, through which the Professor's anxious tones could scarcely be heard. "Keep the door of the Microscope *shut*!" he cried. "If the creature were to escape, *this size*, it would——" But the mischief was done. The door had swung open, and in another moment the Monster had got out, and was trampling down the terrified, shrieking spectators.

But the Professor's presence of mind did not desert him. "Undraw those curtains!" he shouted. It was done. The Monster gathered its legs together, and in one tremendous bound vanished into the sky.

"Where *is* it?" said the Emperor, rubbing his eyes.

"In the next Province, I fancy," the Professor replied. "That jump would take it at *least* five miles! The next thing is to explain a Process or two. But I find there is hardly room enough to operate—the smaller animal is rather in my way——"

"Who does he mean?" Bruno whispered to Sylvie.

"He means *you*!" Sylvie whispered back. "Hush!"

"Be kind enough to move—angularly—to *this* corner," the Professor said, addressing himself to Bruno.

Bruno hastily moved his chair in the direction indicated. "Did I move angrily enough?" he inquired. But the Professor was once more absorbed in his Lecture, which he was reading from his note-book.

"I will now explain the Process of—the name is blotted, I'm sorry to say. It will be illustrated by a number of—of——" here he examined the page for some time, and at last said "It seems to be either 'Experiments' or 'Specimens'——"

"Let it be *Experiments*," said the Emperor. "We've seen plenty of *Specimens*."

"Certainly, certainly!" the Professor assented. "We will have some Experiments."

"May *I* do them?" Bruno eagerly asked.

"Oh dear no!" The Professor looked dismayed. "I really don't know what would happen if *you* did them!"

"Nor nobody doosn't know what'll happen if *oo* doos them!" Bruno retorted.

"Our First Experiment requires a Machine. It has two knobs—only *two*—you can count them, if you like."

The Head-Cook stepped forwards, counted them, and retired satisfied.

“Now you *might* press those two knobs together—but that’s not the way to do it. Or you *might* turn the Machine upside-down—but *that’s* not the way to do it!”

“What *are* the way to do it?” said Bruno, who was listening very attentively.

The Professor smiled benignantly. “Ah, yes!” he said, in a voice like the heading of a chapter. “The Way To Do It! Permit me!” and in a moment he had whisked Bruno upon the table. “I divide my subject,” he began, “into three parts——”

“I think I’ll get down!” Bruno whispered to Sylvie. “It aren’t nice to be divided!”

“He hasn’t got a knife, silly boy!” Sylvie whispered in reply. “Stand still! You’ll break all the bottles!”

“The first part is to take hold of the knobs,” putting them into Bruno’s hands. “The second part is——” Here he turned the handle, and, with a loud “Oh!”, Bruno dropped both the knobs, and began rubbing his elbows.

The Professor chuckled in delight. “It had a sensible effect. *Hadn’t* it?” he enquired.

“No, it hadn’t a *sensible* effect!” Bruno said indignantly. “It were very silly indeed. It jingled my elbows, and it banged my back, and it crinkled my hair, and it buzzed among my bones!”

“I’m sure it *didn’t*!” said Sylvie. “You’re only inventing!”

“Oo doosn’t know nuffin about it!” Bruno replied. “Oo wasn’t there to see. Nobody ca’n’t go among my bones. There isn’t room!”

“Our Second Experiment,” the Professor announced, as Bruno returned to his place, still thoughtfully rubbing his elbows, “is the production of that seldom-seen-but-greatly-to-be-admired phenomenon, Black Light! You have seen White Light, Red Light, Green Light, and so on: but never, till this wonderful day, have any eyes but mine seen *Black Light*! This box,” carefully lifting it upon the table, and covering it with a heap of blankets, “is quite full of it. The way I made it was this—I took a lighted candle into a dark cupboard and shut the door. Of course the cupboard was then full of *Yellow Light*. Then I took a bottle of Black ink, and poured it over the candle: and, to my delight, every atom of the Yellow Light turned *Black*! That was indeed the proudest moment of my life! Then I filled a box with it. And now—would any one like to get under the blankets and see it?”

Dead silence followed this appeal: but at last Bruno said “*I’ll* get under, if it won’t jingle my elbows.”

Satisfied on this point, Bruno crawled under the blankets, and, after a minute or two, crawled out again, very hot and dusty, and with his hair in the wildest confusion.

“What did you see in the box?” Sylvie eagerly enquired.

“I saw *nuffin*!” Bruno sadly replied. “It were too dark!”

“He has described the appearance of the thing exactly!” the Professor exclaimed with enthusiasm. “Black Light, and Nothing, look so extremely alike, at first sight, that I don’t wonder he failed to distinguish them! We will now proceed to the Third Experiment.”

The Professor came down, and led the way to where a post had been driven firmly into the ground. To one side of the post was fastened a chain, with an iron weight hooked on to the end of it, and from the other side projected a piece of whalebone, with a ring at the end of it. “This is a *most* interesting

Experiment!" the Professor announced. "It will need *time*, I'm afraid: but that is a trifling disadvantage. Now observe. If I were to unhook this weight, and let go, it would fall to the ground. You do not deny *that*?"

Nobody denied it.

"And in the same way, if I were to bend this piece of whalebone round the post—thus—and put the ring over this hook—thus—it stays bent: but, if I unhook it, it straightens itself again. You do not deny *that*?"

Again, nobody denied it.

"Well, now, suppose we left things just as they are, for a long time. The force of the *whalebone* would get exhausted, you know, and it would stay bent, even when you unhooked it. Now, *why* shouldn't the same thing happen with the *weight*? The *whalebone* gets so used to being bent, that it ca'n't *straighten* itself any more. Why shouldn't the *weight* get so used to being held up, that it ca'n't *fall* any more? That's what *I* want to know!"

"That's what *we* want to know!" echoed the crowd.

"How long must we wait?" grumbled the Emperor.

The Professor looked at his watch. "Well, I *think* a thousand years will do to *begin* with," he said. "Then we will cautiously unhook the weight: and, if it *still* shows (as perhaps it will) a *slight* tendency to fall, we will hook it on to the chain again, and leave it for *another* thousand years."

Here the Empress experienced one of those flashes of Common Sense which were the surprise of all around her. "Meanwhile there'll be time for another Experiment," she said.

"There will *indeed*!" cried the delighted Professor. "Let us return to the platform, and proceed to the *Fourth* Experiment!"

"For this concluding Experiment, I will take a certain Alkali, or Acid—I forget which. Now you'll see what will happen when I mix it with Some——" here he took up a bottle, and looked at it doubtfully, "—when I mix it with— with Something——"

Here the Emperor interrupted. "What's the *name* of the stuff?" he asked.

"I don't remember the *name*," said the Professor: "and the label has come off." He emptied it quickly into the other bottle, and, with a tremendous bang, both bottles flew to pieces, upsetting all the machines, and filling the Pavilion with thick black smoke. I sprang to my feet in terror, and—and found myself standing before my solitary hearth, where the poker, dropping at last from the hand of the sleeper, had knocked over the tongs and the shovel, and had upset the kettle, filling the air with clouds of steam. With a weary sigh, I betook myself to bed.

Chapter XXII. The Banquet.

"*Heaviness may endure for a night: but joy cometh in the morning.*" The next day found me quite another being. Even the memories of my lost friend and companion were sunny as the genial weather that smiled around me. I did not venture to trouble Lady Muriel, or her father, with another call so soon: but took a walk into the country, and only turned homewards when the low sunbeams warned me that day would soon be over.

On my way home, I passed the cottage where the old man lived, whose face always recalled to me the day when I first met Lady Muriel; and I glanced in as I passed, half-curious to see if he were still living there.

Quoted from Psalm
30:5

An explosion

Yes: the old man was still alive. He was sitting out in the porch, looking just as he did when I first saw him at Fayfield Junction—it seemed only a few days ago!

“Good evening!” I said, pausing.

“Good evening, Maister!” he cheerfully responded. “Wo’n’t ee step in?”

I stepped in, and took a seat on the bench in the porch. “I’m glad to see you looking so hearty,” I began. “Last time, I remember, I chanced to pass just as Lady Muriel was coming away from the house. Does she still come to see you?”

“Ees,” he answered slowly. “She has na forgotten me. I don’t lose her bonny face for many days together. Well I mind the very first time she come, after we’d met at Railway Station. She told me as she come to mak’ amends. Dear child! Only think o’ that! To mak’ amends!”

“To make amends for what?” I enquired. “What could *she* have done to need it?”

“Well, it were loike this, you see? We were both on us a-waiting fur t’ train at t’ Junction. And I had setten mysen down upat t’ bench. And Station-Maister, *he* comes and he orders me off—fur t’ mak’ room for her Ladyship, you understand?”

“I remember it all,” I said. “I was there myself, that day.”

“*Was* you, now? Well, an’ she axes my pardon fur’t. Think o’ that, now! *My* pardon! An owd ne’er-do-weel like me! Ah! She’s been here many a time, sin’ then. Why, she were in here only yestere’en, as it were, asittin’, as it might be, where you’re a-sitting now, an’ lookin’ sweeter and kinder nor an angel! An’ she says ‘You’ve not got your Minnie, now,’ she says, ‘to fettle for ye.’ Minnie was my grand-daughter, Sir, as lived wi’ me. She died, a matter of two months ago—or it may be three. She was a bonny lass—and a good lass, too. Eh, but life has been rare an’ lonely without her!”

He covered his face in his hands: and I waited a minute or two, in silence, for him to recover himself.

"So she says 'Just tak' *me* fur your Minnie!' she says. 'Didna Minnie mak' your tea fur you?' says she. 'Ay,' says I. An she mak's the tea. 'An' didna Minnie light your pipe?' says she. 'Ay,' says I. An' she lights the pipe for me. 'An' didna Minnie set out your tea in t' porch?' An' I says 'My dear,' I says, 'I'm thinking you're Minnie hersen!' An' she cries a bit. We both on us cries a bit——."

Again I kept silence for a while.

"An' while I smokes my pipe, she sits an' talks to me—as loving an' as pleasant! I'll be bound I thowt it were Minnie come again! An' when she gets up to go, I says 'Winnot ye shak' hands wi' me?' says I. An' she says 'Na,' she says: 'a cannot *shak' hands* wi' thee!' she says."

"I'm sorry she said *that*," I put in, thinking it was the only instance I had ever known of pride of rank showing itself in Lady Muriel.

"Bless you, it werena *pride*!" said the old man, reading my thoughts. "She says 'Your Minnie never *shook hands* wi' you!' she says. 'An' *I'm* your Minnie now,' she says. An' she just puts her dear arms about my neck—and she kisses me on t' cheek—an' may God in Heaven bless her!" And here the poor old man broke down entirely, and could say no more.

"God bless her!" I echoed. "And good night to you!" I pressed his hand, and left him. "Lady Muriel," I said softly to myself as I went homewards, "truly you know how to 'mak' amends'!"

Seated once more by my lonely fireside, I tried to recall the strange vision of the night before, and to conjure up the face of the dear old Professor among the blazing coals. "That black one—with just a touch of red—would suit him well," I thought. "After such a catastrophe, it would be sure to be covered with black stains—and he would say:—

"The result of *that* combination—you may have noticed?—was an *Explosion*! Shall I repeat the Experiment?"

"No, no! Don't trouble yourself!" was the general cry. And we all trooped off, in hot haste, to the Banqueting-Hall, where the feast had already begun.

No time was lost in helping the dishes, and very speedily every guest found his plate filled with good things.

"I have always maintained the principle," the Professor began, "that it is a good rule to take some food—occasionally. The great advantage of dinner-parties——" he broke off suddenly. "Why, actually here's the Other Professor!" he cried. "And there's no place left for him!"

The Other Professor came in reading a large book, which he held close to his eyes. One result of his not looking where he was going was that he tripped up, as he crossed the Saloon, flew up into the air, and fell heavily on his face in the middle of the table.

"*What* a pity!" cried the kind-hearted Professor, as he helped him up.

"It wouldn't be *me*, if I didn't trip," said the Other Professor.

The Professor looked much shocked. "Almost *anything* would be better than *that*!" he exclaimed. "It never does," he added, aside to Bruno, "to be anybody else, does it?"

To which Bruno gravely replied "I's got nuffin on my plate."

The Professor hastily put on his spectacles, to make sure that the *facts* were all right, to begin with: then he turned his jolly round face upon the unfortunate

'A cannot shak' hands wi' thee!

The Other Professor's fall

owner of the empty plate. "And what would you like next, my little man?"

"Well," Bruno said, a little doubtfully, "I think I'll take some plum-pudding, please—while I think of it."

"Oh, Bruno!" (This was a whisper from Sylvie.) "It isn't good manners to ask for a dish before it comes!"

And Bruno whispered back "But I might forget to ask for some, when it comes, oo know—I *do* forget things, sometimes," he added, seeing Sylvie about to whisper more.

And *this* assertion Sylvie did not venture to contradict.

Meanwhile a chair had been placed for the Other Professor, between the Empress and Sylvie. Sylvie found him a rather uninteresting neighbour: in fact, she couldn't afterwards remember that he had made more than *one* remark to her during the whole banquet, and that was "What a comfort a Dictionary is!" (She told Bruno, afterwards, that she had been too much afraid of him to say more than "Yes, Sir," in reply; and that had been the end of their conversation. On which Bruno expressed a very decided opinion that *that* wasn't worth calling a 'conversation' at all. "Oo should have asked him a riddle!" he added triumphantly. "Why, *I* asked the Professor *three* riddles! One was that one you asked me in the morning, 'How many pennies is there in two shillings?' And another was——" "Oh, Bruno!" Sylvie interrupted. "*That* wasn't a riddle!" "It *were*!" Bruno fiercely replied.)

By this time a waiter had supplied Bruno with a plateful of *something*, which drove the plum-pudding out of his head.

"Another advantage of dinner-parties," the Professor cheerfully explained, for the benefit of any one that would listen, "is that it helps you to *see* your friends. If you want to *see* a man, offer him something to eat. It's the same rule with a mouse."

"This Cat's very kind to the Mouses," Bruno said, stooping to stroke a remarkably fat specimen of the race, that had just waddled into the room, and was rubbing itself affectionately against the leg of his chair. "Please, Sylvie, pour some milk in your saucer. Pussie's ever so thirsty!"

"Why do you want *my* saucer?" said Sylvie. "You've got one yourself!"

"Yes, I know," said Bruno: "but I wanted *mine* for to give it some *more* milk in."

Sylvie looked unconvinced: however it seemed quite impossible for her *ever* to refuse what her brother asked: so she quietly filled her saucer with milk, and handed it to Bruno, who got down off his chair to administer it to the cat.

"The room's very hot, with all this crowd," the Professor said to Sylvie. "I wonder why they don't put some lumps of ice in the grate? You fill it with lumps of coal in the winter, you know, and you sit round it and enjoy the warmth. How jolly it would be to fill it now with lumps of ice, and sit round it and enjoy the coolth!"

Hot as it was, Sylvie shivered a little at the idea. "It's very cold *outside*," she said. "My feet got almost frozen to-day."

"That's the *shoemaker's* fault!" the Professor cheerfully replied. "How often I've explained to him that he *ought* to make boots with little iron frames under the soles, to hold lamps! But he never *thinks*. No one would suffer from cold, if only they would *think* of those little things. I always use hot ink, myself, in the winter. Very few people ever think of *that*! Yet how simple it is!"

"Yes, it's very simple," Sylvie said politely. "Has the cat had enough?" This was to Bruno, who had brought back the saucer only half-emptied.

But Bruno did not hear the question. "There's somebody scratching at the door and wanting to come in," he said. And he scrambled down off his chair, and went and cautiously peeped out through the door-way.

"Who was it wanted to come in?" Sylvie asked, as he returned to his place.

"It were a Mouse," said Bruno. "And it peeped in. And it saw the Cat. And it said 'I'll come in another day.' And I said 'Oo needn't be flightened. The Cat's *welly* kind to Mouses.' And it said 'But I's got some imporkant business, what I *must* attend to.' And it said 'I'll call again to-morrow.' And it said 'Give my love to the Cat.'"

"What a fat cat it is!" said the Lord Chancellor, leaning across the Professor to address his small neighbour. "It's quite a wonder!"

"It was awfully fat when it came in," said Bruno: "so it would be more wonderfuller if it got thin all in a minute."

"And that was the reason, I suppose," the Lord Chancellor suggested, "why you didn't give it the rest of the milk?"

"No," said Bruno. "It were a betterer reason. I tooked the saucer up 'cause it were so discontented!"

"It doesn't look so to *me*," said the Lord Chancellor. "What made you think it was discontented?"

"Cause it grumbled in its throat."

"Oh, Bruno!" cried Sylvie. "Why, that's the way cats show they're *pleased*!"

Bruno looked doubtful. "It's not a good way," he objected. "Oo wouldn't say *I* were pleased, if I made that noise in my throat!"

"What a singular boy!" the Lord Chancellor whispered to himself: but Bruno had caught the words.

"What do it mean to say 'a *singular* boy'?" he whispered to Sylvie.

"It means *one* boy," Sylvie whispered in return. "And *plural* means two or three."

"Then I's welly glad I *is* a singular boy!" Bruno said with great emphasis. "It would be *horrid* to be two or three boys! P'raps they wouldn't play with me!"

"Why *should* they?" said the Other Professor, suddenly waking up out of a deep reverie. "They might be asleep, you know."

"Couldn't, if *I* was awake," Bruno said cunningly.

"Oh, but they might indeed!" the Other Professor protested. "Boys don't all go to sleep at once, you know. So these boys—but who are you talking about?"

"He *never* remembers to ask that first!" the Professor whispered to the children.

"Why, the rest of *me*, a-course!" Bruno exclaimed triumphantly. "Supposing I was two or three boys!"

The Other Professor sighed, and seemed to be sinking back into his reverie; but suddenly brightened up again, and addressed the Professor. "There's nothing more to be done *now*, is there?"

"Well, there's the dinner to finish," the Professor said with a bewildered smile: "and the heat to bear. I hope you'll enjoy the dinner—such as it is; and that you won't mind the heat—such as it isn't."

The sentence *sounded* well, but somehow I couldn't quite understand it; and the Other Professor seemed to be no better off. "Such as it isn't *what?*" he peevishly enquired.

"It isn't as hot as it might be," the Professor replied, catching at the first idea that came to hand.

"Ah, I see what you mean *now!*" the Other Professor graciously remarked. "It's very badly expressed, but I quite see it *now!* Thirteen minutes and a half ago," he went on, looking first at Bruno and then at his watch as he spoke, "you said 'this Cat's very kind to the Mouses.' It must be a singular animal!"

"So it *are,*" said Bruno, after carefully examining the Cat, to make sure how many there were of it.

"But how do you know it's kind to the Mouses—or, more correctly speaking, the *Mice?*"

"Cause it *plays* with the Mouses," said Bruno; "for to amuse them, oo know."

"But that is just what I *don't* know," the Other Professor rejoined. "My belief is, it plays with them to *kill* them!"

"Oh, that's quite a *accident!*" Bruno began, so eagerly, that it was evident he had already propounded this very difficulty to the Cat. "It 'splained all that to me, while it were drinking the milk. It said 'I teaches the Mouses new games: the Mouses likes it ever so much.' It said 'Sometimes little accidents happens: sometimes the Mouses kills theirselves.' It said 'I's always *welly* sorry, when the Mouses kills theirselves.' It said——"

"If it was so *very* sorry," Sylvie said, rather disdainfully, "it wouldn't *eat* the Mouses after they'd killed themselves!"

But this difficulty, also, had evidently not been lost sight of in the exhaustive ethical discussion just concluded. "It said——" (the orator constantly omitted, as superfluous, his own share in the dialogue, and merely gave us the replies of the Cat) "It said 'Dead Mouses *never* objects to be eaten.' It said 'There's no use wasting good Mouses.' It said 'Wifful—' sumfinoruvver. It said 'And oo may live to say 'How much I wiss I had the Mouse that then I frew away!' It said——"

"It hadn't *time* to say such a lot of things!" Sylvie interrupted indignantly.

"Oo doosn't know how Cats speaks!" Bruno rejoined contemptuously. "Cats speaks *welly* quick!"

Chapter XXIII. The Pig-Tale.

By this time the appetites of the guests seemed to be nearly satisfied, and even *Bruno* had the resolution to say, when the Professor offered him a fourth slice of plum-pudding, "I thinks three helpings is enough!"

Suddenly the Professor started as if he had been electrified. "Why, I had nearly forgotten the most important part of the entertainment! The Other Professor is to recite a Tale of a Pig—I mean a Pig-Tale," he corrected himself. "It has Introductory Verses at the beginning, and at the end."

"It ca'n't have Introductory Verses at the *end*, can it?" said Sylvie.

"Wait till you hear it," said the Professor: "then you'll see. I'm not sure it hasn't some in the *middle*, as well." Here he rose to his feet, and there was an instant silence through the Banqueting-Hall: they evidently expected a speech.

"Ladies, and gentlemen," the Professor began, "the Other Professor is so kind as to recite a Poem. The title of it is 'The Pig-Tale.' He never recited it before!"

(General cheering among the guests.) “He will never recite it again!” (Frantic excitement, and wild cheering all down the hall, the Professor himself mounting the table in hot haste, to lead the cheering, and waving his spectacles in one hand and a spoon in the other.)

Then the Other Professor got up, and began:—

Little Birds are dining
Warily and well,
Hid in mossy cell:
Hid, I say, by waiters
Gorgeous in their gaiters—
I’ve a Tale to tell.

‘Teaching Tigresses to smile’

Little Birds are feeding

Justices with jam,
Rich in frizzled ham:
Rich, I say, in oysters
Haunting shady cloisters—
That is what I am.

Little Birds are teaching
Tigresses to smile,
Innocent of guile:
Smile, I say, not smirkle—
Mouth a semicircle,
That's the proper style.

Little Birds are sleeping
All among the pins,
Where the loser wins:
Where, I say, he sneezes
When and how he pleases—
So the Tale begins.

There was a Pig that sat alone
Beside a ruined Pump:
By day and night he made his moan—
It would have stirred a heart of stone
To see him wring his hoofs and groan,
Because he could not jump.

A certain Camel heard him shout—
A Camel with a hump.
“Oh, is it Grief, or is it Gout?
What is this bellowing about?”
That Pig replied, with quivering snout,
“Because I cannot jump!”

That Camel scanned him, dreamy-eyed.
“Methinks you are too plump.
I never knew a Pig so wide—
That wobbled so from side to side—
Who could, however much he tried,
Do such a thing as *jump*!

“Yet mark those trees, two miles away,
All clustered in a clump:
If you could trot there twice a day,
Nor ever pause for rest or play,
In the far future—Who can say?—
You may be fit to jump.”

That Camel passed, and left him there,
Beside the ruined Pump.
Oh, horrid was that Pig's despair!
His shrieks of anguish filled the air.
He wrung his hoofs, he rent his hair,
Because he could not jump.

'Horried was that Pig's despair!'

There was a Frog that wandered by—
A sleek and shining lump:
Inspected him with fishy eye,
And said "O Pig, what makes you cry?"
And bitter was that Pig's reply,
"Because I cannot jump!"

That Frog he grinned a grin of glee,
And hit his chest a thump
"O Pig," said, "be ruled by me,
And you shall see what you shall see.
This minute, for a trifling fee,
I'll teach you how to jump!"

"You may be faint from many a fall,
And bruised by many a bump:
But, if you persevere through all,
And practise first on something small,
Concluding with a ten-foot wall,
You'll find that you can jump!"

That Pig looked up with joyful start:
"Oh Frog, you *are* a trump!
Your words have healed my inward smart—
Come, name your fee and do your part:
Bring comfort to a broken heart,
By teaching me to jump!"

"My fee shall be a mutton-chop,
My goal this ruined Pump.

Observe with what an airy flop
I plant myself upon the top!
Now bend your knees and take a hop,
For that's the way to jump!"

The fatal jump

Uprose that Pig, and rushed, full whack,
Against the ruined Pump:
Rolled over like an empty sack,
And settled down upon his back,
While all his bones at once went 'Crack!
It was a fatal jump.

When the Other Professor had recited this Verse, he went across to the fire-place, and put his head up the chimney. In doing this, he lost his balance, and fell head-first into the empty grate, and got so firmly fixed there that it was some time before he could be dragged out again.

Bruno had had time to say "I thought he wanted to see how many peoples was up the chimbley."

And Sylvie had said "*Chimney*—not chimbley."

And Bruno had said "Don't talk 'ubbish!"

All this, while the Other Professor was being extracted.

"You must have blacked your face!" the Empress said anxiously. "Let me send for some soap?"

"Thanks, no," said the Other Professor, keeping his face turned away. "Black's quite a respectable colour. Besides, soap would be no use without water."

Keeping his back well turned away from the audience, he went on with the Introductory Verses:—

Little Birds are writing
Interesting books,
To be read by cooks:

'Bathing Crocodiles in cream'

Read, I say, not roasted—
Letterpress, when toasted,
Loses its good looks.

Little Birds are playing
Bagpipes on the shore,
Where the tourists snore:
“Thanks!” they cry. “’Tis thrilling!
Take, oh take this shilling!
Let us have no more!”

Little Birds are bathing
Crocodiles in cream,
Like a happy dream:
Like, but not so lasting—
Crocodiles, when fasting,
Are not all they seem!

‘That Pig lay still as any stone’

That Camel passed, as Day grew dim
Around the ruined Pump.
“O broken heart! O broken limb!
It needs,” that Camel said to him,
“Something more fairy-like and slim,
To execute a jump!”

That Pig lay still as any stone,
And could not stir a stump:
Nor ever, if the truth were known,
Was he again observed to moan,
Nor ever wring his hoofs and groan,

Because he could not jump.
That Frog made no remark, for he
Was dismal as a dump:
He knew the consequence must be
That he would never get his fee—
And still he sits, in miserie,
Upon that ruined Pump!

‘Still he sits in miserie’

“It’s a miserable story!” said Bruno. “It begins miserably, and it ends miser-
abler. I think I shall cry. Sylvie, please lend me your handkerchief.”

“I haven’t got it with me,” Sylvie whispered.

“Then I won’t cry,” said Bruno manfully.

“There are more Introductory Verses to come,” said the Other Professor,
“but I’m hungry.” He sat down, cut a large slice of cake, put it on Bruno’s plate,
and gazed at his own empty plate in astonishment.

“Where did you get that cake?” Sylvie whispered to Bruno.

“He gived it me,” said Bruno.

“But you shouldn’t ask for things! You *know* you shouldn’t!”

“I *didn’t* ask,” said Bruno, taking a fresh mouthful: “he *gived* it me.”

Sylvie considered this for a moment: then she saw her way out of it. “Well,
then, ask him to give *me* some!”

“You seem to enjoy that cake?” the Professor remarked.

“Doos that mean ‘munch’?” Bruno whispered to Sylvie.

Sylvie nodded. “It means ‘to munch’ and ‘to *like* to munch.’”

Bruno smiled at the Professor. “I *doos* enjoy it,” he said.

The Other Professor caught the word. “And I hope you’re enjoying *yourself*,
little Man?” he enquired.

Bruno’s look of horror quite startled him. “No, *indeed* I aren’t!” he said.

The Other Professor looked thoroughly puzzled. "Well, well!" he said. "Try some cowslip wine!" And he filled a glass and handed it to Bruno. "Drink this, my dear, and you'll be quite another man!"

"Who shall I be?" said Bruno, pausing in the act of putting it to his lips.

"Don't ask so many questions!" Sylvie interposed, anxious to save the poor old man from further bewilderment. "Suppose we get the Professor to tell us a story."

Bruno adopted the idea with enthusiasm. "*Please* do!" he cried eagerly. "Sumfin about tigers—and bumble-bees—and robin-redbreasts, oo knows!"

"Why should you always have *live* things in stories?" said the Professor. "Why don't you have events, or circumstances?"

"Oh, *please* invent a story like that!" cried Bruno.

The Professor began fluently enough. "Once a coincidence was taking a walk with a little accident, and they met an explanation—a *very* old explanation—so old that it was quite doubled up, and looked more like a conundrum——" he broke off suddenly.

"*Please* go on!" both children exclaimed.

The Professor made a candid confession. "It's a very difficult sort to invent, I find. Suppose Bruno tells one, first."

Bruno was only too happy to adopt the suggestion.

"Once there were a Pig, and a Accordion, and two Jars of Orange-marmalade——"

"The *dramatis personæ*," murmured the Professor. "Well, what then?"

"So, when the Pig played on the Accordion," Bruno went on, "one of the Jars of Orange-marmalade didn't like the tune, and the other Jar of Orange-marmalade did like the tune—I *know* I shall get confused among those Jars of Orange-marmalade, Sylvie!" he whispered anxiously.

"I will now recite the other Introductory Verses," said the Other Professor.

Little Birds are choking
Baronets with bun,
Taught to fire a gun:
Taught, I say, to splinter
Salmon in the winter—
Merely for the fun.

Little Birds are hiding
Crimes in carpet-bags,
Blessed by happy stags:
Blessed, I say, though beaten—
Since our friends are eaten
When the memory flags.

Little Birds are tasting
Gratitude and gold,
Pale with sudden cold
Pale, I say, and wrinkled—
When the bells have tinkled
And the Tale is told.

"The next thing to be done," the Professor cheerfully remarked to the Lord

'Blessed by happy stags'

Chancellor, as soon as the applause, caused by the recital of the Pig-Tale, had come to an end, "is to drink the Emperor's health, is it not?"

"Undoubtedly!" the Lord Chancellor replied with much solemnity, as he rose to his feet to give the necessary directions for the ceremony. "Fill your glasses!" he thundered. All did so, instantly. "Drink the Emperor's health!" A general gurgling resounded all through the Hall. "Three cheers for the Emperor!" The faintest possible sound followed *this* announcement: and the Chancellor, with admirable presence of mind, instantly proclaimed "A speech from the Emperor!"

The Emperor had begun his speech almost before the words were uttered. "However unwilling to be Emperor—since you all wish me to be Emperor—you know how badly the late Warden managed things—with such enthusiasm as you have shown—he persecuted you—he taxed you too heavily—you know who is fittest man to be Emperor—my brother had no sense——."

How long this curious speech might have lasted it is impossible to say, for just at this moment a hurricane shook the palace to its foundations, bursting open the windows, extinguishing some of the lamps, and filling the air with clouds of dust, which took strange shapes in the air, and seemed to form words.

But the storm subsided as suddenly as it had risen—the casements swung into their places again: the dust vanished: all was as it had been a minute ago—with the exception of the Emperor and Empress, over whom had come a wondrous change. The vacant stare, the meaningless smile, had passed away: all could see that these two strange beings had returned to their senses.

The Emperor continued his speech as if there had been no interruption. "And we have behaved—my wife and I—like two arrant Knaves. We deserve no better name. When my brother went away, you lost the best Warden you ever had. And I've been doing my best, wretched hypocrite that I am, to cheat you into making me an Emperor. Me! One that has hardly got the wits to be a shoe-black!"

The Lord Chancellor wrung his hands in despair. "He is mad, good people!" he was beginning. But both speeches stopped suddenly—and, in the dead silence that followed, a knocking was heard at the outer door.

"What is it?" was the general cry. People began running in and out. The excitement increased every moment. The Lord Chancellor, forgetting all the rules of Court-ceremony, ran full speed down the hall, and in a minute returned, pale and gasping for breath.

Chapter XXIV. The Beggar's Return.

"Your Imperial Highnesses!" he began. "It's the old Beggar again! Shall we set the dogs at him?"

"Bring him here!" said the Emperor.

The Chancellor could scarcely believe his ears. "*Here*, your Imperial Highness? Did I rightly understand——."

"Bring him here!" the Emperor thundered once more. The Chancellor tottered down the hall—and in another minute the crowd divided, and the poor old Beggar was seen entering the Banqueting-Hall.

He was indeed a pitiable object: the rags, that hung about him, were all splashed with mud: his white hair and his long beard were tossed about in wild disorder. Yet he walked upright, with a stately tread, as if used to command:

The old Beggar's return

and—strangest sight of all—Sylvie and Bruno came with him, clinging to his hands, and gazing at him with looks of silent love.

Men looked eagerly to see how the Emperor would receive the bold intruder. Would he hurl him from the steps of the daïs? But no. To their utter astonishment, the Emperor knelt as the beggar approached, and with bowed head murmured "Forgive us!"

"Forgive us!" the Empress, kneeling at her husband's side, meekly repeated.

The Outcast smiled. "Rise up!" he said. "I forgive you!" And men saw with wonder that a change had passed over the old beggar, even as he spoke. What had seemed, but now, to be vile rags and splashes of mud, were seen to be in truth kingly trappings, broided with gold, and sparkling with gems. All knew him now, and bent low before the Elder Brother, the true Warden.

"Brother mine, and Sister mine!" the Warden began, in a clear voice that was heard all through that vast hall. "I come not to disturb you. Rule on, as Emperor, and rule wisely. For I am chosen King of Elfland. To-morrow I return there, taking nought from hence, save only—save only——" his voice trembled, and with a look of ineffable tenderness, he laid his hands in silence on the heads of the two little ones who clung around him.

But he recovered himself in a moment, and beckoned to the Emperor to resume his place at the table. The company seated themselves again—room being found for the Elfin-King between his two children—and the Lord Chancellor rose once more, to propose the next toast.

"The next toast—the hero of the day—why, he isn't here!" he broke off in wild confusion.

Good gracious! Everybody had forgotten Prince Uggug!

"He was told of the Banquet, of course?" said the Emperor.

"Undoubtedly!" replied the Chancellor. "*That* would be the duty of the Gold Stick in Waiting."

"Let the Gold Stick come forwards!" the Emperor gravely said.

The Gold Stick came forwards. "I attended on His Imperial Fatness," was the statement made by the trembling official. "I told him of the Lecture and the Banquet——."

"What followed?" said the Emperor: for the unhappy man seemed almost too frightened to go on.

"His Imperial Fatness was graciously pleased to be sulky. His Imperial Fatness was graciously pleased to box my ears. His Imperial Fatness was graciously pleased to say 'I don't care!'"

"'Don't-care' came to a bad end," Sylvie whispered to Bruno. "I'm not sure, but I *believe* he was hanged."

The Professor overheard her. "*That* result," he blandly remarked, "was merely a case of mistaken identity."

Both children looked puzzled.

"Permit me to explain. 'Don't-care' and 'Care' were twin-brothers. 'Care,' you know, killed the Cat. And they caught 'Don't-care' by mistake, and hanged him instead. And so 'Care' is alive still. But he's very unhappy without his brother. That's why they say 'Begone, dull Care!'"

"Thank you!" Sylvie said, heartily. "It's very extremely interesting. Why, it seems to explain *everything!*"

"Well, not quite *everything*," the Professor modestly rejoined. "There are two or three scientific difficulties——"

"What was your general impression as to His Imperial Fatness?" the Emperor asked the Gold Stick.

"My impression was that His Imperial Fatness was getting more——"

"More *what?*"

All listened breathlessly for the next word.

"More PRICKLY!"

"He must be sent for *at once!*" the Emperor exclaimed. And the Gold Stick went off like a shot. The Elfin-King sadly shook his head. "No use, no use!" he murmured to himself. "Loveless, loveless!"

Pale, trembling, speechless, the Gold Stick came slowly back again.

"Well?" said the Emperor. "Why does not the Prince appear?"

"One can easily guess," said the Professor. "His Imperial Fatness is, without doubt, a little preoccupied."

Bruno turned a look of solemn enquiry on his old friend. "What do that word mean?"

But the Professor took no notice of the question. He was eagerly listening to the Gold Stick's reply.

"Please your Highness! His Imperial Fatness is——" Not a word more could he utter.

The Empress rose in an agony of alarm. "Let us go to him!" she cried. And there was a general rush for the door.

Bruno slipped off his chair in a moment. "May we go too?" he eagerly asked. But the King did not hear the question, as the Professor was speaking to him. "*Preoccupied*, your Majesty!" he was saying. "That is what he is, no doubt!"

“May we go and see him?” Bruno repeated. The King nodded assent, and the children ran off. In a minute or two they returned, slowly and gravely. “Well?” said the King. “What’s the matter with the Prince?”

“He’s—what *you* said,” Bruno replied, looking at the Professor. “That hard word.” And he looked to Sylvie for assistance.

“Porcupine,” said Sylvie.

“No, no!” the Professor corrected her. “‘*Pre-occupied*,’ you mean.”

‘Porcupine!’

“No, it’s *porcupine*,” persisted Sylvie. “Not that other word at all. And please will you come? The house is all in an uproar.” (“And oo’d better bring an uproar-glass wiz oo!” added Bruno.)

We got up in great haste, and followed the children upstairs. No one took the least notice of *me*, but I wasn’t at all surprised at this, as I had long realised that I was quite invisible to them all—even to Sylvie and Bruno.

All along the gallery, that led to the Prince’s apartment, an excited crowd was surging to and fro, and the Babel of voices was deafening: against the door of the room three strong men were leaning, vainly trying to shut it—for some great animal inside was constantly bursting it half open, and we had a glimpse, before the men could push it back again, of the head of a furious wild beast, with great fiery eyes and gnashing teeth. Its voice was a sort of mixture—there was the roaring of a lion, and the bellowing of a bull, and now and then a scream like a gigantic parrot. “There is no judging by the voice!” the Professor cried in great excitement. “What is it?” he shouted to the men at the door. And a general chorus of voices answered him “Porcupine! Prince Uggug has turned into a Porcupine!”

“A new Specimen!” exclaimed the delighted Professor. “Pray let me go in. It should be labeled at once!”

But the strong men only pushed him back. “Label it, indeed! Do you want to be eaten up?” they cried.

“Never mind about Specimens, Professor!” said the Emperor, pushing his way through the crowd. “Tell us how to keep him safe!”

“A large cage!” the Professor promptly replied. “Bring a large cage,” he said to the people generally, “with strong bars of steel, and a portcullis made to go

up and down like a mouse-trap! Does any one happen to have such a thing about him?"

It didn't sound a likely sort of thing for any one to have about him; however, they brought him one directly: curiously enough, there happened to be one standing in the gallery.

"Put it facing the opening of the door, and draw up the portcullis!" This was done in a moment.

"Blankets now!" cried the Professor. "This is a most interesting Experiment!"

There happened to be a pile of blankets close by: and the Professor had hardly said the word, when they were all unfolded and held up like curtains all around. The Professor rapidly arranged them in two rows, so as to make a dark passage, leading straight from the door to the mouth of the cage.

"Now fling the door open!" This did not need to be done: the three men had only to leap out of the way, and the fearful monster flung the door open for itself, and, with a yell like the whistle of a steam-engine, rushed into the cage.

"Down with the portcullis!" No sooner said than done: and all breathed freely once more, on seeing the Porcupine safely caged.

The Professor rubbed his hands in childish delight. "The Experiment has succeeded!" he proclaimed. "All that is needed now is to feed it three times a day, on chopped carrots and——."

"Never mind about its food, just now!" the Emperor interrupted. "Let us return to the Banquet. Brother, will you lead the way?" And the old man, attended by his children, headed the procession down stairs. "See the fate of a loveless life!" he said to Bruno, as they returned to their places. To which Bruno made reply, "I always loved Sylvie, so I'll never get prickly like that!"

"He *is* prickly, certainly," said the Professor, who had caught the last words, "but we must remember that, however porcupiny, he is royal still! After this feast is over, I'm going to take a little present to Prince Uggug—just to soothe him, you know: it isn't pleasant living in a cage."

"What'll you give him for a birthday-present?" Bruno enquired.

"A small saucer of chopped carrots," replied the Professor. "In giving birthday-presents, *my* motto is—cheapness! I should think I save forty pounds a year by giving—oh, *what* a twinge of pain!"

"What is it?" said Sylvie anxiously.

"My old enemy!" groaned the Professor. "Lumbago—rheumatism—that sort of thing. I think I'll go and lie down a bit." And he hobbled out of the Saloon, watched by the pitying eyes of the two children.

"He'll be better soon!" the Elfin-King said cheerily. "Brother!" turning to the Emperor, "I have some business to arrange with you to-night. The Empress will take care of the children." And the two Brothers went away together, arm-in-arm.

The Empress found the children rather sad company. They could talk of nothing but "the dear Professor," and "what a pity he's so ill!", till at last she made the welcome proposal "Let's go and see him!"

The children eagerly grasped the hands she offered them: and we went off to the Professor's study, and found him lying on the sofa, covered up with blankets, and reading a little manuscript-book. "Notes on Vol. Three!" he murmured, looking up at us. And there, on a table near him, lay the book he was seeking when first I saw him.

“And how are you now, Professor?” the Empress asked, bending over the invalid.

The Professor looked up, and smiled feebly. “As devoted to your Imperial Highness as ever!” he said in a weak voice. “All of me, that is not Lumbago, is Loyalty!”

“A sweet sentiment!” the Empress exclaimed with tears in her eyes. “You seldom hear anything so beautiful as that—even in a Valentine!”

“We must take you to stay at the seaside,” Sylvie said, tenderly. “It’ll do you ever so much good! And the Sea’s so grand!”

“But a Mountain’s grander!” said Bruno.

“What is there grand about the Sea?” said the Professor. “Why, you could put it all into a teacup!”

“*Some* of it,” Sylvie corrected him.

“Well, you’d only want a certain number of tea-cups to hold it *all*. And *then* where’s the grandeur? Then as to a Mountain—why, you could carry it all away in a wheel-barrow, in a certain number of years!”

“It wouldn’t look grand—the bits of it in the wheel-barrow,” Sylvie candidly admitted.

“But when oo put it together again——” Bruno began.

“When you’re older,” said the Professor, “you’ll know that you *ca’n’t* put Mountains together again so easily! One lives and one learns, you know!”

“But it needn’t be the *same* one, need it?” said Bruno. “Won’t it do, if *I* live, and if *Sylvie* learns?”

“I *ca’n’t* learn without living!” said Sylvie.

“But I *can* live without learning!” Bruno retorted. “Oo just try me!”

“What I meant, was——” the Professor began, looking much puzzled, “—was—that you don’t know *everything*, you know.”

“But I *do* know everything I know!” persisted the little fellow. “I know ever so many things! Everything, ’cept the things I *don’t* know. And Sylvie knows all the rest.”

The Professor sighed, and gave it up. “Do you know what a Boojum is?”

“I know!” cried Bruno. “It’s the thing what wrenches people out of their boots!”

“He means ‘bootjack,’” Sylvie explained in a whisper.

“You ca’n’t wrench people out of *boots*,” the Professor mildly observed.

Bruno laughed saucily. “Oo *can*, though! Unless they’re *welly* tight in.”

“Once upon a time there was a Boojum——” the Professor began, but stopped suddenly. “I forget the rest of the Fable,” he said. “And there was a lesson to be learned from it. I’m afraid I forget *that*, too.”

“I’ll tell oo a Fable!” Bruno began in a great hurry. “Once there were a Locust, and a Magpie, and a Engine-driver. And the Lesson is, to learn to get up early——”

“It isn’t a bit interesting!” Sylvie said contemptuously. “You shouldn’t put the Lesson so soon.”

“When did you invent that Fable?” said the Professor. “Last week?”

“No!” said Bruno. “A deal shorter ago than that. Guess again!”

“I ca’n’t guess,” said the Professor. “How long ago?”

“Why, it isn’t invented yet!” Bruno exclaimed triumphantly. “But I *have* invented a lovely one! Shall I say it?”

"If you've *finished* inventing it," said Sylvie. "And let the Lesson be 'to try again'!"

"No," said Bruno with great decision. "The Lesson are '*not* to try again'!" "Once there were a lovely china man, what stood on the chimbley-piece. And he stood, and he stood. And one day he tumbleded off, and he didn't hurt his self one bit. Only he *would* try again. And the next time he tumbleded off, he hurted his self welly much, and breaked off ever so much varnish."

"But how did he come back on the chimney-piece after his first tumble?" said the Empress. (It was the first sensible question she had asked in all her life.)

"I put him there!" cried Bruno.

"Then I'm afraid you know something about his tumbling," said the Professor. "Perhaps you pushed him?"

To which Bruno replied, very seriously, "Didn't pushed him *much*—he were a *lovely* china man," he added hastily, evidently very anxious to change the subject.

"Come, my children!" said the Elfin-King, who had just entered the room. "We must have a little chat together, before you go to bed." And he was leading them away, but at the door they let go his hands, and ran back again to wish the Professor good night.

'Good-night, Professor!'

"Good night, Professor, good night!" And Bruno solemnly shook hands with the old man, who gazed at him with a loving smile, while Sylvie bent down to press her sweet lips upon his forehead.

"Good night, little ones!" said the Professor. "You may leave me now—to ruminate. I'm as jolly as the day is long, except when it's necessary to ruminate on some very difficult subject. All of me," he murmured sleepily as we left the room, "all of me, that isn't *Bonhomme*, is Ruminatiun!"

“What did he say, Bruno?” Sylvie enquired, as soon as we were safely out of hearing.

“I *think* he said ‘All of me that isn’t Bone-disease is Rheumatism.’ Whatever *are* that knocking, Sylvie?”

Sylvie stopped, and listened anxiously. It sounded like some one kicking at a door. “I *hope* it isn’t that Porcupine breaking loose!” she exclaimed.

“Let’s go on!” Bruno said hastily. “There’s nuffin to wait for, oo know!”

Chapter XXV. Life out of Death.

The sound of kicking, or knocking, grew louder every moment: and at last a door opened somewhere near us. “Did you say ‘come in!’ Sir?” my landlady asked timidly.

“Oh yes, come in!” I replied. “What’s the matter?”

“A note has just been left for you, Sir, by the baker’s boy. He said he was passing the Hall, and they asked him to come round and leave it here.”

The note contained five words only. “Please come at once. Muriel.”

A sudden terror seemed to chill my very heart. “The Earl is ill!” I said to myself. “Dying, perhaps!” And I hastily prepared to leave the house.

“No bad news, Sir, I hope?” my landlady said, as she saw me out. “The boy said as some one had arrived unexpectedly——.”

“I hope that is it!” I said. But my feelings were those of fear rather than of hope: though, on entering the house, I was somewhat reassured by finding luggage lying in the entrance, bearing the initials “E. L.”

“It’s only Eric Lindon after all!” I thought, half relieved and half annoyed. “Surely she need not have sent for me for *that*!”

Lady Muriel met me in the passage. Her eyes were gleaming—but it was the excitement of joy, rather than of grief. “I have a surprise for you!” she whispered.

“You mean that Eric Lindon is here?” I said, vainly trying to disguise the involuntary bitterness of my tone. “‘*The funeral baked meats did coldly furnish forth the marriage-tables,*’” I could not help repeating to myself. How cruelly I was misjudging her!

“No, no!” she eagerly replied. “At least—Eric *is* here. But——,” her voice quivered, “but there is *another*!”

No need for further question. I eagerly followed her in. There on the bed, he lay—pale and worn—the mere shadow of his old self—my old friend come back again from the dead!

“Arthur!” I exclaimed. I could not say another word.

“Yes, back again, old boy!” he murmured, smiling as I grasped his hand. “*He*,” indicating Eric, who stood near, “saved my life—*He* brought me back. Next to God, we must thank *him*, Muriel, my wife!”

Silently I shook hands with Eric and with the Earl: and with one consent we moved into the shaded side of the room, where we could talk without disturbing the invalid, who lay, silent and happy, holding his wife’s hand in his, and watching her with eyes that shone with the deep steady light of Love.

“He has been delirious till to-day,” Eric explained in a low voice: “and even to-day he has been wandering more than once. But the sight of *her* has been new life to him.” And then he went on to tell us, in would-be careless tones—I knew how he hated any display of feeling—how he had insisted on going back to the plague-stricken town, to bring away a man whom the doctor had abandoned

Quoted from *Hamlet*
by William
Shakespeare

as dying, but who *might*, he fancied, recover if brought to the hospital: how he had seen nothing in the wasted features to remind him of Arthur, and only recognised him when he visited the hospital a month after: how the doctor had forbidden him to announce the discovery, saying that any shock to the overtaxed brain might kill him at once: how he had staid on at the hospital, and nursed the sick man by night and day—all this with the studied indifference of one who is relating the commonplace acts of some chance acquaintance!

“And this was his *rival!*” I thought. “The man who had won from him the heart of the woman he loved!”

‘His wife knelt down at his side’

“The sun is setting,” said Lady Muriel, rising and leading the way to the open window. “Just look at the western sky! What lovely crimson tints! We shall have a glorious day to-morrow——” We had followed her across the room, and were standing in a little group, talking in low tones in the gathering gloom, when we were startled by the voice of the sick man, murmuring words too indistinct for the ear to catch.

“He is wandering again,” Lady Muriel whispered, and returned to the bedside. We drew a little nearer also: but no, this had none of the incoherence of delirium. “*What reward shall I give unto the Lord,*” the tremulous lips were saying, “*for all the benefits that He hath done unto me? I will receive the cup of salvation, and call—and call——*” but here the poor weakened memory failed, and the feeble voice died into silence.

His wife knelt down at the bedside, raised one of his arms, and drew it across her own, fondly kissing the thin white hand that lay so listlessly in her loving grasp. It seemed to me a good opportunity for stealing away without making her go through any form of parting: so, nodding to the Earl and Eric, I silently left the room. Eric followed me down the stairs, and out into the night.

“Is it Life or Death?” I asked him, as soon as we were far enough from the house for me to speak in ordinary tones.

“It is *Life!*” he replied with eager emphasis. “The doctors are quite agreed as to *that*. All he needs now, they say, is rest, and perfect quiet, and good nursing. He’s quite sure to get rest and quiet, here: and, as for the nursing why, I think it’s just *possible——*” (he tried hard to make his trembling voice assume a playful tone) “he may even get fairly well nursed, in his present quarters!”

Quoted from Psalm
116:12-13

"I'm sure of it!" I said. "Thank you so much for coming out to tell me!" And, thinking he had now said all he had come to say, I held out my hand to bid him good night. He grasped it warmly, and added, turning his face away as he spoke, "By the way, there is one other thing I wanted to say. I thought you'd like to know that—that I'm not—not in the mind I was in when last we met. It isn't—that I can accept Christian belief—at least, not yet. But all this came about so strangely. And she had prayed, you know. And I had prayed. And—and—" his voice broke, and I could only just catch the concluding words, "*there is a God that answers prayer!* I know it for certain now." He wrung my hand once more, and left me suddenly. Never before had I seen him so deeply moved.

So, in the gathering twilight, I paced slowly homewards, in a tumultuous whirl of happy thoughts: my heart seemed full, and running over, with joy and thankfulness: all that I had so fervently longed for, and prayed for, seemed now to have come to pass. And, though I reproached myself, bitterly, for the unworthy suspicion I had for one moment harboured against the true-hearted Lady Muriel, I took comfort in knowing it had been but a passing thought.

Not Bruno himself could have mounted the stairs with so buoyant a step, as I felt my way up in the dark, not pausing to strike a light in the entry, as I knew I had left the lamp burning in my sitting-room.

But it was no common *lamplight* into which I now stepped, with a strange, new, dreamy sensation of some subtle witchery that had come over the place. Light, richer and more golden than any lamp could give, flooded the room, streaming in from a window I had somehow never noticed before, and lighting up a group of three shadowy figures, that grew momentarily more distinct—a grave old man in royal robes, leaning back in an easy chair, and two children, a girl and a boy, standing at his side.

"Have you the Jewel still, my child?" the old man was saying.

"Oh, *yes!*" Sylvie exclaimed with unusual eagerness. "Do you think I'd *ever* lose it or forget it?" She undid the ribbon round her neck, as she spoke, and laid the Jewel in her father's hand.

Bruno looked at it admiringly. "What a lovely brightness!" he said. "It's just like a little red star! May I take it in my hand?"

Sylvie nodded: and Bruno carried it off to the window, and held it aloft against the sky, whose deepening blue was already spangled with stars. Soon he came running back in some excitement. "Sylvie! Look here!" he cried. "I can see right through it when I hold it up to the sky. And it isn't red a bit: it's, oh such a lovely blue! And the words are all different! Do look at it!"

Sylvie was quite excited, too, by this time; and the two children eagerly held up the Jewel to the light, and spelled out the legend between them, "ALL WILL LOVE SYLVIE."

"Why, this is the *other* Jewel!" cried Bruno. "Don't you remember, Sylvie? The one you *didn't* choose!"

Sylvie took it from him, with a puzzled look, and held it, now up to the light, now down. "It's blue, *one* way," she said softly to herself, "and it's red, the *other* way! Why, I thought there were *two* of them—Father!" she suddenly exclaimed, laying the Jewel once more in his hand, "I do believe it was the *same* Jewel all the time!"

"Then you choosed it from *itself*," Bruno thoughtfully remarked. "Father, *could* Sylvie choose a thing from itself?"

The blue locket

“Yes, my own one,” the old man replied to Sylvie, not noticing Bruno’s embarrassing question, “it *was* the same Jewel—but you chose quite right.” And he fastened the ribbon round her neck again.

“SYLVIE WILL LOVE ALL—ALL WILL LOVE SYLVIE,” Bruno murmured, raising himself on tiptoe to kiss the ‘little red star.’ “And, when you look *at* it, it’s red and fierce like the sun—and, when you look *through* it, it’s gentle and blue like the sky!”

“God’s own sky,” Sylvie said, dreamily.

“God’s own sky,” the little fellow repeated, as they stood, lovingly clinging together, and looking out into the night. “But oh, Sylvie, what makes the sky such a *darling* blue?”

Sylvie’s sweet lips shaped themselves to reply, but her voice sounded faint and very far away. The vision was fast slipping from my eager gaze: but it seemed to me, in that last bewildering moment, that not Sylvie but an angel was looking out through those trustful brown eyes, and that not Sylvie’s but an angel’s voice was whispering

“It is love.”

‘It is love!’

Ch. 1

“Bear with me.” Shakespeare.

Quoted from *Richard III* by William Shakespeare

It was a snowy December morning. A family party were seated in the snug little breakfast parlour of M^r Hamilton, apparently enjoying the snug fireside, the hissing urn, and the hot tea and toast, all the more for the heavy snow storm, which was to be heard at intervals, clamourously and hopelessly beating against the closely shut windows. The eldest daughter, with all the sedateness of a matron, was pouring out the tea, and dispensing to the younger members of the household their daily portions of oatmeal porridge. The said oatmeal porridge, I may as well state for the benefit of the uninformed, is a curious and indefinite compound bearing a striking resemblance to dirty paste, and in flavour not unlike a mixture of slate-pencil-dust and sand. I may as well add that connoisseurs in this delicacy are in the habit of improving it with a small portion of butter, which has the effect of giving it such an unctuous and greasy appearance as would sicken a Greenlander. The little Hamiltons, however, appeared to relish and even enjoy the wretched mess. The elder daughter would seem a very ordinary individual to any one merely regarding her outward form and figure, but look in her face and there could be no mistake; the turn of the head, the curl of the lip, the haughty eyebrow, every line and feature proclaimed the fact; she was a Hamilton out and out!

The father was a stern and thinking man: “cold and cross-grained,” the neighbours called him, though what the meaning of the term “cross-grained” may be, I will not undertake to say, as I only understand the term when applied to wood. At the present moment his thoughts appeared to be directed towards his eldest son, on whom he incessantly gazed as he sat, likewise wrapped in thought, carelessly cutting up his bread-and-butter into all sorts of fantastic

and inconceivable shapes, out of mere abstraction. How long he might have remained thus it is¹ impossible to say, as his daughter broke into the midst of his cogitations by gently reminding him that his tea was getting quite cold. Thus roused, he hastily swallowed his tea, and merely saying, "When you've finished your breakfast, Sidney, come into my study. I've something to say to you," left the room, and his son, a handsome young man of about eighteen, somewhat disturbed by this abrupt form of address, lost no time in following him, leaving his meal unfinished.

Sidney had just left school, during a flourishing career at which, he had contracted an intimate friendship with a young man of decidedly low origin, "vulgar and mean" the father was pleased to call him, with a bitter sneer at his son's bad taste in forming acquaintances: and this, be it observed, was a constant source of quarrel between father and son.

On the present occasion, when his son entered the room, he received him with a cold and distant manner, and a brow gloomier than that which he usually wore. "You are aware, of course, my dear Sidney," he commenced, in a conciliating tone, "that we are now arrived at that period of your life when I must begin to think about get you some employment, and you have hitherto expressed a preference for a mercantile line of life?" The young man gave a cold assent.

"You are aware of this," continued his father, "and you are further aware that it is in my power to give you the greatest assistance in your wishes. You are aware that I am acquainted with many powerful men, whose interest may be of the greatest service to you?" The son nodded: he did not deign a reply.

"Then observe this, young man!" continued the father, getting more and more excited as he spoke, "unless you agree to drop, at once and forever, all your *vulgar* acquaintances," (an emphasis on "vulgar" which raised a flush on the pale brow of the young man) "unless you will do this, though you would give me the world for it, I will not stir a finger, no, nor utter a syllable, in your service!"

"Look you here, sir!" shouted he, seeing that his words made little impression on his son, "obey me, or on this spot I disinherit you!"

Sadly did his son look upon him: "Father," he replied with an effort, "I owe you the highest respect, and—I should be very sorry to offend you or disobey you, but—but the calls of honour *must* be obeyed! To cast of Edmund Tracy, the dearest friend I have ever known, beyond my own family, would be an act not only of the most flagrant insolence, but, you will permit me to add, of the deepest ingratitude." Without giving his father time to reply, he turned and left the room. One moment his steps were heard echoing through the spacious hall, another, and he was gone.

Ch. 2

"A rat, a rat! dead for a ducat!" Shakespeare.

In the hall he was stopped by his sister: "Dearest Sidney!" she exclaimed, "Stop! why do you look so pale? What has my father been saying to you?"

He turned his face towards her. What a change had these few minutes wrought! The compressed lip, the glassy eye, and the unnaturally pale expression of his face, showed that some terrible straggle had been going on within.

¹"his" in manuscript

Quoted from *Hamlet*
by William
Shakespeare

"I am going away, Lucy," he replied in a strangley quiet tone, "goodbye: Kiss little Rosa for me," and without trusting himself to say any more, he snatched up his hat and hastily left the house.

His sister gazed after his retreating form with unutterable fondness as long as he remained in sight, and even then remained at the door, watching his footsteps imprinted on the deep snow, all that remained to her of him she loved so well, heed less of the storm which was beating upon her, till she heard the harsh voice of her father calling to her, "What in the world are you doing out there, Lucy? You'll catch your death of cold, come in, foolish child!" "Father," said she anxiously, she could say no more. "Well what's the matter," was his careless reply. "Oh Father! Sidney—" again she stopped.

"Speak not to me of Sidney," said her father, his anger now thouroughly roused, "he has disobeyed, wilfully, wantonly, disobeyed me: he is no longer to me a son, and you must no longer mention him as your brother. Never let his name cross your lips again! He—" She waited to hear no more, but fainted away on the spot, and her father was hardly able to catch her before she reached the ground.

Ch. 3

After walking for some distance along the hight road, through the driving snow which wet him to the skin, in a state of excitement and wretchedness which may be more easily imagined than described, Sidney overtook a covered waggon, proceeding in the same direction as himself, but at a more leisurely pace. Any change was prferable to his present distracted state, so without a moment's hesitation he asked the driver, in as unconcerned a voice as he could assume, to give him a lift to the next town: the goodnatured carter at once consented, remarking as he did so, "Why, young man, thee's something wettish. What made thee coom out such a day?" Muttering a few unintelligible words in reply, Sidney selected the most comfortable place he could find amongst the straw of the waggon, and at once composed himself to sleep.

Towards night, (for the distance to the next town was so considerable that the carrier's waggon seldom reached it before morning) the carter awoke him to offer him some food, and told him while he was eating that a few miles further on they would pass a place called by the country people "stand-and-deliver corner", on account of it's being a common resort for highway men, in fact, he concluded, "I never passes it without a bloonderbuss boy me." "Wake me up when you come to it," said Sidney sleepily. "I should rather like to see it," and, anxious as soon as possible to forget his cares in sleep, he again lay down.

Once more in the land of dreams, he imagined himself in company with Edmund Tracy, they were rowing a small boat together on the sea, all was bright and delicious. Suddenly a storm arose, and by one of those strange and sudden changes which so frequently happen in dreams, the boat was gone, and he and his friend were clinging to an oar and drifting on the rocks: his father was standing there, and he had already raised his hand to be helped out of the water, when he heard the voice of his father, harsh as it had sounded to him on that morning, pronounce the words, "Leave *him*, or perish with him!" and at the word they sunk. Oh! the horrors of that endless falling in dreams down, down, down he went, down to the fathomless abyss of ocean, clinging to his friend, with the harsh voice of his father still ringing in his ears, when he was

suddenly aroused by a push from the carter, "this is the place, young man," he whispered. He started up: a low, black grove skirted the road, and, as he gazed on it, two men sprang forth into the moonlight, one of whom seized the horse's bridle.

Ch. 4

"Speed, Malise, speed!" Scott.

Quoted from *The Lady of the Lake* by Sir Walter Scott

When Lucy Hamilton recovered, she found herself lying on one of the drawingroom sofas, where her father had put her down, and left her, caring very little whether she recovered or not. She roused herself instantly, attempted to forget the dreadful event of the morning, and to busy herself with her domestic duties, but all was of no use: the sigh unbidden was always rising to her lips, and floods of involuntary tears streaming from her eyes. A melancholy little party were they when they met that day at dinner. Her father who came in the last, eat his dinner in silence, without speaking a word to any of his family, and left the room as quickly as possible. She attempted to keep up a conversation with her brothers and sisters, but all were as wretched as herself, and the vacant chair at the table was enough of itself to throw a damp over all cheerfulness.

As Mr Hamilton gradually realised the feeling that his son was really gone, gone, in all probability, never to return, the gloom of his mind grew into absolute misery, but his pride would not yet suffer him to admit that it was his own doing, and that he had himself driven him from his roof. The hope that his son would speedily return to submit and ask forgiveness, which he had cherished in the morning, gradually faded away as the day wore on, and was succeeded by such a sickening sense of vacuity and oppression as well nigh drove him to distraction.

The pitiless storm had never ceased for a moment during the whole day, and the thought which was always coming with greater force of the distress his son must even then be enduring, goaded him to the extreme pitch of wretchedness, and sent him to bed in a state of mind bordering on insanity.

Ch. 5

"Strange the recital!" Cowper.

Quoted from *The Progress of Error* by William Cowper

Almost before he knew where he was, Sidney found himself out of the cart. To grasp one of their assailants by the shoulders, and fling him under the horse's feet was the work of a moment, but the other, taller and more muscular than his companion, proved more than a match for him, and after a short struggle, succeeded in getting him down on the ground and placing his knee on his chest. His brain reeled, he heard the clicking of a pistol at his ear, and was already preparing himself for instant death, when the report of the carter's blunderbuss was heard and the robber fell dead beside him.

The goodnatured carter, having thus saved his life, lost no time in extricating him from his fallen enemy, and the two now approached the second ruffian, who was lying stretched on his face in the middle of the road, stunned by the violence with which Sidney had thrown him down. On raising him up, it was quite evident that he was still alive, and the carter, by Sidney's advice, placed him in the cart, having first taken the precaution of binding him hand and foot.

They then proceeded, leaving the other ruffian, who had thus dearly paid the price of his own temerity, lying by the road-side.

Sidney, as before, seated himself in the cart, still greatly excited by the contest in which he had just been engaged and occupied himself in watching the inanimate ruffian who was stretched on the straw at the other side of the cart: after a short time, he fancied he saw him moving one of his arms, but taking it for an illusion of his delirious fancy, he did not think it worthwhile to mention it to the carter, but not many minutes had elapsed when the robber sprang up with a drawn knife in his hand, with which he had been cutting the cords, rushed upon Sidney with a savage yell, and in a moment had him half out of the cart.

Ch. 6

“Secure to please”

Quoted from *The Deserted Village* by Oliver Goldsmith

At five in the morning M^r Hamilton rose from his uneasy couch, plunged in even deeper melancholy than he had been the night before, distracted by the many conflicting emotions which bewildered his brain, and feeling that if he did not do something he must inevitably go mad before night. The one prevailing idea of his mind was to seek his son, and he delayed no longer to put it into execution. He accordingly left the house as quietly as he could without disturbing any of the family. The storm of the proceeding day had worn itself out: the sky was without a cloud, and the ground was covered with a thick mantle of dazzling white snow.

Wrapped up in a thick great coat, yet even then shivering with the intensity of the piercing frost, which was all the more bitter as the sun had scarcely yet risen, he traversed the high road with hasty steps, sinking every moment in the frozen snow nearly up to his knees. He knocked at the door of the first cottage he come to, forgetting in his distraction that there was very little probability of any of the inhabitants being up. After a long delay, the old Scotchwoman appeared at the door, and M^r Hamilton hastily enquired if she had seen any one go by that way during the storm of yesterday. “Ou ay,” replied the old woman, “there were twa went by yestreen. Ane was an uncolarge illfavoured body, muckle like yersel, sir: he came towards night; it had chappit eight of the clock when *he* passed.” “What was the other like?” asked M^r Hamilton impatiently. “Was it the t’other ane ye were speering at? weel, *he* was a younker, I mind: he went by in ane of those hurry-skurry, whirry-awa things, I think they ca’t a dog cart.” “What o’clock was it?” asked M^r Hamilton. “Ah, weel, it was no sae late, nor it was no sae early,” was the reply, and M^r Hamilton, with a hasty “good morning” hurried on, convinced that this must be the direction his son had taken.

On entering the next town, two or three miles further on, he entered the hotel and ordered breakfast, and as the waiter was laying the cloth, carelessly asked, “Did you happen to see a young gentleman in a dog-cart pass through here yesterday morning, waiter?” “Young gentleman in a dog cart, sir? yizzr,” was the ready reply, “put up here, sir, ordered dinner, tea and a bed, sir, for dinner, sir,” rapidly counting on his fingers, “salmon and lobster sauce, roast-chicken, two beers, one wine, one bread; tea and a bed, sir, had a glass of brandy before he went to bed sir; a pipe and the newspaper, sir, not got up yet, sir.” “Tell him a gentleman wishes to see him, when comes down,” “see him sir? yizzr.” and the

waiter rapidly vanished. M^r Hamilton waited anxiously, and about 9 o'clock, the door opened and the young gentleman entered.

Ch. 7

"My kingdom for a horse!" Shakespeare.

Quoted from *Richard III* by William Shakespeare

Such was the suddenness and violence with which Sidney was attacked that he lost his hold of the cart and fell to the ground: instantly starting up, for he had received no more serious injury than a bruise on the shoulder, he followed closely and perceived his friend the carter, who had stopped his horse at the first alarm, engaged in a murderous contest with the robber. The moment seemed favourable: he lightly vaulted over the back rail of the cart and approached the scene of conflict, but, before he reached it, his friend had disappeared, and the robber, who did not know of any one else being in the cart, began flogging on the horse, but in another moment Sidney had got him by the arm, flung him over the shaft, and taken possession of the reins. His attempts to pull up however were vain, for the animal, alarmed both at the unusual noise he heard going on behind, and at the strange hand he felt guiding him, took the bit between his teeth, and broke into a furious gallop. Sidney pulled violently at the reins for some time, but without effect, and he now gradually awoke to the disagreeable consciousness that he was being run away with by a spirited horse, alone, in a cart, on a road he did not know, and at night! He felt that his only course was to sit still and keep quiet, and he did so, as far as the jolting of the vehicle would allow him. He now began to descend a steep hill, and perceived to his alarm that the horse was gradually swerving to the right where the road shelved into a gravel pit: he attempted to turn to the other side of the road, but the animal was now beyond all control, the pace increased every instant, and in another moment horse cart and man were precipitated headlong into it.

Ch. 8

"I give thee all."

Quoted from *My Heart and Lute* by Thomas Moore

In a burst of parental feeling, entirely forgetting all ideas of anger and reproof, M^r Hamilton rose from his seat to meet his son, and threw himself upon his neck. Instead however of receiving the affectionate and filial embrace he expected, he received a tremendous blow in each eye, followed by another in the chest which felled him to the ground. On looking up he encountered the face of a stranger, his fists convulsively clenched, and his eyes glaring with fiery: "I'll tell you what, you old hypocrite," were the first words he managed to articulate, "you'd better not try to come that dodge over me again: I'm not going to have my pockets picked by a sham father for nothing, *I* can tell you: you'll find I'm not so easily done as all that," and, ringing the bell violently, he instantly dispatched the waiter for a policeman: meanwhile he seated himself in a chair to prevent the escape of his victim. "Sir, sir," began M^r Hamilton in broken and subdued accents, "there—has—been—some—some mistake—here—I believe!" "There *has* been some mistake," replied the stranger with a bitter sneer, "I've an idea *you* mistook your mark a *little* when you supposed I was green enough to be taken in by your tricks, you old vagabond: but I'm too old a bird to be

caught with chaff." "No but, I assure you," expostulated his miserable prisoner. "I had no idea—I didn't think—" "You didn't think I was up to the dodge, hey, old fellow?" replied the young man, "was that it? well, one lives and one learns, you see." At his moment the waiter returned with a constable, into whose custody M^r Hamilton was at once committed, after attempting a rambling defence, which the young man cut short at once with, "there, you'd better not waste your sweetness on the desert air, it's no go, I assure you, take him away, constable."

Ch. 9

"Is this the hend?" Dickens.

Quoted from *The Life and Adventures of Nicholas Nickleby* by Charles Dickens

On recovering his consciousness, Sidney perceived a number of people standing round, some were raising the horse and cart, some were leaning over him, and curiously touching him to discover if any bones were broken, "Poor body," said one woman who was bathing his temples with vinegar, "poor body, he's smashed all to nothing, I expect." "Not quite," said Sidney with a smile; the woman was delighted at finding him alive, and, as the others were removing the horse, which had been killed by the fall, and collecting the broken pieces of the cart, she lifted him up, and took him into her cottage which was close by; she then left him, having seated him in a chair, and soon returned with a doctor. "There are no bones broken, I assure you, good woman," said he, rapidly and skilfully examining Sidney, "the system has received a slight shake, but that is all. Give him a little brandy, and he'll be quite well again in a few hours."

His predictions were fulfilled; Sidney rapidly recovered, and, having rewarded his kind friend with something more solid than thanks, he once more set off on his return home, for his recent adventure had cooled his head, and he was anxious to be reconciled with his father. Having arrived at the post town which was a few miles off his home, he felt too faint to go further without refreshment: he accordingly ordered dinner at the inn, and strolled into the town to while away the half hour which the waiter said must elapse before it could be ready, "and if you'd like to go into the town, sir," said the waiter, "there's a most curious case being tried at the police court, there is indeed, sir. It a case of assault with robbery, I believe, sir, but it's a most curious case, sir. You see, sir, the prisoner pretended he was the other's father, sir; threw his arms round him, sir, kissed him, cried, sir, real tears, I assure you, sir, I saw them myself, sir, and it's a most curious case, I assure you, sir."

"Thank you," said Sidney, "I think I'll just look in," and with these words he departed. Having entered the court, and taken his seat among the spectators, he carelessly cast eyes around him: suddenly a flush overspread his features, what? could that be Edmund Tracy in the witness box? and his father at the bar? it was indeed! oh! day of horrors! he concealed his face, and anxiously listened to the proceedings.

"It's my opinion," said the worthy magistrate, "that it was a mistake altogether, and therefore I think the wisest thing you can do sir, is to say no more about the matter. I think it's pretty clear he didn't intend to rob you." "Well, I suppose that'll be the best course," muttered Edmund Tracy, "and so," continued the magistrate, "the case is over, and you are free, M^r Hamilton."

A general rush was immediately made to the outer air, for the court was densely crowded, and in the street Sidney joined his father, "Father!" he cried,

but his father heard him not, "my watch is gone!" was his only cry, Sidney suddenly perceived it in Tracy's hand, knocked him down, got the watch and rejoined his father, "I forgive you, my son," he said, "but—oh—the horrors of that dreadful morning—there was a whole piece of toast left—unfinished—oh! my son—whatever you do—never—never again leave your breakfast unfinished!"

Ch. 1

“Love me, love my dog.”

Quoted from a proverb

“My dear Miss Primmins!” said the kind and comfortable lady, M^{rs} Cogsby, a burly good natured body, engaged in that most delightful occupation of gardening on a summer evening, which consisted of amputating a few dead rosebuds with an enormous and sanguinary looking knife, apparently constructed originally for the rather unusual purpose of murdering crocodiles, but which she employed on the present occasion with no more apparent emotion than if it were the most delicate lady’s penknife. “My dear Miss Primmins, you mustn’t think of going a *step* further, before you’ve come in, and had a glass of my elder wine. Besides you hav’n’t seen my darling Guggy this *age*, and he’s *so* improved!”

The said darling Guggy was a rather overgrown boy of about 6 years old, the delight of his mother, and the utter detestation of all the neighbourhood, who were miserably victimised by M^{rs} Cogsby for whole evenings together, admiring him and hearing of his performances. He was always carried into the room by his mother’s express desire, though it was noticed by the more observant of her visitors that the nurse only took him up outside the door, indeed it was impossible for any human nurse to have carried him 10 yards without dropping.

“Rely, mem,” began the present victim, a sickly decayed looking young lady, of considerably over 70, who screwed all her words with some difficulty out of one of the smallest mouths, “rely, Mem, I kiddnt think of intrewding on your seclusion.” But M^{rs} Cogsby would hear of no excuse, and she was soon seated in the parlour, where in the course of half-an-hour, 8 or 10 other victims were assembled, and the darling Guggy was introduced.

“Oh! what a charming boy!” was the general exclamation on his first appearance, the charming boy meanwhile standing at his mother’s knee with his thumb in his mouth, vouchsafing not a word to any of the company; “I really must show you,” began M^{rs} Cogsby, “a remarkable production of Guggy’s. It’s a portrait of his father, wonderfully like him, (a universal elevation of eye-brows) only the poor dear man wouldn’t look at it, when I shewed it him today, but went off in a fluff.” (Probably a combination of flurry & huff, a confusion of words being one of M^{rs} Cogsby’s peculiarities.) At this moment a gentle knock was heard at the door.

Ch. 2

“They mock the air.” Gray

Quoted from *The Bard* by Thomas Gray

On the door being opened, M^r Cogsby senior timidly entered the room: he cast an anxious glance around him, detected Miss Primmins in the act of examining his portrait, and with a faint shriek of horror, sunk into a chair: M^{rs} Cogsby flew to him, and by dint of a well-directed battery of the most energetic slaps on the back, succeeded in restoring the vital spark. “My dear Alfred,” she murmured reproachfully in his ear, as soon as she saw signs of returning consciousness, “to think that *you* should yield to this weakness! *you*, to whom I’m sure I’ve been *more* than a mother—” “I beg your pardon, ma’am,” interposed a tall, pale young man, leaning over a chair, with the large head of a small stick constantly in his mouth, “but do you happen to be his—*grandmother*?” “Sir!” said M^{rs} Cogsby with a withering glance, which silenced him in a moment. Even in that awful moment she had the presence of mind to ring the bell, “Show that *person* out!” said she faintly, and the young man, rather astounded at the effect of his speech, followed the indignant maid-servant, who saw that her mistress had received *some* insult, though what it was she was by no means clear.

The danger over, M^{rs} Cogsby began to think it was *her* turn to have a scene, and accordingly began, “The brute! the beast!!! to call—a young lady—n-not thirty—t-to call her—a gran-an-an-mother—oh!” and here, having reached the climax, she fell, executing her favourite manœuvre of sinking upon a sofa in a picturesque attitude. The next moment a yell of agony was heard from Guggy, the feet of that beauteous infant being just discernible protruding from under his mother’s dress.

Ch. 3

“Foremost fighting fell.”

Quoted from
Waterloo by Lord
Byron

A series of vigorous little kicks were being applied to M^{rs} Cogsby on one side by her pet son, while her anxious female friends were employing all sorts of un-heard-of restoratives on the other. Miss Primmins, with a whole handful of burnt feathers in one hand, and a bottle of hartshorn in the other, was the most conspicuous among them. M^r Cogsby had disappeared at the first moment of alarm: he now reappeared with a smile of satisfaction on his face, and before any one could interpose to prevent him, soused his wife with the whole contents of a very large bucket of water. All symptoms of fainting vanished in an instant, and M^{rs} Cogsby with wrath and revenge in her flashing eye, rose up from her recumbent position, seized her terrified husband by the ear, and led him from the room: the miserable Guggy whom no one compassionated, was left in a crushed and wafer-like condition on the sofa, where he was found by the maid-servant, hours afterwards, howling frantically.

Shrieks and blows resounded from the next room, and the female visitors, stopping their ears, rushed out of the house, leaving the unhappy M^r Cogsby to his fate. The gentlemen were only too glad to follow them, and no one was left, save and except one deaf old gentleman, who hadn’t the smallest notion of what had been going on, and now remained sitting in the corner, with his legs crossed, and a calm and placid smile settled on his face.

What followed in M^r Cogsby’s house, it is not for us to say: Miss Primmins, on arriving at home was seized with violent hysterics.

Ch. 4

“A tale of the times of old!” *Ossian*.

Quoted from *The poems of Ossian* by James Macpherson

The deepest antipathy and most violent disgust may be got over in the slow course of time, and though for the next six months she was injured innocence personified, though she expressed the most utter abhorrence of the Cogsby conduct, and made solemn vows never again to enter the Cogsby residence, yet when M^{rs} Cogsby issued her invitations to her annual ball on New-years-day there was no one who obeyed the summons with greater alacrity, or arrived more punctually to the time, than Miss Primmins. Clad in a low satin dress of the deepest Prussian blue, with a tiara of jewels on her head, her auburne ringlets gracefully falling over her shoulders, (honestly her’s, for she had payed for them) and her fair complexion (likewise honestly her’s) blooming in all the fresh ruddiness of youth, no one who saw her then would have imagined her to be the ordinary, every-day Miss Primmins, with her sallow face, known to be the most malicious and spiteful gossip in the town, any more than he would have imagined her to be the Emperor of Russia.

And M^r Augustus Bymm was there too, contrite for all past offences, and forgiven by M^{rs} Cogsby, and of course the charming Guggy was introduced in the drawingroom, who after treading on three gentlemen’s toes, pushing a plate of cake into a lady’s lap, and deluging the table with coffee, was finally sent to bed roaring for upsetting the lamp over Miss Primmins.

All hands were immediately at work to “put out” Miss Primmins, who, enwrapped in flames, was at last enveloped by M^r Augustus Bymm in a hearthrug, and finally extinguished. This was hardly done when a more horrifying event took place. M^r Cogsby’s heels were seen for a moment balancing on the sill of the open window, the next he had vanished.

Ch. 5

“Surprising!” *Crabbe*.

Quoted from *Squire Thomas or The Precipitate Choice* by George Crabbe

All rushed to the window: the ill-fated M^r Cogsby was seen stuck in one of the flowerbeds in an inverted position, quivering like an aspen tree: it appeared that the unhappy gentleman had been gradually backing from the scene of conflagration, overcome with horror at the accident which had befallen Miss Primmins, until he had at length backed out of the room in the manner described in the former chapter. M^r Augustus Bymm was on the spot in a moment, uprooted the half-suffocated M^r Cogsby, and bore him in his arms into the house, where he consigned him to the maternal solicitude of his wife, (he did not venture to call it *grand*-maternal on *this* occasion,) and returned in a high state of self-gratulation to the smouldering Miss Primmins, who, overcome by her feelings, took off her (false) diamond necklace on the *spot*, and begged to present it to him with her compliments as a token of her heartfelt gratitude.

Order being at length restored among the agitated guests, and M^{rs} Cogsby having returned with the pleasing intelligence that the only result of M^r Cogsby’s fall had been a stiff neck and a slight attack of alloverishness, conversation proceeded in its usual train, and Miss Primmins, taking her seat by M^{rs} Cogsby’s side, begged to ask her advice in an important matter: “she was thinking,” she said, “of giving a little juvenile party in a few days, but did not *quite* know

how to manage it.” “no? were you really?” exclaimed M^{rs} Cogsby rapturously, “how delightful! well, I’m sure I’ll give you every assistance I can. I shall have no objection to let you have my darling Guggy for the occasion, who I’m sure will be the life and soul of the whole thing.” “Why, no, not, exactly,” said Miss Primmins, coughing nervously to hide her confusion as she had not foreseen this offer and her whole object had been to avoid the presence of that much-detested child, “I did not exactly ask you for *him*, you know, M^{rs} Cogsby.” “I *know* you did not, my dear Miss Primmins,” said M^{rs} Cogsby, affectionately laying her hand upon her arm, “your natural delicacy was too great for you to try to separate a mother from her darling infant, however much you might wish to do so, but I need hardly say that I have *full* confidence in your prudence and experience, and do not hesitate to trust my precious child to your care, no, and should not, if he were a hundred Guggy’s!”

Miss Primmins shuddered at the idea, and proceeded rather less hopefully than before. “But you see, M^{rs} Cogsby, that—I’m *so* nervous! and really—a number—of children,—that is—I did’n’t mean to say—but—you understand what I mean—in fact—for these reasons—I fear I must—decline—the—the—company—of—your—precious Guggy.” “My dear Miss Primmins,” replied M^{rs} Cogsby.

Ch. 6

“Go, call a coach.” Crononhotonthologus.

Quoted from
Chrononhotonthologos
by Henry Carey

“My *dear* Miss Primmins,” said M^{rs} Cogsby, “I understand your wishes, and be assured I will act accordingly.” “Thank you, thank you,” returned that agitated lady. “I am sure you understand—what I wish—that is, you know—I didn’t mean to say it—but better than I could express it myself.” “Yes, yes, I perfectly understand you,” replied M^{rs} Cogsby and here the two ladies parted, the one to seek out M^r Augustus Bymm, and again assure him that she wasn’t in the least hurt, only frightened, and that her sense of gratitude to him would survive to the latest moment of her life, the other to spend the rest of the evening in boasting among her lady-guests of the attainments of her Guggy.

The auspicious day at length arrived, and Miss Primmins, with trembling hands, was herself ornamenting the dishes which she intended to form the repast of her juvenile guests, her loud and imperious maid assisting, or rather hindering, continuously grumbling at her mistress for her ignorance and in the same breath complaining of the trouble these things always gave, and regularly winding up her paragraphs with, “there, I told you so, you’d better let me do it!” snatching the dish or other article out of her hands. One by one her little guests dropped in, shy, timid, and shrinking. “How d’you do, my dears,” began Miss Primmins, “won’t you take off your bonnets?” “There, you’d better let me do it!” remarked her maid in a surly undertone. When all had arrived, Miss Primmins was joyfully counting heads when the door opened and in marched Master George Cogsby.

Ch. 7

“A sight of horror.” Thomson.

Quoted from *The Four Seasons: Summer* by James Thomson

Master George Cogsby, who, as the reader already knows, rejoiced in the mellifluous sobriquet of Guggy, entered the room, and Miss Primmins, in whose face the most intense disgust was vividly depicted, rose to meet him. "My *darling* child," she began, "I am *delighted* to see you, how is your dear mother?" "don't know," was the darling's intelligent reply, and Miss Primmins turned to her other guests saying "Well, I *hope* you'll all enjoy yourselves," with a look which plainly added, "but I don't think you've much chance, now!" She then occupied herself in setting her little visitors to games &c but master Guggy would do nothing, join in nothing, but kept going round the room, pinching the guests, and enjoying their screams: at last he took his station by Miss Primmins herself, who was playing a brisk polka for the enlivenment of the company in general.

After listening with the profoundest attention for some time, during which he was unscrewing three wires in the inside of the piano, he suddenly asked "Is that part of the tune Miss Prim?" "Is what part of the tune, precious?" "Putting your tongue in your cheek." "No, love," she hastily replied and rising from her seat, sought another part of the room. The delightful infant then proceeded to examine the internal arrangement of the instrument, and ended in breaking off the pedal.

At last, when he had produced universal dissatisfaction among the children, and set three little girls crying, Miss Primmins thought it time to summon them to tea in another room. A magnificent cake stood at the top of the table: Miss Primmins dispensed half of it among her guests in large slices, and then left the room for some wine: on her return she missed the remainder, "Jane," she asked in a confidential whisper, "what have you done with the rest of the cake?" "If you please 'm," was the reply in an equally low whisper, "if you please 'm, Master Cogsby's eaten it!"

Ch. 8

"The hour is almost come." Shakespeare.

Quoted from *Hamlet*
by William
Shakespeare

Miss Primmins turned to Master Cogsby in horror; that infant's hand grasped a huge hunch of the cake, his cheeks were distended to their fullest extent, his jaws making a feeble attempt to move. Uttering a scream of passion she struck the cake out of his hands, and seizing his hair with one hand, administered such a shower of heavy blows on his back, that the cake was instantly swallowed, to the imminent danger of the darling's life, and from the beauteous lips of Guggy there issued forth such a horrid discordant yell, as sent the whole of the party out of the room, stopping their ears, to shut out the dreadful noise.

Miss Primmins bore it for full 20 seconds, retaining her hold of his hair, and then, finding that the noise, instead of abating was getting worse, and without check or inspiration, was gradually rising to a climax, which would beat 3 steam-engines screaming together into fits, she deserted her post, and fled upstairs into the drawing room, where her other guests were assembled.

Even there the voice of Guggy was plainly heard, echoing through the house, making the walls ring again. As a last resource she rang for a maid, and giving her a pitcher of water, screamed in her ear, so as to make herself heard above the din, "Be so good as to take this jug down to the dining room, and pour it *all over Master Cogsby!*" The maid departed, and Miss Primmins seated herself,

mentally counting the moments which must elapse before she could get down stairs. "Now," she thought, "she's on the second landing, and now she's passing the stair window. Now she's in the hall, she must have got to the dining room door by this time, and now—" The noise had been gradually dying away during these thoughts, and the party were beginning to hope that it would soon stop, but just as Miss Primmins had reached this exact point in her calculations, the house was shaken from top to bottom, and such a sudden and intensely terrible roar thundered in her ears, as can only be compared to the explosion of a large powder mill, blowing up with it a menagerie of wild beasts. Five of the party fainted away on the spot: the rest, crouching down on the floor, clung to one another in mute and agonizing terror, and when the last echo of the frightful sound had died away, the only sound that was to be heard in the house was the gasping of the terrified Miss Primmins.

The silence that succeeded was almost as terrible as the noise, & Miss Primmins, as soon as she recovered herself, hastened trembling down stairs and found Guggy, considerably discomposed, but quite quiet, standing by the table, with his mouth open, dripping like a drowned rat. The pitcher was empty on the floor, and by it was extended the unfortunate maid, in a fainting fit.

Ch. 9

The next day Miss Primmins left the place, and a few months afterwards, M^{rs} Cogsby received a couple of wedding cards, with a slice of bride-cake from, "*M^r and M^{rs} Bymm.*"

3.3 The Village School

“Teach the young idea how to shoot.” Cowper.

Quoted from *The Seasons. Spring* by James Thomson

Methought I visited a village school: the mistress was reported to be mild and kind to the children, so that they all loved her, and I wished to see the fact with my own eyes, as I entered lessons were going on, “Sally Brown! don’t talk or you’ll catch it!” “Please’m, I wasn’t talking!” “Don’t answer! go into the coal hole!” (pushes her in, and locks the door) “and,” (calling through the door) “and there you’ll stay till midnight.” “John Dobbs! don’t wink!” (gives him a violent blow on the back) “Don’t hurt that little boy,” I ventured to observe, “Hold your tongue, sir! it’s none of your business!” “Don’t move! Mary Jones!” “Please’m will you let out Sally? it was me that was talking.” “Oh! it was you, was it? well, take that,” (knocks her down,) “but I ca’n’t let *her* out now.” “Don’t look at me! Jack Burns!” (pushes him into the fire.) Methought I left the school.

3.4 The Walking-Stick of Destiny

Source: The Rectory Umbrella

All chapters end with “(continued at page . . .)” (“at” missing in some cases) in the original, this has not been reproduced here.

Ch. 1

The Baron was pacing his tapestried chamber two mortal hours ere sunrise.¹ Ever and anon he would pause at the open casement, and gaze from its giddy height² on the ground beneath. Then a stern smile³ would light up his gloomy brow, and muttering to himself in smothered accents, “twill do” he would again resume his lonely march.

Uprose the glorious sun, and illumined⁴ the darkened world with the light of day: still was the haughty Baron pacing his chamber, albeit his step was hastier and more impatient than before, and more than once he stood motionless, listening anxiously and eagerly, then turned with a disappointed air upon his heel, while a darker shade passed over his brow. Suddenly the trumpet⁵ which hung at the castle gate gave forth a shrill⁶ blast: the Baron heard it, and savagely beating his breast with both his clenched fists, he murmured in bitter tone “the time draws nigh, I must nerve myself for action.” Then, throwing himself into an easy chair, he hastily drank⁷ off the contents of a large goblet of wine which stood on the table, and in vain attempted to assume an air of indifference. The door was suddenly thrown open and in a loud voice an attendant announced “Signor Blowski!”

“Be seated! Signor! you are early this morn, and Alonzo! ho! fetch a cup of wine for the Signor! spice⁸ it well, boy! ha! ha! ha!” and the Baron laughed loud and boisterously, but the laugh was forced and hollow,⁹ and died quickly away. Meanwhile the stranger, who had not uttered a syllable, carefully divested himself of his hat and gloves,¹⁰ and seated himself opposite to the Baron, then having quietly waited till the Baron’s laughter had subsided, he commenced in a harsh grating tone, “The Baron Muggzwig greets you, and sends you this;” why did a sudden paleness overspread the Baron Slogdod’s features? why did his fingers tremble, so that he could scarcely open the letter? for one moment he glanced at it, and then raising his head, “taste the wine, Signor,” he said in strangely altered tone, “regale yourself, I pray,” handing him one of the goblets which had just been brought in.

¹i. e. probably at about 3 o’clock in the morning.

⁷drinking wine was his constant occupation.

⁸hot spiced wine was much drunk in those days, vide page 627.

⁹the voice was sometimes hollow as well as the laugh, vide page 631.

¹⁰vide his exit without either, next page.

The Signor received it with a smile, put his lips to it, and then quietly changing goblets with the Baron without his perceiving it, swallowed half the contents at a draught. At that moment Baron Slogdod looked up, watched him for a moment as he drank, and smiled the smile of a wolf.¹¹

For full ten minutes there was a dead silence through the apartment, and then the Baron closed the letter, and raised his face: their eyes met: the Signor had many a time faced a savage tiger at bay without flinching, but now he involuntarily turned away his eyes. Then did the Baron speak in calm and measured tone: “you know, I presume, the contents of this letter?” the Signor bowed, “and you await an answer?” “I do:” “*this*, then, is my answer,” shouted the Baron, rushing upon him, and in another moment he had precipitated him from the open window. He gazed after him for a few seconds as he fell, and then tearing up the letter which lay on the table into innumerable pieces, he scattered them to the wind.

Ch. 2

One! two! three!” The magician set down the bottle, and sank exhausted into a seat: “nine weary hours,” he sighed, as he wiped his smoking brow, “nine weary hours have I been toiling, and only got to the eight-hundred and thirty-second ingredient! a-well! I verily believe Martin Wagner¹² hath ordered three drops of everything on the face of this earth in his prescription.¹³ However there are only a hundred and sixty-eight¹⁴ ingredients more to put in—’twill soon be done—then comes the seething¹⁵—and then—” He was checked in his

¹⁵boiling.

soliloquy by a low timid rap outside: “’tis Blowski’s knock,” muttered the old man, as he slowly undid the bars and fastenings of the door, “I marvel what brings *him* here at this late hour. He is a bird¹⁶ of evil omen: I do mistrust his vulture face.¹⁷—Why! how now, Signor?” he cried, starting back in surprise as his visitor entered, “where got you that black eye? and verily your face is bruised like any rainbow!¹⁸ who has insulted you? or rather,” he muttered in an under tone, “whom have you been insulting, for that were the more likely of the two.”

“Never mind my face, good father,” hastily answered Blowski, “I only tripped up, coming home last night in the dark, that’s all, I do assure you. But I am now come on other business—I want advice—or rather I should say I want your opinion—on a difficult question—suppose a man was to—suppose two men—suppose there were two men, A and B¹⁹—” “suppose! suppose!” contemptuously muttered the magician, “and suppose these men, good father, that is A, was to bring B a letter, then we’ll suppose A read the letter, that is B, and then B tried—I mean A tried—to poison B—I mean A²⁰—and then suppose”—“my son,” here interposed the old man, “is this a general case you are putting? Methinks you state it in a marvellously confused manner.” “*Of course* it’s a general case,” savagely answered Blowski, “and if you’d just listen instead of interrupting, methinks you’d understand it better!” “Proceed, my son,” mildly replied the other.

“And then suppose A—that is B—threw A out of the window—or rather,” he added in conclusion, being himself by this time a little confused, “or rather I should have said the other way.” The old man rubbed his beard,²¹ and mused for some time: “aye, aye,” he said at length, “I see, A—B—so so²²—B poisons A—” “No! no!” cried the signor, “B *tries* to poison A, he didn’t really do it, I

¹⁶we have a similar expression “a jail-bird.”

¹⁷this the artist has not ventured to depict.

²²meaning, “yes, yes.”

changed the—I mean,” he hastily added, turning crimson as he spoke, “you’re to *suppose* that he doesn’t really do it.” “Aye!” continued the magician, “it’s all clear *now*—B—A—to be sure—but what has all this to do with your cut²³ face?” he suddenly asked. “Nothing whatever,” stammered Blowski, “I’ve told you once that I cut my face by a fall from my horse—” “ah! well! let’s see,” repeated the other in a low voice, “tripped up in the dark—fell from his horse—hm! hm!—yes, my lad, *you’re* in for it—I should say,” he continued in a louder voice, “it were better—but troth I know not yet what the question is.” “Why, what had B better do,” said the signor. “But who is B?” inquired the magician, “standeth B for Blowski?” “No,” was the reply, “I meant A.” “Oh!” returned he, “*now* I perceive—but verily I must have time to consider it, so adieu, fair²⁴ sir,” and, opening the door he abruptly showed his visitor out: “and now,” said he to himself, “for the mixture—let me see—three drops of—yes, yes, my lad, *you’re* in for it.²⁵”

Ch. 3

It had struck twelve o’clock two minutes and a quarter. The Baron’s footman²⁶ hastily seized a large goblet,²⁷ and gasped with terror as he filled it with hot, spiced wine. “’Tis past the hour, ’tis past,” he groaned in anguish, “and surely I shall now get the red hot poker the Baron hath so often promised me, oh! woe is me! would that I had prepared the Baron’s lunch²⁸ before!” and, without pausing a second he grasped in one hand the steaming goblet and flew

along the lofty passages with the speed of a race horse. In less time than we take to relate it he reached the Baron's apartment, opened the door, and—remained standing on tiptoe, not daring to move one way or the other, petrified with utter astonishment. “Now then! donkey!” roared the Baron, “why stand you there staring your eyes out like a great toad²⁹ in a fit of apoplexy?” (the Baron was remarkably choice in his similes;) “what's the matter with you? speak out! can't you?”

The unfortunate domestic made a desperate effort to speak, and managed at length to get out the words “Noble Sir!” “Very good! that's a very good beginning!” said the Baron in a rather pacified tone for he liked being called “noble,” “go ahead! don't be all day about it!” “Noble Sir!” stammered the alarmed man, “where—where—ever—is—the stranger?” “Gone!” said the Baron sternly and emphatically, pointing unconsciously his thumb over his right shoulder, “gone! he had other visits to pay, so he *condescended*³⁰ to go and pay them—but where's my wine?” he abruptly asked, and his attendant was only too glad to place the goblet in his hands, and get out of the room.

The Baron drained the goblet at a draught,³¹ and then walked to the window: his late victim was no longer to be seen, but the Baron, gazing on the spot where he had fallen muttered to himself with a stern³² smile, “methinks I see a dint³³ in the ground.” At that moment a mysterious looking figure³⁴ passed by, and the Baron, as he looked after him, could not help thinking “I wonder who that is!” long time he gazed after his retreating footsteps, and still the only thought which rose to his mind was “I do wonder who that is!”

Ch. 4.

Down went the western sun, and darkness was already stealing³⁵ over the earth when for the second³⁶ time that day the trumpet which hung at the Baron's

²⁹it is doubtful whether the Baron thought him most like a donkey or a toad.

gate was blown. Once more did the weary domestic ascend to his master's apartment, but this time it was a stranger whom he ushered in, "M^r Milton Smith"! The Baron hastily rose from his seat at the unwonted³⁷ name, and advanced to meet his visitor.

"Greetings fair, noble sir," commenced the illustrious visitor, in a pompous tone and with a toss³⁸ of the head, "it betided me to hear of your name and abode, and I made high resolve to visit and behold you 'ere night!" "Well, fair sir, I hope you are satisfied with the sight," interrupted the Baron, wishing to cut short a conversation he neither understood nor liked. "It rejoiceth me," was the reply, "nay, so much so that I could wish to prolong the pleasure, for there is a Life and Truth³⁹ in those tones which recall to me scenes of earlier days—" "does it indeed?" said the Baron, considerably puzzled; "ay soothly," returned the other, "and now I bethink me," walking to the window, "it was the country likewise I did desire to look upon; 'tis fine, is't not?" "It's a very fine country,⁴⁰" replied the Baron, adding internally, "and I wish you were well out of it!"

The stranger stood some minutes gazing out of the window, and then said, suddenly turning to the Baron, "you must know, fair sir, that I am a poet!" "Really?" replied he, "and pray what's that?" M^r Milton Smith made no reply, but continued his observations, "perceive you, mine host, the enthusiastic⁴¹ halo which encircles yon tranquil mead?" "The quickset hedge, you mean;" remarked the Baron rather contemptuously, as he walked up to the window. "My mind," continued his guest, "feels alway a bounding—and a longing—for—what is True and Fair⁴² in Nature, and—and—see you not the gorgeous rusticity—I mean sublimity, which is wafted over, and as it were intermingled with the verdure—that is, you know, the grass?" "Intermingled with the grass? oh! you mean the butter-cups⁴³?" said the other, "yes, they've a very pretty effect." "Pardon me," replied M^r Milton Smith, "I meant not that, but—but I could almost poetise thereon!"

"Lovely meadow, thou whose fragrance

⁴³a sign of bad land, and as it was the Baron's estate, we may guess from this that he was not rich. A further proof of this may be found in page 633.

“Beams beneath the azure sky,

“Where repose the lowly—” “vagrants,”⁴⁴ suggested the Baron: “vagrants!” repeated the poet, staring with astonishment, “yes, vagrants, gipsies you know,” coolly replied his host, “there are very often some sleeping down in the meadow.” The inspired⁴⁵ one shrugged his shoulders, and went on

“Where repose the lowly violets,” “violets doesn’t rhyme half as well as vagrants,” argued the Baron, “can’t help that,” was the reply:

“Murmuring gently”—“oh my eye!”⁴⁴ said the Baron, finishing the line for him, “so there’s one stanza done, and now I must wish you good night; you’re welcome to a bed, so, when you’ve done poetising, ring the bell, and the servant will show you where to sleep.” “Thanks,” replied the poet, as the Baron left the room.

“Murmuring gently with a sigh—Ah! *that’s* all right,” he continued when the door was shut, and leaning out of the window he gave a low whistle. The mysterious figure in a cloak immediately emerged⁴⁶ from the bushes, and said in a whisper, “all right?” “*all right,*” returned the poet, “I’ve sent the old covey⁴⁷ to sleep with some poetry, by the bye I nearly forgot that stanza you taught me, I got into *such* a fix! However the coast is clear now, so look sharp.” The figure then produced a rope ladder from under his cloak, which the poet proceeded to draw up.

⁴⁴the Baron had evidently a good ear for rhyme.

⁴⁵quasi-inspired.

⁴⁶came out of.

⁴⁷the “o” long.

Ch. 5

Reader! dare you enter once more the cave of the great Magician? If your heart be not bold, abstain: close these pages: read no more. High in air suspended hung the withered forms of two black cats; between was an owl, resting on a self-supported hideous viper.

The spiders were crawling on the long grey hair of the great Astrologer, as he wrote with letters of gold an awful spell on the magic scroll which hung from the deadly viper's mouth. A strange figure like an animated⁴⁸ potatoe with arms and legs hovered over the mystic scroll, and appeared to be reading the words upside down. Hark!

A shrill scream rolled round the cave, echoing from side to side till it died⁴⁹ away in the massive roof. Horror! yet did not the Magician's heart quail, albeit his little finger shook slightly thrice, and one of his grey hairs stood out straight from his head, erect with terror: there was one other that would have followed it's example, but a spider was hanging on it, and it could not.

A flash of mystic light, black⁵⁰ as the darkest ebony, now pervades the place, and in it's momentary gleam the owl is seen to wink once. Dread omen! Did it's supporting viper hiss? Ah no! that would be *too* terrible! In the deep dead silence which followed this thrilling event, a solitary sneeze was distinctly heard from the left hand cat. Distinct, and now the Magician *did* tremble. "Gloomy spirits of the vasty deep!" he murmured in faltering tone, as his aged limbs seemed about to sink beneath him, "I did not call for ye: why come ye?" He spoke, and the potatoe answered, in hollow tone: "Thou didst!" then all was silence.

The magician recoiled in terror. What! bearded⁵¹ by a potatoe!⁵² never! He smote his aged breast in anguish, and then collecting strength to speak, he

⁴⁸it had a "hollow" voice and probably was something akin to "fishs." vide page 1930.

⁴⁹after it's death it's ghost appeared. page 632.

⁵⁰it is difficult to imagine what black light can look like. It may be obtained by pouring ink over a candle in a darkroom.

⁵¹vide page 626.

⁵²the potatoe's history should be carefully remembered, as it is important.

shouted, "Speak but the word again, and on the spot I'll boil thee!" There was an ominous pause, long, vague, and mysterious. What is about to happen? The potatoe sobbed audibly, and it's thick showering tears were heard falling heavily down on the rocky floor. Then slow, clear, and terrible came the awful words: "Gobno strodgol slok slabolgo^{53!}" and then in a low hissing whisper "'tis time!"

"Mystery! mystery!" groaned the horrified Astrologer, "The Russian war cry! oh Slogdod! Slogdod! what hast thou done?" He stood expectant, tremulous; but no sound met his anxious ear, nothing but the ceaseless dribble of the far off waterfall. At length a voice said "now!" and at the word the right hand cat fell with a heavy thump to the earth. Then an Awful Form⁵⁴ was seen, dimly looming through the darkness: it prepared to speak, but a universal cry⁵⁵ of "corkscrews!" resounded through the cave, and with a noiseless howl it vanished. A rapid fluttering was now heard pervading the whole cave, three⁵⁶ voices cried "yes!" at the same moment, and it was light. Dazzling light, so that the Magician shuddering closed his eyes, and said, "it is a dream, oh that I could wake!" He looked up, and cave, Form, cats, everything were gone: nothing remained before him but the magic scroll and pen, a stick of red sealing wax, and a lighted wax taper.

"August potatoe!" he muttered, "I obey your potent voice." Then sealing up the mystic roll, he summoned a courier, and dispatched it: "haste for thy life, post! haste! haste! for thy life post! haste!" were the last words the frightened man heard dinned in his ears as he galloped off.

Then with a heavy sigh the great magician turned back into the gloomy cave, murmuring in a hollow tone, "now for the toad^{57!}"

⁵³this is quoted from Punch: it is there stated that after singing this the soldiers are never known to give or receive quarter.

⁵⁴the ghost of the shrill scream. vide page 631.

⁵⁷vide page 634. the toad was always necessary to magical rites, see Shakespeare's "Macbeth."

Ch. 6

Hush! The Baron slumbers! two men with stealthy steps are removing his strong-box.⁵⁸ It is very heavy, and their knees tremble, partly with the weight, partly with fear. He snores and they both start: the box rattles, not a moment is to be lost, they hasten from the room. It was very, very hard to get the box out of the window but they did it at last, though not without making noise enough to waken ten ordinary sleepers: the Baron, luckily for them, was an *extraordinary* sleeper.

At a safe distance from the castle they set down the box, and proceeded to force off the lid. Four mortal hours⁵⁹ did M^r Milton Smith and his mysterious companion labour thereat: at sunrise it flew off with a noise louder than the explosion of fifty powder-magazines,⁶⁰ which was heard for miles and miles around. The Baron sprang from his couch at the sound, and full furiously did he ring his bell: up rushed the terrified domestic, and tremblingly related when he got down stairs again, how “his Honour was wisely frustrated, and pitched the poker⁶¹ at him more than ordinary savage-like!” But to return to our two adventurers: as soon as they recovered from the swoon into which the explosion had thrown them, they proceeded to examine the contents of the box. M^r M. Smith timidly put his head into it, his companion still remaining stretched on the ground, and being too lazy to get up.

M. Smith drew a long breath, and ejaculated, “Well! I never!” “Well! you never!” angrily repeated the other, “what’s the good of going on like that? just tell us what’s in the box, and don’t make such an ass of yourself!” “My dear fellow!” interposed the poet, “I give you my honour—” “I wouldn’t give twopence⁶² for your honour;” retorted his friend, savagely tearing up the grass by handfuls, “give me what’s in the box, that’s a deal more valuable.” “Well but you won’t hear me out, I was just going to tell you; there’s nothing whatever in the box but a walkingstick! and that’s a fact; if you won’t believe me, come and look yourself!” “You don’t say so!” shouted his companion, springing to his feet, his laziness gone in a moment, “surely there’s more than that!” “I tell you there isn’t!” replied the poet rather sulkily, as he stretched himself on the grass.

The other one however turned the box over, and examined it on all sides before he would be convinced, and then carelessly twirling the stick on his forefinger he began: “I suppose it’s no use taking *this* to Baron Muggzwig? it’ll be no sort of use.” “Well, I don’t know!” was the somewhat hesitating reply, “it might be as well—you see he didn’t say what he expected—” “I know that, you

⁵⁸it’s contents, as afterwards appears were very small. vide page 629, note (43).

⁵⁹probably they began at about one o’clock.

⁶⁰the amount of this noise can only be guessed at, as the experiment has never been tried.

⁶¹probably red hot. vide page 627.

⁶²we may therefore conclude it to have been worth about three-half-pence, “honour among thieves” is a proverbial expression, so they most likely had about three-pennyworth between them.

donkey!" interrupted the other impatiently, "but I don't suppose he expected a walkingstick! if that had been all, do you think he'd have given us ten dollars a piece to do the job?" "I'm sure I can't say," muttered the poet: "well! do as you please then!" said his companion angrily, and flinging the walkingstick at him as he spoke he walked hastily away.

Never had he of the hat and cloak thrown away such a good opportunity of making his fortune! At twelve⁶³ o'clock that day a visitor was announced to Baron Muggzwig, and our poet entering placed the walkingstick in his hands. The Baron's eyes flashed with joy, and hastily placing a large purse of gold in his hand he said, "adieu for the present, my dear friend! you shall hear from me again!" and then he carefully locked up the stick muttering, "nothing is now wanting but the toad!"

Ch. 7

The Baron Muggzwig was fat.⁶⁴ Far be it from the humble author of these pages to insinuate that his fatness exceeded the bounds of proportion, or the manly beauty of the human figure, but he certainly was fat, and of that fact there is not the shadow of a doubt. It may perhaps have been owing to this fatness of body that a certain thickness and obtuseness of intellect was at times perceptible in the noble Baron. In his ordinary conversation he was, to say the least of it, misty and obscure, but after dinner or when at all excited his language certainly verged on the incomprehensible. This was perhaps owing to his liberal use of the parenthesis without any definite pause to mark the different clauses of the sentence. He used to consider his arguments unanswerable, and they certainly were so perplexing, and generally reduced his hearers to such a state of bewilderment and stupefaction, that few ever ventured to attempt an answer to them.

He usually however compensated⁶⁵ in length for what his speeches wanted in clearness, and it was owing to this cause that his visitors, on the morning we are speaking of had to blow the trumpet at the gate three times before they were admitted, as the footman was at that moment undergoing a lecture from his master, supposed to have reference to the yesterday's dinner, but which, owing to a slight admixture of extraneous matter in the discourse, left on the footman's mind a confused impression that his master had been partly scolding him for not keeping a stricter watch on the fishing trade, partly setting forth his own private views on the management of railway shares, and partly finding fault with the bad arrangement of financial affairs⁶⁶ in the moon.

In this state of mind it is not surprising that his first answer to their question, "is the Baron at home?" should be, "the fish, sir, was the cook's affair, I

⁶³so that it was a 7 hours' walk from Baron Slogdod's to Baron Muggzwig's.

⁶⁴this Laconic commencement bears some resemblance to Hood's "My aunt Shakerly was of enormous bulk," in his "Whims and Oddities." It is hardly necessary to state which was the original.

⁶⁵the author must be understood to say that length *is* any compensation for clearness, though there certainly have been orators who seem to have held that opinion.

⁶⁶our range of information on this subject is extremely limited. There would appear to be an over-hasty precipitation in the conduct of its inhabitant, who is related to have "come down too soon."

had nothing whatsoever to do with it," which on reflection he immediately afterwards corrected to, "the trains was late, so it was impossible as the wine could come sooner." "The man is surely mad or drunk!" angrily exclaimed one of the strangers, no other than the mysterious man in a cloak: "not so," was the reply in gentle voice, as the great magician stepped forward, "but let me interrogate him—ho! fellow!" he continued in a louder tone, "is thy master at home?" The man gazed at him for a moment like one in a dream, and then suddenly recollecting himself he replied, "I begs pardon, gentlemen, The Baron *is* at home: would you please to walk in?" and with these words he ushered them up stairs.

On entering the room they made a low obeisance, and the Baron starting from his seat exclaimed with singular rapidity, "and even if you have called on behalf of Slogdod that infatuated wretch and I'm sure I've often told him—" "we have called," gravely interrupted the magician, "to ascertain whether—" "yes" continued the excited⁶⁷ Baron, "scores of times aye scores of times I have and you may believe me or not as you like for though—" "to ascertain," persisted the magician, "whether you have in your possession,⁶⁸ and if so—" "but yet" broke in Muggzwig, "he always would and as he used to say if—" "and if so," shouted the man in a cloak despairing of the Magician ever getting through the sentence, "to know what you would like to be done with regard to Signor Blowski." So saying, they retired a few steps, and waited for the Baron's reply, and their host, without further delay delivered the following remarkable⁶⁹ speech: "and though I have no wish to provoke the enmity which considering the provocations I have received and really if you reckon them up they are more than any mortal man let alone a Baron for the family temper has been known for years to be beyond nay the royal family themselves will hardly boast of considering too that he has so long a time kept which I shouldn't have found out only that rascal Blowski said and how he could bring himself to tell all those lies I ca'n't think for I always considered him quite honest and of course wishing if possible to prove him innocent⁷⁰ and the walkingstick since it is absolutely necessary in such matters and begging your pardon I consider the toad and all that humbug but that's between you and me and even when I had sent for it by two of my bandits⁷¹ and one of them bringing it to me yesterday for which I gave him a

⁶⁷wherefore excited? the thoughtful reader will doubtless enquire. the only circumstance we can offer in explanation is his recent squabble with the footman.

⁶⁸understand "the Walking-stick of Destiny."

⁶⁹It is hoped that a ready solution of any little difficulties and inconsistencies which may have occurred in the course of the story will be found by the attentive reader, in this speech, no less remarkable for its rapid change of subject, than for its uninterrupted flow.

⁷⁰the reader will naturally ask in what his guilt consisted, and for an answer we can only refer him to the first chapter.

⁷¹this explains who the man in the cloak was.

purse of gold and I hope he was grateful for it and though the employment of bandits is at all times and particularly in this case if you consider the but even on account of some civilities he showed me though I daresay there was something and by-the-bye perhaps that was the reason he pitched himself I mean him out of the window for—” here he paused, seeing that his visitors in despair had left the room. Now, Reader, prepare yourself for the last chapter.

Ch. 8 and last

All was silence.⁷² The Baron Slogdod was seated in the hall of his ancestors, in his chair of state, but his countenance wore not it’s usual expression of calm content: there was an uncomfortable restlessness about him which betokened a mind ill at ease, for why? closely packed in the hall around, so densely wedged together as to resemble one vast living ocean without a gap or hollow, were seated seven thousand human beings: all eyes were bent upon him, each breadth was held in eager expectation, and he felt, he felt in his inmost heart, though he vainly endeavoured to conceal his uneasiness under a forced and unnatural smile, that something awful was about to happen. Reader! if your nerves are not adamant, turn not this page!

Before the Baron’s seat there stood a table: what sat thereon? well knew the trembling crowds, as with blanched cheek and tottering knees they gazed upon it, and shrank from it even while they gazed: ugly, deformed, ghastly and hideous it sat, with large dull eyes, and bloated cheeks, the magic toad!

All feared and loathed it, save the Baron only, who, rousing himself at intervals from his gloomy meditations, would raise his toe, and give it a sportive⁷³ kick, of which it took not the smallest notice. *He* feared it not, no, deeper terrors possessed *his* mind, and clouded his brow with anxious thought.

Beneath the table was crouched a quivering mass, so abject and grovelling as scarce to bear the form of humanity: none regarded, and none pitied it.

Then outspoke the magician: “The man I accuse,⁷⁴ if man indeed he be, is—Blowski!” At the word, the shrunken form arose, and displayed to the horrified assembly the well-known vulture face: he opened his mouth to speak, but no sound issued from his pale and trembling lips . . . a solemn stillness settled on all around . . . the magician raised the walking-stick of destiny, and in thrilling accents pronounced the fatal words: “recreant vagabond! misguided reprobate! receive thy due deserts!” . . . Silently he sank to the earth . . . all was dark for a moment, . . . returning light revealed to their gaze . . . a heap of mashed potatoe⁷⁵ . . . a globular form faintly loomed through the darkness, and howled once audibly, then all was still. Reader, our tale is told.

⁷²This chapter, it is hoped, will clear up all the mystery in the story.

⁷³sportive in fact only, but the gloomy mind of the Baron was far from entertaining any sportive thoughts at that moment.

⁷⁴it may well be asked “of what?” and the author regrets he cannot furnish an answer.

⁷⁵many have vainly asked the author, “what had he done?” He don’t know.

A Tale

Chap: I.

'Respond! Respond! oh Muse!'
Goldsmith.

It was a glowing summer morning: the Orient sun had long risen, and gilded with his dazzling beam the topmost fane of Tom, the great tower of Christ Church. Out of the Eastern gate, known by the name of Canterbury, is walking a young man, solitary, downcast. His years are scarcely enough for a clergyman, and yet he wears a white neck-cloth and bands. Who can he be, and where is he going? Let us follow him: he approaches a vast range of buildings, ugly and un-architectural: they are called 'the schools.' As he passes along, men in the street, lounging against doorposts, look up for a moment, roused by the passing footfall, gaze on his retreating form, remark to a companion, 'On'y one o' them 'varsity coves in for a little go;' and resume their listless attitude. They notice nothing of that calm expansive brow, those eyes glistening with the fire of genius, those chiselled features: they know not *who* has passed and how should they? Let us follow him in. A long table, covered with books, and surrounded with chairs; two gloomy-browed examiners, and twelve pale-faced youths complete the picture. Seats, like those in a circus, slant up at the end of the room: these are crowded with spectators.

Chap: II.

'Veni, vidi, vici'
Caesar.

The youth is sitting at the table: before him lies a small edition of Sophocles. Sternly does the examiner remark, 'Go on at the four hundred and fiftieth line.' Slightly shading back with one hand an auburn curl from his ivory forehead, and resting his head peacefully on the other, in a low, musical tone, he commences. Some mistakes he makes, small and few: he is given two passages to translate—They are done: they are handed in: they are looked over. What is the examiner saying—'you may go.' All is over.

fragment of an unpublished novel by G. P. R. James

3.6 Wilhelm von Schmitz

Chapter I.

Source: The Whitby Gazette, September 7, 1854 (signature "B. B." and "(To be continued)" omitted here and following)

"'Twas Ever Thus." Old Play.

The sultry glare of noon was already giving place to the cool of a cloudless evening, and the lulled ocean was washing against the pier with a low murmur, suggestive to poetical minds of the kindred ideas of motion and lotion, when two travellers might have been seen, by such as chose to look that way, approaching the secluded town of Whitby by one of those headlong paths, dignified by the name of road, which serve as entrances into the place, and which were originally constructed, it is supposed, on the somewhat fantastic model of pipes running into a water-butt. The elder of the two was a sallow and careworn man; his features were adorned with what had been often at a distance mistaken for a moustache, and were shaded by a beaver hat, of doubtful age, and of appearance which, if not respectable, was at least venerable. The younger, in whom the sagacious reader already recognizes the hero of my tale, possessed a form which, once seen, could scarcely be forgotten: a slight tendency to obesity proved but a trifling drawback to the manly grace of its contour, and though the strict laws of beauty might perhaps have required a somewhat longer pair of legs to make up the proportion of his figure, and that his eyes should match rather more exactly than they chanced to do, yet to those critics who are untrammelled with any laws of taste, and there are many such, to those who could close their eyes to the faults in his shape and single out its beauties, though few were ever found capable of the task, to those above all who knew and esteemed his personal character, and believed that the powers of his mind transcended those of the age he lived in, though alas! none such has as yet turned up—to those he was a very Apollo.

What thought it had not been wholly false to assert that too much grease had been applied to his hair, and too little soap to his hands? that his nose turned too much up, and his shirt collars too much down? that his whiskers had borrowed all the colour from his cheeks, excepting a little that had run down into his waistcoat? Such trivial criticisms were unworthy the notice of any who laid claim to the envied title of the connoisseur.

He had been christened William, and his father's name was Smith, but though he had introduced himself to many of the higher circles in London under the imposing name of, "Mr. Smith, of Yorkshire," he had unfortunately not attracted so large a share of public notice as he was confident he merited: some had asked him how far back he traced his ancestry; others had been mean enough to hint that his position in society was not entirely unique; while the sarcastic enquiries of others touching the dormant peerage in his family, to which, it was suggested, he was about to lay claim, had awakened in the breast of the noble-spirited youth an ardent longing for that high birth and connection which an adverse Fortune had denied him.

Hence he had conceived the notion of that fiction, which perhaps in his case must be considered merely as a poetical licence, whereby he passed himself off

upon the world under the sounding appellation which heads this tale. This step had already occasioned a large increase in his popularity, a circumstance which his friends spoke of under the unpoetical simile of a bad sovereign fresh gilt, but which he himself more pleasantly described as, “—a violet pale, At length discovered in its mossy dale, And borne to sit with kings:” a destiny for which, as it is generally believed, violets are not naturally fitted.

The travellers, each buried in his own thoughts, paced in silence down the steep, save when an unusually sharp stone, or an unexpected dip in the road, produced one of those involuntary exclamations of pain, which so triumphantly demonstrate the connection between Mind and Matter. At length the younger traveller, rousing himself with an effort from his painful reverie, broke upon the meditations of his companion with an unexpected question, “Think you she will be much altered in feature? I trust me not.” “Think who?” testily rejoined the other; then hastily correcting himself, with an exquisite sense of grammar, he substituted the expressive phrase, “Who’s the she you’re after?” “Forget you then,” asked the young man, who was so intensely poetical in soul that he never even spoke in ordinary prose, “forget you the subject we conversed on but now? Trust me, she hath dwelt in my thoughts ever since.” “But now!” his friend repeated in sarcastic tone, “it is an hour good since you spoke last.” The young man nodded assent; “An hour? true, true. We were passing Lyth, as I bethink me, and lowly in thine ear was I murmuring that touching sonnet to the sea I writ of late, beginning, ‘Thou roaring, snoring, heaving, grieving main! which—’” “For pity’s sake!” interrupted the other, and there was real earnestness in that pleading tone, “don’t let us have it all again! I have heard it with patience once already.”

“Thou hast, thou hast,” the baffled poet replied: “well then, she shall again be the topic of my thoughts,” and he frowned, and bit his lip, muttering to himself such words as cooky, hookey, and crooky, as if he were trying to find a rhyme to something. And now the pair were passing near a bridge, and shops were on their left and water on their right; and from beneath uprose a confused hubbub of sailors’ voices, and, wafted on the landward breeze, came an aroma, dimly suggestive of salt herring, and all things from the heaving waters in the harbour to the light smoke that floated gracefully above the housetops, suggested nought but poetry to the mind of the gifted youth.

Chapter II.

Source: The Whitby Gazette, September 14, 1854

“And I, For One.” Old Play.

“But about she,” resumed the man of Prose, “what’s her name? you never told me that yet.” A faint flush crossed the interesting features of the youth; could it be that her name was unpoetical, and did not consort with his ideas of the harmony of nature? He spoke reluctantly and indistinctly; “Her name,” he faintly gasped, “is—Sukie.”

A long, low whistle was the only reply; thrusting his hands deep in his pockets, the elder speaker turned away, while the unhappy youth, whose delicate nerves were cruelly shaken by his friend’s ridicule, grasped the railing near him

to steady his tottering feet. Distant sounds of melody from the Cliff at this moment reached their ears, and while his unfeeling comrade wandered in the direction of the music, the distressed Poet hastily sought the Bridge, to give his pent-up feelings vent, unnoticed by the passers-by.

The sun was setting as he reached the spot, and the still surface of the waters below, as he crossed on to the Bridge, calmed his perturbed spirit, and sadly leaning his elbows on the rail, he pondered. What visions filled that noble soul, as, with features that would have beamed with intelligence, had they only possessed an expression at all, and a frown that only needed dignity to be appalling, he fixed upon the sluggish tide those fine though bloodshot eyes?

Visions of his early days; scenes from the happy time of pinafores, treacle, and innocence; through the long vista of the past came floating spectres of long forgotten spelling-books, slates scrawled thick with dreary sums, that seldom came out at all, and never came out right; tingling and somewhat painful sensations returned to his knuckles and the roots of his hair; he was a boy once more.

“Now, young man there!” so broke a voice upon the air, “tak whether o’ the two roads thou likes, but thou cant stop in’t middle!” The words fell idly on his ears, or served but to suggest new trains of reverie; “roads, aye, roads;” he whispered low, and then louder, as the glorious idea burst upon him, “aye, and am not I the Colossus of Rhodes?” he raised his manly form erect at the thought, and planted his feet with a firmer stride.

... Was it but a delusion of his heated brain? or stern reality? slowly, slowly yawned the Bridge beneath him, and now his footing is already grown unsteady, and now the dignity of his attitude is gone: he recks not, come what may; he is not a Colossus?

... The stride of a Colossus is possibly equal to any emergency; the elasticity of fustian is limited: it was at this critical juncture that “the force of nature could no further go,” and therefore deserted him, while the force of gravity began to operate in its stead.

In other words, he fell.

And the Hilda went slowly on its way, and knew not that it passed a Poet under the Bridge, and guessed not whose were those two feet, that disappeared through the eddying waters, kicking with spasmodic energy; and men pulled into a boat a dripping, panting form, that resembled rather a drowned rat than a Poet; and spoke to it without awe, and even said, “young feller;” and something about “greenhorn,” and laughed: what knew they of Poetry?

Turn we to other scenes: a long, low room, with high backed settles, and a sanded floor: a knot of men drinking and gossiping: a general prevalence of tobacco: a powerful conviction that spirits exist somewhere: and she, the fair Sukie herself, gliding airily through the scene, and bearing in those lily hands—what? Some garland doubtless, wreathed of the most fragrant flowers that grow? Some cherished volume, morocco-bound and golden-clasped, the works immortal of the bard of eld, whereon she loveth oft to ponder? Possibly, “The Poems of William Smith,” that idol of her affections, in two volumes quarto, published some years agone, whereof one copy only has as yet been sold, and that he bought himself—to give to Sukie. Which of these is it that the beauteous maiden carries with such tender care? Alas! none: it is those two “goes of arf-an-arf, warm without,” which have just been ordered by the guests in the taproom.

In a small parlour hard by, unknown, untended, though his Sukie was so

near, wet, moody, and dishevelled, sat the youth: the fire had been kindled at his desire, and before it he was now drying himself, but as “the cherry blaze, Blithe harbinger of wintry days,” to use his own powerful description, consisted at present of a feeble, spluttering faggot, whose only effect was to half-choke him with its smoke, he may be pardoned for not feeling, more keenly than he does, that “—fire of Soul, When, gazing on the kindling coal, A Britain feels that, spite of fone, He wots his native hearth his own!” we again employ his own thrilling words on the subject.

The waiter, unconscious that a Poet sat before him, was talking, confidently: he dwelt on various themes, and still the youth sat heedless, but when at last he spoke of Sukie, those dull eyes flashed with fire, and cast upon the speaker a wild glance of scornful defiance, that was unfortunately wasted, as its object was stirring the fire at the moment and failed to see it. “Say, oh say those words again!” he gasped. “I surely heard thee not aright!” The waiter looked astonished, but obligingly repeated his remark, “Hi were merely a saying, sir, that she’s an uncommon clever gyurl, hand as how, Hi were oping some day for to hacquire her Hart, hif so be that—” He said no more, for the Poet, with a groan of anguish, had rushed distractedly from the room.

Chapter III.

Source: The Whitby Gazette, September 21, 1854; Mischmasch (as newspaper cutting, plus illustration)

“Nay, ’tis too much!” Old Play.

Night, solemn night.

On the present occasion the solemnity of night’s approach was rendered far more striking than it is to dwellers in ordinary towns, by that time-honoured custom observed by the people of Whitby, of leaving their streets wholly unlighted: in thus making a stand against the deplorably swift advance of the tide of progress and civilization, they displayed no small share of moral courage and independent judgment. Was it for a people of sense to adopt every new-fangled invention of the age, merely because their neighbours did? It might have been urged, in disparagement of their conduct, that they only injured themselves by it, and the remark would have been undeniably true; but it would only have served to exalt, in the eyes of an admiring nation, their well earned character of heroic self-denial and uncompromising fixity of purpose.

Headlong and desperate, the love-lorn Poet plunged through the night; now tumbling up against a door-step, and now half down in a gutter, but ever onward, onward, reckless where he went.

In the darkest spot of one of those dark streets, (the nearest lighted shop window being about fifty yards off,) chance threw into his way the very man he fled from, the man whom he hated as a successful rival, and who had driven him to this pitch of frenzy. The waiter, not knowing what was the matter, had followed him to see that he came to no harm, and to bring him back, little dreaming of the shock that awaited him.

The instant the Poet perceived who it was, all his pent-up fury broke forth: to rush upon him, to grasp him by the throat with both hands, to dash him to

the ground, and there to reduce him to the extreme verge of suffocation—all this was the work of a moment.

“Traitor! villain! malcontent! regicide!” he hissed through his closed teeth, taking any abusive epithet that came into his head, without stopping to consider its suitability, “Is it thou? now shalt thou feel my wrath!” And doubtless the waiter did experience that singular sensation, whatever it may have been, for he struggled violently with his assailant, and bellowed “murder!” the instant he recovered his breath.

“Say not so,” the Poet sternly answered, as he released him, “it is thou that murderest me.” The waiter gathered himself up, and began in great surprise, “Why, Hi never—” “’Tis a lie!” the Poet screamed, “she loves thee not! Me, me alone.” “Who ever said she did?” the other asked, beginning to perceive how matters stood. “Thou! thou saidst it,” was the wild reply, “what, villain? acquire her heart? thou never shalt.”

The waiter calmly explained himself: “My ope were, sir, to hacquire her Hart of waiting at table, which she do perdigious well, sure-ly: seeing as ow Hi were thinking of happlying for to be ed-waiter at the otel.” The Poet’s wrath instantly abated, indeed, he looked rather crestfallen than otherwise; “Excuse my violence,” he gently said, “and let us take a friendly glass together.” “Hi hagree,” was the waiter’s generous answer, “but man halive, you’ve ruinated my coat!”

“Courage,” cried our hero gaily, “thou shalt have a new one anon: aye, and of the best cashmere.” “Hm!” said the other, hesitatingly, “well, Hi ardlly know—wouldn’t hany other stuff—” “I will not buy thee one of any other stuff,” returned the Poet, gently but decidedly, and the waiter gave up the point.

Arrived once more at the friendly tavern, the Poet briskly ordered a jorum of punch, and, on its being furnished, called on his friend for a toast. “Hi’ll give you,” said the waiter, who was of a sentimental turn, however little he looked like it, “hi’ll give you—Woman! She doubles our sorrows and alves our joys.” The Poet drained his glass, not caring to correct his companion’s mistake, and at intervals during the evening the same inspiring sentiment was repeated. And so the night wore away, and another jorum of punch was ordered, and another.

* * * * *

“Hand now hallow me,” said the waiter, attempting for about the tenth time to rise on to his feet and make a speech, and failing even more signally than he had yet done, “to give a toast for this appy hoccasion. Woman! she doubles—” but at this moment, probably in illustration of his favourite theory, he “doubled” himself up, and so effectually, that he instantly vanished under the table.

Occupying that limited sphere of observation, it is conjectured that he fell to moralizing on human ills in general, and their remedies, for a solemn voice was presently heard to issue from his retreat, proclaiming, feelingly though rather indistinctly, that “when the art of a man is hoppedressed with care——” here came a pause, as if he wished to leave the question open to discussion, but as no one present seemed competent to suggest the proper course to be taken in that melancholy contingency, he attempted to supply the deficiency himself with the remarkable statement “she’s hall my fancy painted er.”

Meanwhile the Poet was sitting, smiling quietly to himself, as he sipped his punch: the only notice he took of his companion’s abrupt disappearance was to

Quoted from *Alice Gray* by William Mee

help himself to a fresh glass, and say, "your health!" in a cordial tone, nodding to where the waiter ought to have been. He then cried "hear, hear!" encouragingly, and made an attempt to thump the table with his fist, but missed it. He seemed interested in the question regarding the heart oppressed with care, and winked sagaciously with one eye two or three times, as if there were a good deal he could say on that subject, if he chose: but the second quotation roused him to speech, and he at once broke into the waiter's subterranean soliloquy with an ecstatic fragment from the poem he had been just composing:

"What though the world be cross and crooky?
Of Life's fair flowers the fairest bouquet
I plucked, when I chose *thee*, my Sukie!

"Say, could'st thou grasp at nothing greater
Than to be wedded to a waiter?
And did'st thou deem thy Schmitz a traitor?

"Nay! the fond waiter was rejected,
And thou, alone, with flower-bedecked head,
Sitting, did'st sing of one expected.

"And while the waiter, crazed and silly,
Dreamed he had won that priceless lily,
At length he came, thy wished-for Willie.

"And then thy music took a new key,
For whether Schmitz be boor or duke, he
Is all in all to faithful Sukie!"

He paused for a reply, but a heavy snoring from beneath the table was the only one he got.

Chapter IV.

Source: The Whitby Gazette, September 28, 1854 (with minor differences as noted, without illustrations); Mischmasch

“Is this the hend?” Nicholas Nickleby

Quoted from *The Life and Adventures of Nicholas Nickleby* by Charles Dickens

Bathed in the radiance of the newly-risen sun, the billows are surging and bristling below the cliff, along which the Poet is thoughtfully wending his way. It may possibly surprise the reader that he should not ere this have obtained an interview with his beloved Sukie: he may ask the reason; he will ask in vain: to record with rigid accuracy the progress of events, is the sole duty of the historian: were he to go beyond that, and attempt to dive into the hidden causes of things, the why and the wherefore, he would be trespassing on the province of the metaphysician.

Scarcely observing, as he passed along, a row of newly built lodging-houses, a spacious Hotel, with excellent stabling and lock-up coach-houses, hot, cold, and shower-baths in the house, an omnibus and cabs attend the arrival and departure of each train,—a mysterious-looking wooden sugar-loaf, perched upon posts, with a handle to it above, suggesting the idea of an umbrella blown inside out,—and a series of grass-plots, shaped like saucers, he reached a small rising ground at the end of the gravel walk, where he found a seat commanding a view of the sea, and here he sunk down wearily.

For a while he gazed dreamily upon the expanse of ocean, then, struck by a sudden thought, he opened a small pocket book, and proceeded to correct and complete his last poem. Slowly to himself he muttered¹ the words “death,—saith,—breath,—” impatiently tapping the ground with his foot, “ah, that’ll do,” he said at last with an air of relief, “breath”:

“His barque hath perished in the storm,
Whirled by its fiery breath
On sunken rocks, his stalwart form
Was doomed to watery death.”

“That last line’s good,” he continued exultingly, “and on Coleridge’s principle of alliteration too, W, D, W, D, ‘was doomed to watery death.’”

“Say you so?”² growled a deep voice in his ear, “take care!”³ what you say will be used in evidence against you,—now it’s no use trying that sort of thing⁴, we’ve got you tight”: this last remark being caused by the struggles of the Poet, naturally indignant at being unexpectedly collared by two men from behind.

“He’s confessed to it, constable? you heard him?” said one of the two⁵, (who rejoiced in the euphonious title of Muggle, and whom it is almost superfluous to introduce to the reader as the elder traveler of Chapter I,) “it’s as much as his life is worth.” “I say, stow that —” warmly responded the other, “seems to me the gen’leman was a spouting potry.”

¹he muttered to himself

²“Take care,”

³(missing in the *Whitby Gazette*)

⁴trying that

⁵the first speaker

“What—what’s the matter?” here gasped our unfortunate hero, who had recovered his breath, “you—Muggle—what do you mean by it?”

“Mean by it!” blustered his quondam friend, “what do *you* mean by it, if you come to that? you’re an assassin, that’s what *you* are! where’s the waiter you had with you last night? answer me that!”

“The—the waiter?” slowly repeated the Poet, still stunned by the suddenness of his capture, “why, he’s dr——”

“I knew it!” cried his friend, who was at him in a moment, and choked up the unfinished word in his throat, “drowned, constable! I told you so—and who did it?” he continued, loosing his grasp a moment to obtain an answer.

The Poet’s answer, so far as it could be gathered, (for it came out in a very fragmentary state, and as it were by crumbs, in intervals of choking) was the following: “It was my—my—you’ll kill me—fault—I say, fault—I—I gave him—you—you’re suffoca—I say,—I gave him——” “—a push I suppose,” concluded the other, who here “shut off” the slender supply of breath he had hitherto allowed his victim, “and he fell in: no doubt. I heard some one had fallen off the bridge last night,” turning to the constable, “no doubt this unfortunate waiter. Now mark my words! from this moment I renounce this man as my friend: don’t pity him, constable! don’t think of letting him go to spare *my* feelings!”

⌊“Don’t wex yourself,” was the philosophic rejoinder, “I wouldn’t let him go—not for to spare the feelings o’ twenty sich.”⁶

⌊This reply, though it could scarcely be considered complimentary, seemed quite satisfactory to the exited Muggle, who now continued more calmly, “But don’t you go talking about poetry, constable, and trying to get him off that way, otherwise you *may* be—mark my words, I say you *may* be, acquitted as adversary before the fact!” a keen love for the use of law-terms, in which however he did not shine, being a marked trait in the character of Muggle.⁷

⌊The constable, who was chewing a straw, made no answer to this extraordinary communication, nor, to say the truth, did he appear at all interested in it.⁸ Some convulsive sounds ⌊were heard at this moment from⁹ the Poet, which, on attentive consideration, were found to be, “The punch—was—was too much—for him—it, ⌊quite¹⁰——”

“Miserable man!” sternly interposed Muggle, “can you jest about it! you gave him a punch, did you? and what then?”

“It quite—quite—upset him,” continued the unhappy Schmitz, in a sort of rambling soliloquy, which was here cut short by the impatience of the constable, and the party set forth on their return to the town.

⌊A small knot of people were assembled at the street corner to see the melancholy procession go past: the Poet was on the point of addressing them, and the words “Friends, Romans, countrymen,” rose to his lips, but on second thoughts he discarded the phrase, as inapplicable to the present occasion. Before, however, he was yet waving his right arm gracefully up and down in act to speak, a distant cry of “hinnocent! hinnocent!” was heard, and an unexpected character burst upon the scene.¹¹

⁶(paragraph missing in the *Whitby Gazette*)

⁷(paragraph missing in the *Whitby Gazette*)

⁸(missing in the *Whitby Gazette*)

⁹at this moment were heard from

¹⁰quite—it quite

¹¹(paragraph missing in the *Whitby Gazette*)

⌊The first impression the Poet formed of him was, that some baker's apprentice had gone mad, had been stopped in an attempt to drown himself, and escaped from his friends: the being in question had a white apron twisted about him in a mysterious manner, his hair was dripping with water, his eyes wild and rolling, and his manner desperate: and his whole vocabulary seemed to consist of the single word "hinnocent!" which he repeated without any pause, and with surprising emphasis.¹²

⌊A path was made for him to pass through the mob, and on arriving opposite the constable he suddenly¹³ broke into a speech, far more remarkable for energetic delivery, than for grammatical accuracy: "Hi've only just erd of it—Hi were ⌊asleep¹⁴ under table—avin taking more punch nor Hi could stand—him's as hinnocent as Hi ⌊ham¹⁵—howing to the punch, which uncommon good it were, but that's neither ere nor there—dead hindeed! Hi'd like to see im ⌊as¹⁶ said it!—Hi'm ⌊haliver¹⁷ than yer, a precious sight!"

This speech produced ⌊different¹⁸ effects on its hearers: the constable calmly released his man, ⌊and with the parting words, "All right, young 'un; wish you joy," turned on his heel whistling, and departed¹⁹: the bewildered Muggle ⌊plunged his hands into his pockets, and muttered²⁰ "Impossible! conspiracy—perjury—have it tried at assizes": while the happy Poet rushed into the arms of his deliverer, crying in a broken voice, "No, never from this hour to part, We'll live and love so true!" a sentiment which the waiter did not echo with the cordiality that might have been expected.

⌊From this transport of gratitude and delight he awoke to feel a gentle touch on his shoulder, and to see the fair Sukie herself bending over him: their meeting was—, but on second thoughts we abandon the description as hopeless: it transcends the feeble powers of language.²¹

⌊It was in the course of the same day, when Wilhelm and his Sukie²² were sitting conversing with the waiter and a ⌊few mutual friends²³, ⌊that²⁴ the penitent Muggle suddenly entered the room, placed a folded paper on the knees of Schmitz, pronounced in a hollow tone the affecting words "be happy!", vanished, and ⌊was no more seen²⁵.

After perusing the paper, ⌊the Poet²⁶ rose to his feet, ⌊and the grace of his attitude struck all present: (one of his friends afterwards compared it to the Belvidere Apollo, but the simile is supposed to be exaggerated). The inspiration of the moment roused him²⁷ into unconscious and extempore verse, ⌊positively

for the first and last time within the memory of man²⁸.

“My Sukie! he hath bought, yea, Muggle’s self,
Convinced at last of deeds unjust and foul,
The licence of a vacant public-house,
Which, with it’s chattels, site, and tenement,²⁹
He hands us over,—we are licensed here,
Even in this document, to sell to all
Snuff, pepper, vinegar, to sell to all
Ale, porter, spirits, but—observe you well—
‘Not to be drunk upon the premises!’
Oh, Sukie! heed it well! in other places,
Even as thou listest, be intoxicate:
Drink without limit whiles thou art abroad,
But never, never, in thy husband’s house!”

So we leave him: his after happiness who dares to doubt? has he not Sukie?

²⁸(missing in the *Whitby Gazette*)

²⁹Instead of this and all the rest of the poem:

We are licensed here to sell to all,
Spirits, porter, snuff, and ale!”

and having her, he is content, or, to use the more graceful and expressive language of the sympathetic waiter, with whose words we conclude the tale, he “henvies no hother³⁰ man on³¹ hearth, owever many may ate *im*.” *B. B.*

3.7 Photography Extraordinary

Source: The Comic Times, November 3, 1855; Mischmasch (as newspaper cuttig)

The recent extraordinary discovery in Photography, as applied to the operations of the mind, has reduced the art of novel-writing to the merest mechanical labour. We have been kindly permitted by the artist to be present during one of his experiments; but as the invention has not yet been given to the world, we are only at liberty to relate the results, suppressing all details of chemicals and manipulation.

The operator began by stating that the ideas of the feeblest intellect, when once received on properly prepared paper, could be “developed” up to any required degree of intensity. On hearing our wish that he would begin with an extreme case, he obligingly summoned a young man from an adjoining room, who appeared to be of the very weakest possible physical and mental powers. On being asked what we thought of him, we candidly confessed that he seemed incapable of anything but sleep: our friend cordially assented to this opinion.

The machine being in position, and a mesmeric rapport established between the mind of the patient and the object glass, the young man was asked whether he wished to say anything; he feebly replied “Nothing.” He was then asked what he was thinking of, and the answer, as before, was “Nothing.” The artist on this pronounced him to be in a most satisfactory state, and at once commenced the operation.

After the paper had been exposed for the requisite time, it was removed and submitted to our inspection; we found it to be covered with faint and almost illegible characters. A closer scrutiny revealed the following:—

“The eve was soft and dewy mild; a zephyr whispered in the lofty glade, and a few light drops of rain cooled the thirsty soil. At a slow amble, along the primrose-bordered path, rode a gentle-looking and amiable youth, holding a light cane in his delicate hand; the pony moved gracefully beneath him, inhaling as it went the fragrance of the roadside flowers: the calm smile, and languid eyes, so admirably harmonising with the fair features of the rider, showed the even tenor of his thoughts. With a sweet though feeble voice, he plaintively murmured out the gentle regrets that clouded his breast:—

“Alas! she would not hear my prayer!
Yet it were rash to tear my hair;
Disfigured, I should be less fair.

“She was unwise, I may say blind;
Once she was lovingly inclined;
Some circumstance has changed her mind.”

There was a moment’s silence; the pony stumbled over a stone in the path, and unseated his rider. A crash was heard among the dried leaves; the youth arose; a slight bruise on his left shoulder, and a disarrangement of his cravat, were the only traces that remained of this trifling accident.”

“This,” we remarked, as we returned the paper, “belongs apparently to the milk-and-water School of Novels.”

“You are quite right,” our friend replied, “and, in its present state, it is of course utterly unsaleable in the present day: we shall find, however, that the

next stage of development will remove it into the strong-minded or Matter-of-Fact School." After dipping it into various acids, he again submitted it to us: it had now become the following:—

"The evening was of the ordinary character, barometer at 'change': a wind was getting up in the wood, and some rain was beginning to fall; a bad look-out for the farmers. A gentleman approached along the bridle-road, carrying a stout knobbed stick in his hand, and mounted on a serviceable nag, possibly worth some £40 or so; there was a settled business-like expression on the rider's face, and he whistled as he rode; he seemed to be hunting for rhymes in his head, and at length repeated, in a satisfied tone, the following composition:—

"Well! so my offer was no go!
She might do worse, I told her so;
She was a fool to answer 'No.'
"However, things are as they stood;
Nor would I have her if I could,
For there are plenty more as good."

At this moment the horse set his foot in a hole, and rolled over; his rider rose with difficulty; he had sustained several severe bruises, and fractured two ribs; it was some time before he forgot that unlucky day."

We returned this with the strongest expression of admiration, and requested that it might now be developed to the highest possible degree. Our friend readily consented, and shortly presented us with the result, which he informed us belonged to the Spasmodic or German School. We perused it with indescribable sensations of surprise and delight.

"The night was wildly tempestuous—a hurricane raved through the murky forest—furious torrents of rain lashed the groaning earth. With a headlong rush—down a precipitous mountain gorge—dashed a mounted horseman armed to the teeth—his horse bounded beneath him at a mad gallop, snorting fire from its distended nostrils as it flew. The rider's knotted brows—rolling eye-balls—and clenched teeth—expressed the intense agony of his mind—weird visions loomed upon his burning brain—while with a mad yell he poured forth the torrent of his boiling passion:—

"Firebrands and daggers! hope hath fled!
To atoms dash the doubly dead!
My brain is fire—my heart is lead!
"Her soul is flint, and what am I?
Scorch'd by her fierce, relentless eye.
Nothingness is my destiny!"

There was a moment's pause. Horror! his path ended in a fathomless abyss—
* * * A rush—a flash—a crash—all was over. Three drops of blood, two teeth, and a stirrup were all that remained to tell where the wild horseman met his doom."

The young man was now recalled to consciousness, and shown the result of the workings of his mind: he instantly fainted away.

In the present infancy of the art we forbear from further comment on this wonderful discovery; but the mind reels as it contemplates the stupendous addition thus made to the powers of science.

Our friend concluded with various minor experiments, such as working up a passage of Wordsworth into strong, sterling poetry: the same experiment was tried on a passage of Byron, at our request, but the paper came out scorched and blistered all over by the fiery epithets thus produced.

As a concluding remark: *could* this art be applied (we put the question in the strictest confidence)—*could* it, we ask, be applied to the speeches in Parliament? It may be but a delusion of our heated imagination, but we will still cling fondly to the idea, and hope against hope.

3.8 Novelty and Romancement

Source: The Train, October 1856; illustration by William M'Connell

Several typesetting errors have been fixed, punctuation changes are not noted.

A Broken Spell

By Lewis Carroll

I had grave doubts at first whether to call this passage of my life “A Wail,” or “A Pœan,” so much does it contain that is great and glorious, so much that is sombre and stern. Seeking for something which should be a sort of medium between the two. I decided, at last, on the above heading—wrongly, of course; I am always wrong; but let me be calm. It is a characteristic of the true orator never to yield to a burst of passion at the outset; the mildest of commonplaces are all he dare indulge in at first, and thence he mounts gradually;—“*vires acquirit eundo.*” (See cover.) Suffice it, then, to say, in the first place, that *I am Leopold Edgar Stubbs*. I state this fact distinctly in commencing, to prevent all chance of the reader’s confounding me either with the eminent shoemaker of that name, of Pottle-street, Camberwell, or with my less reputable, but more widely known, namesake, Stubbs, the light comedian, of the Provinces; both which connexions I repel with horror and disdain: no offence, however, being intended to either of the individuals named—men whom I have never seen, whom I hope I never shall.

So much for commonplaces.

Tell me now, oh! man, wise in interpretation of dreams and omens, how it chanced that, on a Friday afternoon, turning suddenly out of Great Wattles-street, I should come into sudden and disagreeable collision with an humble individual of unprepossessing exterior, but with an eye that glowed with all the fire of genius? I had dreamed at night that the great idea of my life was to be fulfilled. What was the great idea of my life? I will tell you. With shame or sorrow I will tell you.

My thirst and passion from boyhood (predominating over the love of taws and running neck and neck with my appetite for toffy) has been for poetry—for poetry in its widest and wildest sense—for poetry untrammelled by the laws of sense, rhyme, or rhythm, soaring through the universe, and echoing the music of the spheres! From my youth, nay, from my very cradle, I have yearned for poetry, for beauty, for novelty, for romancement. When I say “yearned,” I employ a word mildly expressive of what may be considered as an outline of my feelings in my calmer moments: it is about as capable of picturing the headlong impetuosity of my life-long enthusiasm as those unanatomical paintings which adorn the outside of the Adelphi, representing Flexmore in one of the many conceivable attitudes into which the human frame has never yet been reduced, are of conveying to the speculative pit-goer a true idea of the feats performed by that extraordinary compound of humanity and Indian-rubber.

I have wandered from the point: that is a peculiarity, if I may be permitted to say so, incidental to life; and, as I remarked on an occasion which time will not suffer me more fully to specify, “What, after all, *is* life?” nor did I find any one of the individuals present (we were a party of nine, including the waiter, and it was while the soup was being removed that the above-recorded observation was made) capable of furnishing me with a rational answer to the question.

Quoted from *Aeneid*
by Virgil, and motto
of the *Train*

The verses which I wrote at an early period of life were eminently distinguished by a perfect freedom from conventionalism, and were thus unsuited to the present exactions of literature: in a future age they will be read and admired, "when Milton," as my venerable uncle has frequently exclaimed, "when Milton and such like is forgot!" Had it not been for this sympathetic relative, I firmly believe that the poetry of my nature would never have come out; I can still recall the feelings which thrilled me when he offered me sixpence for a rhyme to "despotism." I never succeeded, it is true, in finding the rhyme, but it was on the very next Wednesday that I penned my well known "Sonnet on a Dead Kitten," and in the course of a fortnight had commenced three epics, the titles of which I have unfortunately now forgotten.

Seven volumes of poetry have I given to an ungrateful world during my life; they have all shared the fate of true genius—obscurity and contempt. Not that any fault could be found with their contents; whatever their deficiencies may have been, *no reviewer has yet dared to criticise them*. This is a great fact.

The only composition of mine which has yet made any noise in the world, was a sonnet I addressed to one of the Corporation of Muggleton-cum-Swillside, on the occasion of his being selected Mayor of that town. It was largely circulated through private hands, and much talked of at the time; and though the subject of it, with characteristic vulgarity of mind, failed to appreciate the delicate compliments it involved, and indeed spoke of it rather disrespectfully than otherwise, I am inclined to think that it possesses all the elements of greatness. The concluding couplet was added at the suggestion of a friend, who assured me it was necessary to complete the sense, and in this point I deferred to his maturer judgment:—

"When Desolation snatched her tearful prey
From the lorn empire of despairing day;
When all the light, by gemless fancy thrown,
Served but to animate the putrid stone;
When monarchs, lessening on the wildered sight,
Crumblingly vanished into utter night;
When murder stalked with thirstier strides abroad,
And redly flashed the never-sated sword;
In such an hour thy greatness had been seen—
That is, if such an hour had ever been—
In such an hour thy praises shall be sung,
If not by mine, by many a worthier tongue;
And thou be gazed upon by wondering men,
When such an hour arrives, but not till then!"

Alfred Tennyson is Poet Laureate, and it is not for me to dispute his claim to that eminent position; still I cannot help thinking, that if the Government had only come forward candidly at the time, and thrown the thing open to general competition, proposing some subject to test the powers of the candidate (say "Frampton's Pill of Health, an Acrostic"), a very different result might have been arrived at.

But let us return to our mutttons (as our noble allies do most unromantically express themselves), and to the mechanic of Great Wattles-street. He was coming out of a small shop—rudely built it was, dilapidated exceedingly, and in its

general appearance seedy—what did I see in all this to inspire a belief that a great epoch in my existence had arrived? Reader, I saw the sign board!

Yes. Upon that rusty signboard, creaking awkwardly on its one hinge against the mouldering wall, was an inscription which thrilled me from head to foot with unwonted excitement. “Simon Lubkin. Dealer in Romancement.” Those were the very words.

It was Friday, the fourth of June, half-past four, p. m.

Three times I read that inscription through, and then took out my pocket-book, and copied it on the spot; the mechanic regarding me during the whole proceeding with a stare of serious and (as I thought at the time) respectful astonishment.

I stopped that mechanic, and entered into conversation with him: years of agony since then have gradually branded that scene upon my writhing heart, and I can repeat all that passed, word for word.

Did the mechanic (this was my first question) possess a kindred soul, or did he not?

Mechanic didn’t know as he did.

Was he aware (this with thrilling emphasis) of the meaning of that glorious inscription upon his `signboard`¹?

Bless you, mechanic knew all about that ’ere.

Would mechanic (overlooking the suddenness of the invitation) object to adjourn to the neighbouring public-house, and there discuss the point more at leisure?

Mechanic would *not* object to a drain. On the contrary.

(Adjournment accordingly: brandy-and-water for two: conversation resumed.)

Did the article sell well, especially with the “*mobile vulgus*?”

Mechanic cast a look of good-natured pity on the questioner: the article sold well, he said, and the vulgars bought it most.

Why not add “Novelty” to the inscription? (This was a critical moment: I trembled as I asked the question.)

Not so bad an idea, mechanic thought: time was, it might have answered; but time flies, you see.

Was mechanic alone in his glory, or was there any one else who dealt as largely in the article?

Mechanic would pound it there was none.

What was the article employed for? (I brought this question out with a gasp, excitement almost choking my utterance.)

It would piece a’most anything together, mechanic believed, and make it solider nor stone.

This was a sentence difficult of interpretation. I thought it over a little, and then said, doubtfully, “you mean, I presume, that it serves to connect the broken threads of human destiny? to invest with a—with a sort of vital reality the chimerical products of a fertile imagination?”

Mechanic’s answer was short, and anything but encouraging: “mought be—
— I’s no scollard, bless you.”

At this point conversation certainly began to flag; I was seriously debating in my own mind whether this could really be the fulfilment of my life-cherished dream; so ill did the scene harmonise with my ideas of romance, and so painfully

¹accidently printed “sideboard”

did I feel my companion's lack of sympathy in the enthusiasm of my nature—an enthusiasm which has found vent, ere now, in actions which the thoughtless crowd have too often attributed to mere eccentricity.

I have risen with the lark—"day's sweet harbinger"—(once, certainly, if not oftener), with the aid of a patent alarum, and have gone forth at that unseemly hour, much to the astonishment of the housemaid cleaning the door steps, to "brush with hasty steps the dewy lawn," and have witnessed the golden dawn with eyes yet half-closed in sleep. (I have always stated to my friends, in any allusion to the subject, that my raptures at that moment were such that I have never since ventured to expose myself to the influence of excitement so dangerous. In confidence, however, I admit that the reality did not come up to the idea I had formed of it over night, and by no means repaid the struggle of getting out of bed so early.)

Quoted from *Address to Health* by H. S.

I have wandered in the solemn woods at night, and bent me o'er the moss-grown fountain, to lave in its crystal stream my tangled locks and fevered brow. (What though I was laid up with a severe cold in consequence, and that my hair was out of curl for a week? Do paltry considerations such as these, I ask, affect the poetry of the incident?)

I have thrown open my small, but neatly furnished, cottage tenement, in the neighbourhood of St. John's Wood, and invited an aged beggar in to "sit by my fire, and talk the night away." (It was immediately after reading Goldsmith's "Deserted Village." True it is that he told me nothing interesting, and that he took the hall-clock with him when he departed in the morning; still my uncle has always said that he wishes he had been there, and that it displayed in me a freshness and greenness of fancy (or "disposition," I forget which) such as he had never expected to see.)

Quoted from *The Deserted Village* by Oliver Goldsmith

I feel that it is incumbent on me to enter more fully into this latter topic—the personal history of my uncle: the world will one day learn to revere the talents of that wonderful man, though a want of funds prevents, at present, the publication of the great system of philosophy of which he is the inventor. Meanwhile, out of the mass of priceless manuscripts which he has bequeathed to an ungrateful nation, I will venture to select one striking specimen. And when the day arrives that my poetry is appreciated by the world at large (distant though it now appear!) then, I feel assured, shall his genius also receive its meed of fame!

Among the papers of that respected relative, I find what appears to have been a leaf torn from some philosophical work of the day: the following passage is scored. "Is this your rose? It is mine. It is yours. Are these your houses? They are mine. Give to me (of) the bread. She gave him a box on the ear." Against this occurs a marginal note in my uncle's handwriting: "some call this unconnected writing: I have my own opinion." This last was a favourite expression of his, veiling a profundity of ethical acumen on which it would be vain to speculate; indeed, so uniformly simple was the language of this great man, that no one besides myself ever suspected his possessing more than the ordinary share of human intellect.

May I, however, venture to express what I believe would have been my uncle's interpretation of this remarkable passage? It appears that the writer intended to distinguish the provinces of Poetry, Real Property, and Personal Property. The inquirer touches first on flowers, and with what a gush of generous feeling does the answer break upon him! "It is mine. It is yours." That is the beautiful,

the true, the good; these are not hampered by petty consideration of “meum” and “tuum;” these are the common property of men. (It was with some such idea as this that I drew up the once celebrated bill, entitled “An Act for exempting Pheasants from the operation of the Game Laws, on the ground of Beauty”—a bill which would, doubtless, have passed both Houses in triumph, but that the member who had undertaken the care of it was unfortunately incarcerated in a Lunatic Asylum before it had reached the second reading.) Encouraged by the success of his first question, our inquirer passes on to “houses” (“Real Property,” you will observe); he is here met by the stern, chilling answer, “They are mine”—none of the liberal sentiment which dictated the former reply, but in its place a dignified assertion of the rights of property.

Had this been a genuine Socratic dialogue, and not merely a modern imitation, the inquirer would have probably here interrupted with “To me indeed,” or, “I, for my part,” or, “But how otherwise?” or some other of those singular expressions, with which Plato makes his characters display at once their blind acquiescence in their instructor’s opinions, and their utter inability to express themselves grammatically. But the writer takes another line of thought; the bold inquirer, undeterred by the coldness of the last reply, proceeds from questions to demands, “give me (of) the bread;” and here the conversation abruptly ceases, but the moral of the whole is pointed in the narrative: “she gave him a box on the ear.” This is not the philosophy of one individual or nation, the sentiment is, if I may so say, European; and I am borne out in this theory by the fact that the book has evidently been printed in three parallel columns, English, French, and German.

Such a man was my uncle; and with such a man did I resolve to confront the suspected mechanic. I appointed the following morning for an interview, when I would personally inspect “the article” (I could not bring myself to utter the beloved word itself). I passed a restless and feverish night, crushed by a sense of the approaching crisis.

The hour came at last—the hour of misery and despair; it always does so, it cannot be put off forever; even on a visit to a dentist, as my childhood can attest with bitter experience, we are not forever getting there; the fatal door too surely dawns upon us, and our heart, which for the last half hour has been gradually sinking lower and lower, until we almost doubt its existence, vanishes suddenly downwards into depths hitherto undreamed of. And so, I repeat it, the hour came at last.

Standing before that base mechanic’s door, with a throbbing and expectant heart, my eye chanced to fall once more upon that signboard, once more I perused its strange inscription. Oh! fatal change! Oh! horror! What do I see? Have I been deluded by a heated imagination? A hideous gap yawns between the N and the C, making it not one word but two!

And the dream was over.

At the corner of the street I turned to take a sad fond look at the spectre of a phantom hope, I once had held so dear. “Adieu!” I whispered; this was all the last farewell I took, and I leant upon my walking-stick and wiped away a tear. On the following day I entered into commercial relations with the firm of Dumpy and Spagg, wholesale dealers in the wine and spirit department.

The signboard yet creaks upon the mouldering wall, but its sound shall make music in these ears nevermore—ah! nevermore.

3.9 The Legend of “Scotland”

Source: manuscript written for the daughters of Archbishop Longley, 1858

Being a true and terrible report touching the rooms of Auckland Castell, called Scotland, and of the things there endured by Matthew Dixon, Chaffer, and of a certain Ladye, called Gaunless of some, there apparent, and how that none durst in these days sleep therein, (belike through fear,) all which things fell out in ye days of Bishop Bec, of chearfull memorie, and were writ down by mee in the Yeere One Thousand Three Hundred and Twenty Five, in the Month February, on a certayn Tuesday and other days. *Edgar Cuthwellis.*

Now the said Matthew Dixon, having fetched wares unto that place, my Loods commended the same, and bade that hee should be entertained for that night, (which in sooth hee was, supping with a grete Appetite,) and sleep in a certayn roome of that apartment now called Scotland—From whence at Mid-night hee rushed forth with so grete a Scream, as awaked all men, and hastily running into those Passages, and meeting him so screaming, hee presentlie faynted away.

Whereon they hadde hym into my Loorde’s parlour, and with much ado set hym on a Chaire, wherefrom hee three several times split even to the grounde, to the grete admiration of all men.

But being stayed with divers Strong Liquors, (and, chifest, wyth Gin,) he after a whyle gave forth in a lamentable tone these following particulars, all which were presentlie sworn to by nine painful and stout farmers, who lived hard by, which witness I will here orderlie set downe.

Witness of Matthew Dixon, Chaffer, being in my right minde, and more than Fortie Yeeres of Age, though sore affrighted by reason of Sightes and Sounds in This Castell endured by mee, as touching the Vision of Scotland, and the Ghosts, all two of them, therein containd, and of A certayn straunge Ladye, and of the lamentable thyngs by her uttered, with other sad tunes and songs, by her and by other Ghosts devised, and of the coldness and shakynge of my Bones, (through sore grete feer,) and of other things very pleasant to knowe, chiefly of a Picture hereafter suddenlie to bee taken, and of what shall befall thereon, (as trulie foreshowne by Ghosts,) and of Darkness, with other things more terrible than Woordes and of that which Men call Chimera.

Matthew Dixon, Chaffer, deposeth: “that hee, having supped well over Night on a Green Goose, a Pasty, and other Condiments of the Bishop’s grete bountie provided, (looking, as he spake, at my Loorde, and essaying toe pull offe hys hatte untoe hym, but missed soe doing, for that hee hadde yt not on hys hedde,) soe went untoe hys bedde, where of a lang tyme hee was exercysed with sharp and horrible Dreems. That hee saw yn hys Dreem a young Ladye, habited, (not as yt seemed) yn a Gaun, but yn a certayn sorte of Wrapper, perchance a Wrap-Rascal.” (Hereon a Mayde of the House affirmed that noe Ladye woold weare such a thing, and hee answered, “I stand corrected,” and indeed rose from hys chaire, yet fayled to stand.)

Witness continued: “that ye sayde Ladye waved toe and froe a Grete Torche, whereat a thin Voyce shreeked ‘Gaunless! Gaunless!’ and Shee standyng yn the midst of the flor, a grete Chaunge befell her, her Countenance waxing ever more

and more Aged, and her Hayr grayer, shee all that tyme saying yn a most sad Voyce, ‘Gaunless, now, as Ladyes bee: yet yn yeeres toe come they shall not lacke for Gauns.’ At whych her Wrapper seemed slowlie toe melte, chaunging into a gaun of sylk, which puckered up and down, yes, and flounced itself out not a lyttle:” (at thys mye Loorde, waxing impatient, smote hym roundlie onne the hedde, bydding hym finish hys tale anon.)

Witness continued; “that the sayd Gaun thenne chaunged ytself into divers fashyons whych shall hereafter bee, loopyng ytself uppe yn thys place and yn that, soe gyving toe View ane pettycote of a most fiery hue, even Crimson toe looke upon, at whych dismal and blodethirstie sight he both groned and wepte. That at the laste the skyrt swelled unto a Vastness beyond Man’s power toe tell ayded, (as hee judged,) bye Hoops, Cartwheels, Balloons, and the lyke, bearing yt uppe within. That yt fylled alle that Chamber, crushing hym flat untoe hys bedde, tylle such as she appeared toe depart, fryzzling hys Hayre with her Torche as she went.

“That hee, awakyng from such Dreems, herd thereon a Rush, and saw a Light.” (Hereon a Mayde interrupted hym, crying out that there was yndeed a Rush-Light burning yn that same room, and woulde have sayde more, but that my Loorde checkt her, and sharplie bade her stow that, meening thereby, that she shoulde holde her peece.)

Witness continued: “that being mucche affrited thereat, whereby hys Bones were, (as hee sayde,) all of a dramble, hee essayed to leep from hys bedde, and soe quit. Yet tarried hee some wyle, not, as might bee thought from being stout of Harte, but rather of Bodye; whych tyme she chaunted snatches of old lays, as Maister Wil Shakespeare hath yt.”

Hereon my Loorde questioned what lays, bydding hym syng the same, and saying hee knew but of two lays: “‘Twas yn Trafalgar’s bay wee saw the Frenchmen lay,” and “There wee lay all that day yn the Bay of Biscay—O,” whych hee forthwyth hummed aloud, yet out of tune, at whych somme smyled.

Witness continued: “that hee perchance coulde chaunt the sayde lays wyth Music, but unaccompanied hee durst not.” On thys they hadde hym to the Schoolroom, where was a Musical Instrument, called a Paean-o-Forty, (meaning that yt hadde forty Notes, and was a Paean or Triumph of Art,) whereon two young ladyes, Nieces of my Loorde, that abode there, (lerning, as they deemed, Lessons; but, I wot, idlyng not a lyttle,) did wyth much thumpyng playe certyn Music wyth hys synging, as best they mighte, seeing that the Tunes were such as noe Man had herde before.

“Lorenzo dwelt at Heighington,
 (Hys cote was made of Dimity,
Least-ways yf not exactly there,
 Yet yn yt’s close proximity.
Hee called on mee—hee stayed to tee—
 Yet not a word he ut-tered,
Untyl I sayd, ‘D’ye lyke your bread
Dry?’ and hee answered ‘But-tered.’”

(Chorus whereyn all present joynd with fervour).

“Noodle dumb

Has a noodle-head,
I hate such noodles, *I* do.”

Witness continued: “that shee then appeared unto hym habited yn the same loose Wrapper, whereyn hee first saw her yn hys Dreem, and yn a stayd and piercing tone gave forth her History as followeth.”

The Ladye’s History

“On a dewie autumn evening, mighte have been seen, pacing yn the grounds harde by Aucklande Castell, a yong Ladye of a stiff and perky manner, yet not ill to look on, nay, one mighte saye, faire to a degree, save that haply that hadde been untrue.

“That yong Ladye, O miserable Man, was I” (whereon I demanded on what score shee held mee miserable, and shee replied, yt mattered not). “I plumed myself yn those tymes on my exceeding not soe much beauty as loftiness of Figure, and gretely desired that some Painter might paint my picture: but they ever were too hight, not yn skyll I trow, but yn charges.” (At thys I most humbly enquired at what charge the then Painters wrought, but shee loftily affirmed that money-matters were vulgar and that shee knew not, no, nor cared.)

“Now yt chaunced that a certyn Artist, hight Lorenzo, came toe that Quarter, having wyth hym a mervellous machine called by men a Chimera (that ys, a fabulous and wholly incredible thing;) where wyth hee took manie pictures, each yn a single stroke of Tyme, whiles that a Man might name ‘John, the son of Robin’ (I asked her, what might a stroke of Tyme bee, but shee, frowning, answered not).

“He yt was that undertook my Picture: yn which I mainly required one thyng, that yt shoulde bee at full-length, for yn none other way mighte my Loftiness bee trulie set forth. Nevertheless, though hee took manie Pictures, yet all fayled yn thys: for some, beginning at the Hedde reeched not toe the Feet; others, takyng yn the Feet, yet left out the Hedde; whereof the former were a grief unto myself, and the latter a Laughing-Stocke unto others.

“At these thyngs I justly fumed, having at the first been frendly unto hym (though yn sooth hee was dull), and oft smote hym gretely on the Eares, rending from hys Hedde certyn Locks, whereat crying out hee was wont toe saye that I made hys lyfe a burden untoe hym, whych thyng I not so much doubted as highlie rejoyced yn.

“At the last hee counselled thys, that a Picture shoulde bee made, showing so much skyrt as mighte reasonably bee gotte yn, and a Notice set below toe thys effect: ‘Item, two yards and a Half Ditto, and then the Feet.’ But thys no Whit contented mee, and thereon I shut hym ynto the Cellar, where hee remaned three Weeks, growing dayly thinner and thinner, till at the last hee floted up and downe like a Feather.

“Now yt fell at thys tyme, as I questioned hym on a certyn Day, yf hee woulde nowe take mee at full-length, and hee replying untoe mee, yn a little moning Voyce, lyke a Gnat, one chaunced to open the Door: whereat the Draft before hym uppe ynto a Cracke of the Ceiling, and I remaned awaytyng hym, holding uppe my Torche, until such time as I also faded ynto a Ghost, yet stickyng untoe the Wall.”

Then did my Loorde and the Companie haste down ynto the Cellar, for to see thys straunge sight, to whych place when they came, my Loorde bravely drew hys sword, loudly crying “Death!” (though to whom or what he explained not); then some went yn, but the more part hung back, urging on those yn front, not soe largely bye example, as Words of cheer: yet at last all entered, my Loorde last.

Then they removed from the wall the Casks and other stuff, and founde the sayd Ghost, dredful toe relate, yet extant on the Wall, at which horrid sight such screams were raysed as yn these days are seldom or never herde: some faynted, others bye large drafts of Beer saved themselves from that Extremity, yet were they scarcely alive for Feer.

Then dyd the Ladye speak unto them yn suchwise:—

“Here I bee, and here I byde,
Till such tyme as yt betyde
That a Ladye of thys place,
Lyke to mee yn name and face,
(Though my name bee never known,
My initials shall bee shown,)
Shall be fotograffed aright—
Hedde and Feet bee both yn sight—
Then my face shall disappear,
Nor agayn affrite you heer.”

Then sayd Matthew Dixon unto her, “Wherefore holdest thou uppe that Torche?” to whych shee answered, “Candles Gyve Light”: but none understood her.

After thys a thyn Voyce sayd from overhedde:

“Yn the Auckland Castell cellar,
Long, long ago,
I was shut—a brisk young feller—
Woe, woe, ah woe!
To take her at full-lengthe
I never hadde the strengthe
Tempore (and soe I tell her)
Praeterito!

Parody on *Long long ago*
by Thomas H.
Bayly

(Yn thys Chorus they durst none joyn, seeing that Latyn was untoe them a Tongue unknown.)

“She was hard—oh, she was cruel—
Long, long ago,
Starved mee here—not even gruel—
No, believe mee, no!—
Frae Scotland could I flee,
I’d gie my last bawbee,—
Arrah, bhoys, fair play’s a jhewel,
Lave me, darlints, goe!”

Then my Loorde, putting bye hys Sworde, (whych was layd up thereafter, yn memory of soe grete Bravery,) bade hys Butler fetch hym presentlie a Vessel of Beer, whych when yt was brought at hys nod, (nor, as hee merrily sayd, hys “nod, and Bec, and wreathed smyle,”) hee drank hugelie thereof: “for why?” quoth hee, “surely a Bec ys no longer a Bec, when yt ys Dry.”

3.10 A Photographer's Day Out

Source: South Shields Amateur Magazine, 1860

By Lewis Carroll

I am shaken, and sore, and stiff, and bruised. As I have told you many times already, I haven't the least idea how it happened, and there is no use in plaguing me with any more questions about it. Of course, if you wish it, I can read you an extract from my diary, giving a full account of the events of yesterday, but if you expect to find any clue to the mystery in *that*, I fear you are doomed to be disappointed.

AUGUST 23, TUESDAY.—They say that we Photographers are a blind race at best; that we learn to look at even the prettiest faces as so much light and shade; that we seldom admire, and never love. This is a delusion I long to break through—if I could only find a young lady to photograph, realising *my* ideal of beauty—above all, if her name should be—(why is it, I wonder, that I dote on the name Amelia more than any other word in the English language?)—I feel sure that I could shake off this cold, philosophic lethargy.

The time has come at last. Only this evening I fell in with young Harry Glover in the Haymarket—"Tubbs!" he shouted, slapping me familiarly on the back, "my Uncle wants you down to-morrow at his Villa, camera and all!"

"But I don't know your uncle," I replied, with my characteristic caution. (N.B. If I have a virtue, it is quiet, gentlemanly caution.)

"Never mind, old boy, he knows all about *you*. You be off by the early train, and take your whole kit of bottles, for you'll find lots of faces to uglify, and—"

"Can't go," I said rather gruffly, for the extent of the job alarmed me, and I wished to cut him short, having a decided objection to talking slang in the public streets.

"Well, they'll be precious cut up about it, that's all," said Harry, with rather a blank face, "and my cousin Amelia—"

"Don't say another word!" I cried enthusiastically, "I'll go!" And as my omnibus came by at the moment, I jumped in and rattled off before he had recovered his astonishment at my change of manner. So it is settled, and to-morrow I am to see an Amelia, and—oh Destiny, what hast thou in store for me?

AUGUST 24, WEDNESDAY.—A glorious morning. Packed in a great hurry, luckily breaking only two bottles and three glasses in doing so. Arrived at Rosemary Villa as the party were sitting down to breakfast. Father, mother, two sons from school, a host of children from the nursery, and the inevitable BABY.

But how shall I describe the daughter? words are powerless; nothing but a Talbotype could do it. Her nose was in beautiful perspective—her mouth wanting perhaps the last possible foreshortening—but the exquisite half-tints on the cheek could have blinded one to any defects, and as to the high light on her chin, it was (photographically speaking) perfection. Oh! what a picture she would have made if fate had not—but I am anticipating.

There was a Captain Flanagan present—

I am aware that the preceding paragraph is slightly abrupt, but when I reached that point, I remembered that the idiot actually believed himself engaged to Amelia, (*my* Amelia!) I choked, and could get no further. His figure,

I am willing to admit, was good: some might have admired his face; but what is face or figure without brains?

My own figure is perhaps a *little* inclined to the robust; in stature I am none of your military giraffes—but why should I describe myself? my photograph (done by myself) will be sufficient evidence to the world.

The breakfast, no doubt, was good, but I knew not what I ate or drank; I lived for Amelia only, and as I gazed on that peerless brow, those chiselled features, I clenched my fist in an involuntary transport (upsetting my coffee-cup in doing so), and mentally exclaimed, “I will photograph that woman, or perish in the attempt!”

After breakfast the work of the day commenced, which I will here briefly record.

PICTURE 1.—Paterfamilias. This I wanted to try again, but they all declared it would do very well, and had “just his usual expression;” though unless his usual expression was that of a man with a bone in his throat, endeavouring to alleviate the agony of choking by watching the end of his nose with both eyes, I must admit that this was too favourable a statement of the case.

PICTURE 2.—Materfamilias. She told us with a simper, as she sat down, that she “had been very fond of private theatricals in her youth,” and that she “wished to be taken in a favourite Shakespearian character.” What the character was, after long and anxious thought on the subject, I have given up as a hopeless mystery, not knowing any one of his heroines in whom an attitude of such spasmodic energy could have been combined with a face of such blank indifference, or who could have been thought appropriately costumed in a blue silk gown, with a Highland scarf over one shoulder, a ruffle of Queen Elizabeth’s time round the throat, and a hunting-whip.

* * * * *

PICTURE 3.—17th sitting. Placed the baby in profile. After waiting till the usual kicking had subsided, uncovered the lens. The little wretch instantly threw its head back, luckily only an inch, as it was stopped by the nurse’s nose, establishing the infant’s claim to “first blood” (to use a sporting phrase). This, of course, gave *two* eyes in the result, something that might be called a nose, and an unnaturally wide mouth. Called it a full-face accordingly and went on to

PICTURE 4.—The three younger girls, as they would have appeared, if by any possibility a black dose could have been administered to each of them at the same moment, and the three tied together by the hair before the expression produced by the medicine has subsided from any of their faces. Of course, I kept this view of the subject to myself, and merely said that “it reminded me of a picture of the three Graces,” but the sentence ended in an involuntary groan, which I had the greatest difficulty in converting into a cough.

PICTURE 5.—This was to have been the great artistic triumph of the day; a family group, designed by the two parents, and combining the domestic with the allegorical. It was intended to represent the baby being crowned with flowers, by the united efforts of the children, regulated by the advice of the father, under the personal superintendence of the mother; and to combine with this the secondary meaning of “Victory transferring her laurel crown to Innocence, with Resolution, Independence, Faith, Hope and Charity, assisting in the graceful

task, while Wisdom looks benignly on, and smiles approval!" Such, I say, was the *intention*; the result, to any unprejudiced observer, was capable of but one interpretation—that the baby was in a fit—that the mother, (doubtless under some erroneous notions of the principles of Human Anatomy,) was endeavouring to recover it by bringing the crown of its head in contact with its chest—that the two boys, seeing no prospect for the infant but immediate destruction, were tearing out some locks of its hair as mementoes of the fatal event—that two of the girls were waiting for a chance at the baby's hair, and employing the time in strangling the third—and that the father, in despair at the extraordinary conduct of his family, had stabbed himself, and was feeling for his pencil case, to make a memorandum of having done so.

All this time I had no opportunity of asking my Amelia for a sitting, but during luncheon I succeeded in finding one, and, after introducing the subject of photographs in general, I turned to her and said, "before the day is out, Miss Amelia, I hope to do myself the honour of coming to *you* for a negative."

With how sweet a smile she replied "certainly, Mr. Tubbs. There is a cottage near here, that I wish you would try after luncheon, and when you've done that, I shall be at your service."

Faix! an' I hope she'll give you a decoisive one!" broke in that awkward Captain Flanagan, "won't you, Mely Darlint?" "I trust so, Captain Flanagan," I interposed with great dignity: but all politeness is wasted on that animal; he broke into a great "haw! haw!" and Amelia and I could hardly refrain from laughing at his folly. She, however, with ready tact turned it off, saying to the bear, come, come, Captain, we mustn't be *too* hard on him! (Hard on *me!* on *me!* bless thee, Amelia!)

The sudden happiness of that moment nearly overcame me; tears rose to my eyes as I thought, "the wish of a Life is accomplished! I shall photograph an Amelia!" Indeed, I almost think I should have gone down on my knees to thank her, had not the table-cloth interfered with my so doing, and had I not known what a difficult position it is to recover from.

However, I seized an opportunity toward the conclusion of the meal to give utterance to my overwrought feelings: turning toward Amelia, who was sitting next to me, I had just murmured the words, "there beats in this bosom a heart," when a general silence warned me to leave the sentence unfinished. With the most admirable presence of mind she said, "some tart, did you say, Mr Tubbs? Captain Flanagan, may I trouble you to cut Mr Tubbs some of that tart?"

"It's nigh done," said the captain, poking his great head almost into it, "will I send him the dish, Mely?"

"No, sir!" I interrupted, with a look that ought to have crushed him, but he only grinned and said, "Don't be modest now, Tubbs, me bhoy, sure there's plenty more in the larder."

Amelia was looking anxiously at me, so I swallowed my rage—and the tart.

Luncheon over, after receiving directions by which to find the cottage, I attached to my camera the hood used for developing pictures in the open air, placed it over my shoulder, and set out for the hill which had been pointed out to me.

My Amelia was sitting in the window working, as I passed with the machine; the Irish idiot was with her. In reply to my look of undying affection, she said anxiously, "I'm sure that's too heavy for you, Mr Tubbs. Won't you have a boy to carry it?"

“Or a donkey?” giggled the captain.

I pulled up short, and faced round, feeling that now, if ever, the dignity of Man, and the liberty of the subject, must be asserted. To *her* I merely said, “thanks, thanks!” kissing my hand as I spoke; then, fixing my eyes on the idiot at her side, I hissed through my clenched teeth, “*we shall meet again, Captain!*”

“Sure, I hope so, Tubbs,” said the unconscious blockhead, “sharp six is the dinner hour, mind!” A cold shiver passed over me; I had made my great effort, and had *failed*; I shouldered my camera again, and strode moodily on.

Two steps, and I was myself again; *her* eyes, I knew, were upon me, and once more I trod the gravel with an elastic tread. What mattered to me, in that moment, the whole tribe of captains? should *they* disturb my equanimity?

The hill was nearly a mile from the house, and I reached it tired and breathless. Thoughts of Amelia, however, bore me up. I selected the best point of view for the cottage, so as to include a farmer and a cow in the picture, cast one fond look towards the distant villa, and, muttering, “Amelia, ’tis for thee!” removed the lid of the lens; in 1 minute and 40 seconds I replaced it: “it is over!” I cried in uncontrollable excitement, “Amelia, thou art mine!”

Eagerly, tremblingly, I covered my head with the hood, and commenced the development. Trees rather misty—well! the wind had blown them about a little; *that* wouldn’t show much—the farmer? well, *he* had walked on a yard or two, and I should be sorry to state how many legs and arms he appeared with—never mind! call him a spider, a centipede, anything—the cow? I must, however, reluctantly, confess that the cow had three heads, and though such an animal may be curious, it is *not* picturesque. However, there could be no mistake about the cottage; its chimnies were all that could be desired, and, “all things considered,” I thought, “Amelia will——”

At this point my soliloquy was interrupted by a tap on the shoulder, more, peremptory than suggestive. I withdrew myself from the hood, need I say with what quiet dignity? and turned upon the stranger. He was a thick-built man, vulgar in dress, repulsive in expression, and carried a straw in his mouth: his companion outdid him in these peculiarities. “Young man,” began the first “y’are trespassing here, and ya mun take yourself off, and no bones about it.” I need hardly say that I took no notice of this remark, but took up the bottle of hypo-sulphate of soda, and proceeded to fix the picture; he tried to stop me; I resisted: the negative fell, and was broken. I remember nothing further, except that I have an indistinct notion that I hit somebody.

If you can find anything in what I have just read to you to account for my present condition, you are welcome to do so; but, as I before remarked, all I can tell you is that I am shaken, and sore, and stiff, and bruised, and that how I came so I haven’t the faintest idea.

3.11 Bruno's Revenge

→ 2.5, p. 395

It was a very hot afternoon—too hot to go for a walk or do anything—or else it wouldn't have happened, I believe.

In the first place, I want to know why fairies should always be teaching *us* to do our duty, and lecturing *us* when we go wrong, and we should never teach

them anything? You can't mean to say that fairies are never greedy, or selfish, or cross, or deceitful, because that would be nonsense, you know. Well then, don't you agree with me that they might be all the better for a little scolding and punishing now and then?

I really don't see why it shouldn't be tried, and I'm almost sure (only *please* don't repeat this loud in the woods) that if you could only catch a fairy, and put it in the corner, and give it nothing but bread and water for a day or two, you'd find it quite an improved character—it would take down its conceit a little, at all events.

The next question is, what is the best time for seeing fairies? I believe I can tell you all about that.

The first rule is, that it must be a *very* hot day—that we may consider as settled: and you must be just a *little* sleepy—but not too sleepy to keep your eyes open, mind. Well, and you ought to feel a little—what one may call “fairyish”—the Scotch call it “eerie,” and perhaps that's a prettier word; if you don't know what it means, I'm afraid I can hardly explain it; you must wait till you meet a fairy, and then you'll know.

And the last rule is, that the crickets shouldn't be chirping. I can't stop to explain that rule just now—you must take it on trust for the present.

So, if all these things happen together, you've a good chance of seeing a fairy—or at least a much better chance than if they didn't.

The one I'm going to tell you about was a real, naughty little fairy. Properly speaking, there were two of them, and one was naughty and one was good, but perhaps you would have found that out for yourself.

Now we really *are* going to begin the story.

It was Tuesday afternoon, about half past three—it's always best to be particular as to dates—and I had wandered down into the wood by the lake, partly because I had nothing to do, and that seemed to be a good place to do it in, and partly (as I said at first) because it was too hot to be comfortable anywhere, except under trees.

The first thing I noticed, as I went lazily along through an open place in the woods, was a large beetle lying struggling on its back, and I went down directly on one knee to help the poor thing on its feet again. In some things, you know, you can't be quite sure what an insect would like: for instance, I never could quite settle, supposing I were a moth, whether I would rather be kept out of the candle, or be allowed to fly straight in and get burnt—or again, supposing I were a spider, I'm not sure if I should be *quite* pleased to have my web torn down, and the fly let loose—but I felt quite certain that, if I were a beetle and had rolled over on my back, I should always be glad to be helped up again.

So, as I was saying, I had gone down on one knee, and was just reaching out a little stick to turn the beetle over, when I saw a sight that made me draw back hastily and hold my breath, for fear of making any noise and frightening the little creature away.

Not that she looked as if she would be easily frightened: she seemed so good and gentle that I'm sure she would never expect that any one could wish to hurt her. She was only a few inches high, and was dressed in green, so that you really would hardly have noticed her among the long grass; and she was so delicate and graceful that she quite seemed to belong to the place, almost as if she were one of the flowers. I may tell you, besides, that she had no wings (I don't believe in fairies with wings), and that she had quantities of long brown

hair and large earnest brown eyes, and then I shall have done all I can to give you an idea of what she was like.

Sylvie (I found out her name afterwards) had knelt down, just as I was doing, to help the beetle; but it needed more than a little stick for *her* to get it on its legs again; it was as much as she could do, with both arms, to roll the heavy thing over; and all the while she was talking to it, half scolding and half comforting, as a nurse might do with a child that had fallen down.

“There, there! You needn’t cry so much about it; you’re not killed yet—though if you were, you couldn’t cry, you know, and so it’s a general rule against crying, my dear! And how did you come to tumble over? But I can see well enough how it was—I needn’t ask you that—walking over sand-pits with your chin in the air, as usual. Of course if you go among sand-pits like that, you must expect to tumble; you should look.”

The beetle murmured something that sounded like “I *did* look,” and Sylvie went on again:

“But I know you didn’t! You never do! You always walk with your chin up—you’re so dreadfully conceited. Well, let’s see how many legs are broken this time. Why, none of them, I declare! though that’s certainly more than you deserve. And what’s the good of having six legs, my dear, if you can only kick them all about in the air when you tumble? Legs are meant to walk with, you know. Now don’t be cross about it, and don’t begin putting out your wings yet; I’ve some more to say. Go down to the frog that lives behind that buttercup—give him my compliments—Sylvie’s compliments—can you say ‘compliments’?”

The beetle tried and, I suppose, succeeded.

“Yes, that’s right. And tell him he’s to give you some of that salve I left with him yesterday. And you’d better get him to rub it in for you; he’s got rather cold hands, but you mustn’t mind that.”

I think the beetle must have shuddered at this idea, for Sylvie went on in a graver tone—“Now you needn’t pretend to be so particular as all that, as if you were too grand to be rubbed by a frog. The fact is, you ought to be very much obliged to him. Suppose you could get nobody but a toad to do it, how would you like that?”

There was a little pause, and then Sylvie added, “Now you may go. Be a good beetle, and don’t keep your chin in the air.” And then began one of those performances of humming, and whizzing, and restless banging about, such as a beetle indulges in when it has decided on flying, but hasn’t quite made up its mind which way to go. At last, in one of its awkward zigzags, it managed to fly right into my face, and by the time I had recovered from the shock, the little fairy was gone.

I looked about in all directions for the little creature, but there was no trace of her—and my “eerie” feeling was quite gone off, and the crickets were chirping again merrily—so I knew she was really gone.

And now I’ve got time to tell you the rule about the crickets. They always leave off chirping when a fairy goes by—because a fairy’s a kind of queen over them, I suppose—at all events it’s a much grander thing than a cricket—so whenever you’re walking out, and the crickets suddenly leave off chirping, you may be sure that either they see a fairy, or else they’re frightened at your coming so near.

I walked on sadly enough, you may be sure. However, I comforted myself with thinking “It’s been a very wonderful afternoon, so far—I’ll just go quietly

on and look about me, and I shouldn't wonder if I come across another fairy somewhere."

Peering about in this way, I happened to notice a plant with rounded leaves, and with queer little holes cut out in the middle of several of them. "Ah! The leafcutter bee," I carelessly remarked—you know I am very learned in natural history (for instance, I can always tell kittens from chickens at one glance)—and I was passing on, when a sudden thought made me stoop down and examine the leaves more carefully.

Then a little thrill of delight ran through me—for I noticed that the holes were all arranged so as to form letters; there were three leaves side by side, with "B," "R," and "U" marked on them, and after some search I found two more, which contained an "N" and an "O."

By this time the "eerie" feeling had all come back again, and I suddenly observed that no crickets were chirping; so I felt quite sure that "Bruno" was a fairy, and that he was somewhere very near.

And so indeed he was—so near that I had very nearly walked over him without seeing him; which would have been dreadful, always supposing that fairies *can* be walked over—my own belief is that they are something of the nature of will-o'-the-wisps, and there's no walking over *them*.

Think of any pretty little boy you know, rather fat, with rosy cheeks, large dark eyes, and tangled brown hair, and then fancy him made small enough to go comfortably into a coffee-cup, and you'll have a very fair idea of what the little creature was like.

"What's your name, little fellow?" I began, in as soft a voice as I could manage. And, by the way, that's another of the curious things in life that I never could quite understand—why we always begin by asking little children their names; is it because we fancy there isn't quite enough of them, and a name will help to make them a little bigger? You never thought of asking a real large man his name, now, did you? But, however that may be, I felt it quite necessary to know *his* name; so, as he didn't answer my question, I asked it again a little louder. "What's your name, my little man?"

"What's yours?" he said, without looking up.

"My name's Lewis Carroll," I said, quite gently, for he was much too small to be angry with for answering so uncivilly.

"Duke of Anything?" he asked, just looking at me for a moment and then going on with his work.

"Not Duke at all," I said, a little ashamed of having to confess it.

"You're big enough to be two Dukes," said the little creature; "I suppose you're Sir Something, then?"

"No," I said, feeling more and more ashamed. "I haven't got any title."

The fairy seemed to think that in that case I really wasn't worth the trouble of talking to, for he quietly went on digging, and tearing the flowers to pieces as fast as he got them out of the ground.

After a few minutes I tried again. "*Please* tell me what your name is."

"B'uno," the little fellow answered, very readily: "why didn't you say 'please' before?"

"That's something like what we used to be taught in the nursery," I thought to myself, looking back through the long years (about a hundred and fifty of them) to the time when I used to be a little child myself. And here an idea

came into my head, and I asked him "Aren't you one of the fairies that teach children to be good?"

"Well, we have to do that sometimes," said Bruno. "and a d'eadful bother it is." As he said this he savagely tore a heartsease in two, and trampled on the pieces.

"What *are* you doing there, Bruno?" I said.

"Spoiling Sylvie's garden," was all the answer Bruno would give at first. But, as he went on tearing up the flowers, he muttered to himself "The nasty c'oss thing—wouldn't let me go and play this morning, though I wanted to ever so much—said I must finish my lessons first—lessons, indeed!—I'll vex her finely, though!"

"Oh, Bruno, you shouldn't do that!" I cried. "Don't you know that's revenge? And revenge is a wicked, cruel, dangerous thing!"

"River-edge?" said Bruno. "What a funny word! I suppose you call it c'ooel and dangerous because if you went too far and tumbled in, you'd get d'owned."

"No, not river-edge," I explained; "rev-enge" (saying the word very slowly and distinctly). But I couldn't help thinking that Bruno's explanation did very well for either word.

"Oh!" said Bruno, opening his eyes very wide, but without attempting to repeat the word.

"Come! Try and pronounce it, Bruno!" I said cheerfully. "Rev-enge, rev-enge."

But Bruno only tossed his little head, and said he couldn't; that his mouth wasn't the right shape for words of that kind. And the more I laughed, the more sulky the little fellow got about it.

"Well, never mind, little man!" I said. "Shall I help you with the job you've got there?"

"Yes, please," Bruno said, quite pacified. "Only I wish I could think of something to vex her more than this. You don't know how hard it is to make her ang'y!"

"Now listen to me, Bruno, and I'll teach you quite a splendid kind of revenge!"

"Something that'll vex her finely?" Bruno asked with gleaming eyes.

"Something that'll vex her finely. First, we'll get up all the weeds in her garden. See, there are a good many at this end—quite hiding the flowers."

"But *that* won't vex her," said Bruno, looking rather puzzled.

"After that," I said, without noticing the remark, "we'll water this highest bed—up here. You see, it's getting quite dry and dusty."

Bruno looked at me inquisitively, but he said nothing this time.

"Then after that," I went on, "the walks want sweeping a bit; and I think you might cut down that tall nettle—it's so close to the garden that it's quite in the way—"

"What *are* you talking about?" Bruno impatiently interrupted me. "All that won't vex her a bit!"

"Won't it?" I said, innocently. "Then, after that, suppose we put in some of these coloured pebbles—just to mark the divisions between the different kinds of flowers, you know. That'll have a very pretty effect."

Bruno turned round and had another good stare at me. At last there came an odd little twinkle in his eye, and he said, with quite a new meaning in his voice, "Ve'y well—let's put 'em in rows—all the 'ed together, and all the blue together."

"That'll do capitally," I said; "and then—what kind of flowers does Sylvie like best in her garden?"

Bruno had to put his thumb in his mouth and consider a little before he could answer. "Violets," he said, at last.

"There's a beautiful bed of violets down by the lake——"

"Oh, let's fetch 'em!" cried Bruno, giving a little skip into the air. "Here! Catch hold of my hand and I'll help you along. The g'ass is rather thick down that way."

I couldn't help laughing at his having so entirely forgotten what a big creature he was talking to. "No, not yet, Bruno," I said; "we must consider what's the right thing to do first. You see we've got quite a business before us."

"Yes, let's consider," said Bruno, putting his thumb into his mouth again, and sitting down upon a dead mouse.

"What do you keep that mouse for?" I said. "You should bury it, or throw it into the lake."

"Why, it's to measure with!" cried Bruno. "How ever would you do a garden without one? We make each bed th'ee mouses and a half long, and two mouses wide."

I stopped him, as he was dragging it off by the tail to show me how it was used, for I was half afraid the "eerie" feeling might go off before we had finished the garden, and in that case I should see no more of him or Sylvie. "I think the best way will be for *you* to weed the beds, while *I* sort out these pebbles, ready to mark the walks with."

"That's it!" cried Bruno. "And I'll tell you about the caterpillars while we work."

"Ah, let's hear about the caterpillars," I said, as I drew the pebbles together into a heap, and began dividing them into colours.

And Bruno went on in a low, rapid tone, more as if he were talking to himself. "Yesterday I saw two little caterpillars, when I was sitting by the brook, just where you go into the wood. They were quite g'een, and they had yellow eyes, and they didn't see *me*. And one of them had got a moth's wing to carry—a g'eat b'own moth's wing, you know, all d'y, with feathers. So he couldn't want it to eat, I should think—perhaps he meant to make a cloak for the winter?"

"Perhaps," I said, for Bruno had twisted up the last word into a sort of question, and was looking at me for an answer.

One word was quite enough for the little fellow, and he went on merrily. "Well, and so he didn't want the other caterpillar to see the moth's wing, you know—so what must he do but t'y to carry it with all his left legs, and he t'ied to walk on the other set. Of course he toppled over after that."

"After what?" I said, catching the last word, for, to tell the truth, I hadn't been attending much.

"He toppled over," Bruno repeated, very gravely, "and if *you* ever saw a caterpillar topple over, you'd know it's a serious thing, and not sit g'inning like that—and I shan't tell you any more."

"Indeed and indeed, Bruno, I didn't mean to grin. See, I'm quite grave again now."

But Bruno only folded his arms, and said "Don't tell *me*. I see a little twinkle in one of your eyes—just like the moon."

"Am *I* like the moon, Bruno?" I asked.

"Your face is large and round like the moon," Bruno answered, looking at me thoughtfully. "It doesn't shine quite so bright—but it's cleaner."

I couldn't help smiling at this. "You know I wash *my* face, Bruno. The moon never does that."

"Oh, doesn't she though!" cried Bruno; and he leant forwards and added in a solemn whisper "The moon's face gets dirtier and dirtier every night, till it's black all ac'oss. And then, when it's dirty all over—*so*—" (he passed his hand across his own rosy cheeks as he spoke) "then she washes it."

"And then it's all clean again, isn't it?"

"Not all in a moment," said Bruno. "What a deal of teaching you want! She washes it little by little—only she begins at the other edge."

By this time he was sitting quietly on the dead mouse with his arms folded, and the weeding wasn't getting on a bit: so I was obliged to say "Work first and pleasure afterwards—no more talking till that bed's finished."

After that we had a few minutes of silence, while I sorted out the pebbles, and amused myself with watching Bruno's plan of gardening. It was quite a new plan to me: he always measured each bed before he weeded it, as if he was afraid the weeding would make it shrink; and once, when it came out longer than he wished, he set to work to thump the mouse with his tiny fist, crying out "There now! It's all 'ong again! Why don't you keep your tail st'aight when I tell you!"

"I'll tell you what I'll do," Bruno said in a half-whisper, as we worked: "I'll get you an invitation to the king's dinner-party. I know one of the head-waiters."

I couldn't help laughing at this idea. "Do the waiters invite the guests?" I asked.

"Oh, not *to sit down!*" Bruno hastily replied. "But to help, you know. You'd like that, wouldn't you? To hand about plates, and so on."

"Well, but that's not so nice as sitting at the table, is it?"

"Of course it isn't," Bruno said, in a tone as if he rather pitied my ignorance; "but if you're not even Sir Anything, you can't expect to be allowed to sit at the table, you know."

I said, as meekly as I could that I didn't expect it, but it was the only way of going to a dinner-party that I really enjoyed. And Bruno tossed his head, and said, in a rather offended tone, that I might do as I pleased—there were many he knew that would give their ears to go.

"Have you ever been yourself, Bruno?"

"They invited me once last year," Bruno said, very gravely. "It was to wash up the soup-plates—no, the cheese-plates I mean—that was g'and enough. But the g'andest thing of all was, *I* fetched the Duke of Dandelion a glass of cider!"

"That *was* grand!" I said, biting my lip to keep myself from laughing.

"Wasn't it?" said Bruno, very earnestly. "You know it isn't every one that's had such an honour as *that!*"

This set me thinking of the various queer things we call "an honour" in this world, which, after all, haven't a bit more honour in them than what the dear little Bruno enjoyed (by the way, I hope you're beginning to like him a little, naughty as he was?) when he took the Duke of Dandelion a glass of cider.

I don't know how long I might have dreamed on in this way, if Bruno hadn't suddenly roused me. "Oh, come here quick!" he cried, in a state of the wildest excitement. "Catch hold of his other horn! I can't hold him more than a minute!"

He was struggling desperately with a great snail, clinging to one of its horns, and nearly breaking his poor little back in his efforts to drag it over a blade of grass.

I saw we should have no more gardening if I let this sort of thing go on, so I quietly took the snail away, and put it on a bank where he couldn't reach it. "We'll hunt it afterwards, Bruno," I said, "if you really want to catch it. But what's the use of it when you've got it?"

"What's the use of a fox when you've got it?" said Bruno. "I know you big things hunt foxes."

I tried to think of some good reason why "big things" should hunt foxes, and he shouldn't hunt snails, but none came into my head: so I said at last "Well, I suppose one's as good as the other. I'll go snail-hunting myself some day."

"I should think you wouldn't be so silly," said Bruno, "as to go snail-hunting all by yourself. Why, you'd never get the snail along, if you hadn't somebody to hold on to his other horn!"

"Of course I shan't go alone," I said, quite gravely. "By the way, is that the best kind to hunt, or do you recommend the ones without shells?"

"Oh no, we never hunt the ones without shells," Bruno said, with a little shudder at the thought of it. "They're always so c'oss about it; and then, if you tumble over them, they're ever so sticky!"

By this time we had nearly finished the garden. I had fetched some violets, and Bruno was just helping me to put in the last, when he suddenly stopped and said, "I'm tired."

"Rest, then," I said: "I can go on without you."

Bruno needed no second invitation: he at once began arranging the dead mouse as a kind of sofa. "And I'll sing you a little song," he said as he rolled it about.

"Do," said I: "there's nothing I should like better."

"Which song will you choose?" Bruno said, as he dragged the mouse into a place where he could get a good view of me. "'Ting, ting, ting,' is the nicest."

There was no resisting such a strong hint as this: however, I pretended to think about it for a moment, and then said: "Well, I like 'Ting, ting, ting' best of all."

"That shows you're a good judge of music," Bruno said, with a pleased look. "How many blue-bells would you like?" And he put his thumb into his mouth to help me to consider.

As there was only one blue-bell within easy reach, I said very gravely that I thought one would do *this* time, and I picked it and gave it to him. Bruno ran his hand once or twice up and down the flowers, like a musician trying an instrument, producing a most delicious delicate tinkling as he did so. I had never heard flower-music before—I don't think one can, unless one's in the "eerie" state—and I don't know quite how to give you an idea of what it was like, except by saying that it sounded like a peal of bells a thousand miles off. When he had satisfied himself that the flowers were in tune, he seated himself on the dead mouse (he never seemed really comfortable anywhere else), and, looking up at me with a merry twinkle in his eyes, he began. By the way, the tune was rather a curious one, and you might like to try it for yourself, so here are the notes.¹

¹Later Errata state:

“Rise, oh, rise! The daylight dies:
 The owls are hooting, ting, ting, ting!
 Wake, oh, wake! Beside the lake
 The elves are fluting, ting, ting, ting!
 Welcoming our fairy king
 We sing, sing, sing.”

He sang the first four lines briskly and merrily, making the blue-bells chime in time with the music; but the last two he sang quite slowly and gently, and merely waved the flowers backwards and forwards above his head. And when he had finished the first verse, he left off to explain. “The name of our fairy king is Obberwon” (he meant “Oberon,” I believe), “and he lives over the lake—*there*—and now and then he comes in a little boat—and then we go and meet him—and then we sing this song, you know.”

“And then you go and dine with him?” I said, mischievously.

“You shouldn’t talk,” Bruno hastily said: “it interrupts the song so.”

I said I wouldn’t do it again.

“I never talk myself when I’m singing,” he went on, very gravely; “so you shouldn’t either.” Then he tuned the blue-bells once more, and sang.

“Hear, oh, hear! From far and near
 A music stealing, ting, ting, ting!
 Fairy bells adown the dells
 Are merrily pealing, ting, ting, ting!
 Welcoming our fairy king
 We ring, ring, ring.

“See, oh, see! On every tree
 What lamps are shining, ting, ting, ting!
 They are eyes of fiery flies
 To light our dining, ting, ting, ting!
 Welcoming our fairy king
 They swing, swing, swing.

Only the third correction was applied in *Sylvie and Bruno*.

“Haste, oh, haste! to take and taste
The dainties waiting, ting, ting, ting!
Honey-dew is stored——”

“Hush, Bruno!” I interrupted, in a warning whisper. “She’s coming!”

Bruno checked his song only just in time for Sylvie not to hear him, and then, catching sight of her as she slowly made her way through the long grass, he suddenly rushed out headlong at her like a little bull, shouting “Look the other way! Look the other way!”

“Which way?” Sylvie asked, in rather a frightened tone, as she looked round in all directions to see where the danger could be.

“*That* way!” said Bruno, carefully turning her round with her face to the wood. “Now, walk backwards—walk gently—don’t be frightened: you shan’t t’ip!”

But Sylvie did “t’ip” notwithstanding: in fact he led her, in his hurry, across so many little sticks and stones, that it was really a wonder the poor child could keep on her feet at all. But he was far too much excited to think of what he was doing.

I silently pointed out to Bruno the best place to lead her to, so as to get a view of the whole garden at once: it was a little rising ground, about the height of a potato; and, when they had mounted it, I drew back into the shade, that Sylvie mightn’t see me.

I heard Bruno cry out triumphantly “*Now* you may look!” and then followed a great clapping of hands, but it was all done by Bruno himself. Sylvie was quite silent—she only stood and gazed with her hands clasped tightly together, and I was afraid she didn’t like it after all.

Bruno too was watching her anxiously, and when she jumped down off the mound, and began wandering up and down the little walks, he cautiously followed her about, evidently anxious that she should form her own opinion of it all, without any hint from him. And when at last she drew a long breath, and gave her verdict—in a hurried whisper, and without the slightest regard to grammar—“It’s the loveliest thing as I never saw in all my life before!” the little fellow looked as well pleased as if it had been given by all the judges and juries in England put together.

“And did you really do it all by yourself, Bruno?” said Sylvie. “And all for me?”

“I was helped a bit,” Bruno began, with a merry little laugh at her surprise. “We’ve been at it all the afternoon—I thought you’d like——” and here the poor little fellow’s lip began to quiver, and all in a moment he burst out crying, and running up to Sylvie he flung his arms passionately round her neck, and hid his face on her shoulder.

There was a little quiver in Sylvie’s voice too, as she whispered “Why, what’s the matter, darling?” and tried to lift up his head and kiss him.

But Bruno only clung to her, sobbing, and wouldn’t be comforted till he had confessed all. “I tried—to spoil your garden—first—but—I’ll never—never——” and then came another burst of tears, which drowned the rest of the sentence. At last he got out the words “I liked—putting in the flowers—for *you*, Sylvie—and I never was so happy before——” and the rosy little face came up at last to be kissed, all wet with tears as it was.

Sylvie was crying too by this time, and she said nothing but “Bruno, dear!” and “*I* never was so happy before—” though why two children who had never been so happy before should both be crying, was a great mystery to me.

I felt very happy too, but of course I didn’t cry: “big things” never do, you know—we leave all that to the fairies. Only I think it must have been raining a little just then, for I found a drop or two on my cheeks.

After that they went through the whole garden again, flower by flower, as if it were a long sentence they were spelling out, with kisses for commas, and a great hug by way of a full-stop when they got to the end.

“Do you know, that was my river-edge, Sylvie?” Bruno began, looking solemnly at her.

Sylvie laughed merrily. “What *do* you mean?” she said; and she pushed back her heavy brown hair with both hands, and looked at him with dancing eyes in which the big tear-drops were still glittering.

Bruno drew in a long breath, and made up his mouth for a great effort. “I mean rev—enge,” he said: “now you under’tand.” And he looked so happy and proud at having said the word right at last, that I quite envied him. I rather think Sylvie didn’t “under’tand” at all; but she gave him a little kiss on each cheek, which seemed to do just as well.

So they wandered off lovingly together, in among the buttercups, each with an arm twined round the other, whispering and laughing as they went, and never so much as once looked back at poor me. Yes, once, just before I quite lost sight of them, Bruno half turned his head, and nodded me a saucy little good-bye over one shoulder. And that was all the thanks I got for *my* trouble.

I know you’re sorry the story’s come to an end—aren’t you?—so I’ll just tell you one thing more. The very last thing I saw of them was this—Sylvie was stooping down with her arms round Bruno’s neck, and saying coaxingly in his ear “Do you know, Bruno, I’ve quite forgotten that hard word—do say it once more. Come! Only this once, dear!”

But Bruno wouldn’t try it again.

Lewis Carroll

3.12 The Wasp in a Wig

Source: proof sheets with a few corrections for a removed chapter (or rather not a whole chapter, but probably something that was meant to be a large part of one chapter, together with some parts of what are today chapters 8 and 9) from *Through the Looking-Glass*, 1870

[A very few steps brought her to the edge of the brook,] and she was just going to spring over, when she heard a deep sigh, which seemed to come from the wood behind her.

“There’s somebody *very* unhappy there,” she thought, looking anxiously back to see what was the matter. Something like a very old man (only that his face was more like a wasp) was sitting on the ground, leaning against a tree, all huddled up together, and shivering as if he were very cold.

“I don’t *think* I can be of any use to him,” was Alice’s first thought, as she turned to spring over the brook:—“but I’ll just ask him what’s the matter,” she added, checking herself on the very edge. “If I once jump over, everything will change, and then I can’t help him.”

So she went back to the Wasp—rather unwillingly, for she was *very* anxious to be a Queen.

“Oh, my old bones, my old bones!” he was grumbling, as Alice came up to him.

“It’s rheumatism, I should think,” Alice said to herself, and she stooped over him, and said very kindly, “I hope you’re not in much pain?”

The Wasp only shook his shoulders, and turned his head away. “Ah, dreary me!” he said to himself.

“Can I do anything for you?” Alice went on. “Aren’t you rather cold here?”

“How you go on!” the Wasp said in a peevish tone. “Worryity, worryity! There never was such a child!”

Alice felt rather offended at this answer, and was very nearly walking on and leaving him, but she thought to herself “Perhaps it’s only pain that makes him so cross.” So she tried once more.

“Won’t you let me help you round to the other side? You’ll be out of the cold wind there.”

The Wasp took her arm, and let her help him round the tree, but when he got settled down again he only said, as before, “Worryity, worryity! Can’t you leave a body alone?”

“Would you like me to read you a bit of this?” Alice went on, as she picked up a newspaper which had been lying at his feet.

“You may read it if you’ve a mind to,” the Wasp said, rather sulkily. “Nobody’s hindering you, that *I* know of.”

So Alice sat down by him, and spread out the paper on her knees, and began. “*Latest News. The Exploring Party have made another tour in the Pantry, and have found five new lumps of white sugar, large and in fine condition. In coming back—*”

“Any brown sugar?” the Wasp interrupted.

Alice hastily ran her eye down the paper and said “No. It says nothing about brown.”

“No brown sugar!” grumbled the Wasp. “A nice exploring party!”

“In coming back,” Alice went on reading, *“they found a lake of treacle. The banks of the lake were blue and white, and looked like china. While tasting the treacle, they had a sad accident: two of their party were engulfed—”*

“Were *what?*” the Wasp asked in a very cross voice.

“En-gulph-ed,” Alice repeated, dividing the word into syllables.

“There’s no such word in the language!” said the Wasp.

“It’s in this newspaper, though,” Alice said a little timidly.

“Let it stop there!” said the Wasp, fretfully turning away his head.

Alice put down the newspaper. “I’m afraid you’re not well,” she said in a soothing tone. “Can’t I do anything for you?”

“It’s all along of the wig,” the Wasp said in a much gentler voice.

“Along of the wig?” Alice repeated, quite pleased to find that he was recovering his temper.

“You’d be cross too, if you’d a wig like mine,” the Wasp went on. “They jokes at one. And they worrits one. And then I gets cross. And I gets cold. And I gets under a tree. And I gets a yellow handkerchief. And I ties up my face—as at the present.”

Alice looked pityingly at him. “Tying up the face is very good for the toothache,” she said.

“And it’s very good for the conceit,” added the Wasp.

Alice didn’t catch the word exactly. “Is that a kind of toothache?” she asked.

The Wasp considered a little. “Well, no,” he said: “it’s when you hold up your head—*so*—without bending your neck.”

“Oh, you mean stiff-neck,” said Alice.

The Wasp said “That’s a new-fangled name. They called it conceit in my time.”

“Conceit isn’t a disease at all,” Alice remarked.

“It is, though,” said the Wasp: “wait till you have it, and then you’ll know. And when you catches it, just try tying a yellow handkerchief round your face. It’ll cure you in no time!”

He untied the handkerchief as he spoke, and Alice looked at his wig in great surprise. It was bright yellow like the handkerchief, and all tangled and tumbled about like a heap of sea-weed. “You could make your wig much neater,” she said, “if only you had a comb.”

“What, you’re a Bee, are you?” the Wasp said, looking at her with more interest. “And you’ve got a comb. Much honey?”

“It isn’t that kind,” Alice hastily explained. “It’s to comb hair with—your wig’s so *very* rough, you know.”

“I’ll tell you how I came to wear it,” the Wasp said. “When I was young, you know, my ringlets used to wave—”

A curious idea came into Alice’s head. Almost every one she had met had repeated poetry to her, and she thought she would try if the Wasp couldn’t do it too. “Would you mind saying it in rhyme?” she asked very politely.

“It ain’t what I’m used to,” said the Wasp: “however I’ll try; wait a bit.” He was silent for a few moments, and then began again—

*“When I was young, my ringlets waved
And curled and crinkled on my head:
And then they said ‘You should be shaved,
And wear a yellow wig instead.’*

*But when I followed their advice,
 And they had noticed the effect,
 They said I did not look so nice
 As they had ventured to expect.
 They said it did not fit, and so
 It made me look extremely plain:
 But what was I to do, you know?
 My ringlets would not grow again.
 So now that I am old and gray,
 And all my hair is nearly gone,
 They take my wig from me and say
 'How can you put such rubbish on?'
 And still, whenever I appear,
 They hoot at me and call me 'Pig!'
 And that is why they do it, dear,
 Because I wear a yellow wig."*

"I'm very sorry for you," Alice said heartily: "and I think if your wig fitted a little better, they wouldn't tease you quite so much."

"Your wig fits very well," the Wasp murmured, looking at her with an expression of admiration: "it's the shape of your head as does it. Your jaws ain't well shaped, though—I should think you couldn't bite well?"

Alice began with a little scream of laughter, which she turned into a cough as well as she could. At last she managed to say gravely, "I can bite anything I want."

"Not with a mouth as small as that," the Wasp persisted. "If you was a-fighting, now—could you get hold of the other one by the back of the neck?"

"I'm afraid not," said Alice.

"Well, that's because your jaws are too short," the Wasp went on: "but the top of your head is nice and round." He took off his own wig as he spoke, and stretched out one claw towards Alice, as if he wished to do the same for her, but she kept out of reach, and would not take the hint. So he went on with his criticisms.

"Then your eyes—they're too much in front, no doubt. One would have done as well as two, if you *must* have them so close—"

Alice did not like having so many personal remarks made on her, and as the Wasp had quite recovered his spirits, and was getting very talkative, she thought she might safely leave him. "I think I must be going on now," she said. "Good-bye."

"Good-bye, and thank-ye," said the Wasp, and Alice tripped down the hill again, quite pleased that she had gone back and given a few minutes to making the poor old creature comfortable.

3.13 Isa's Visit to Oxford. 1888.

Source: manuscript written for Isa Bowman's visit, 1888

Chap. I.

On Wednesday, the Eleventh of July, Isa happened to meet a friend at Paddington Station at half-past-ten. She can't remember his name, but she says he was an old old old gentleman, and he had invited her, she thinks, to go with him somewhere or other, she can't remember where.

Chap. II.

The first thing they did, after calling at a shop, was to go to the Panorama of the "Falls of Niagara". Isa thought it very wonderful. You seemed to be on the top of a tower, with miles and miles of country all round you. The things in front were real, and somehow they joined into the picture behind, so that you couldn't tell where the real things ended and the picture began. Near the foot of the Falls, there was a steam-packet crossing the river, which showed what a tremendous height the Falls must be, it looked so tiny. In the road in front were two men and a dog, standing looking the other way. They may have been wooden figures, or part of the picture, there was no knowing which. The man, who stood next to Isa, said to another man "That dog looked round just now. Now see, I'll whistle to him, and make him look round again!" And he began whistling: and Isa almost expected, it looked so exactly like a real dog, that it would turn its head to see who was calling it!

After that Isa and her friend (the Aged Aged Man) went to the house of a Mr Dymes. Mrs Dymes gave them some dinner, and two of her children, called Helen and Maud, went with them to Terry's Theatre, to see the play of "Little Lord Fauntleroy". Little Véra Beringer was the little Lord Fauntleroy. Isa would have liked to play the part, but the Manager at the Theatre did not allow her, as she did not know the words, which would have made it go off badly. Isa liked the whole play very much: the passionate old Earl, and the gentle Mother of the little boy, and the droll "Mr. Hobbs", and all of them.

Then they all went off by the Metropolitan Railway, and the two Miss Dymeses got out at their station, and Isa and the A. A. M. went on to Oxford. A kind old lady, called Mrs Symonds, had invited Isa to come and sleep at her house: and she was soon fast asleep, and dreaming that she and little Lord Fauntleroy were going in a steamer down the Falls of Niagara, and whistling to a dog, who was in such a hurry to go *up* the Falls that he wouldn't attend to them.

Chap. III.

The next morning Isa set off, almost before she was awake, with the A. A. M., to pay a visit to a little College, called "Christ Church". You go in under a magnificent tower, called "Tom Tower", nearly four feet high (so that Isa had hardly to stoop at all, to go under it) into the Great Quadrangle (which very vulgar people call "Tom Quad".) You should always be polite, even when speaking to

a Quadrangle: it might seem not to take any notice, but it doesn't like being called names. On their way to Christ Church they saw a tall monument, like the spire of a church, called the "Martyrs' Memorial", put up in memory of three Bishops, Cranmer, Ridley and Latimer, who were burned in the reign of Queen Mary, because they would not be Roman Catholics. Christ Church was built in 1546.

They had breakfast at Ch. Ch., in the rooms of the A. A. M., and then Isa learned how to print with the "Type-Writer", and printed several beautiful volumes of poetry, all of her own invention. By this time it was 1 o'clock, so Isa paid a visit to the Kitchen, to make sure that the chicken, for her dinner, was being properly roasted. The Kitchen is about the oldest part of the College, so was built about 1546. It has a fire-grate large enough to roast forty legs of mutton at once.

Then they saw the Dining Hall, in which the A. A. M. has dined several times, (about 8000 times, perhaps). After dinner, they went, through the quadrangle of the Bodleian Library, into Broad Street, and, as a band was just going by, of course they followed it. (Isa likes Bands better than anything in the world, except Lands, and walking on Sands, and wringing her Hands). The Band led them into the gardens of Wadham College (built in 1613), where there was a school-treat going on. The treat was, first marching twice round the garden—then having a photograph done of them, all in a row—then a *promise* of "Punch and Judy", which wouldn't be ready for 20 minutes, so Isa, and Co., wouldn't wait, but went back to Ch. Ch., and saw the "Broad Walk." In the evening they played at "Reversi", till Isa had lost the small remainder of her temper. Then she went to bed, and dreamed she was Judy, and was beating Punch with a stick of barley-sugar.

Chap. IV.

On Friday morning (after taking her medicine very amiably), went with the A. A. M. (who *would* go with her, though she told him over and over she would rather be alone) to the gardens of Worcester College (built in 1714) where they didn't see the swans (who ought to have been on the lake), nor the hippopotamus, who ought not to have been walking about among the flowers, gathering honey like a busy bee.

After breakfast, Isa helped the A. A. M. to pack his luggage, because he thought he would go away, he didn't know where, some day, he didn't know when. So she put a lot of things, she didn't know what, into boxes, she didn't know which.

After dinner they went to St. John's College (built in 1555), and admired the large lawn, where more than 150 ladies, dressed in robes of gold and silver, were not walking about.

Then they saw the Chapel of Keble College (built in 1870): and then the New Museum, where Isa quite lost her heart to a charming stuffed Gorilla, that smiled on her from a glass case. The Museum was finished in 1860. The most curious thing they saw there was a "Walking Leaf", a kind of insect that looks exactly like a withered leaf.

Then they went to New College (built in 1386), & saw, close to the entrance, a "skew" arch (going slantwise through the wall) one of the first ever built in England. After seeing the gardens, they returned to Ch. Ch. (Parts of the old

City walls run round the gardens of New College: and you may still see some of the old narrow slits, through which the defenders could shoot arrows at the attacking army, who could hardly succeed in shooting through them from the outside).

They had tea with Mrs Paget, wife of Dr. Paget one of the Canons of Ch. Ch. Then, after a sorrowful evening, Isa went to bed, and dreamed she was buzzing about among the flowers, with the dear Gorilla: but there wasn't any honey in them—only slices of bread-and-butter, and multiplication-tables.

Chap. V.

On Saturday Isa had a Music Lesson, and learned to play on an American OrguINETTE. It is not a *very* difficult instrument to play, as you only have to turn a handle round and round: so she did it nicely. You put a long piece of paper in, and it goes through the machine, and the holes in the paper make different notes play. They put one in wrong end first, and had a tune backwards, and soon found themselves in the day before yesterday: so they dared not go on, for fear of making Isa so young she would not be able to talk. The A. A. M. does not like visitors who only howl, and get red in the face, from morning to night.

In the afternoon they went round Ch. Ch. meadow, and saw the Barges belonging to the Colleges, and some pretty views of Magdalen Tower through the trees.

Then they went through the "Botanical Gardens, built in the year—no, by the bye, they never were built at all. And then to Magdalen College. At the top of the wall, in one corner, they saw a very large jolly face, carved in stone, with a broad grin, and a little man at the side, helping him to laugh by pulling up the corner of his mouth for him. Isa thought that, the next time she wants to laugh, she will get Nellie and Maggie to help her. With two people to pull up the corners of your mouth for you, it is as easy to laugh as can be!

They went into Magdalen Meadow, which has a pretty walk all round it, arched over with trees: and there they met a lady "from Amurrica", as she told them, who wanted to know the way to "Addison's Walk", and particularly wanted to know if there would be "any danger" in going there. They told her the way, and that *most* of the lions and tigers and buffaloes, round the meadow, were quite gentle and hardly ever killed people: so she set off, pale and trembling, and they saw her no more: only they heard her screams in the distance: so they guessed what had happened to her.

Then they rode in a tram-car to another part of Oxford, and called on a lady called Mrs Jeane, and her little grand-daughter, called "Noël", because she was born on Christmas-Day. ("Noël" is the French name for "Christmas".) And there they had so much Tea that at last Isa nearly turned into a "Teaser".

Then they went home, down a little narrow street, where there was a little dog standing fixed in the middle of the street, as if its feet were glued to the ground: they asked it how long it meant to stand there, and it said (as well as it could) "till the week after next".

Then Isa went to bed, and dreamed she was going round Magdalen Meadow, with the "Amurrican" lady, and there was a buffalo sitting at the top of every tree, handing her cups of tea as she went underneath: but they all held the cups upside-down, so that the tea poured all over her head and ran down her face.

Chap. VI.

On Sunday morning they went to St. Mary's church, in High Street. In coming home, down the street next to the one where they had found a fixed dog, they found a fixed cat—a poor little kitten, that had put out its head through the bars of the cellar-window, and get back again. They rang the bell at the next door, but the maid said the cellar wasn't in that house, and, before they could get to the right door the cat had unfixed its head—either from its neck or from the bars, and had gone inside. Isa thought the animals in this city have a curious way of fixing themselves up and down the place, as if they were hat-pegs.

Then they went back to Ch. Ch., and looked at a lot of dresses, which the A. A. M. kept in a cupboard, to dress up children in, when they come to be photographed. Some of the dresses had been used in Pantomimes at Drury Lane: some were rags, to dress up beggar-children in: some had been very magnificent once, but were getting quite old and shabby. Talking of old dresses, there is one College in Oxford, so old that it is not known for certain when it was built. The people, who live there, say it was built more than 1000 years ago: and, when they say this, the people who live in the other Colleges never contradict them, but listen most respectfully—only they wink a little with one eye, as if they didn't *quite* believe it.

The same day, Isa saw a curious book of pictures of ghosts. If you look hard at one for a minute, and then look at the ceiling, you see another ghost there: only, when you have a black one in the book, it is a *white* one on the ceiling: when it is green in the book, it is *pink* on the ceiling.

In the middle of the day, as usual, Isa had her dinner: but this time it was grander than usual. There was a dish of "Meringues" (this is pronounced "Marangs"), which Isa thought so good that she would have liked to live on them all the rest of her life.

They took a little walk in the afternoon, and in the middle of Broad Street they saw a cross buried in the ground, very near the place where the Martyrs were burned. Then they went into the gardens of Trinity College (built in 1554) to see the "Lime Walk", a pretty little avenue of lime-trees. The great iron "gates" at the end of the garden are not real gates, but all done in one piece: and they couldn't open them, even if you knocked all day. Isa thought them a miserable sham.

Then they went into the "Parks" (this word doesn't mean "parks of grass, with trees and deer", but "parks" of guns: that is, great rows of cannons, which stood there when King Charles the First was in Oxford, and Oliver Cromwell fighting against him.

They saw "Mansfield College", a new College just begun to be built, with such tremendously narrow windows that Isa was afraid the young gentlemen who come there will not be able to see to learn their lessons, and will go away from Oxford just as wise as they came.

Then they went to the evening service at New College, and heard some beautiful singing and organ-playing. Then back to Ch. Ch., in pouring rain. Isa tried to count the drops: but, when she had counted four millions, three hundred and seventy-eight thousand, two hundred and forty-seven, she got tired of counting, and left off.

After dinner, Isa got somebody or other (she is not sure who it was) to finish this story for her. Then she went to bed, and dreamed she was fixed in

the middle of Oxford, with her feet fast to the ground, and her head between the bars of a cellar-window, in a sort of final tableau. Then she dreamed the curtain came down, and the people all called out "encore!" But she cried out "Oh, not again! It would be *too* dreadful to have my visit all over again!" But, on second thoughts, she smiled in her sleep, and said "Well, do you know, after all, I think I wouldn't mind so very much if I *did* have it all over again!"

Part 4

Geometrical Texts

4.1 A Syllabus of Plane Algebraical Geometry

Source: A Syllabus of Plane Algebraical Geometry
Currently only introduction

Introduction

In teaching the subject of Algebraical Geometry, I have found the advantage of giving formal definitions of such words as “axis,” “ordinate,” and “radius-vector,” as giving the learner a clearer notion of the elements of the subject than he could gather for himself from the ordinary treatises.

In drawing up these definitions I found that several of the geometrical terms borrowed from Euclid could not be used in Algebraical Geometry without some modification of their definitions as given by him, whilst other terms were wanted for which he had given no definition at all; hence I was led to prefix to my Definitions of Algebraical Geometry a modernised version of Euclid’s Definitions. The Propositions also of the subject appeared to me to be wanting in uniformity; for example, the relation between an equation of the first degree and a right line is discussed by one writer in the form “to find the equation to a straight line,” (thus assuming the *possibility* of such an equation being found;) by another, in the form “we proceed to enquire the geometrical signification of a *single* equation between the co-ordinates.” To remedy such defects as these I endeavoured to reduce the subject to a uniform series of formal Propositions. Such was the origin of the present Syllabus.

I hope it will not be thought presumptuous in me if I here state in order those defects which appear to me to exist in the modern treatises, and for which I have attempted to furnish a remedy; next, the method I have pursued in doing so; and lastly, the defects which still remain unremedied, and to which those, who are desirous of forwarding towards perfection this beautiful science, would do well to turn their attention.

The defects which I have attempted to remedy relate to three main points in the subject; I. Definitions, II. Enunciations, and III. Treatment of Subject.

I. Definitions. Many of the technical terms employed by the various writers on the subject are left undefined, or only with such definitions as may be gathered from a page or more of explanatory matter; others are *inadequately* defined, (as, for instance, the angle employed in Polar Co-ordinates, the definition of which, as given in Mr. Salmon's Conic Sections, p. 9, will not apply to the case of a negative radius-vector); and even when a correct and formal definition is furnished, it is only to be found in the passage where the term first occurs, a method likely to give much unnecessary trouble in referring to it afterwards.

II. Enunciations. These, in the present treatises, are only given along with their demonstrations, which again are interspersed with much explanatory and illustrative matter, all liable to confuse the student who desires to review the subject, briefly and connectedly, as a whole. Moreover there is a great want of uniformity in the language employed, the data being put first in some, and the quæsitæ in others; while some propositions have no "general enunciation" at all, but begin at once with the "particular enunciation."

III. Treatment of Subject. The propositions are in too many cases made to depend on each other, so that if we wish to make out the proof of any particular theorem by itself, it is necessary to refer back to the proposition from which it is deduced, and from that perhaps to another, and so at last to build up the required proof. This method would not be so liable to objection if there were any received text-book on the subject, answering to Euclid in Geometry, and furnishing a recognised series of consecutive propositions which could be appealed to as authority; but, as the case now stands, when one writer may prove A from B, and another B from A, the whole system is illogical and therefore unsatisfactory.

Again, an unphilosophical method is employed in arriving at various of the necessary formulæ; it is a method neither analytical nor synthetical, but begins in synthesis, and concludes with a kind of analysis, introduced to prove the lawfulness of the assumption made, but giving no information as to how it was originally arrived at. As an instance, we may take the conversion of the equation $Ax + By + C = 0$, into the form of $x \cdot \cos a + y \cdot \sin a - \rho = 0$, where the rule is laid down "divide by $\sqrt{A^2 + B^2}$," and we are afterwards told that we *may* assume $\frac{A}{\sqrt{A^2 + B^2}} = \cos a$, and $\frac{B}{\sqrt{A^2 + B^2}} = \sin a$ "since the sum of the squares of these two quantities = 1." Again, the focus of the ellipse is introduced by arbitrarily taking two points on the major axis, at a distance from the centre equal to $\pm\sqrt{a^2 - b^2}$, and discussing their properties; but no reason is given why these, rather than any other points, are so chosen for discussion.

A third deficiency is to be found in the notation adopted, where the symbols and language are not adapted to the expansion, which is necessary to meet the larger requirements of Algebraical Geometry of three dimensions. For instance, in the equations, $\frac{x-x'}{l} = \frac{y-y'}{m}$, and $y = tx + b$, when referred to rectangular Cartesian axes, it is usual to define "*l*" and "*m*" as "the cosine and sine of the angle which the line makes with the X-axis,"¹ and "*t*" as "the tangent of the same angle." On coming to oblique axes, it is found necessary to modify both definitions; "*l*" and "*m*" become "the ratios which the sines of the angles, made by the line with the two axes respectively, bear to the sine of the angle between the axes," and "*t*," "the ratio between these two sines themselves." On

¹(Or, which is the same thing, as "the cosines of the angles which the line makes with the two axes.")

examination it appears that the definitions for rectangular axes are included as a particular case of these, and it may now be thought that we have got definitions sufficiently broad for the whole subject, but on coming to Solid Geometry we have to return to the cosines for rectangular axes, (as otherwise the phrase “the sine of the angle between the axes” would be unmeaning,) while for oblique axes we are forced upon the entirely new theory of projections, unless we choose to adopt the following definition for “ l ,” “the ratio which the sine of the angle made by the line with the intersection of two planes, (namely, the plane in which the line itself and the X-axis lie, and that in which the Y-axis and Z-axis lie,) bears to the sine of the angle made by the X-axis with the same intersection”! This instance will shew how necessary it is to consider the future requirements of Solid Geometry in dealing with Plane Geometry.

The method I have pursued in endeavouring to remedy these defects may be most conveniently discussed under the same three headings.

I. As to Definitions. In those borrowed from Euclid I have altered no word of his, except where it was necessary, either to bring the language into uniformity with the other definitions, or to meet the new requirements of Algebraical Geometry. In the rest, I have always taken his as the model, being careful at the same time to provide for the subsequent expansion necessary in Solid Geometry. And these definitions I have placed all together, at the commencement of each Book.

II. As to Enunciations. These I have given by themselves, without their proofs, to afford the student a convenient means of reviewing the subject, and testing his knowledge of it, by taking each enunciation in succession, and considering whether or no his unassisted memory can supply the demonstration. Where any difficulty is found in doing this, he is recommended to add a marginal reference to the place where the demonstration may be found, whether in the text-book which he employs on the subject, or in the Appendix to this Syllabus. I have endeavoured to reduce all these enunciations to one uniform shape, always placing the “data” before the “quæsitæ” or “demonstranda.” Lastly, I have endeavoured to make all the enunciations “general;” and I trust it will be found that they have thus gained in uniformity what they have, in some instances, lost in brevity and clearness.

III. As to Treatment of Subject. I have endeavoured, for reasons which I have already mentioned, to render each proposition, as far as possible, *independent* of others; and being thus released from the necessity of stringing them together in a consecutive series, I was able to adopt what seemed the more natural principle of arrangement, of beginning with those which involved the fewest and simplest conditions, and so going on to the more complicated. Whether I was right in attempting the further simplification of separating Problems from Theorems, I am now doubtful; it introduced several difficulties which would not have otherwise arisen; still, the great advantages of clearness and convenience of reference made the experiment a plausible one.

Next, I have introduced every new formula in a method as purely *analytical* as I found possible. For instance, in arriving at the equation to a right line, I first investigate the method of representing a point (the original purpose for which the system of co-ordinates is introduced); then, on finding that *two* equations are necessary for this, it naturally follows that we should consider the geometrical signification of *one* such equation taken by itself. Similarly, the rule already

alluded to for reducing the equation $Ax + By + C = 0$, to the form $x \cdot \cos a + y \cdot \sin a - \rho = 0$, is found at once by simply applying the test that two equations shall represent the same line. And similarly, the co-ordinates of the "focus" of an ellipse may be easily found by solving the Problem "to find a point whose distance, from any given point on the curve, shall be a simple function of the abscissa of that given point."

Another innovation will be found in the method of treating what is called by Mr. Salmon "abridged notation." It appeared to me that the symbols " α " and " β ," employed in that system, are in no other sense abridged forms of " $x \cdot \cos a + y \cdot \sin a - p$ &c., than that in which " x " is an abridged form of " $\rho \cdot \cos \theta$," (the relation between a Cartesian and a Polar System,) or of " $x' \cdot \cos \theta - y' \cdot \sin \theta$," (the relation between two rectangular Cartesian Systems inclined at an angle θ). In other words, it appeared to me simpler, and I have certainly found it to be so in practice, to constitute a new System of reference, which I have called the "Distantial" System, and only to introduce the fact that $\alpha = x \cdot \cos a + y \cdot \sin a - p$, as a *formula of transformation from a Distantial to a Cartesian System*.

The distinction introduced between an infinitely small quantity and absolute zero needs perhaps a word of apology, as it is not noticed in other treatises, and indeed belongs more properly to the subject of Differential Calculus. Still it is, at worst, superfluous, and those who think it merely fanciful will find that it can easily be omitted, as nothing in the book is made to depend upon it.

Apology is also due for the number of new words I have introduced; I have not done so in any case without an apparent necessity, to avoid the constant repetition of a cumbrous periphrasis. I will here enumerate the new words introduced, with reference to the pages where their definitions may be found. I have endeavoured to make them, as far as possible, suggest their meaning by their derivations:

divisional-angles, and divisional-ratio	18
direction-angles	21
abscissa-ratio, ordinate-ratio, and co-ordinate-ratio	22
sagittal-line, sagittal-angles, and sagit	22, 23
interceptive, sagittal, and directional equations	29
fixed-radius	30
vectorial-line	30
distantial system, lines of reference, vertex of reference, principal portion, and referent	36
interceptor	44
co-radical circles	96

It remains that I should enumerate those defects in the subject, for which I have not been able here to furnish a remedy.

In the first place, there is something unphilosophical in the very groundwork of the science. It professes to prove, from independent sources, many of the propositions of Pure Geometry, while it is so entirely dependent upon that science for its merest elements, that even the equation to a straight line cannot be investigated without assuming Euclid, Book VI, Prop. 4. As long as Algebraical Geometry requires the previous proof of so large a range of geometrical propositions, it cannot fairly be employed to prove any theorems which fall within that range.

Secondly, there are terms employed in the science in more senses than one;

for the secondary meaning a new word should be introduced. For example, while we have “superficies” to denote a surface of indefinite extent, and “figure” to denote a limited portion of one—while we have “space” to denote indefinite extent of three dimensions, and “solid” to denote a limited portion of space—the word “line” is made to do double duty. Another example may be found in the word “direction,” discussed in the Appendix, p. 124.

Thirdly, there are several instances of two or more words being used in precisely the same sense; these require to be desynonymised, or, if that be impossible, all the synonymous terms, but one, should be excluded from use, and reserved for the possible future requisitions of the subject. As instances of this may be mentioned,

denote, represent, indicate, express;
contain, involve, require, postulate;
constant, fixed, invariable, determinate;
given, known, determined.

Fourthly, some simple rules are required for ascertaining, in any given problem, whether it may best be solved by the Cartesian, Polar, or Distantial System.

Many defects in the present Syllabus have been discovered and rectified while the sheets were passing through the press; many more, in an attempt so new, and (so to speak) experimental, have no doubt escaped my notice; there is also a great hiatus in the subject of Trigonometry, the whole of which needs to be systematised in the same way. Still I have thought it better to publish it in its present incomplete state, in order that by bringing it under the notice of more mathematicians than would otherwise have seen it, and so getting more suggestions for its improvement than could otherwise have been obtained, means may be afforded, whether to myself or to some other writer, of hereafter reducing the whole subject to a complete and uniform system, which shall occupy, with regard to Algebraical Geometry, the same position which is occupied by that of Euclid with regard to Pure Geometry.

4.2 Notes on the First Two Books of Euclid

Source: Notes on the First Two Books of Euclid

Designed for Candidates for Resposions.

Notes on the Definitions

A POINT. It must not be supposed that a Point has *only* negative qualities, in which case it would be identical with absolute *nothing*. It has the positive quality of *position*, and it is this which enables us to distinguish one Point from another.

A PLANE ANGLE. It should be observed that an angle is *not* the point where two lines intersect; it is *not* the lines themselves; it is *not* the space between them; but it *is* the “inclination,” (or “bending,”) of the two lines to each other.

A TRIANGLE. A Triangle may be said to consist of 6 parts, viz., 3 sides and 3 angles. In order to prove one Triangle equal in all respects to another, it must be first given, (or proved) that 3 of these 6 parts in the one are equal to the corresponding 3 in the other. The various cases are:—

Prop. IV. Two sides and the included angle of the one equal to two sides and the included angle of the other.

Prop. VII. The three sides of the one equal to the three sides of the other.

Prop. XXVI. Two angles and one side of the one equal to two angles and one side of the other.

Additional Definitions

I.

A POSTULATE is something to be done, for which no proof is given. (From *postulatum*, because it is *demanded* that the reader should grant it to be possible.)

II.

AN AXIOM is something to be believed, for which no proof is given. (From *ἀξιωμα*, because it is *thought worthy* of belief.)

III.

A PROPOSITION is something either to be done, or to be believed, for which a proof is given. (From *propositum*, because it is *put before* the reader.) Propositions therefore are of 2 kinds, Problems, and Theorems.

IV.

A PROBLEM is something to be done, for which a proof is given. (From *πρόβλημα*, for the same reason as the last.)

V.

A THEOREM is something to be believed, for which a proof is given. (From θεωρημα, because it is to be *considered*, as to its being true or false.)

VI.

THE ENUNCIATION of a Proposition states (1) what is given, (2) what is required to be done or proved true: these two parts of the Enunciation are called THE DATA, and THE QUÆSITA.

VII.

THE HYPOTHESIS of a Proposition is the same as its Data: it is a word used only with reference to Theorems. (From υπόθεσις, because it is *supposed* to be true.)

VIII.

A COROLLARY is something proved in the course of Proposition, which it was not the object of the Proposition to prove. (From corolla, because it is a sort of ornament, or *garland*, of the Proposition.)

IX.

TWO PROPOSITIONS are said to be CONVERSE to each other when that which is given in the first is to be done or believed in the second, and that which is to be done or believed in the first is given in the second. For example, the Propositions, “*if 2 sides of a triangle be equal, the opposite angles are equal,*” and “*if 2 angles of a triangle be equal, the opposite sides are equal,*” are converse to each other.

X.

“A FORTIORI,” (or “*much more then,*”) is a phrase used when the conclusion has a *stronger* claim to be believed than any of the facts from which it is proved. For example, “3 is greater than 2, and 4 is greater than 3; *much more then* is 4 greater than 2.”

XI.

REDUCTIO AD ABSURDUM is the name of a form of argument, in which something is proved true, by showing that, if it were *not* true, an absurdity, (or impossibility,) would follow. For example, Prop. XXVII. “*If a straight line, falling on 2 other straight lines, make the alternate angles equal to each other; these 2 straight lines shall be parallel,*” is proved true, by showing that, if they were *not* parallel, an absurdity would follow.

The following scheme may assist the reader in understanding the first five Definitions given above.

Things set before us in Geometry may be of 2 kinds, viz.:

(without proofs)		(with proofs)	
		i. e. PROPOSITIONS.	
(to be done)		(to be believed)	
i. e. POSTULATES.	i. e. AXIOMS.	i. e. PROBLEMS.	i. e. THEOREMS.

A Proposition may be divided into the following parts:—

- I. General Enunciation.
 - (1) Data.
 - (2) Quæsitæ.
- II. Particular Enunciation.
 - (1) Data.
 - (2) Quæsitæ.
- III. Construction.
- IV. Proof.
- V. Particular Conclusion.
- VI. General Conclusion. (Only found in Theorems.)

Take, for example, Prop. VI of Book I.

- I. General Enunciation.
 - (1) Data.
If two angles of a triangle be equal to each other,
 - (2) Quæsitæ.
the sides also which subtend the equal angles, shall be equal to each other.
- II. Particular Enunciation.
 - (1) Data.
Let ABC be a \triangle having $\angle ABC = \angle ACB$,
 - (2) Quæsitæ.
then side AB shall = side AC .
- III. Construction.
For, if $AB \neq AC$, one of them is $>$ the other;
let AB be $> AC$;
from BA cut off $BD = AC$, and join DC ,
- IV. Proof.
Then, in \triangle s DBC, ABC ,
 $\therefore DB = AC$, and BC is common, and $\angle DBC = \angle ABC$;
 \therefore base $DC =$ base AB ,
and $\triangle DBC = \triangle ABC$,
the $< =$ the $>$, which is absurd;
 $\therefore AB$ is not $\neq AC$;
- V. Particular Conclusion.
that is, $AB = AC$.
- VI. General Conclusion.
Therefore, if two triangles, &c. Q. E. D.

Notes on the Propositions

When two Propositions are converse to each other, the *second* has generally no “construction,” and is proved by a “reductio ad absurdum.”

Book I. Prop. XVI. The second part may be proved thus:—

Bisect BC in H , join AH , and produce it to K , making $HK = AH$, and join CK ;

$\therefore AH = HK$, and $BH = HC$, and $\angle AHB = \angle KHC$, (being vertical angles);

$\therefore CK = AB$, and $\angle KCH = \angle ABH$, i. e. $\angle ABC$;

but $\angle GCB > \angle KCB$;

$\therefore \angle GCB > \angle ABC$;

and $\angle ACD = \angle GCB$, (being vertical angles);

$\therefore \angle ACB > \angle ABC$.

Q. E. D.

Book I. Prop. XXXV. Here the taking away of the triangles from the trapezium is meant to be done thus:—

From the trapezium $ABCF$ take the triangle FDC , and observe that there remains the parallelogram $ABCD$; then replace this triangle, so as to make the trapezium complete again; then take away from it the triangle EAB , and observe that there remains the parallelogram $EBCF$. Since, in the two subtractions, equal triangles are taken away, the remainders are equal.

Book II. Prop. VII. It should be observed, that on the space $CGKB$ there are supposed to be *two* squares, one lying over the other. One of these is supposed to be added to the complement AG , the other to the complement GE .

Book II. Prop. XIII. This may be proved more simply thus:—

\therefore (in fig. 1.) BC is divided into 2 parts in D ,

and \therefore (in fig. 2.) BD is divided into 2 parts in C ,

\therefore (in both) $BC^2 + BD^2 = 2BC \cdot BD + CD^2$;

add to each AD^2 ;

$\therefore BC^2 + BD^2 + AD^2 = 2BC \cdot BD + CD^2 + AD^2$;

but $BD^2 + AD^2 = AB^2$,

and $CD^2 + AD^2 = AC^2$;
 $\therefore BC^2 + AB^2 = 2BC \cdot BD + AC^2$;
 $\therefore AC^2 < BC^2 + AB^2$ by $2BC \cdot BD$.
 Also \therefore (in fig. 3.) $AB^2 = BC^2 + AC^2$,
 add to each BC^2 ;
 $\therefore BC^2 + AB^2 = 2BC^2 + AC^2$;
 $\therefore AC^2 < BC^2 + AB^2$ by $2BC^2$, i. e. by $2BC \cdot BC$.
 Therefore in any triangle, &c.

Q. E. D.

List of Abbreviations

$/AB$	means	the line AB
$\angle BAC$	"	the angle BAC
\perp	"	right angle
\perp	"	at right angles to
\odot	"	circle
\triangle	"	triangle
\parallel	"	parallel to
\nparallel	"	not parallel to
$=$	"	equal to
\neq	"	not equal to
$>$	"	greater than
$<$	"	less than
\nless	"	not greater than
\nless	"	not less than
\square	"	parallelogram
AB^2	"	the square described on AB
$AB \cdot AC$	"	the rectangle contained by AB, AC
\therefore	"	because
\therefore	"	therefore
Q. E. F.	"	quod erat faciendum
Q. E. D.	"	quod erat demonstrandum

N.B. The symbol for "less than" must be carefully distinguished from that for "angle."

The symbols for "greater than" and "less than" may be distinguished from each other by remembering that the *greater* end of the symbol is placed next the *greater* quantity. Thus " $A > B$ " shows that A is the greater, " $A < B$ " that B is the greater.

The symbols for "because" and "therefore" may be distinguished thus: when "because" is used, the pyramid (\therefore) is balanced on the point, to show that the argument is still unsettled; but when "therefore" is used, the pyramid (\therefore) is placed on the base, to show that the argument is settled.

4.3 The Formulæ of Plane Trigonometry

Source: The Formulæ of Plane Trigonometry

Preface

Other version:
→ 9.21, p. 1466

This Pamphlet is published with two objects: first, to exhibit a specimen of a collection of “Formulæ of Pure Mathematics,” which I am preparing for publication; secondly, to suggest the substitution of symbols for the cumbersome expressions “sin,” “tan,” “cosec,” &c., at present employed in Trigonometry.

As to the first of these objects, I am in hopes that, by publishing this specimen by itself, I may receive, from other mathematicians, suggestions both as to the form and the matter of the larger work; and any simple and compendious formulæ, not given in the published treatises, or superseding those which are there given, will be most acceptable for this object.

As to the second, I am anxious to ascertain what probability there is of others’ consenting to adopt these, or any similar symbols, before employing them either in the above-mentioned “Formulæ of Pure Mathematics,” or in another work, (also in preparation,) on Algebraical Geometry, (on the plan indicated in a Syllabus published in 1860,) into both of which works these symbols would of course enter largely.

Objections may be raised, first, against the introduction of any symbols at all into this subject, and, secondly, against the particular symbols here suggested: these objections I proceed to examine.

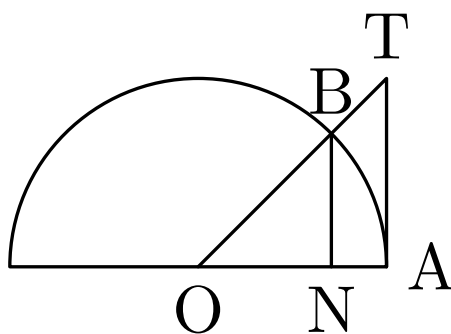

First, then, as to the introduction of any symbols at all: if it could be shown that such symbols were likely to confuse those who are used to the existing notation, or to make the books at present in use unintelligible to those who learn only the new notation, I grant that it would be much too late in the history of Trigonometry to attempt any such radical change. But I am sure that no such effects would be produced; the new symbols would still be *called* “sin,” “cos,” &c., so that the old names would not die out, and those who use the new symbols would find no more difficulty in reading books where the names are given in full, than we do in reading old mathematical books where the words “plus,” and “minus” occur. And there can be no question that the use of symbols would save much time, space, and labour; all of which are points of great importance to those who are much engaged in writing or printing Mathematics.

Secondly, as to the particular symbols here suggested: on this point I speak much more doubtfully; and I shall be very willing, if simpler and more appropriate symbols be proposed, to adopt them instead of these; still, as these have not been chosen without some thought, and the trial and rejection of many others, I have great hopes that they may be found sufficiently simple and expressive for the purpose: and perhaps a simple account of the way in which they originated will be the best explanation and defence of them which I can offer.

It seemed necessary, then, that symbols for such a purpose should be—easily written—suggestive (as far as possible) of their meaning—connected with each other—and, above all, distinct from all symbols at present in use. Letters of the alphabet of course suggested themselves first: but besides that all the alphabets, capital and small, Roman, Greek, even Old English and Hebrew, are already

largely appropriated in Mathematics, it did not seem that any but initials were sufficiently connected with the words to stand much chance of being remembered. Now the words “sine, secant, cosine, cosecant, cotangent, tangent,” have unfortunately only three initials among them; and of these “*S*” and “*C*” (whether we take them as capital or small letters,) are already distinctly appropriated in this very subject of Algebraical Geometry—“*S*” and “*C*” signifying, one, the semi-perimeter of a triangle; the other, one of its angles—and “*s*” and “*c*” signifying, one, an arc of a curve; the other, one of the sides of a triangle: as to the latter indeed it is sufficient to point out that the phrase “ $a. \cos A + b. \cos B + c. \cos C$ ” would, under this notation, be written “ $a. cA + b. cB + c. cC$ ”!

Setting aside, then, all alphabets, and (of course) all purely *mathematical* symbols, such as numerals, &c., no course remained but to *invent* new symbols for this purpose. In setting about this I took as principles—to secure their being easily written, that each should consist of *two* strokes of the pen only—to connect them with each other, that *one* of these two strokes should be the same in all—to make them suggestive of their meaning, that they should represent (as nearly as possible) the *geometrical* lines to which these ratios belong. And as, in modern Trigonometry, each of these ratios involves *two* lines, I thought it better to fall back on the older theory, where the sine, cosine, &c., are all *single* lines.

In the annexed diagram, *BN* is the *sine* of the angle *AOB*, *ON* its *cosine*, *TO* its *secant*, and *AT* its *tangent*. It occurred to me, then, to construct a set of symbols for these by taking the semicircle itself as the part *common* to all the symbols, and these lines as their distinctive features, altering them only so far as to make each symbol symmetrical. I shall now consider each “goniometrical ratio” by itself.

I. “Sine,” \cap . In this it will be seen that the line *BN* has merely been shifted to the middle of the figure.

II. “Cosine,” \sqcup . In this the line *ON* has been produced, (which in hasty writing one could hardly avoid doing,) and taken a little *beyond* the curve, to avoid confusion with the existing symbol for “semicircle.” Observe here also that the line in this symbol is *at right angles* to that in the last; which may be connected with the fact that these are corresponding ratios of *complemental* angles (i. e. of angles, whose sum is a *right angle*).

III. “Secant,” \sphericalangle . In this the line *TO* has been produced downwards, to avoid all chance of confusion with the symbol \cap .

IV. "Cosecant," \curvearrowright . This I derived from the former, by turning the line round through a *right angle*, on the principle which I have explained in II.

V. "Tangent," $\overline{\cap}$. If the symbol for this were taken from the diagram, it would have a one-sided effect, and it would be difficult to find an analogous symbol for "cotangent," since the three other positions in which it might be placed are pre-occupied by the letters h , μ , and y . I therefore preferred placing it horizontally on the top of the curve, leaving a little interval between the two, to avoid confusion with the letter π .

VI. "Cotangent," $\underline{\cup}$. I could not derive this from the last, on the principle of II, without destroying its character as a *tangent*. I therefore simply *inverted* the former symbol, which may be taken to indicate the fact that each is the *reciprocal* of the other: so that if $\overline{\cap} = \frac{a}{b}$, $\underline{\cup} = \frac{b}{a}$, which seems to be a very consistent and self-interpreting notation.

VII. "Versed-sine," \curvearrowleft . This is of course a combination of the semicircle with the letter "V"; it contains one stroke more than the other symbols, but as it is very seldom used, this is of little importance.

I have thus endeavoured to show that the proposed symbols satisfy three of the four requisitions, viz.: that they should be—easily written—suggestive of their meaning—and connected with each other. As to whether they are distinct from existing symbols, it is for the objectors to point out any with which they are liable to be confused; none such have been suggested to me, except the letter Ω , which is something like the new symbol \triangleleft ; but, as the latter is closed, instead of open, below, and much wider in proportion to its height than the former, I do not think there is much danger of either's being mistaken for the other.

I will conclude by putting into the form of definite questions the points to which I wish to draw the attention of those mathematicians into whose hands this may come:

(1) Do you object *in limine* to the introduction of *any symbols whatever* as substitutes for the words *sin*, *cos*, &c.? If not,

(2) Can you suggest others, better adapted than these for such a purpose? If not,

(3) Do you so far approve of the symbols here suggested, that, if they were employed in a published work, you would not, *on that account alone*, object to use or to recommend such a work?

Ch. Ch. June 11, 1861.

Preliminary Remarks.

The subject-matter usually assigned to Plane Trigonometry may be more properly arranged thus:

Part I. *Goniometry Proper*. i. e. the measurement of angles by *angular units*.

Part II. *Goniometry by Ratios*. i. e. the *indication*, (not *measurement*,) of angles by what are called "goniometrical ratios."

Part III. *Trigonometry*. i. e. the properties of rectilinear figures.

Before proceeding to enumerate the Formulæ of the subject, I shall make a few remarks on each of these three Parts.

Part I. Goniometry Proper.

Two different units are in common use:

- (1). a right angle.
- (2). the angle which is subtended, (in any circle), by an arc equal to the radius; this can easily be proved to be the same, whatever be the size of the circle, and to be about $\frac{2}{3}$ of a right angle.

This angle I propose to call “a radial angle.”

When (1) is employed, it is subdivided, either into 90 degrees (English measure), or 100 grades (French measure).

When (2) is employed, the following proportion holds good;

$$\text{No. of radial angles contained} : 1 :: \text{arc} : \text{radius},$$

which may be briefly expressed thus; $\text{angle} = \frac{\text{arc}}{\text{radius}}$.

The quantity “2 right angles” would be algebraically represented—in English measure by “180°”—in French measure by 200^g—and in “radial” measure by “3.14159... radial angles.”

Part II. Goniometry by Ratios.

The student will do well to observe that the statement, to be found in most treatises on Trigonometry, that “if any of the quantities, $\sin A$, $\cos A$, &c., be given, the angle A may be determined,” is untrue. The word “angle” is used in various senses; in one of these senses, it could not be determined, even if *all* the “goniometrical ratios” were given, and even in its simplest sense “ $\sin A$ ” is *never* sufficient to determine it. I believe that the chief difficulty of Trigonometry is surmounted, when we have once arrived at a clear notion of the different meanings of this word “angle.” It may be thought that the following explanation is unnecessarily complicated, but if such complication really exists in the science itself, it surely deserves investigation; we can never get rid of the difficulties of a subject by ignoring them.

First, then, there is the “geometrical angle,” or the angle as treated of by Euclid: of this it may be remarked, that it is considered as an *absolute magnitude*, without regard to *direction*, and that it is always measured the *shortest* way round, so that it can never exceed two right angles. Thus, in the annexed figure, the “geometrical angle” contained between OX and OA is measured (whether from X to A , or from A to X , does not matter) along the arrow marked S , and *not* along that marked L . If OX and OA were in one straight line, the angle might still be called geometrical, though not treated of in Euclid; it would then be *equal* to two right angles, and might of course be measured either way round at pleasure.

Secondly, there is the “angle of position”: in measuring this, *one* of the lines is supposed to be fixed in position, and the angle to be measured, *from* it, *to* the other, the shortest way round: and as this angle may lie in either of two opposite directions, these are distinguished as “positive“ and “negative.” Thus, in the annexed figure, the angles XOA and XOA' are identical when viewed as “geometrical angles” only, since they have the same magnitude: nevertheless OA and OA' have different positions with regard to OX , and these may be distinguished by calling the angle XOA “positive,” and XOA' “negative.” Observe also, that every possible position of OA , if *above* the line $X'OX$, may be represented by a positive “geometrical angle,” if *below* it, by a negative one, and if coinciding with OX' , by a positive or negative one, equal to two right angles; but that in no case need the angle *exceed* two right angles.

Thirdly, there is the “angle of revolution”: in measuring this, *one* of the lines is (as before) supposed to be fixed, and the angle to be measured *from* it *to* the other; but no longer are we obliged to do this the *shortest* way round, nor even to stop measuring it the first time we come upon the other line: we may go round and round the circle any number of times, the only rule being

that we must at last stop on the other line. Thus, in the annexed figure, the arrows, S_1 , S_2 , and S_3 , are specimens of the various ways in which the “angle of revolution” may be measured from OX to OA ; S_1 and S_3 being “positive,” and S_2 “negative.”

Let us now consider how far the “goniometrical ratios” enable us to determine an angle under each of these senses.

It is evident that these ratios depend *only* on the *position* of OA with regard to OX , and are unaffected by the method in which we may choose to measure the angle; so that they are of no use in determining the “angle of *revolution*”; this can only be expressed by referring it to some angular unit.

How far, then, will they help us in determining the “angle of *position*”? We may see by the annexed figure that if the *sine* only of XOA_1 were given, we could not distinguish it from XOA_2 ; nor, by its *cosine* only, could we distinguish it from XOA_3 ; nor, by its *tangent* only, from XOA_4 ; and the same may be said of its *cosecant*, its *secant*, and its *cotangent*, which are the reciprocals of the former three. Hence *no one* of the goniometrical ratios is sufficient by itself to determine an “angle of position”: and since from any one we may determine the *magnitude* of *all* the rest, and the *magnitude* and *sign* of the *reciprocal* ratio, we may lay it down as a rule, that in order to determine an “angle of position” we require to know the *magnitude* of some *one* ratio, and the *signs* of *two*, and that these two must *not* be reciprocals of each other, (to which we may add, that they must *not* be the cosine and versed-sine).

But in the case of the “*geometrical* angle,” (as, for instance, when we are treating of one of the angles of a triangle, which is always positive, and can never exceed two right angles,) can *this* never be determined unless *two* “goniometrical ratios” are given? In some cases it can: but not in all. If in the last figure we confine our attention to the *positive* angles only, we see that if the *sine* only of XOA_1 were given, we could not distinguish it from XOA_2 , (and the same may be said of its reciprocal, the cosecant); but that from any one of the remaining ratios the angle might be absolutely determined.

Hence the statement, which I quoted at the beginning of this dissertation, that “if any of the quantities, $\sin A$, $\cos A$, &c., be given the angle A may be determined,” ought to be read thus: “to determine the angle A as a *geometrical angle*, one of the 4 quantities, $\cos A$, $\tan A$, $\sec A$, $\cot A$, must be given ($\sin A$ and cosec A not being sufficient for this purpose): to determine it as an *angle of position*, the magnitude of *one* of these 6 quantities must be given, and the signs of *two* (which two must not be reciprocals): to determine it as *angle of revolution*, it must be referred to some angular unit.”

N.B. The phrase “goniometrical ratio,” besides being too long for constant repetition, conveys the false notion of its *measuring* the angle, (whereas the measure always varies as the thing measured,) instead of merely *indicating* its value: and does *not* convey the notion that *two* of these ratios are generally necessary to determine the angle; for this latter purpose some term analogous to “co-ordinate,” (which, by the way should rather be “co-ordinant,”) is needed. I propose, then, to call them the “co-indicants” of the angle.

In the following Formulæ, the “data” are separated from the “quæsitæ,” so that, by covering half of the page, the student may test for himself the accuracy of his recollection of them.

The following are the new symbols introduced:

Symbol.	Name.	Meaning.
\cap .	sin.	sine.
\sqcup .	cos.	cosine.
\sphericalangle .	sec.	secant.
\sphericalangle .	cosec.	cosecant.
$\overline{\cap}$.	tan.	tangent.
$\underline{\cup}$.	cot.	cotangent.
\sphericalangle .	versin.	versed-sine.

Part III. Trigonometry.

It should be observed that the angles of a rectilinear Figure are considered as angles of *absolute magnitude only*, i. e. as “geometrical angles.” Hence the angle A can be determined from $\cos A$, or $\sec A$, or $\tan A$, or $\cot A$; but it can *not* be determined from $\sin A$, or $\text{cosec } A$: this gives rise to what is called the “ambiguous case” in the solution of Triangles.

Formulæ of Part I.

Given an angle expressed in one of the 3 measures, English, French, and radial; to express it in another

N.B. The number of English degrees in an angle is represented by “ E ”; the number of French grades by “ F ”; the number of radial angles by “ Θ ”; and the number of radial angles contained in two right angles, (i. e. 3.14159&c,) by “ π .”

- (1) Formula connecting E and F ,
 E and Θ ,

$$E : F :: 9 : 10.$$

$$E : \Theta :: 180 : \pi.$$

Other version:
 → 8.6, p. 1267

Formulæ of Part II.

I. FORMULÆ CONCERNING *one* ANGLE ONLY.

(α) *Given magnitude and sign of a co-indicant: to find magnitude and sign of one other.*

- (1) The pairs of reciprocals are,
 (β) *Given magnitude of a co-indicant: to find magnitude of the rest.*

- (2) Formula connecting \cap and \sqcup ,

- (3) $\overline{\cap}$, \cap , and \sqcup ,

- (4) \sphericalangle and $\overline{\cap}$,

- (5) \sphericalangle and \cap ,

(γ) *Given certain angles: to find their co-indicants.*

- (6) \cap , \sqcup , and $\overline{\cap}$ of $0^\circ =$
 $90^\circ =$

$$\cap \text{ and } \sphericalangle, \sqcup \text{ and } \sphericalangle, \overline{\cap} \text{ and } \underline{\cup}.$$

$$\cap^2 + \sqcup^2 = 1.$$

$$\overline{\cap} = \frac{\cap}{\sqcup}.$$

$$\sphericalangle^2 = \overline{\cap}^2 + 1.$$

$$\sphericalangle = 1 - \cap.$$

$$0, 1, 0.$$

$$1, 0, \frac{1}{0}.$$

$$\begin{aligned}
180^\circ &= 0, -1, 0. \\
270^\circ &= -1, 0, \frac{1}{0}. \\
45^\circ &= \frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}, 1. \\
60^\circ &= \frac{\sqrt{3}}{2}, \frac{1}{2}, \sqrt{3}. \\
30^\circ &= \frac{1}{2}, \frac{\sqrt{3}}{2}, \frac{1}{\sqrt{3}}.
\end{aligned}$$

II. FORMULÆ CONCERNING 2 OR MORE ANGLES.

(α) Given the co-indicants of 2 angles: to find the co-indicants of their sum and difference.

$$\begin{aligned}
(7) \quad \cap \overline{A+B} &= \\
\cap \overline{A-B} &= \\
\sqcup \overline{A+B} &= \\
\sqcup \overline{A-B} &=
\end{aligned}$$

Hence $\cap 2A =$
 $\sqcup 2A$, in terms of $\cap A$ and $\sqcup A$, =
in terms of $\cap A$ only, =
in terms of $\sqcup A$ only, =

$$\begin{aligned}
(8) \quad \overline{\cap A+B} &= \\
\overline{\cap A-B} &=
\end{aligned}$$

Hence $\overline{\cap 2A} =$

(9) The formulæ of (8) may also be written thus, by taking $\overline{\cap^{-1} t}$ to mean "the angle whose tangent is t ."

$$\begin{aligned}
\overline{\cap^{-1} t_1 + \overline{\cap^{-1} t_2}} &= \\
\overline{\cap^{-1} t_1 - \overline{\cap^{-1} t_2}} &= \\
2 \overline{\cap^{-1} t} &=
\end{aligned}$$

(β) Given the co-indicants of 3 angles: to find the co-indicants of their sum.

$$\begin{aligned}
(10) \quad \cap \overline{A+B+C} &= \\
\sqcup \overline{A+B+C} &=
\end{aligned}$$

Hence $\cap 3A =$
 $\sqcup 3A =$

$$(11) \quad \overline{\cap A+B+C} =$$

Hence $\overline{\cap 3A} =$

$$(12) \quad \overline{\cap^{-1} t_1 + \overline{\cap^{-1} t_2 + \overline{\cap^{-1} t_3}}} =$$

Hence $3 \overline{\cap^{-1} t} =$

(γ) Given 2 angles: to reduce the sum or difference of their corresponding co-indicants to one term (for logarithmic computation).

$$\begin{aligned}
(13) \quad \cap A + \cap B &= \\
\cap A - \cap B &= \\
\sqcup A + \sqcup B &= \\
\sqcup A - \sqcup B &=
\end{aligned}$$

$$\begin{aligned}
\cap A. \sqcup B + \sqcup A. \cap B. \\
\cap A. \sqcup B - \sqcup A. \cap B. \\
\sqcup A. \sqcup B - \cap A. \cap B. \\
\sqcup A. \sqcup B + \cap A. \cap B. \\
2 \cap A. \sqcup A. \\
\sqcup^2 A - \cap^2 A. \\
1 - 2 \cap^2 A. \\
2 \sqcup^2 A - 1. \\
\frac{\overline{\cap A + \overline{\cap B}}}{1 - \overline{\cap A. \overline{\cap B}}}. \\
\frac{\overline{\cap A - \overline{\cap B}}}{1 + \overline{\cap A. \overline{\cap B}}}. \\
\frac{2 \overline{\cap A}}{1 - \overline{\cap^2 A}}.
\end{aligned}$$

$$\begin{aligned}
\overline{\cap^{-1} \frac{t_1+t_2}{1-t_1 t_2}}. \\
\overline{\cap^{-1} \frac{t_1-t_2}{1+t_1 t_2}}. \\
\overline{\cap^{-1} \frac{2t}{1-t^2}}.
\end{aligned}$$

$$\begin{aligned}
\sqcup A. \sqcup B. \sqcup C. (\overline{\cap A + \overline{\cap B + \overline{\cap C} - \overline{\cap A. \overline{\cap B. \overline{\cap C}}}}). \\
\sqcup A. \sqcup B. \sqcup C. (1 - \overline{\cap B. \overline{\cap C} - \overline{\cap C. \overline{\cap A} - \overline{\cap A. \overline{\cap B}}}). \\
\cap A. (3 - 4 \cap^2 A). \\
\sqcup A. (4 \sqcup^2 A - 3). \\
\frac{\overline{\cap A + \overline{\cap B + \overline{\cap C} - \overline{\cap A. \overline{\cap B. \overline{\cap C}}}}}{1 - (\overline{\cap B. \overline{\cap C} + \overline{\cap C. \overline{\cap A} + \overline{\cap A. \overline{\cap B}}})}. \\
\frac{3 \overline{\cap A} - \overline{\cap^3 A}}{1 - 3 \overline{\cap^2 A}}. \\
\overline{\cap^{-1} \frac{t_1+t_2+t_3-t_1.t_2.t_3}{1-(t_2 t_3+t_3 t_1+t_1 t_3)}}. \\
\overline{\cap^{-1} \frac{3t-t^3}{1-3t^2}}.
\end{aligned}$$

$$\begin{aligned}
2 \cap \frac{A+B}{2}. \sqcup \frac{A-B}{2}. \\
2 \sqcup \frac{A+B}{2}. \cap \frac{A-B}{2}. \\
2 \sqcup \frac{A+B}{2}. \sqcup \frac{A-B}{2}. \\
-2 \cap \frac{A+B}{2}. \cap \frac{A-B}{2}.
\end{aligned}$$

$$\overline{\cap} A + \overline{\cap} B =$$

$$\overline{\cap} A - \overline{\cap} B =$$

III. FORMULÆ CONCERNING THE POWERS OF CO-INDICANTS.

(15) Demoiivre's theorem, viz.: $(\sqcup \theta \pm \sqrt{-1} \cdot \cap \theta)^n =$

Hence, if $2 \sqcup \theta = v + \frac{1}{v}$,

then $2\sqrt{-1} \cdot \cap \theta =$

$$2 \sqcup n\theta =$$

$$2\sqrt{-1} \cdot \cap n\theta =$$

(16) Formula expressing $\sqcup^n \theta$ in terms of $\sqcup \theta$, $\sqcup 2\theta$, $\sqcup 3\theta$, &c. Rule is

(17) Formula expressing $\cap^n \theta$ in terms of $\cap \theta$, $\cap 2\theta$, $\cap 2\theta$, &c. Rule is

(18) Formula expressing $\overline{\cap}^n \theta$ in terms of $\overline{\cap} \theta$, $\overline{\cap} 2\theta$, $\overline{\cap} 3\theta$, &c. Rule is

IV. SUMMATION OF SERIES OF CO-INDICANTS.

$$(19) \cap A + \cap(A+B) + \dots + \cap(A + \overline{n+1}. B) =$$

$$\sqcup A + \sqcup(A+B) + \dots + \sqcup(A + \overline{n+1}. B) =$$

$$\text{Hence } \cap A + \cap 2A + \dots + \cap nA =$$

$$\sqcup A + \sqcup 2A + \dots + \sqcup nA =$$

V. FORMULÆ CONNECTING THE CO-INDICANTS OF AN ANGLE WITH ITS RADIAL MEASURE.

N.B. The number $\left(1 + \frac{1}{\underline{1}} + \frac{1}{\underline{2}} + \dots \text{ad inf.}\right)$, i. e. the number 2.71828&c., is represented by "e." Also, when the symbol θ is used without any co-indicant symbol, it represents the angle in *radial* measure.

(20) Formulæ expressing $\cap \theta$ and $\sqcup \theta$ in terms of θ , θ^2 , θ^3 , &c.

(21) Gregorie's series, expressing θ in terms of $\overline{\cap} \theta$, $\overline{\cap}^3 \theta$, &c. (i. e. expressing $\overline{\cap}^{-1} t$ in terms of t , t^3 , &c.)

Hence to find π .

(22) Euler's series to find π .

Rule is

Rule is

$$\frac{\cap(A+B)}{\sqcup A \cdot \sqcup B} \cdot$$

$$\frac{\cap(A-B)}{\sqcup A \cdot \sqcup B} \cdot$$

$$\sqcup n\theta \pm \sqrt{-1} \cdot \cap n\theta.$$

$$v - \frac{1}{v}.$$

$$v^n + \frac{1}{v^n}.$$

$$v^n - \frac{1}{v^n}.$$

$$\text{let } (2 \sqcup \theta)^n = \left(v + \frac{1}{v}\right)^n.$$

$$\text{let } (2\sqrt{-1} \cdot \cap \theta)^n = \left(v - \frac{1}{v}\right)^n.$$

in Demoiivre's theorem, equate the possible and impossible parts on both sides, and divide one by the other.

$$\frac{\cap \frac{nB}{2}}{\cap \frac{B}{2}} \cdot \cap \left(A + \frac{(n-1) \cdot B}{2}\right).$$

$$\frac{\cap \frac{nB}{2}}{\cap \frac{B}{2}} \cdot \sqcup \left(A + \frac{(n-1) \cdot B}{2}\right).$$

$$\frac{\cap \frac{nA}{2}}{\cap \frac{A}{2}} \cdot \cap \frac{(n+1) \cdot A}{2}.$$

$$\frac{\cap \frac{nA}{2}}{\cap \frac{A}{2}} \cdot \sqcup \frac{(n+1) \cdot A}{2}.$$

$$\sqcup \theta = 1 - \frac{\theta^2}{\underline{2}} + \frac{\theta^4}{\underline{4}} - \&c.$$

$$\cap \theta = \theta - \frac{\theta^3}{\underline{3}} + \frac{\theta^5}{\underline{5}} - \&c.$$

$$\theta = \frac{\overline{\cap} \theta}{1} - \frac{\overline{\cap}^3 \theta}{3} + \frac{\overline{\cap}^5 \theta}{5} - \&c.$$

$$\text{i. e. } \overline{\cap}^{-1} t = \frac{t}{1} - \frac{t^3}{3} + \frac{t^5}{5} - \&c.$$

let $\theta = \frac{1}{2}$ a right angle.

in the formula $\overline{\cap}^{-1} t_1 - \overline{\cap}^{-1} t_2 = \overline{\cap}^{-1} \frac{t_1 - t_2}{1 + t_1 t_2}$,

let $t_1 = 1$, and $t_2 = \frac{1}{2}$, and use Gregorie's series.

(23) Machin's series to find π . Rule is

(24) Formulæ expressing $\cap \theta$ and $\sqcup \theta$ in terms of θ and ϵ .

$$\begin{aligned}\cap \theta &= \frac{1}{2} \cdot (\epsilon^{\theta\sqrt{-1}} + \epsilon^{-\theta\sqrt{-1}}), \\ \sqcup \theta &= \frac{1}{2\sqrt{-1}} \cdot (\epsilon^{\theta\sqrt{-1}} - \epsilon^{-\theta\sqrt{-1}}).\end{aligned}$$

in the formula $2 \overline{\cap}^{-1} t = \overline{\cap}^{-1} \frac{2t}{1-t^2}$, let $t = \frac{1}{5}$, multiply both sides by 2, and reduce the right-hand side by the same formula; subtract the equation $\left(\frac{\pi}{4} = \overline{\cap}^{-1} 1\right)$ from the result, and use Gregorie's series.

Formulæ of Part III.

(α) *Given certain magnitudes concerning a triangle: to find certain other magnitudes.*

N.B. The 3 sides are represented by " a, b, c "; the opposite angles by " A, B, C "; and the quantity $\frac{a+b+c}{2}$ by " S ."

- (1) "Formula of sines."
- (2) "Formula of sides."
- (3) "Formula of tangents."
- (4) $\sqcup \frac{A}{2}$, in terms of the sides, =
- $\cap \frac{A}{2}$, in terms of the sides, =
- (5) $\cap A$, in terms of the sides, =
- (6) Area of triangle, in terms of the sides, =
- (7) Area of triangle, in terms of 2 sides and the included angle, =

N.B. The radius of the circle inscribed in a triangle is represented by " r "; the radius of the circumscribed circle by " R "; and the radii of the 3 escribed circles, respectively touching the sides " a, b, c ," by " R_a, R_b, R_c ." Also the quantity $\sqrt{S \cdot (S-a) \cdot (S-b) \cdot (S-c)}$ is represented by M .

- (8) r , in terms of the sides, =
- (9) R , in terms of the sides, =
- (10) R_a, R_b , and R_c , in terms of the sides, =

(β) *Given certain magnitudes connected with a quadrilateral figure, whose opposite angles are supplementary: to find certain other magnitudes.*

N.B. The 4 sides are represented by " a, b, c, d "; the quantity $\frac{a+b+c+d}{2}$ by " S "; and the quantity $\sqrt{(ab+cd) \cdot (ac+bd) \cdot (ad+bc)}$ by " D ".

- (11) Area of figure, in terms of the sides, =
- (12) Length of diagonal lying between the sides a, b , and the sides c, d , =

$$\begin{aligned}\frac{\cap A}{a} &= \frac{\cap B}{b} = \frac{\cap C}{c}. \\ \sqcup A &= \frac{b^2+c^2-a^2}{2bc}. \\ \frac{a-b}{a+b} &= \overline{\cap} \frac{A-B}{2} \cdot \overline{\cap} \frac{C}{2}. \\ &\sqrt{\frac{S \cdot (S-a)}{bc}}. \\ &\sqrt{\frac{(S-b) \cdot (S-c)}{bc}}. \\ \frac{2}{bc} \sqrt{S \cdot (S-a) \cdot (S-b) \cdot (S-c)}. \\ &\sqrt{S \cdot (S-a) \cdot (S-b) \cdot (S-c)}.\end{aligned}$$

$$\frac{bc}{2} \cdot \cap A.$$

$$\begin{aligned}&\frac{M}{S}. \\ &\frac{abc}{4M}. \\ &\frac{M}{S-a}, \frac{M}{S-b}, \text{ and } \frac{M}{S-c}.\end{aligned}$$

$$\sqrt{(S-a) \cdot (S-b) \cdot (S-c) \cdot (S-d)}.$$

$$\frac{D}{ab+cd}.$$

(13) Length of diagonal lying between the sides a, d , and the sides b, c , =

$$\frac{D}{ad+bc}.$$

N.B. The radius of the circumscribed circle is represented by " R ," and the quantity $\sqrt{(S-a)(S-b)(S-c)(S-d)}$ by M .

(14) R , in terms of sides, =

$$\frac{D}{4M}.$$

(γ) *Given certain magnitudes connected with a regular polygon: to find certain other magnitudes.*

N.B. The length of each side is represented by " a ," and the number of the sides by " n ."

(15) Area, in terms of a , =

$$\frac{na^2}{4} \cdot \cup \frac{180^\circ}{n}.$$

N.B. The radius of the inscribed circle is represented by " r ," and of the circumscribed by " R ."

(16) r , in terms of a , =

$$\frac{a}{2} \cdot \cup \frac{180^\circ}{n}.$$

(17) R , in terms of a , =

$$\frac{a}{2} \cdot \cap \frac{180^\circ}{n}.$$

(18) Area, in terms of r , =

$$nr^2 \cdot \cup \frac{180^\circ}{n}.$$

(19) Area, in terms of R , =

$$\frac{nR^2}{2} \cdot \cap \frac{360^\circ}{n}.$$

4.4 Euclid and His Modern Rivals

Source: Euclid and His Modern Rivals, second edition

Act I.

Scene I.

'Confusion worse confounded.'

Quoted from
Paradise Lost by
John Milton

[*Scene, a College study. Time, midnight. MINOS discovered seated between two gigantic piles of manuscripts. Ever and anon he takes a paper from one heap, reads it, makes an entry in a book, and with a weary sigh transfers it to the other heap. His hair, from much running of fingers through it, radiates in all directions, and surrounds his head like a halo of glory, or like the second Corollary of Euc. I. 32. Over one paper he ponders gloomily, and at length breaks out in a passionate soliloquy.*]

Min. So, my friend! *That's* the way you prove I. 19, is it? Assuming I. 20? Cool, refreshingly cool! But stop a bit! Perhaps he doesn't 'declare to win' on Euclid. Let's see. Ah, just so! 'Legendre,' of course! Well, I suppose I must give him full marks for it: what's the question worth?—Wait a bit, though! Where's his paper of yesterday? I've a very decided impression he was all for 'Euclid' then: and I know the paper had I. 20 in it. . . . Ah, here it is! 'I think we do know the sweet Roman hand.' Here's the Proposition, as large as life, and proved by I. 19. 'Now, infidel, I have thee on the hip!' You shall have such a sweet thing to do in *vivâ-voce*, my very dear friend! You shall have the two Propositions together, and take them in any order you like. It's my profound conviction that you don't know how to prove either of them without the other. They'll have to introduce each other, like Messrs. Pyke and Pluck. But what fearful confusion the whole subject is getting into! (*Knocking heard.*) Come in!

Quoted from *Twelfth Night* by William Shakespeare

Quoted from *The Merchant of Venice* by William Shakespeare

Enter RHADAMANTHUS.

Rhad. I say! Are we bound to mark an answer that's a clear logical fallacy?

Min. Of course you are—with that peculiar mark which cricketers call 'a duck's egg,' and thermometers 'zero.'

Rhad. Well, just listen to this proof of I. 29.

Reads.

‘Let EF meet the two parallel Lines AB , CD , in the points GH . The alternate angles AGH , GHD , shall be equal.

‘For AGH and EGB are equal because vertically opposite, and EGB is also equal to GHD (Definition 9); therefore AGH is equal to GHD ; but these are alternate angles.’

Did you ever hear anything like that for calm assumption?

Min. What does the miscreant mean by ‘Definition 9’?

Rhad. Oh, that’s the grandest of all! You must listen to that bit too. There’s a reference at the foot of the page to ‘Cooley.’ So I hunted up Mr. Cooley among the heaps of Geometries they’ve sent me—(by the way, I wonder if they’ve sent *you* the full lot? Forty-five were left in my rooms to-day, and ten of them I’d never even heard of till to-day!)—well, as I was saying, I looked up Cooley, and here’s the Definition.

Reads.

‘Right Lines are said to be parallel when they are equally and similarly inclined to the same right Line, or make equal angles with it towards the same side.’

Min. That is very soothing. So far as I can make it out, Mr. Cooley quietly assumes that a Pair of Lines, which make equal angles with *one* Line, do so with *all* Lines. He might just as well say that a young lady, who was inclined to *one* young man, was ‘equally and similarly inclined’ to *all* young men!

Rhad. She might ‘make equal angling’ with them all, anyhow. But, seriously, what are we to do with Cooley?

Min. (*thoughtfully*) Well, if we had him in the Schools, I *think* we should pluck him.

Rhad. But as to this answer?

Min. Oh, give it full marks! What have we to do with logic, or truth, or falsehood, or right, or wrong? ‘We are but markers of a larger growth’—only that *we* have to mark foul strokes, which a respectable billiard-marker doesn’t do, as a general rule!

Rhad. There’s one thing more I want you to look at. Here’s a man who puts ‘Wilson’ at the top of his paper, and proves Euc. I. 32 from first principles, it seems to me, without using any other Theorem at all.

Min. The thing sounds impossible.
Rhad. So *I* should have said. Here's the proof.

‘Slide $\angle DBA$ along BF into position GAF , GA having same direction as DC (Ax. 9); similarly slide $\angle BCE$ along AE into position GAC . Then the ext. $\angle s = CAF, FAG, GAC =$ one revolution $=$ two straight $\angle s$. But the ext. and int. $\angle s = 3$ straight $\angle s$. Therefore the int. $\angle s =$ one straight $\angle = 2$ right angles. Q. E. D.’

I'm not well up in 'Wilson': but surely he doesn't beg the whole question of Parallels in one axiom like this!

Min. Well, no. There's a Theorem and a Corollary. But this is a sharp man: he has seen that the Axiom does just as well by itself. Did you ever see one of those conjurers bring a globe of live fish out of a pocket-handkerchief? That's the kind of thing we have in Modern Geometry. A man stands before you with nothing but an Axiom in his hands. He rolls up his sleeves. 'Observe, gentlemen, I have nothing concealed. There is no deception!' And the next moment you have a complete Theorem, Q. E. D. and all!

Rhad. Well, so far as *I* can see, the proof's worth nothing. What am I to mark it?

Min. Full marks: we *must* accept it. Why, my good fellow, I'm getting into that state of mind, I'm ready to mark *any* thing and *any* body. If the Ghost in Hamlet came up this minute and said 'Mark me!' I should say 'I will! Hand in your papers!'

Rhad. Ah, it's all very well to chaff, but it's enough to drive a man wild, to have to mark all this rubbish! Well, good night! I must get back to my work. [*Exit.*]

Min. (*indistinctly*) I'll just take forty winks, and—

(*Snores.*)

Scene II.

Οὐκ ἀγαθὸν πολυκοιρανίη ἐἴς κοίρανος ἔστω,
 Εἴς βασιλεὺς.

Quoted from *Iliad* by
 Homer

[MINOS *sleeping: to him enter the Phantasm of EUCLID. MINOS opens his eyes and regards him with a blank and stony gaze, without betraying the slightest surprise or even interest.*]

§ 1. **A priori reasons for retaining Euclid's Manual.** *Enc.* Now what is it you really require in a Manual of Geometry?

Min. Excuse me, but—with all respect to a shade whose name I have revered from early boyhood—is not that *rather* an abrupt way of starting a conversation? Remember, we are twenty centuries apart in history, and consequently have never had a personal interview till now. Surely a few preliminary remarks—

Enc. Centuries are long, my good sir, but *my* time to-night is short: and I never was a man of many words. So kindly waive all ceremony and answer my question.

Min. Well, so far as I can answer a question that comes upon me so suddenly, I should say—a book that will exercise the learner in habits of clear definite conception, and enable him to test the logical value of a scientific argument.

Enc. You do *not* require, then, a complete repertory of Geometrical truth?

Min. Certainly not. It is the ἐνέργεια rather than the ἔργον that we need here.

Enc. And yet many of my Modern Rivals have thus attempted to improve upon me—by filling up what they took to be my omissions.

Min. I doubt if they are much nearer to completeness themselves.

Enc. I doubt it too. It is, I think, a friend of yours who has amused himself by tabulating the various Theorems which might be enunciated in the single subject of Pairs of Lines. How many did he make them out to be?

Min. About two hundred and fifty, I believe.

Enc. At that rate, there would probably be, within the limits of my First Book, about how many?

Min. A thousand, at least.

Enc. What a popular school-book it will be! How boys will bless the name of the writer who first brings out the complete thousand!

Min. I think your Manual is fully long enough already for all possible purposes of teaching. It is not in the region of new matter that you need fear your Modern Rivals: it is in *quality*, not in *quantity*, that they claim to supersede you. Your methods of proof, so they assert, are antiquated, and worthless as compared with the new lights.

Enc. It is to that very point that I now propose to address myself: and, as we are to discuss this matter mainly with reference to the wants of *beginners*, we may as well limit our discussion to the subject-matter of Books I and II.

Min. I am quite of that opinion.

Enc. The first point to settle is whether, for purposes of teaching and examining, you desire to have one fixed logical sequence of Propositions, or would allow the use of conflicting sequences, so that one candidate in an examination might use *X* to prove *Y*, and another use *Y* to prove *X*—or even that the same candidate might offer *both* proofs, thus 'arguing in a circle.'

Min. A very eminent Modern Rival of yours, Mr. Wilson, seems to think that no such fixed sequence is really necessary. He says (in his Preface, p. 10) 'Geometry when treated as a science, treated inartificially, falls into a certain

order from which there can be no very wide departure; and the manuals of Geometry will not differ from one another nearly so widely as the manuals of algebra or chemistry; yet it is not difficult to examine in algebra and chemistry.'

Euc. Books may differ very 'widely' without differing in logical sequence—the only kind of difference which could bring two text-books into such hopeless collision that the one or the other would have to be abandoned. Let me give you a few instances of conflicting logical sequences in Geometry. Legendre proves my Prop. 5 by Prop. 8, 18 by 19, 19 by 20, 27 by 28, 29 by 32. Cuthbertson proves 37 by 41. Reynolds proves 5 by 20. When Mr. Wilson has produced similarly conflicting sequences in the manuals of algebra or chemistry, we may then compare the subjects: till then, his remark is quite irrelevant to the question.

Min. I do not think he will be able to do so: indeed there are very few logical chains *at all* in those subjects—most of the Propositions being proved from first principles. I think I may grant at once that it is essential to have *one* definite logical sequence, however many manuals we employ: to use the words of another of your Rivals, Mr. Cuthbertson (Pref. p. viii.), 'enormous inconvenience would arise in conducting examinations with no recognised sequence of Propositions.' This however applies to *logical* sequences only, such as your Props. 13, 15, 16, 18, 19, 20, 21, which form a continuous chain. There are many Propositions whose place in a manual would be partly arbitrary. Your Prop. 8, for instance, is not wanted till we come to Prop. 48, so that it might occupy any intermediate position, without involving risk of circular argument.

Euc. Now, in order to secure this uniform logical sequence, we should require to know, as to any particular Proposition, what other Propositions were its logical descendants, so that we might avoid using any of these in proving it?

Min. Exactly so.

Euc. We might of course give this information by attaching to each enunciation references to its logical descendants: but this would be a very cumbersome plan. A better way would be to give them in the form of a genealogy, but this would be very bulky if the enunciations themselves were inserted: so that it would be desirable to have numbers to distinguish the enunciations. In that case (supposing *my* logical sequence to be adopted) the genealogy would stand thus:—(see *Frontispiece*).

Min. Would it not be enough to publish an arranged list (which would be all the better if numbered also), and to enact that no Proposition should be used to prove any of its predecessors?

Euc. That would hamper the writers of manuals very much more than the genealogy would. Suppose, for instance, that you adopted, in the list, the order of Theorems in my First Book, and that a writer wished to prove Prop. 8 by Prop. 47: this would not interfere with my logical sequence, and yet your list would bar him from doing so.

Min. But we might place 8 close before 48, and he would then be free to do as you suggest.

Euc. And suppose some other writer wished to prove 24 by 8?

Min. I see now that any single list must necessarily prevent many possible arrangements which would not conflict with the agreed-on logical sequence. And yet this is what the Committee of the Association for the Improvement of Geometrical Teaching have approved of, namely, 'a standard sequence for examination purposes,' and what the Association have published in their 'Syllabus of Plane Geometry.'

Euclid, Book I.

Arranged in Logical Sequence.

Euc. I think they have overlooked the fact that they are enacting many more sequences, as binding on writers, than the one logical sequence which they desire to secure. Their ‘standard sequence’ would be fitly replaced by a ‘standard genealogy.’ But in any case we are agreed that it is desirable to have, besides a standard logical sequence, a standard list of enunciations, numbered for reference?

Min. We are.

Euc. The next point to settle is, *what* sequence and numbering to adopt. You will allow, I think, that there are strong *a priori* reasons for retaining *my* numbers. The Propositions have been known by those numbers, for two thousand years; they have been referred to, probably, by hundreds of writers—in many cases by the numbers only, without the enunciations: and some of them, I. 5 and I. 47 for instance—‘the Asses’ Bridge’ and ‘the Windmill’—are now historical characters, and their nicknames are ‘familiar as household words.’

Min. Even if no better *sequence* than yours could be found, it might still be urged that a new set of *numbers* must be adopted, in order to introduce, in their proper places, some important Theorems which have been added to the subject since your time.

Euc. That want, if it were proved to exist, might, I think, be easily provided for without discarding my system of numbers. If you wished, for instance, to insert two new Propositions between I. 13 and I. 14, it would be far less inconvenient to call them 13 B and 13 C than to abandon the old numbers.

Min. I give up the objection.

Euc. You will allow then, I think, that my sequence and system of numbers should not be abandoned without good cause?

Min. Oh, certainly. And the *onus probandi* lies clearly on your Modern Rivals, and not on you.

Euc. Unless, then, it should appear that one of my Modern Rivals, whose logical sequence is incompatible with mine, is so decidedly better in his treatment of really important topics, as to make it worth while to suffer all the inconvenience of a change of numbers, you would not recognise his demand to supersede my Manual?

Min. On that point let me again quote Mr. Wilson. In his Preface, p. 15, he says, ‘In a few years I hope that our leading mathematicians will have published, perhaps in concert, one or more text-books of Geometry, not inferior, to say the least, to those of France, and that they will supersede Euclid by the sheer force of superior merit.’

Euc. And I should be quite content to be so superseded. ‘A fair field and no favour’ is all I ask.

§ 2. Method of procedure in examining Modern Rivals. *Min.* You wish me then to compare your book with those of your Modern Rivals?

Euc. Yes. But, in doing this, I must beg you to bear in mind that a Modern Rival will not have proved his case if he only succeeds in showing

- (1) that certain Propositions might with advantage be omitted (for this a teacher would be free to do, so long as he left the logical sequence complete);
- or (2) that certain proofs might with advantage be changed for others (for these might be interpolated as ‘alternative proofs’);

or (3) that certain new Propositions are desirable (for these also might be interpolated, without altering the numbering of the existing Propositions).

All these matters will need to be fully considered hereafter, if you should decide that my Manual ought to be retained: but they do not constitute the evidence on which that decision should be based.

Min. *That*, I think, you have satisfactorily proved. But what *would* you consider to be sufficient grounds for abandoning your Manual in favour of another?

Euc. Many grave charges have been brought against my Manual; but, of all these, there are only *two* which I regard as *crucial* in this matter. The first concerns my arrangement of Problems and Theorems: the second my treatment of Parallels.

If it be agreed that Problems and Theorems ought to be treated separately, my system of numbering must of course be abandoned, and no reason will remain why my Manual should then be retained as a *whole*; which is the only point I am concerned with. This question you can, of course, settle on its own merits, without examining any of the new Manuals.

If, again, it be agreed that, in treating Parallels, some other method, *essentially* different from mine, ought to be adopted, I feel that, after so vital a change as that, involving (as no doubt it would) the abandonment of my sequence and system of numbering, the remainder of my Manual would not be worth fighting for, though portions of it might be embodied in the new Manual. To settle this question, you must, of course, examine one by one the new methods that have been proposed.

Min. You would not even ask to have your Manual retained as an alternative for the new one?

Euc. No. For I think it essential for purposes of teaching, that in treating this vital topic one uniform method should be adopted; and that this method should be the best possible (for it is almost inconceivable that two methods of treating it should be *equally* good). An alternative proof of a minor Proposition may fairly be inserted now and then as about equal in merit to the standard proof, and may make a desirable variety: but on this one vital point it seems essential that nothing but the best proof existing should be offered to the limited capacity of a learner. *Vacuis committere venis nil nisi lene decet.*

Min. I agree with you that we ought to have one system only, and that the best, for treating the subject of Parallels. But would you have me limit my examination of your 'Modern Rivals' to this single topic?

Euc. No. There are several other matters of so great importance, and admitting of so much variety of treatment, that it would be well to examine any method of dealing with them which differs much from mine—not with a view of substituting the new Manual for mine, but in order to make such changes in my proofs as may be thought desirable. There are other matters again, where changes have been suggested, which you ought to consider, but on *general* grounds, not by examining particular writers.

Let me enumerate what I conceive should be the subjects of your enquiry, arranged in order of importance.

- (1) The combination, or separation, of Problems and Theorems.
- (2) The treatment of Pairs of Lines, especially Parallels, for which various new methods have been suggested. These may be classified as involving—
 - (α) Infinite series: suggested by LEGENDRE.

- (β) Angles made with transversals: COOLEY.
- (γ) Equidistance: CUTHBERTSON.
- (δ) Revolving Lines: HENRICI.
- (ε) Direction: WILSON, PIERCE, WILLOCK.
- (ζ) The substitution of 'Playfair's Axiom' for my Axiom 12.

If your decision, on these two crucial questions, be given in my favour, we may take it as settled, I think, that my Manual ought to be retained as a *whole*: how far it should be modified to suit modern requirements will be matter for further consideration.

- (3) The principle of superposition.
- (4) The use of diagonals in Book II.

These two are *general* questions, and will not need the examination of particular authors.

Besides this, it will be well, in order that your enquiry into the claims of my Modern Rivals may be as complete as possible, to review them one by one, with reference to their treatment of matters not already discussed, especially:—

- (5) Right Lines.
- (6) Angles, including right angles.
- (7) Propositions of mine omitted.
- (8) Propositions of mine treated by a new method.
- (9) New Propositions.
- (10) And you may as well conclude, in each case, with a general survey of the book, as to style, &c.

The following may be taken as a fairly complete catalogue of the books to be examined:—

- | | |
|-----------------|---------------------------------|
| 1. Legendre. | 8. Chauvenet. |
| 2. Cooley. | 9. Loomis. |
| 3. Cuthbertson. | 10. Morell. |
| 4. Henrici. | 11. Reynolds. |
| 5. Wilson. | 12. Wright. |
| 6. Pierce. | 13. Wilson's 'Syllabus'-Manual. |
| 7. Willock. | |

You should also examine the Syllabus, published by the Association for the Improvement of Geometrical Teaching, on which the last-named Manual is based. Not that it can be considered as a '*Rival*'—in fact, it is not a text-book at all, but a mere list of enunciations—but because, first, it comes with an array of imposing names to recommend it, and secondly, it discards my system of numbers, so that its adoption, as a standard for examinations, would seriously interfere with the retention of my Manual as the standard text-book.

Now, of these questions, I shall be most happy to discuss with you the *general* ones (I mean questions 1, 2 (ζ), 3, and 4) before we conclude this interview: but, when it comes to criticising particular authors, I must leave you to yourself, to deal with them as best you can.

Min. It will be weary work to do it all alone. And yet I suppose you cannot, even with *your* supernatural powers, fetch me the authors themselves?

Euc. I dare not. The living human race is so strangely prejudiced. There is nothing men object to so emphatically as being transferred by ghosts from place to place. I cannot say they are consistent in this matter: they are for ever 'raising' or 'laying' us poor ghosts—we cannot even haunt a garret without

having the parish at our heels, bent on making us change our quarters: whereas if *I* were to venture to move one single small boy—say to lift him by the hair of his head over only two or three houses, and to set him down safe and sound in a neighbour’s garden—why, I give you my word, it would be the talk of the town for the next month!

Min. I can well believe it. But what *can* you do for me? Are their *Doppelgänger* available?

Euc. I fear not. The best thing I can do is to send you the Phantasm of a German Professor, a great friend of mine. He has read all books, and is ready to defend any thesis, true or untrue.

Min. A charming companion! And his name?

Euc. Phantasms have no names—only numbers. You may call him ‘Herr Niemand,’ or, if you prefer it, ‘Number one-hundred-and-twenty-three-million-four-hundred-and-fifty-six-thousand-seven-hundred-and-eighty-nine.’

Min. For *constant* use, I prefer ‘Herr Niemand.’ Let us now consider the question of the separation of Problems and Theorems.

§ 3. The combination, or separation, of Problems and Theorems.

Euc. I shall be glad to hear, first, the reasons given for separating them, and will then tell you *my* reasons for mixing them.

Min. I understand that the Committee of the Association for the Improvement of Geometrical Teaching, in their Report on the Syllabus of the Association, consider the separation as ‘equivalent to the assertion of the principle that, while Problems are from their very nature dependent for the form, and even the possibility, of their solution on the arbitrary limitation of the instruments allowed to be used, Theorems, being truths involving no arbitrary element, ought to be exhibited in a form and sequence independent of such limitations.’ They add however that ‘it is probable that most teachers would prefer to introduce Problems, not as a separate section of Geometry, but rather in connection with the Theorems with which they are essentially related.’

Euc. It seems rather a strange proposal, to print the Propositions in one order and read them in another. But a stronger objection to the proposal is that several of the Problems are Theorems as well—such as I. 46, for instance.

Min. How is that a Theorem?

Euc. It proves that there is such a thing as a Square. The definition, of course, does not assert real existence: it is merely provisional. Now, if you omit I. 46, what right would you have, in I. 47, to say ‘draw a Square’? How would you know it to be possible?

Min. We could easily deduce that from I. 34.

Euc. No doubt a Theorem might be introduced for that purpose: but it would be very like the Problem: you would have to say ‘if a figure were drawn under such and such conditions, it would be a Square.’ Is it not quite as simple to draw it?

Then again take I. 31, where it is required to draw a Parallel. Although it has been proved in I. 27 that such things as parallel Lines *exist*, that does not tell us that, for every Line and for every point without that Line, there exists a real Line, parallel to the given Line *and passing through the given point*. And yet that is a fact essential to the proof of I. 32.

Min. I must allow that I. 31 and I. 46 have a good claim to be retained in their places: and if two are to be retained, we may as well retain all.

Euc. Another argument, for retaining the Problems where they are, is the importance of keeping the numbering unchanged—a matter we have already discussed.

But perhaps the strongest argument is that it saves you from ‘hypothetical constructions,’ the danger of which has been so clearly pointed out by Mr. Todhunter (see pp. 222, 241).

Min. I think you have proved your case very satisfactorily. The next subject is ‘the treatment of Pairs of Lines.’ Would it not be well, before entering on this enquiry, to tabulate the Propositions that have been enunciated, whether as Axioms or Theorems, respecting them?

Euc. That will be an excellent plan. It will both give you a clear view of the field of your enquiry, and enable you to recognise at once any doubtful Axioms which you may meet with.

Min. Will you then favour me with your views on this matter?

Euc. Willingly. It is a subject which I need hardly say I considered very carefully before deciding what Definitions and Axioms to adopt.

§ 4. Syllabus of propositions relating to Pairs of Lines. Let us begin with the simplest possible case, a Pair of infinite Lines which have two common points, and which therefore coincide wholly, and let us consider how such a Pair may be defined, and what other properties it possesses.

After that we will take a Pair of Lines which have a common point and a separate point (‘a separate point’ being one that lies on one of the Lines but not on the other), and which therefore have no other common point, and treat it in the same way.

And in the third place we will take a Pair of Lines which have *no* common point.

And let us understand, by ‘the distance between two points,’ the length of the right Line joining them; and, by ‘the distance of a point from a Line,’ the length of the perpendicular drawn, from the point, to the Line.

Now the properties of a Pair of Lines may be ranged under four headings:—

- (1) as to common or separate points;
- (2) as to the angles made with transversals;
- (3) as to the equidistance, or otherwise, of points on the one from the other;
- (4) as to direction.

We might distinguish the first two classes, which I have mentioned, as ‘coincident’ and ‘intersecting’: and these names would serve very well if we were going to consider only infinite Lines; but, as all the relations of infinite Lines, with regard to angles made with transversals, equidistance of points, and direction, are equally true of finite portions of them, it will be well to use names which will include them also. And the names I would suggest are ‘coincidental,’ ‘intersectional,’ and ‘separational.’

By ‘coincidental Lines,’ then, I shall mean Lines which either coincide or would do so if produced: and by ‘intersectional Lines’ I shall mean Lines which either intersect or would do so if produced; and, by ‘separational Lines,’ Lines which have no common point, however far produced.

In the same way, when I speak of ‘Lines having a common point,’ or of ‘Lines having two common points,’ I shall mean Lines which either have such points or would have them if produced.

It will also save time and trouble to agree on the use of a certain conventional phrase respecting transversals.

It admits of easy proof that, if a Pair of Lines make, with a certain transversal, either (a) a pair of alternate angles equal, or (b) an exterior angle equal to the interior opposite angle on the same side of the transversal, or (c) a pair of interior angles on the same side of the transversal supplementary; they will make, with the same transversal, (d) each pair of alternate angles equal, and (e) every exterior angle equal to the interior opposite angle on the same side of the transversal, and (f) each pair of interior angles on the same side of the transversal supplementary.

You will accept that as a simple Theorem, though with a somewhat lengthy enunciation?

Min. Certainly.

Euc. The phrase I propose is as follows. When I speak of a Pair of Lines as ‘equally inclined to’ a transversal, I wish it to be understood that they fulfil some one of the three conditions (a), (b), (c), and *therefore* all the three conditions (d), (e), (f).

Min. A most convenient abridgment.

Euc. Similarly, it admits of easy proof that, if a Pair of Lines make, with a certain transversal, either (a) a pair of alternate angles unequal, or (b) an exterior angle unequal to the interior opposite angle on the same side of the transversal, or (c) a pair of interior angles on the same side of the transversal not supplementary; they will make, with the same transversal, (d) each pair of alternate angles unequal, and (e) every exterior angle unequal to the interior opposite angle on the same side of the transversal, and (f) each pair of interior angles on the same side of the transversal not supplementary.

And when I speak of a Pair of Lines as ‘unequally inclined to’ a transversal, I wish it to be understood that they fulfil some one of the three conditions (a), (b), (c), and *therefore* all the three conditions (d), (e), (f).

Min. Very well.

Euc. Now the Propositions relating to Pairs of Lines may be divided into two classes, the first covering the ground occupied by my Axiom 10 (‘two straight Lines cannot enclose a space’) and my Propositions I. 16, 17, 27, 28, 31; the second that occupied by my Axiom 12 and Propositions I. 29, 30, 32. Those in the first class are logical deductions from Axioms which have never been disputed: the second class has furnished, through all ages, a battle-field for rival mathematicians. That *some one* of the Propositions in this class must be assumed as an Axiom is agreed on all hands, and each combatant in turn proclaims his own special favourite to be the *one* axiomatic truth of the series, insisting that all the rest ought to be proved as Theorems.

Let us now consider the properties of Pairs of Lines.

Such pairs may be arranged in three distinct classes. I will take them separately, and enumerate, for each class, first the ‘subjects,’ and secondly the ‘predicates,’ of Propositions concerning it.

Min. Let us make sure that we understand each other as to those two words. I presume that a ‘subject’ will include just so much ‘property’ as is needed to

indicate the Pair of Lines referred to, i. e. to serve as a sufficient Definition for them?

Euc. Exactly so. Now, if we are told that a certain Pair of Lines fulfil some one of the following conditions:—

(1) they have two common points;

or (2) they have a common point, and are equally inclined to a certain transversal;

or (3) they have a common point, and one of them has two points on the same side of, and equidistant from, the other;

or (4) they have a common point and identical directions;

we may conclude that they fulfil *all* the following conditions:—

(1) they are coincidental;

(2) they are equally inclined to any transversal;

(3) they are ‘equidistantial,’ i. e. any two points on one are equidistant from the other;

(4) they have identical directions.

Min. You mean, by ‘conclude,’ that we may *prove* our conclusion?

Euc. Yes, wherever proof is needed. Conclusions (1) and (4) need none, and are usually stated as Axioms.

Min. In subject (4), instead of ‘identical directions,’ why not say ‘the same direction’?

Euc. Because I want to keep clearly in view that there are *two* Lines.

Min. In predicate (2), you speak of ‘*any* transversal’: a little while ago, you spoke of ‘*every* exterior angle.’ Do you make any distinction between ‘any’ and ‘every’?

Euc. Where the things spoken of are limited in number, I use ‘every’; where infinite, I use ‘any’ in order to bring the idea within the grasp of our finite intellects. For instance, you may talk of ‘*every* grain of sand in the world’: there are, no doubt, what country-folk would call ‘a good few’ of them, but still the number is limited, and the mind can just grasp the idea. But if you tell me that ‘*every* cubic inch of Space contains eight cubic half-inches,’ my mind is unable to form a distinct conception of the subject of your Proposition: you would convey the same truth, and in a form I *could* grasp, by saying ‘*any* cubic inch.’

Min. The angles made with the transversal are a little bewildering when the Pair of Lines shrinks, as it does in this case, into *one* Line. For instance, what becomes of the pair of interior angles on the same side of the transversal?

Euc. A diagram will make it clear.

By examining the second figure (in which, as you see, there are three points with double names) we find that the alternate angles AGF , EHD , have become *vertical* angles; that the exterior and interior opposite angles EGB , EHD , have become *the same* angle; and that the two interior angles BGF , DHE , have become *adjacent* angles.

Min. That is quite clear.

Euc. Let us go on to the second class of Pairs of Lines.

If we are told that a certain Pair of Lines fulfil some one of the following conditions:—

- (1) they have a common point and a separate point;
- or (2) they have a common point, and are unequally inclined to a certain transversal;
- or (3) they have a common point, and one of them has two points not-equidistant from the other;
- or (4) they have a common point and different directions;

we may conclude that they fulfil *all* the following conditions:—

- (1) they are separational;
- (2) they are unequally inclined to any transversal;
- (3) any two points on one, which are on the same side of the other, are not equidistant from it;
- (4) a point may be found on each, whose distance from the other shall exceed any assigned length;
- (5) they have different directions.

And thirdly, if we are told that a certain Pair of Lines fulfil some one of the following conditions:—

(1) they have a separate point, and are equally inclined to a certain transversal;

or (2) they have a separate point, and one of them has two points on the same side of, and equidistant from, the other;

we may conclude that they are separational.

Min. Why not use your own word 'parallel'?

Euc. Because that word is not uniformly employed, by modern writers, in one and the same sense. I would advise you, in discussing the works of my Modern Rivals, to disallow the use of the word 'parallel' altogether, and to oblige each writer to adopt a word which shall express his own definition.

Min. When you speak of two points on one Line, *which are on the same side of the other*, being 'equidistant from it,' do you include the case of their lying on the other Line?

Euc. Certainly. You may take them as lying on either side you like, and at zero-distances. The only case excluded is, where both points are *outside* the other Line, and on *opposite* sides of it.

Min. I understand you.

Euc. We shall find the Table of Propositions, which I now lay before you, very convenient to refer to. I have placed contranominal Propositions (i. e. Propositions of the form 'All X is Y,' 'All not-Y is not-X') in the same section.

TABLE I.

Containing twenty Propositions, of which some are undisputed Axioms, and the rest real and valid Theorems, deducible from undisputed Axioms.

[N.B. Those marked * have been proposed as Axioms.]

*1. A Pair of Lines, which have two common points, are coincidental.

or

*. Two Lines cannot enclose a space. [Euc. Ax.]

2. (a) A Pair of Lines, which have a separate point, have not two common points.

(b) A Pair of Lines, which have a common point and a separate point, are intersectional.

3. If there be given a Line and a point, it is possible to draw a Line, through the given point, intersectional with the given Line.

4. A Pair of intersectional Lines are unequally inclined to any transversal.

Cor. 1. In either pair of alternate angles, that, which is on the side, of the transversal, remote from the point of intersection, is the greater. [I. 16.]

Cor. 2. Every exterior angle, which is on the side, of the transversal, next to the point of intersection, is greater than the interior opposite angle on the same side. [I. 16.]

Cor. 3. The pair of interior angles, which are on the side, of the transversal, next to the point of intersection, are together less than two right angles. [I. 17.]

5. A Pair of Lines, which have a common point and are equally inclined to a certain transversal, are coincidental.

6. A Pair of Lines, which have a separate point and are equally inclined to a certain transversal, are separational. [I. 27, 28.]

7. If there be given a Line and a point without it, it is possible to draw a Line, through the given point, separational from the given Line. [I. 31.]
8. A Pair of intersectional Lines are such that any two points on one, which are on the same side of the other, are not equidistant from it. Cor. That which is the more remote from the point of intersection has the greater distance.
9. A Pair of Lines, which have a common point and of which one has two points on the same side of and equidistant from the other, are coincidental.
10. A Pair of Lines, which have a separate point and of which one has two points on the same side of and equidistant from the other, are separational.
11. Each of a Pair of intersectional Lines has, in each portion of it, a point whose distance from the other exceeds any given length. or A Pair of intersectional Lines diverge without limit.
12. A Pair of Lines, which have two common points, have identical directions.
*13. (a) A Pair of Lines, which have different directions, have not two common points. (b) A Pair of Lines, which have a common point and different directions, are intersectional.
*14. A Pair of intersectional Lines have different directions.
*15. A Pair of Lines, which have a common point and identical directions, are coincidental.
*16. If there be given a Line and a point without it: it is possible to draw a Line, through the given point, having a direction different from that of the given Line.
17. A Line, which has a point in common with one of two coincidental Lines has a point in common with the other also.
18. A Line, which has a point in common with one of two separational Lines, has a point separate from the other.
*19. A Line, which has a point in common with one of two separational Lines and also a point in common with the other, is intersectional with both.
*20. If there be three Lines; the first a right Line; the second, not assumed to be right, having a point separate from the first and being equidistant from it; the third a right Line intersecting the first and diverging from it without limit on the side next to the second: the third is intersectional with the second.

Min. I see that 2 (a) is the contranominal of 1. But where does 2 (b) come from?

Euc. It is got from 2 (a) by adding, to each term, the property 'having a common point'—just as if we were to deduce, from 'all men are mortal,' 'all fat men are fat mortals.'

Min. You mean 5 to be contranominal to 4, I suppose. But 'coincidental' is not equivalent to 'non-intersectional.'

Euc. True: but I have added a new condition, viz. 'which have a common point,' to the subject. Non-intersectional Lines, which have a common point, are coincidental, just as, in the next Proposition, non-intersectional Lines, which

have a separate point, are separational.

Min. 20 is rather a difficult enunciation to grasp.

Euc. A diagram will make it clear. As a matter of fact. No. 2 would be a right Line: but, as we have no right, at present, to assume this, I have drawn it as a wavy line.

Min. I can suggest two Contranominals which you have omitted: one, deducible from 13 (*b*), ‘Two Lines, which are not intersectional and which have different directions, have no common point, i. e. are separational’; the other, deducible from 15, ‘Two Lines, which have a separate point and identical directions, have no common point, i. e. are separational.’

Euc. They are *valid* deductions, but in neither case do we know the ‘subject’ to be *real*.

Min. The ‘contranominality’—if such a fearful word be allowable—of 17, 18, 19, seems obscure.

Euc. I will do what I can to make it less so.

Let us name the three Lines ‘*A, B, C.*’

Then 17 may be read ‘A Line (*C*), which has a point in common with one (*A*) of two coincidental Lines (*A, B*), has a point in common with the other (*B*) also.’

From this we may deduce two Contranominals.

The first is ‘If *A, C*, have a common point; and *B, C*, are separational: *A, B* have a separate point.’ That is, ‘a Line (*A*), which has a point in common with one (*C*) of two separational Lines (*B, C*), has a point separate from the other (*B*)’: and thus we get 18.

The other Contranominal is ‘If *A, C*, have a common point; and *A, B*, have a common point; and *B, C*, are separational: *A, B*, are intersectional.’ That is, ‘A Line (*A*), which has a point in common with one (*C*) of two separational Lines (*B, C*), and also a point in common with the other (*B*), is intersectional with that other (*B*).’

But we may evidently interchange *B* and *C* without interfering with the argument, and thus prove that *A* is *also* intersectional with *C*. Hence *A* is intersectional with *both*: and thus we get 19.

Min. That is quite clear.

Euc. We will now go a little further into the subject of separational Lines, as to which Table I. has furnished us with only three Propositions. There are, however, many other Propositions concerning them, which are fully admitted to be *true*, though no one of them has yet been proved from undisputed Axioms: and we shall find that they are so related to one another that, if any *one* be granted as an Axiom, all the rest may be proved; but, unless some one be so

granted, none can be proved. Two thousand years of controversy have not yet settled the knotty question *which* of them, if any, can be taken as axiomatic.

If we are told that a certain Pair of Lines fulfil some one of the following conditions:—

- (1) they are separational;
- (2) they have a separate point and are equally inclined to a certain transversal;
- (3) they have a separate point, and one of them has two points on the same side of and equidistant from the other;

we may prove (though not without the help of *some* disputed Axiom) that they fulfil *both* the following conditions:—

- (1) they are equally inclined to any transversal;
- (2) they are equidistantial from each other.

These Propositions, with the addition of my own I. 30, I. 32, and certain others, I will now arrange in a tabular form, placing Contranominals in the same section.

TABLE II.	
<i>Containing eighteen Propositions, of which no one is an undisputed Axiom, but all are real and valid Theorems, which, though not deducible from undisputed Axioms, are such that, if any one be admitted as an Axiom, the rest can be proved.</i>	
[N.B. Those marked * have been, or parts of them have been, proposed as Axioms.]	
1. A Pair of separational Lines are equally inclined to any transversal.	[I. 29.]
*2. A Pair of Lines, which are unequally inclined to a certain transversal, are intersectional.	[Euc. Ax.]
3. Through a given Point, without a given Line, a Line may be drawn such that the two Lines are equally inclined to any transversal.	
4. A Pair of Lines, which are equally inclined to a certain transversal, are so to any transversal.	
5. A Pair of Lines, which are unequally inclined to a certain transversal, are so to any transversal.	
6. A Pair of separational Lines are equidistantial from each other.	
*7. A Pair of Lines, of which one has two points on the same side of, and not equidistant from, the other, are intersectional.	
*8. Through a given point, without a given Line, a Line may be drawn such that the two Lines are equidistantial from each other.	
9. A Pair of Lines, of which one has two points on the same side of, and equidistant from, the other, are equally inclined to any transversal.	
10. A Pair of Lines, which are unequally inclined to a certain transversal, are such that any two points on one, which are on the same side of the other, are not equidistant from it.	

<p>11. A Pair of Lines, which are equally inclined to a certain transversal, are equidistant from each other.</p> <p>12. A Pair of Lines, of which one has two points on the same side of, and not equidistant from, the other, are unequally inclined to any transversal.</p>
<p>13. A Pair of Lines, of which one has two points on the same side of, and equidistant from, the other, are equidistant from each other.</p> <p>14. A Pair of Lines, of which one has two points on the same side of, and not equidistant from, the other, are such that any two points on one, which are on the same side of the other, are not equidistant from it.</p>
<p>15. (a) A Pair of Lines, which are separational from a third Line, are not intersectional with each other.</p> <p>(b) A Pair of Lines, which have a common point and are separational from a third Line, are coincidental with each other.</p> <p style="text-align: center;">or,</p> <p>If there be given a Line and a point without it, only one Line can be drawn, through the given point, separational from the given Line.</p> <p>(c) A Pair of Lines, which have a separate point and are separational from a third Line, are separational from each other. [I. 30.]</p> <p>*16. (a) A Pair of intersectional Lines cannot both be separational from the same Line.</p> <p>(b) A Line, which is intersectional with one of two separational Lines, is intersectional with the other also.</p>
<p>*17. A Line cannot recede from and then approach another; nor can one approach and then recede from another while on the same side of it.</p>
<p>18. (a) If a side of a Triangle be produced, the exterior angle is equal to each of the interior opposite angles. [I. 32.]</p> <p>(b) The angles of a Triangle are together equal to two right angles. [I. 32.]</p>

You will find it convenient to have the Propositions, that have been proposed as Axioms, repeated in a Table by themselves.

<p>TABLE III.</p> <p><i>Containing five Propositions, taken from Table II, which have been proposed as Axioms.</i></p>
<p>EUCLID'S AXIOM.</p> <p>A Pair of Lines, which have a separate point and make, with a certain transversal, two interior angles on one side of it together less than two right angles, are intersectional on that side.</p> <p>[This is one case of II. 2, with an additional statement as to the <i>side</i> of the transversal on which the Lines will meet.]</p>
<p>T. SIMPSON'S AXIOM.</p> <p>A Pair of Lines, which have a separate point and of which one has two points on the same side of, and not equidistant from, the other, are intersectional.</p> <p>[<i>This is</i> II. 7.]</p>

<p>CLAVIUS' AXIOM.</p> <p>Through a given Point, without a given Line, a Line may be drawn equidistantial from the given Line.</p> <p>[<i>This is part of II, 8.</i>]</p>
<p>PLAYFAIR'S AXIOM.</p> <p>A pair of intersectional Lines cannot both be separational from the same Line.</p> <p>[<i>This is II. 16 (a).</i>]</p>
<p>R. SIMPSON'S AXIOM.</p> <p>A Line cannot recede from and then approach another: nor can one approach and then recede from another while on the same side of it.</p> <p>[<i>This is II. 17.</i>]</p>

Min. In the predicate of 2, what right have you to say 'are intersectional'? The true contradictory of 'separational' would be 'have a common point.'

Euc. True: but we may assume as an Axiom 'A Pair of coincidental Lines are equally inclined to any transversal.' This, combined with 1, gives 'A Pair of not-intersectional Lines are equally inclined to any transversal,' whose Contranominal is 2.

Similarly, we may combine, with 6, the Axiom 'A Pair of coincidental Lines are equidistantial from each other,' and thus get a Theorem whose Contranominal is 7.

Min. In classing 15 (a), (b), and (c) under one number, you mean, I suppose, that they are so related that, if any one of them be granted, the others may be deduced?

Euc. Certainly.

Min. I see that if (a) be given, (b) may be deduced by simply adding 'having a common point' to subject and predicate. And I see that (b) and (c) are Contranominals, so that, if either be given, the other follows. But I don't see how, if (b) only were given, you would prove (a).

Euc. You can prove (c) from it, as you say: and then, from (b) and (c) combined, you can prove (a) thus:—

Any Pair of Lines, which are separational from a third Line, must belong to one or both of the two classes, 'having a common point,' 'having a separate point.' Hence if we take these two classes together, we include *any* Pair that can be proposed. Thus we get the Theorem 'Any Pair of Lines, which are separational from a third Line, are either coincidental or separational'; the predicate of which is equivalent to 'are not intersectional.'

Min. I see. And how are 16 (a) and 16 (b) related to 15?

Euc. Each of them is a Contranominal of 15 (a); and they are also contranominal to each other.

Min. I should like to see that drawn out.

Euc. Let 'A, B, C' be three Lines. Then 16 (a) may be written 'A Pair of Lines (A, B), which are separational from a third Line (C), are not intersectional with each other.'

This yields three Contranominals. The first is ‘If A, B , are intersectional; it cannot be true that B, C , are separational, and also A, C .’ i. e. ‘A Pair of intersectional Lines (A, B) cannot both be separational from a third Line (C):’ the second is ‘If B, C are separational, and A, B intersectional; then A, C are not separational.’ i. e. ‘A Line (A) which is intersectional with one (B) of two separational Lines (B, C), is not separational from the other (C):’ and the third proves a similar Theorem for B .

Min. Yes, but your conclusion *now* is ‘ A is not separational from C ’: whereas 16 (*b*) says ‘is intersectional.’

Euc. That is so: but since A is intersectional with a Line (B) which is separational from C , it is axiomatic that it has a point separate from C , and so cannot be coincidental with it. Hence, its being ‘not separational from C ’ proves that it must be intersectional with it.

Min. I suppose I must take it on trust that any one of these 18 is sufficient logical basis for the other 17: I can hardly ask you to go through 306 demonstrations!

Euc. I can do it with 11. You will grant me that, when two Propositions are contranominal, so that each can be proved from the other, I may select either of the two for my series of proofs, but need not include *both*?

Min. Certainly.

Euc. Here are the proofs, which you can read afterwards at your leisure. (See Appendix III.)

§ 5. Playfair’s Axiom. *Euc.* The next *general* question to be discussed is the proposed substitution of Playfair’s Axiom for mine. With regard to mine, I am quite ready to admit that it is not axiomatic until Prop. 17 has been proved. What is an Axiom at one stage of our knowledge is often anything but an Axiom at an earlier stage.

Min. The great question is whether it is axiomatic then.

Euc. I am quite aware of that: and it is because this is not only the great question of the whole First Book, but also the crucial test by which my method, as compared with those of my ‘Modern Rivals,’ must stand or fall, that I entreat your patience in speaking of a matter which cannot possibly be dismissed in a few words.

Min. Pray speak at whatever length you think necessary to so vital a point.

Euc. Let me remark in the first place—it is a minor matter, but yet one that *must* come in somewhere, and I do not want to break the thread of my argument—that we need, in any complete geometrical treatise, *some* practical geometrical test by which we can prove that two given finite Lines will meet if produced. My Axiom serves this purpose—a secondary purpose it is true—but it is incumbent on any one, who proposes to do away with it, to provide some sufficient substitute.

Min. I admit all that.

Euc. Now, if the test I propose—that the two Lines make with a certain transversal two interior angles on the same side of it together less than two right angles—be objected to as not sufficiently simple, the question arises, what simpler test can be proposed?

Min. The supporters of Playfair’s Axiom would of course reply ‘that one of the two Lines should cut a Line known to be parallel to the other.’

Euc. Assuming that what is needed is a distinct conception of the geometrical relationship of the two Lines, whose future meeting we are asked to believe in, which picture, think you, is the more likely to yield us such a conception—two finite Lines, both intersected by a transversal, and having a known angular relation to that transversal and so to each other—or two Lines ‘known to be parallel,’ that is two Lines of whose geometrical relationship, so far as our field of vision extends, we know absolutely nothing, but can only say that, in the far-away region of infinity, they do *not* meet?

Min. In clearness of conception, your picture seems to have the advantage. In fact, I could not form any mental picture *at all* of the relative position of two finite Lines, if *all* I knew about them was their never meeting however far produced: and it would be equally impossible to form any mental picture of the position which a Line, crossing one of them, would have relatively to the other. But, though your picture may be *more* easy to conceive, I doubt if it is enough so to constitute an axiom.

Euc. Taken by itself, it may be, as you say, not entirely axiomatic. But I think I can put before you a few considerations which will make it more acceptable.

Min. They will be well worth having. An absolute *proof* of it, from first principles, would be received, I can assure you, with absolute *rapture*, being an *ignis fatuus* that mathematicians have been chasing from your age down to our own.

Euc. I know it. But I cannot help you. Some mysterious flaw lies at the root of the subject. Probabilities are all I have to offer you.

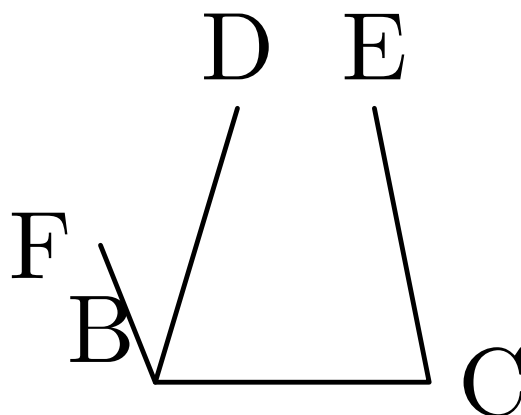

Now suppose you were assured, with regard to two finite Lines placed before you, that, when produced in a certain direction, one of them *approached* the other, that is, contained two points, of which the second was nearer, to the other Line, than the first, would you not think it probable—if not absolutely certain—that they would meet at last?

Min. Utilising—as I suppose you will allow me to do—my knowledge of the properties of *asymptotes*, I should say ‘No. The mere fact of *approach*, granted as to two Lines, does *not* secure a future *meeting*.’

Euc. But, if you look into the depths of your own consciousness—assuming such depths to exist—you will find, I believe, an eternal distinction maintained, in this respect, between straight and curved Lines: so that Lines of the one kind *must*, if they approach, ultimately meet, whereas those of the other kind need not.

Min. I will grant it, provisionally, if only to know what you are going to deduce from it.

Euc. I will now ask you to consider this diagram.

Suppose it given that the Lines BD , CE , make with BC two angles together less than two right angles. My object is to show that probably—if not certainly—they will meet, if produced towards D , E .

Let BF be so drawn that the angles FBC , BCE , may be together equal to two right angles.

Now, if any point in BD be nearer to CE than B is, what is required is proved, since BD approaches CE .

But, if this be not so, then F (which is obviously further from CE than some point in BD is) must also be further from CE than B is; i. e. FB must approach EC ; i. e. FB and EC must ultimately meet, below BC , and so form a Triangle, whose angles at B and C will be (by my Prop. 17) less than two right angles. Hence the angles FBC , BCE , must be *greater* than two right angles, since the four angles are (by my Prop. 13) equal to four right angles. But this is absurd, since they were made *equal* to two right angles.

Hence D is nearer to CE than B is; i. e. BD approaches CE , and so will meet it if produced.

Min. You certainly *have* made your Axiom a little more axiomatic. It is, I presume, an afterthought of yours: otherwise you would have made your Axiom deal with *approaching* Lines, and would then have proved your present Axiom as a Theorem.

Euc. Excuse me. Whatever the habits of modern geometricians may be, in *our* day we always investigated a subject down to the very roots. No ‘afterthought’ was possible. You of the nineteenth century may ‘look before and after,’ if it so please you, so long as *we* have liberty to look at what is at our feet: *you* may ‘sigh for what is not,’ and welcome, so long as we may chuckle at what *is*!

Quoted from *To a Skylark* by Percy Bysshe Shelley

Min. Flippancy will not serve your turn. If you have no better reason than *that*—

Euc. I *have* a better reason. How could I have dealt with *approaching* Lines without first strictly defining ‘the distance of a point from a Line’?

Min. Nohow, I grant you.

Euc. Which would have entailed a definition of ‘the distance of a point from a point,’ i. e. the length of the *shortest* path by which the one can pass to the other—which again would have entailed the comparison of all possible paths—which again would have entailed the estimation of the lengths of curved Lines—which again—

Min. This is uncanny! It is whichcraft!

Euc. (*preserves a disgusted silence*).

Min. I beg your pardon. I grant that you have made out a very good case for your own Axiom, and but a bad one for Playfair's.

Euc. I will make it worse yet, before I have done. My next remark will be best explained with the help of a diagram.

Let AB and CD make, with EF , the two interior angles BEF , EFD , together less than two right angles. Now if through E we draw the Line GH such that the angles HEF , EFD may be equal to two right angles, it is easy to show (by Prop. 28) that GH and CD are 'separational.'

Min. Certainly.

Euc. We see, then, that any Lines which have the property (let us call it ' α ') of making, with a certain transversal, two interior angles together less than two right angles, have also the property (let us call it ' β ') that one of them intersects a Line which is separational from the other.

Min. I grant it.

Euc. Now suppose you decline to grant my 12th Axiom, but are ready to grant Playfair's Axiom, that two intersectional Lines cannot both be separational from the same Line: then you have in fact granted my Axiom.

Min. Be good enough to prove that.

Euc. Lines, which have property ' α ,' have property ' β .' Lines, which, have property ' β ,' meet if produced; for, if not, there would be two Lines both separational from the same Line, which is absurd. Hence Lines, which have property ' α ,' meet if produced.

Min. I see now that those who grant Playfair's Axiom have no right to object to yours: and yours is certainly the more simple one.

Euc. To make assurance doubly sure, let me give you two additional reasons for preferring my Axiom.

In the first place, Playfair's Axiom (or rather the Contranomial of it which I have been using, that 'a Line which intersects one of two separational Lines will also meet the other') does not tell us *which way* we are to expect the Lines to meet. But this is a very important matter in constructing a diagram.

Min. We might obviate that objection by re-wording it thus:—'If a Line intersect one of two separational Lines, that portion of it which falls between them will, if produced, meet the other.'

Euc. We might: and therefore I lay little stress on *that* objection.

Euc. In the second place, Playfair's Axiom asserts *more* than mine does: and all the additional assertion is superfluous, and a needless strain on the faith of the learner.

Min. I do not see that in the least.

Enc. It is rather an obscure point, but I think I can make it clear. We know that all Pairs of Lines, which have property ' α ,' have also property ' β '; but we do *not* know as yet (till we have proved I. 29) that all, which have property ' β ,' have also property ' α .'

Min. That is so.

Enc. Then, for anything we know to the contrary, class ' β ' *may* be larger than class ' α .' Hence, if you assert anything of class ' β ,' the logical effect is more extensive than if you assert it of class ' α ': for you assert it, not only of that portion of class ' β ' which is known to be included in class ' α ,' but also of the unknown (but possibly existing) portion which is *not* so included.

Min. I see that now, and consider it a real and very strong reason for preferring your axiom.

But so far you have only answered Playfair. What do you say to the objection raised by Mr. Potts? 'A stronger objection appears to be that the converse of it forms Euc. I. 17; for both the assumed Axiom and its converse should be so obvious as not to require formal demonstration.'

Enc. Why, I say that I deny the general law which he lays down. (It is, of course, the *technical* converse that he means, not the *logical* one. 'All X is Y ' has for its technical converse 'All Y is X '; for its logical, 'Some Y is X .') Let him try his law on the Axiom 'All right angles are equal,' and its technical converse 'All equal angles are right'!

Min. I withdraw the objection.

§ 6. The Principle of Superposition. *Min.* The next subject is the principle of 'superposition.' You use it twice only (in Props. 4 and 8) in the First Book: but the modern fancy is to use it on all possible occasions. The Syllabus indicates (to use the words of the Committee) 'the free use of this principle as desirable in many cases where Euclid prefers to keep it out of sight.'

Enc. Give me an instance of this modern method.

Min. It is proposed to prove I. 5 by taking up the isosceles Triangle, turning it over, and then laying it down again *upon itself*.

Enc. Surely that has too much of the Irish Bull about it, and reminds one a little too vividly of the man who walked down his own throat, to deserve a place in a strictly philosophical treatise?

Min. I suppose its defenders would say that it is conceived to leave a trace of itself behind, and that the reversed Triangle is laid down upon the trace so left.

Enc. That is, in fact, the same thing as conceiving that there are *two* coincident Triangles, and that one of them is taken up, turned over, and laid down upon the other. And what does their subsequent coincidence prove? Merely this: that the right-hand angle of the first is equal to the left-hand angle of the second, and *vice versâ*. To make the proof complete, it is necessary to point out that, owing to the original coincidence of the Triangles, this same 'left-hand angle of the second' is *also* equal to the *left*-hand angle of the first: and then, and not till then, we may conclude that the base-angles of the first Triangle are equal. This is the full argument, strictly drawn out. The Modern books on Geometry often attain their much-vaunted brevity by the dangerous process of omitting links in the chain; and some of the new proofs, which at first sight seem to be shorter than mine, are really longer when fully stated. In this particular

case I think you will allow that I had good reason for not adopting the method of superposition?

Min. You had indeed.

Euc. Mind, I do not object to that proof, if appended to mine as an *alternative*. It will do very well for more advanced students. But, for beginners, I think it much clearer to have two non-isosceles Triangles to deal with.

Min. But your objection to laying a Triangle down *upon itself* does not apply to such a case as I. 24.

Euc. It does not. Let us discuss that case also. The Moderns would, I suppose, take up the Triangle ABC , and apply it to DEF so that AB should coincide with DE ?

Min. Yes.

Euc. Well, that would oblige you to say ‘and join C , in its new position, to E and F .’ The words ‘in its new position’ would be necessary, because you would now have *two* points in your diagram, both called ‘ C .’ And you would also be obliged to give the points D and E additional names, namely ‘ A ’ and ‘ B .’ All which would be very confusing for a beginner. You will allow, I think, that I was right here in constructing a new Triangle instead of transferring the old one?

Min. Cuthbertson evades that difficulty by re-naming the point C , and calling it ‘ Q .’

Euc. And do the points A and B take their names with them?

Min. No. They adopt the names ‘ D ’ and ‘ E .’

Euc. It is very like making a new Triangle!

Min. It is indeed. I think you have quite disposed of the claims of ‘superposition.’ The only remaining subject for discussion is the omission of the diagonals in Book II.

§ 7. The omission of diagonals in Euc. II. *Euc.* Let us test it on my II. 4. We will go through *my* proof of it, and then the proof given by some writer who ignores the diagonal, supplying if necessary any of those gaps in argument which my Modern Rivals so often indulge in, and which give to their proofs a delusive air of neatness and brevity.

‘If a Line be divided into any two parts, the square of the Line is equal to the squares of the two parts with twice their rectangle.’

Let AB be divided at C . It is to be proved that square of AB is equal to squares of AC , CB , with twice rectangle of AC , CB .

On AB describe Square $ADEB$; join BD ; from C draw CF parallel to AD or BE , cutting BD at G ; and through G draw HK parallel to AB or DE .

$\therefore BD$ cuts Parallels AD , CF ,

\therefore exterior angle $CGB =$ interior opposite angle ADB . [I. 29]

also $\therefore AD = AB$,

\therefore angle $ADB =$ angle ABD ; [I. 5]

\therefore angle $CGB =$ angle ABD ;

$\therefore CG = CB$; [I. 6]

but $BK = CG$, and $GK = CB$; [I. 34]

$\therefore CK$ is equilateral.

also, \therefore angle CBK is right,

$\therefore CK$ is rectangular; [I. 46. Cor.]

$\therefore CK$ is a Square.

Similarly HF is a Square and $=$ square of AC , for $HG = AC$. [I. 34]

Also, $\therefore AG$, GE are equal, being complements, [I. 43]

$\therefore AG$ and $GE =$ twice AG ;

$=$ twice rectangle of AC , CB .

But these four figures make up AE .

Therefore the square of AB &c.

Q. E. D.'

That is just 128 words, counting from 'On AB describe' down to the words 'rectangle of AC , CB .' What author shall we turn to for a rival proof?

Min. I think Wilson will be best.

Euc. Very well. Do the best you can for him. You may use all my references if you like, and if you can do so legitimately.

Min. 'Describe Square $ADEB$ on AB . Through C draw CF parallel to AD , meeting—'

Euc. You must insert 'or BE ,' to make the comparison fair.

Min. Certainly. I will mark the necessary insertions by parentheses. 'Through C draw CF parallel to AD (or BE), meeting DE in F .'

Euc. You may omit those four words, as they do not occur in my proof.

Min. Very well. 'Cut off (from CF) $CG = CB$. Through G draw HK parallel to AB (or DE). It is easily shewn that CK, HF are squares of CB, AC ; and that AG, GE , are each of them rectangle of AC, CB .'

Euc. We can't admit 'it is easily shewn'! He is bound to *give* the proof.

Min. I will do it for him as briefly as I can. ' $\because CG = CB$, and $BK = CG$, and $GK = CB$, $\therefore CK$ is equilateral. It is also rectangular, since angle CBK is right. $\therefore CK$ is a Square.' I'm afraid I mustn't say 'Similarly HF is a Square'?

Euc. Certainly not: it requires a different proof.

Min. 'Because $CE = AD = AB$, and CG, CB , parts of them, are equal, \therefore remainder $GF =$ remainder $AC, = HG$. But $HD = GF$, and $DF = HG$; $\therefore HF$ is equilateral. It is also rectangular, since angle HDF is right. $\therefore HF$ is a Square, and = square of AC . Also AG is rectangle of AC, CB .' I fear I can't assume GE to be equal to AG ?

Euc. I fear I cannot permit you to assume the truth of my I. 43.

Min. 'Also GE is rectangle of AC, CB , since $GF = AC$, and $GK = CB$. $\therefore AG$ and $GE =$ twice rectangle of AC, CB .'

Euc. That will do. How many words do you make it?

Min. 145.

Euc. Then the omission of the diagonal, instead of shortening the proof, has really lengthened it by seventeen words! Well! Has it any advantage in the way of neatness to atone for its greater length?

Min. Certainly not. It is quite unsymmetrical. I very much prefer your method of appealing to the beautiful Theorem of the equality of complements.

Euc. Then that concludes our present interview: we will meet again when you have reviewed my Modern Rivals one by one. If you had any slow music handy, I would vanish to it: as it is—

(*Vanishes without slow music.*)

Act II.

Manuals which reject Euclid's treatment of Parallels.

Scene I.

'E fumo dare lucem.'

Quoted from *Art of Poetry* by Horace

[MINOS sleeping. To him enter, first a cloud of tobacco-smoke; secondly the bowl, and thirdly the stem, of a gigantic meerschaum; fourthly the phantasm of HERR NIEMAND, carrying a pile of phantom-books, the works of Euclid's *Modern Rivals*, phantastically bound.]

Niemand. The first author we have to consider is M. Legendre, is it not?

Minos. (*aside*) Not a single word of greeting! He plunges *in medias res* with a more fearful suddenness than Euclid himself! (*Aloud*) It is so, mein lieber Herr.

Nie. No time to waste in civil speeches! It is for you to question, for me to answer. I have read M. Legendre's book. Ach! It is beautiful! You shall find in it no flaw!

Min. I do not expect to do so.

Scene II.

Treatment of Parallels by methods involving infinite series.

LEGENBRE.

'Fine by degrees, and beautifully less.'

Quoted from Henry
and Emma by
Matthew Prior

Nie. I lay before you '*Éléments de Géométrie*' by Mons. A. M. Legendre, the 14th edition, 1860.

Min. Let me begin by asking you (since I consider you and your client as one in this matter) how you define a straight Line.

Nie. As 'the shortest path from one point to another.'

Min. This does not seem to me to embody the primary idea which the word 'straight' raises in the mind. Is not the natural process of thought to realise *first* the notion of 'a straight Line,' and *then* to grasp the fact that it is the shortest path between two points?

Nie. That may be the natural process: but surely you will allow our Definition to be a legitimate one?

Min. I think not: and I have the great authority of Kant to support me. In his 'Critique of Pure Reason,' he says (I quote from Meiklejohn's translation, in Bohn's Philosophical Library, pp. 9, 10), 'Mathematical judgments are always synthetical . . . "A straight Line between two points is the shortest" is a synthetical Proposition. For my conception of *straight* contains no notion of *quantity*, but is merely *qualitative*. The conception of the *shortest* is therefore wholly an addition, and by no analysis can it be extracted from our conception of a straight Line.'

This may fairly be taken as a denial of the fitness of the Axiom to stand as a Definition. For all Definitions ought to be the expressions of analytical, not of synthetical, judgments: their predicates ought not to introduce anything which is not already included in the idea corresponding to the subject. Thus, if the idea of 'shortest distance' cannot be obtained by a mere analysis of the conception represented by 'straight Line,' the Axiom ought not to be used as a Definition.

Nie. We are not particular as to whether it be taken as a Definition or Axiom: either will answer our purpose.

Min. Let us then at least banish it from the *Definitions*. And now for its claim to be regarded as an *Axiom*. It involves the assertion that a straight Line is shorter than any *curved* Line between the two points. Now the length of a curved Line is altogether too difficult a subject for a beginner to have to consider: it is moreover unnecessary that he should consider it at all, at least in the earlier parts of Geometry: all he really needs is to grasp the fact that it is shorter than any *broken* Line made up of straight Lines.

Nie. That is true.

Min. And all cases of broken Lines may be deduced from their simplest case, which is Euclid's I. 20.

Nie. Well, we will abate our claim and simply ask to have I. 20 granted us as an Axiom.

Min. But it can be *proved* from your own Axioms: and it is a generally admitted principle that, at least in dealing with beginners, we ought not to

take as axiomatic any Theorem which can be proved by the Axioms we already possess.

Nie. For *beginners* we must admit that Euclid's method of treating this point is the best. But you will allow ours to be a legitimate and elegant method for the advanced student?

Min. Most certainly. The whole of your beautiful treatise is admirably fitted for advanced students: it is only from the *beginner's* point of view that I venture to criticise it at all.

Your treatment of angles and right angles does not, I think, differ much from Euclid's?

Nie. Not much. We *prove*, instead of assuming, that all right angles are equal, deducing it from the Axiom that two right Lines cannot enclose a space.

Min. I think some such proof a desirable interpolation.

I will now ask you how you prove Euc. I. 29.

Nie. What preliminary Propositions will you grant us as proved?

Min. Euclid's series consists of Ax. 12, Props. 4, 5, 7, 8, 13, 15, 16, 27, 28. I will grant you as much of that series as you have proved by methods not radically differing from his.

Nie. That is, you grant us Props. 4, 13, and 15. Prop. 16 is not in our treatise. The next we require is Prop. 6.

Min. That you may take as proved.

Nie. And, next to that. Prop. 20: *that* we assume as an Axiom, and from it, with the help of Prop. 6, we deduce Prop. 19.

Min. For our present purpose you may take Prop. 19 as proved.

Nie. From Props. 13 and 19 we deduce Prop. 32; and from that, Ax. 12; from which Prop. 29 follows at once.

Min. Your proof of Prop. 32 is long, but beautiful. I need not, however, enter on a discussion of its merits. It is enough to say that what we require is a proof suited to the capacities of *beginners*, and that this Theorem of yours (Prop. XIX, at p. 20) contains an infinite series of Triangles, an infinite series of angles, the terms of which continually decrease so as to be ultimately less than any assigned angle, and magnitudes which vanish simultaneously. These considerations seem to me to settle the question. I fear that your proof of this Theorem, though a model of elegance and perspicuity as a study for the advanced student, is wholly unsuited to the requirements of a beginner.

Nie. That we are not prepared to dispute.

Min. It seems superfluous, after saying this, to ask what test for the meeting of Lines you have provided: but we may as well have that stated, to complete the enquiry.

Nie. We give Euclid's 12th Axiom, which we prove from Prop. 32, using the principle of Euc. X. 1 (second part), that 'if the greater of two unequal magnitudes be bisected, and if its half be bisected, and so on; a magnitude will at length be reached less than the lesser of the two magnitudes.'

Min. That again is a mode of proof entirely unsuited to beginners.

The general style of your admirable treatise I shall not attempt to discuss: it is one I would far rather take as a model to imitate than as a subject to criticise.

I can only repeat, in conclusion, what I have already said, that your book, though well suited for advanced students, is not so for beginners.

Nie. At this rate we shall make short work of the twelve Modern Rivals!

Scene III.

Treatment of Parallels by angles made with transversals.

COOLEY.

'The verbal solemnity of a hollow logic.'

COOLEY, *Pref. p. 20.*

Nie. I have now the honour to lay before you *'The Elements of Geometry, simplified and explained,'* by W. D. COOLEY, A.B., published in 1860.

Min. Please to hand me the book for a moment. I wish to read you a few passages from the Preface. It is always satisfactory—is it not?—to know that a writer, who attempts to 'simplify' Euclid, begins his task in a becoming spirit of humility, and with some reverence for a name that the world has accepted as an authority for two thousand years.

Nie. Truly.

MINOS *reads.*

'The Elements of Plane Geometry . . . are here presented in the reduced compass of 36 Propositions, perfectly coherent, fully demonstrated, and reaching quite as far as the 173 Propositions contained in the first six books of Euclid.' Modest, is it not?

Nie. A little high-flown, perhaps. Still, you know, if they really *are* 'fully demonstrated'—

Min. If! In page 4 of the Preface he talks of 'Euclid's circumlocutory shifts': in the same page he tells us that 'the doctrine of proportion, as propounded by Euclid, runs into prolixity though wanting in clearness': and again, in the same page, he states that most of Euclid's *ex absurdo* proofs 'though containing little,' yet 'generally puzzle the young student, who can hardly comprehend why gratuitous absurdities should be so formally and solemnly dealt with. These Propositions therefore are omitted from our Book of Elements, and the Problems also, for the science of Geometry lies wholly in the Theorems. Thus simplified and freed from obstructions, the truths of Geometry may, it is hoped, be easily learned, even by the youngest.' But perhaps the grandest sentence is at the end of the Preface. 'Then as to those Propositions (the first and last of the 6th Book), in which, according to the same authority' (he is alluding to the Manual of Euclid by Galbraith and Haughton), 'Euclid so beautifully illustrates his celebrated Definition, they appear to our eyes to exhibit only the verbal solemnity of a hollow logic, and to exemplify nothing but the formal application of a nugatory principle.' Now let us see, mein Herr, whether Mr. Cooley has done anything worthy of the writer of such 'brave 'orts' (as Shakespeare has it): and first let me ask how you define Parallel Lines.

NIEMAND *reads.*

'Right Lines are said to be parallel when they are equally and similarly inclined to the same right Line, or make equal angles with it towards the same side.'

Min. That is to say, if we see a Pair of Lines cut by a certain transversal, and are told that they make equal angles with it, we say 'these Lines are parallel';

and conversely, if we are told that a Pair of Lines are parallel, we say 'then there is a transversal, *somewhere*, which makes equal angles with them'?

Nie. Surely, surely.

Min. But we have no means of finding it? We have no right to draw a transversal at random and say 'this is the one which makes equal angles with the Pair'?

Nie. Ahem! Ahem! Ahem!

Min. You seem to have a bad cough.

Nie. Let us go to the next subject.

Min. Not till you have answered my question. *Have* we any means of finding the particular transversal which makes the equal angles?

Nie. I am sorry for my client, but, since you are so *exigeant*, I fear I must confess that we have *no* means of finding it.

Min. Now for your proof of Euc. I. 32.

Nie. You will allow us a preliminary Theorem?

Min. As many as you like.

Nie. Well, here is our Theorem 11. 'When two parallel straight Lines AB , CD , are cut by a third straight Line EF , they make with it the alternate angles AGH , GHD , equal; and also the two internal angles at the same side BGH , GHD equal to two right angles.'

For AGH and EGB are equal because vertically opposite, and EGB is also equal to GHD (Definition); therefore—'

Min. There I must interrupt you. How do you know that EGB is equal to GHD ? I grant you that, by the Definition, AB and CD make equal angles with a *certain* transversal: but have you any ground for saying that EF is the transversal in question?

Nie. We have not. We surrender at discretion. You will permit us to march out with the honours of war?

Min. We grant it you of our royal grace. March him off the table, and bring on the next Rival.

Scene IV.

Treatment of Parallels by equidistances.

CUTHBERTSON.

'Thou art so near, and yet so far.'

Modern Song.

Quoted from song by
Alexander Reichardt

Nie. I now lay before you '*Euclidian Geometry*,' by FRANCIS CUTHBERTSON, M.A., late Fellow of C. C. C, Cambridge; Head Mathematical Master of the City of London School; published in 1874.

Min. It will not be necessary to discuss with you *all* the innovations of Mr. Cuthbertson's book. The questions of the separation of Problems and Theorems, the use of superposition, and the omission of the diagonals in Book II, are general questions which I have considered by themselves. The only points, which you and I need consider, are the methods adopted in treating Right Lines, Angles, and Parallels, wherever those methods differ from Euclid's.

The first subject, then, is the Right Line. How do you define and test it?

Nie. As in Euclid. But we *prove* what Euclid has assumed as an Axiom, namely, that two right Lines cannot have a common segment.

Min. I am glad to hear you assert that Euclid has assumed it 'as an Axiom,' for the interpolated and illogical corollary to Euc. I. 11 has caused many to overlook the fact that he has assumed it as early as Prop. 4, if not in Prop. 1. What is your proof?

NIEMAND *reads.*

'Two straight Lines cannot have a common segment.'

'For if two straight Lines ABC , ABH could have a common segment AB ; then the straight Line ABC might be turned about its extremity A , towards the side on which BH is, so as to cut BH ; and thus two straight Lines would enclose a space, which is impossible.'

Min. You assume that, *before* C crosses BH , the portions coinciding along AB will diverge. But, if ABH is a right Line, this will not happen till C has passed H .

Nie. But you would then have one portion of the revolving Line in motion, and another portion at rest.

Min. Well, why not?

Nie. We may assume *that* to be impossible; and that, if a Line revolves about its extremity, it all moves at once.

Min. Which, I take the liberty to think, is *quite* as great an assumption as Euclid's. I think the Axiom quite plain enough without any proof.

Your treatment of angles, and right angles, is the same as Euclid's, I think?

Nie. Yes, except that we *prove* that 'all right angles are equal.'

Min. Well, it *is* capable of proof, and therefore had better not be retained as an Axiom.

I must now ask you to give me your proof of Euc. I. 32.

Nie. We prove as far as I. 28 as in Euclid. In order to prove I. 29, we first prove, as a Corollary to Euc. I. 20, that 'the shortest distance between two points is a straight Line.'

Min. What is your next step?

Nie. A Problem (Pr. F. p. 52) in which we prove the Theorem that, of all right Lines drawn from a point to a Line, the perpendicular is the least.

Min. We will take that as proved.

Nie. We then deduce that the perpendicular is the shortest path from a point to a Line.

Next comes a Definition. 'By the distance of a point from a straight Line is meant the shortest path from the point to the Line.'

Min. Have you anywhere defined the distance of one point from another?

Nie. No.

Min. We had better have that first.

Nie. Very well. 'The distance of one point from another is the shortest path from one to the other.'

Min. Might we not say 'is the length of the right Line joining them?'

Nie. Yes, that is the same thing.

Min. And similarly we may modify the Definition you gave just now.

Nie. Certainly. 'The distance of a point from a right Line is the length of the perpendicular let fall upon it from the given point.'

Min. What is your next step?

NIEMAND *reads.*

P. 33. *Ded. G.* 'If points be taken along one of the arms of an angle farther and farther from the vertex, their distances from the other arm will at length be greater than any given straight line.'

In proving this we assume as an Axiom that the lesser of two magnitudes of the same kind can be multiplied so as to exceed the greater.

Min. I accept the Axiom and the proof.

NIEMAND *reads.*

P. 34. *Ax.* 'If one right Line be drawn in the same Plane as another, it cannot first recede from and then approach to the other, neither can it first approach to and then recede from the other on the same side of it.'

Min. Here, then, you assume, as axiomatic, one of the Propositions of Table II. After this, you ought to have no further difficulty in proving Euc. I. 32 and all other properties of Parallels. How do you proceed?

Nie. We prove (p. 34. *Lemma*) that, if two Lines have a common perpendicular, each is equidistant from the other.

Min. What then?

Nie. Next, that any Line intersecting one of these will intersect the other (p. 35).

Min. That, I think, depends on Deduction *G*, at p. 33?

Nie. Yes.

Min. A short, but not very easy, Theorem; and one containing a somewhat intricate diagram. However, it proves the point. What is your next step?

NIEMAND *reads.*

P. 34. Lemma. ‘Through a given point without a given straight Line one and only one straight Line can be drawn in the same Plane with the former, which shall never meet it. Also all the points in each of these straight Lines are equidistant from the other.’

Min. I accept all that.

Nie. We then introduce Euclid’s definition of ‘Parallels’. It is of course now obvious that parallel Lines are equidistant, and that equidistant Lines are parallel.

Min. Certainly.

Nie. We can now, with the help of Euc. I. 27, prove I. 29, and thence I. 32.

Min. No doubt. We see, then, that you propose, as a substitute for Euclid’s 12th Axiom, a new Definition, two new Axioms, and what virtually amounts to five new Theorems. In point of ‘axiomatization’ I do not think there is much to choose between the two methods. But in point of brevity, clearness, and suitability to a beginner, I give the preference altogether to Euclid’s axiom.

The next subject to consider is your practical test, if any, for two given Lines meeting when produced.

Nie. One test is that one of the Lines should meet a Line parallel to the other.

Min. Certainly: and that will suffice in such a case as Euc. I. 44 (Pr. M. p. 60, in this book) though you omit to point out *why* the Lines may be assumed to meet. But what if the diagram does not contain ‘a Line parallel to the other’? Look at Pr. (*h*) p. 69, where we are told to make, at the ends of a Line, two angles which are together less than two right angles, and where it is assumed that the Lines, so drawn, will meet. That is, you assume the truth of Euclid’s 12th Axiom. And you do the same thing at pp. 70, 123, 143, and 185.

Nie. Euclid’s 12th Axiom is easily proved from our Theorems.

Min. No doubt: but you have not done it, and the omission makes a very serious hiatus in your argument. It is not a thing that beginners are at all likely to be able to supply for themselves.

I have no adverse criticisms to make on the general style of the book, which seems clear and well written. Nor is it necessary to discuss the claims of the book to *supersede* Euclid, since the writer makes no such claim, but has been careful (as he states in his preface) to avoid any arrangement incompatible with Euclid’s order. The chief novelty in the book is the introduction of the principle of ‘equidistance,’ which does not seem to me a desirable feature in a book meant for beginners: otherwise it is little else than a modified version of Euclid.

Scene V.

Source: also in Supplement to “Euclid and His Modern Rivals” (with minor differences as noted)

Treatment of Parallels by revolving Lines.

HENRICI.

'In order that an aggregate of elements may be called a spread, it is necessary that they follow continuously.'—HENRICI'S *Art of Dining*, p. 12.

Nie. I lay before you '*Elementary Geometry: Congruent Figures*,' by OLAUS HENRICI, Ph.D., F.R.S., Professor of Pure Mathematics in University College, London, 1879.

Min. What is your Definition of a Line?

Nie. 'The boundary of a surface or of part of a surface is called a *Line* or a *curve*.' (p. 5.)

Min. Good—'Line,' I presume, meaning 'right Line.' But that throws us back upon 'surface.' Of course *that* is defined correctly?

Nie. I will tell you in a moment. (*He turns over a few pages*) Yes, here it is. 'A surface is the—' (*He gives a perceptible start, stops reading, and turns a few pages back*) Yes, it's all right. 'That which bounds a solid and separates it from other parts of Space is called its *surface*.' (p. 4.)

Min. (*aside*) There is more here than meets the eye! (*Aloud*) You will be good enough to read that *other* Definition of 'surface.'

Nie. (*innocently*) What other Definition?

Min. No evasions, Sir! Read it at once! You know the one I mean.

Nie. (*desperately*) It's only this—'A surface is the path of a moving curve.' (p. 9.) Merely another way of looking at it, you know.

Min. (*contemptuously*) Oh! Merely another way of looking at it, is it? Of course the curve preserves its shape as it moves?

Nie. No doubt.

Min. Now look here. Take this Jargonelle pear—

Nie. Thank you very much. It *is* rather dry work—

Min. Stop! Don't eat it yet! Look at it. Would you call its curvature regular?

Nie. Certainly not: it bulges here and there, in all sorts of queer ways.

Min. Well, now take this bit of wire: bend it into any curve you like, and then move it so that its path may coincide with the surface of the pear.

Nie. (*uneasily*) I cannot do it.

Min. Well, eat it, then. *That* is possible, at all events. So! We start with a Definition which is simply ridiculous! Now for the distinction between 'right Line' and 'curve'—

Nie. Here my client's meaning is not very clear. The first Definition I can find is that of a *curve*. He says (p. 6) 'a point may be moved, and then it will describe a path. This path of a moving point is a curve.'

Min. Surely he does not mean that a point can never move *straight*? He must mean that there are two kinds of curves, 'curved curves,' and 'straight curves'—as the Irish talk of 'tay-tay' and 'coffee-tay.' But, if so, he makes 'Line' and 'curve' synonymous.

Nie. I have looked a little further on, and I find a description of a 'Line,' which seems to limit the word to *bent* Lines. He says (p. 7) 'The notion of a Line may be obtained directly by considering a wire bent into any shape and abstracting all thickness from it.'

Min. So then a 'Line' *must* be bent, though a 'curve' need not be so? Your client has clearly *one* merit—great originality of style!

Nie. Here is another definition of ‘curve,’ which may be more to your taste, ‘A curve is a *one-way spread, with points as elements.*’ (p. 10.)

Min. Too much like a dinner *à la Russe*. I don’t like ‘spread’ at all.

Nie. He illustrates his use of ‘spread’ by applying it to other subjects. For instance, ‘a musical tone allows of variations which form a two-way spread, with different degrees of intensity and of pitch as elements.’ (p. 12.)

Min. That explains the phrase ‘too-tooing on a flute.’ How simple and intelligible all this must be to boys just beginning Geometry! But I am still waiting for a definition of ‘right Line.’

Nie. (*after turning over several pages*) I have found it at last—after passing over a good deal about ‘continuity’ and ‘space’ and ‘congruence.’ We say (p. 17) ‘If we suspend a weight by a string, the string becomes stretched; and we say it is straight.’

Min. That will serve very well to give a *notion* of ‘straight.’ For a *working* definition we require of course some practical test, such as ‘two straight Lines cannot enclose a space.’

Nie. We have that. At p. 20 we give you Axiom IV. ‘Through two points always one, and only one, Line can be drawn.’ And at p. 18 we at last distinguish ‘Line’ and ‘curve.’ ‘A straight Line will in future be called a *Line* simply. All other Lines will be called *curved Lines*, or *curves.*’

Min. Better late than never: though it makes wild work of your former theory—in which you got the notion of ‘Line’ from a bent wire, and of ‘curve’ from the path of a moving point. Now for the Definition of ‘angle.’

Nie. (*after turning the leaves backwards and forwards for some time, begins to read in an unsteady voice*) ‘The part of a pencil of half-rays, described by a half-ray on turning about its end point from one position to another, is called an angle.’ (p. 47.)

Min. So you reject the notion of ‘inclination’ (or rather ‘declination’)? Well! This *is* an innovation! We must investigate it thoroughly. You mean by ‘half-ray,’ I presume, what Euclid calls ‘a Line terminated in one direction but not in the other’?

Nie. Certainly.

Min. Now what is a ‘pencil’?

Nie. ‘The aggregate of all Lines in a plane which pass through a given point.’ (p. 38.)

Min. Aha! And where will you get your angular magnitude, I should like to know? What kinds of magnitude is a Line capable of possessing?

Nie. Length only, of course.

Min. Two Lines?

Nie. (*uneasily*) Length only.

Min. A million?

Nie. (*more uneasily*) Length only.

Min. A pencil?

Nie. (*faintly*) Spare me!

Min. So much for the *quality* of your angular magnitude! Now for its *quantity*. What is the length of one of these half-rays?

Nie. Infinite, of course.

Min. And the aggregate length of all the half-rays in your ‘angle’ cannot well be less. Thus we may deduce a truly delightful definition of angular magnitude. ‘As to *quality*, it is linear. As to *quantity*, it is infinite!’

Nie. (*writhes, but says nothing*).

Min. Will you not throw up your brief?

Nie. Not yet: I must fight it out.

Min. Then we must review this marvellous book 'to the bitter end.' What have you to say about 'right angles'?

Nie. We have 'angles of rotation' and 'angles of continuation' (p. 48); and the axiom 'all angles of rotation are equal' (p. 49) as a substitute for 'all right angles are equal.'

Min. It is a practicable method, but not so suitable for beginners as Euclid's. This matter I have already discussed (see p. 744). And now for the subject of Parallels.

Nie. We have Playfair's Axiom (or rather its equivalent) 'Through a given point only one Line can be drawn parallel to a given Line' (p. 68), but this we do not simply lay down *as* an Axiom. We lead up to it by two or three pages of reasoning.

Min. This is *most* interesting! Let us examine the argument minutely. A logical *proof* of that Axiom would be perhaps the greatest advance ever made in the subject since the days of Euclid.

Nie. 'Two indefinite Lines in a Plane may intersect, as we have seen. We shall now consider the possibility of there being such Lines which do not intersect.' (p. 65.)

Min. That, of course, you can easily prove, without appealing to any disputable Axiom. It is simply Euc. I. 27. Do you prove it in Euclid's way?

Nie. Not exactly. Our argument is quite different from Euclid's: and we come to *two* conclusions—one being the real existence of Parallels, the other the equivalent of Playfair's Axiom.

Min. I very much doubt your proving the first by any simpler method than Euclid's: and as to proving the second, by any method *at all*, without assuming some disputable Axiom, I defy you to do it! However, let us hear your argument.

Nie. We take a Line, and a point without it: and from the point we draw two 'half-rays' intersecting the line. These half-rays we then turn about the point, in opposite directions, until they cease to intersect the Line. And then we proceed to consider where their 'productions' have got to.

Min. Like 'little Bo-peep,' you are anxious about their '*tails*' in fact; taking their 'heads' to be the ends which at first intersected the given Line.

Nie. We say that there are only three conceivable cases: one, where the *tails* fall next to the given Line; another, where the *heads* fall next to it; the third, where the tail of each coincides with the head of the other.

Min. I admit all that.

Nie. The first case we say is inadmissible because, if it were true, any Line through *P*, lying within the angle formed by the head of one ray and the tail of the other, would cut the given Line both ways.

Min. A *reductio ad absurdum*, no doubt; but it only holds good on the supposition that you *can* draw Lines through *P*, so as to lie within that angle. But this supposition requires a finite angle. If we suppose that, the moment one ray begins to revolve so as to bring its head nearer to the given line, it instantly coincides with the other ray, head with tail and tail with head, it will not then be *possible* to draw any such Line as you suggest: and *then* where is your *reductio ad absurdum*?

Nie. We do not seem to have noticed that case.

Min. In point of fact, your *three* cases are really *five*. Before going any further let us have them all clearly stated.

We assume, in all three figures, that the ray-heads, as drawn, do *not* intersect the given line; but that either of them would, if it began to revolve towards the given Line, instantly intersect it. In other words we assume that any half-ray, drawn from *P* in the dotted angular space, *would* intersect the given Line: but that any half-ray, drawn from *P* in the undotted angular space, as well as the two ray-heads which limit that angular space, would *not* intersect it. And as to the ray-tails, it is obvious that in fig. 1 they *do* intersect the given Line, but in figs. 2, 3, they do *not* do so.

Nie. That is all clear enough.

Min. Then these are the five cases:—

(α) Figure 1. The head of each ray must revolve downwards through a *finite* angle before it can coincide with the tail of the other ray.

(β) Same figure. The head of each ray, on beginning to revolve downwards, *instantly* coincides with the tail of the other ray.

(γ) Figure 2. The head of each ray must revolve upwards through a *finite* angle before it can coincide with the tail of the other ray.

(δ) Same figure. The head of each ray, on beginning to revolve upwards, *instantly* coincides with the tail of the other ray.

(ε) Figure 3.

These five cases suggest a few observations.

In case (α) a number of Lines may be drawn through *P*, in the angular space contained between the head of one ray and the tail of the other: and all such Lines will intersect the given line *both* ways.

In case (β) this absurdity does not arise: all Lines, through *P*, intersect the given Line one way or the other: there is no instance of a Line intersecting it *both* ways, nor of one wholly separate from it.

In case (γ) a number of Lines may be drawn as in case (α): and all such Lines will be wholly separate from the given Line.

In case (δ) the two rays themselves, as drawn in the figure, are wholly separate from the given Line: but no other such Line can be drawn through *P*.

In case (ε) there is only *one* Line through *P* wholly separate from the given Line.

Now let us hear what you make of these five cases.

Nie. We exclude case (α), as I told you just now, by a *reductio ad absurdum*. Case (β) we have failed to notice.

Min. True: but it *can* be excluded by Euc. I. 27: so that if you can manage, by pure reasoning, from ordinary Axioms, and without assuming any disputable Axiom, to exclude cases (γ) and (δ), you will have achieved what geometers have been vainly trying to do for the last two thousand years!

Nie. We go on thus. 'But our Axioms are not sufficient to decide which of the remaining two cases actually does occur.' (p. 67.)

Min. Or rather ‘the remaining *three* cases.’

Nie. ‘In looking at the figures the reader will at once feel that the third case’ (we mean your ‘case (ε)’) ‘is the true one.’

Min. An appeal to sentiment! What if the reader *doesn't* feel it?

Nie. ‘But this cannot be considered decisive;’

Min. It cannot.

Nie. ‘for the two Lines may include a very small angle—’

Min. Aye, or even a large one.

Nie. ‘that is, they may very nearly coincide without actually doing so. Or it may be that sometimes the one, sometimes the other, happens, according as we take the point P at a smaller or greater distance from the Line.’

Min. That seems a fair statement of the difficulty. And now, how are you going to grapple with it?

Nie. ‘The only way of settling this point is to make an assumption, and to see whether the consequences drawn from it do or do not agree with our experience.’

Min. If you find a consequence *not* agreeing with experience, you may of course conclude that your assumption was false; but, if it *does* agree, what then?

Nie. Nothing, I fear, unless you can prove that this is the case with *one* assumption only, and that all other possible assumptions lead to absurd results.

Min. Exactly so. If, then, you want to prove case (ε), your logical course is to assume case (γ) as true, and from that assumption to deduce some consequence which is evidently contrary to experience. And then to exclude case (δ) by a similar argument. Is that your method?

Nie. Well, hardly. We say ‘The assumption to be made is, that the third case’ (i. e. case (ε)) ‘only happens, and this will give us a new axiom.’ (p. 67.)

Min. You may assume it as an *axiom*, if you like. Then you will merely be in the same boat with Playfair. But if you are going to discuss the *consequences* of its being true, and get anything out of *that*, look to your feet! There are pitfalls about!

Nie. ‘In the second case’ (i. e. case (γ)) ‘we should have to—’

Min. Oho! Then it is case (γ), after all, that you are provisionally assuming as true?

Nie. Apparently so.

Min. Well, go on. You are on the right track now.

Nie. In this case we should have to turn the ray ‘through a finite angle’ before its tail would cut the given Line: ‘or there would be an indefinite number of Lines through P which do not cut’ it. (p. 68.)

Min. What do you mean by ‘or’? That one result would follow, *or* the other, but not both?

Nie. We mean that the two results are equivalent.

Min. Then you should say ‘that is.’ ‘Or’ is misleading. However, I grant you that this consequence *would* follow, if case (γ) were true. What then? Is there any obvious absurdity in such a consequence?

Nie. *That* we do not assert. We merely make the remark—and we now proceed to case (ε).

Min. A weak and pointless remark: but let that pass. Do you omit case (δ)?

Nie. We do. We proceed thus. ‘But in the third case (i. e. in case (ε)) there would be only *one* Line through P which does not cut’ the given Line. ‘As soon as we turn this Line about P it would meet it to the right or to the left.’

Min. Certainly. And what then? Do you expect me to admit that, because case (ε) would lead to a consequence not obviously absurd, therefore it is *the* case which always happens, to the exclusion of cases (γ) and (δ)?

Nie. (*hesitatingly*) Well, I think that *is* what we expect. But we first deduce the real existence of Parallels. ‘Thus we are led to the conclusion that there exist Lines in a Plane which, though both be unlimited, do not meet. Such Lines are called *parallel*.’

Min. Oh most lame and impotent conclusion! After all these magnificent Catherine-wheels of revolving half-rays, to deduce Euc. I. 27! And even *this* wretched result you have no right to. Just consider what your argument has been. There are five conceivable cases, (α), (β), (γ), (δ), and (ε). If (α) or (β) were true, *no* Line could be drawn, through *P*, parallel to the given Line: if (γ), *many* such Lines could be drawn: if (δ), *two* such Lines: if (ε), *one* such Line. Now what have you proved? Positively nothing whatever but this—that case (α) would lead to an absurd result. You leave me perfectly free to range about among the other four cases, one of which, (β), denies the real existence of Parallels, which existence you tell me you have *proved*! And so, for the ‘long course of logical reasoning’ which you object to so much in Euclid, you substitute a *short* course of *illogical* reasoning! But you deduce another conclusion, do you not?

Nie. Yes, one other. ‘The assumption mentioned in § 113’ (the assumption that case (ε) is the only true one) ‘may now be stated thus:—Axiom VI. *Through a given point only one Line can be drawn parallel to a given Line.*’

Min. May it indeed? And why ‘now’ rather than three pages back? Is there a single word, in all this argument, which tends to show that case (ε) is—I will not say certainly true, but—even fairly probable?

Nie. (*cautiously*) I will not assert that there is.

Min. In point of fact the odds are exactly three to one against it—since you have only excluded *one* of the five cases, and the other four are, for anything we know to the contrary, equally probable.

Nie. I will not dispute it.

Min. Well! Then it only remains to say that your attempted *proof* of Playfair’s Axiom is an utter failure. Anything more hopelessly illogical I have *never* met with, not even in [Cooley]¹—and that is saying a great deal!

Nie. I confess I do not see my way to defending this proof. But even if we abandon the whole of it, we are no worse off than any other writer who assumes Playfair’s Axiom.

Min. That I quite admit.

Nie. And then, my client instructs me to plead, this Manual (*handing it to Minos*) being so distinctly better than Euclid’s in every other particular—

Min. Gently, gently! You are anticipating. I have not yet had my general survey of the book.

Nie. (*refilling his pipe*) Well, let us have it then.

Min. I will begin with the general remark that the first 151 pages of this book (the rest of it going beyond the limits of Euc. I, II) contain (excluding 7 pages on Logic and 22 pages of Exercises) 122 pages of text, which I presume the learner is expected to master.

Nie. A great deal of that is merely explanatory.

¹Wilson

Min. True: but even omitting all that, we have, of Definitions, 80: and of Theorems, 145. And when the unfortunate learner has mastered all these—more than there are in Euclid's first six Books—he finds he has learned no more Euclid than Props. 1 to 34!

Nie. But he will have learned a good deal that is *not* in Euclid.

Min. Undoubtedly: and it would have been easy to crowd in twice as many Theorems as Mr. Henrici has done, without passing Prop. 34. I believe the subject to be practically inexhaustible. But fancy having to master 145 Theorems before even hearing of so important a one as Prop. 47!

Nie. If all the new matter is *good*, it is a poor objection to raise that there is too much of it.

Min. You think the *quantity* unassailable? Well, let us test its *quality* a little, then.

The book begins with a page or two of very general considerations. Time and Force, Kinetics and Kinematics, Chemistry and Biology, cross the stage in a grand but shadowy procession. Then when the pupil has been sufficiently crushed by the spectacle of how much there is to know, we allow him, little by little, to contract his view: till at last we condescend to contemplate so trifling an entity as Infinite Space.

And here I notice a singular mental process. 'Two material bodies,' we are told, 'cannot occupy the same space. We are thus led to recognise a third property common to all bodies: every body has *position*.' (p. 3.) The word '*thus*' is what I want to call your special attention to: for I confess *I* can see no such sequence of thought as it would seem to imply. Suppose bodies *could* occupy the same space: wouldn't they have 'position' just as much as if they couldn't? Does an orange—to take the favourite logical entity—lose its position because another orange most uncivilly insists on permeating it and occupying the same portion of Space? But if not, what is the meaning of 'thus'? As Artemus Ward would say, 'why this thussness?'

Nie. I can't say.

Min. A little further on I find a 'therefore' which is equally shadowy. The writer's logical ideas—in spite of his actually introducing a 'Digression on Logic'—are, I fear, a little vague. He says 'If we bring different points together into the same position, they will never give us anything but a point; we never obtain any extension. We cannot, therefore, say that Space is made up of points' (p. 6). I venture to say that there is no such sequence as 'therefore' seems to imply: he has made the whole argument null and void by using the words 'into the same position.'

Nie. I do not understand you.

Min. I will put it in another way. The *real* reason why you cannot construct Space of points is that they have no *size*: if they *had* size you *could* do it. But, under the condition here laid down—of bringing them 'together into the same position'—you make the thing impossible, whether they have size or not.

I have often found it the best way for exhibiting the unsoundness of an argument, to make another exactly like it, but leading to an absurd conclusion. I will try it here. You grant that a cubic foot² can be made up of cubic inches?

Nie. Certainly.

²Space

Min. Well, I will prove to you that it *cannot*; and I will do so by an argument just as good as Mr. Henrici's. 'If we bring different cubic inches together into the same position they will never give us anything but a cubic inch; we never obtain any extension—'

Nie. That won't do! You have the 'extension' of one cubic inch.

Min. Yes, but you had that to begin with. You don't 'obtain' any extension by squeezing in *other* cubic inches, do you?

Nie. No, I suppose not.

Min. Then the argument is sound so far. And now comes my triumphant conclusion, *à la Henrici*. 'We cannot, *therefore*, say that a cubic foot³ is made up of cubic inches.'

Nie. I see your meaning now. I give up the words 'into the same position.'

Min. I haven't quite done with points yet. I find an assertion that they never jump. Do you think that arises from their having 'position,' which they feel might be compromised by such conduct?

Nie. I cannot tell without hearing the passage read.

Min. It is this:—'A point, in changing its position on a curve, passes, in moving from one position to another, through all intermediate positions. It does not move by jumps.' (p. 12.)

Nie. That is quite true.

Min. Tell me, then—is every centre of gravity a point?

Nie. Certainly.

Min. Let us now consider the centre of gravity of a flea. Does it—

Nie. *(indignantly)*⁴ Another word, and I shall vanish! I cannot waste a night on such trivialities.

Min. Forgive me. I drop the flea. My next remark shall be serious. I wish to point out to you the illogical *tone* of the book. I do not say that the instances I am going to give are crucial or fatal to the argument. But, however unimportant, and however easily corrected, they will, I think, justify me in asking 'Is a text-book, which contains such loosely reasoned arguments as these, to be trusted?'

My first selection is § 52, p. 23. For brevity's sake I shall omit superfluous words. The passages in parentheses are interpolations of my own.

(see *Henrici*, p. 23.)

'If we conceive a Plane (and a point *A* chosen anywhere in Space; then, either the Plane already passes through *A*, or) we may move it until a point on it comes to *A*, which has been chosen anywhere in Space. (If we now fix a second point *B*; then, either the Plane already passes through *B*, or) if we keep *A* fixed we may turn the Plane about it, until the Plane comes to pass also through *B*, likewise chosen arbitrarily in Space. (If we now fix a third point *C*; then, either the Plane already passes through *C*, or) we may still move the Plane, as only two points of it are fixed, by turning it about the Line joining them, until the Plane passes through *C*, chosen arbitrarily, like *A* and *B*. Thus it appears that we may place a Plane so as to pass through three points, *A*, *B*, *C*, chosen anywhere in Space.'

You accept that, interpolations and all?

³Space

⁴missing in Supplement

Nie. Certainly.

Min. Omit the interpolations, and what do you say of it then?

Nie. It remains true. The three successive movings do no harm, but they are not always *necessary*.

Min. Would this statement be correct? ‘Three “movings” are *generally* necessary: but there are three exceptions. If the Plane at first passes through *A*, the *first* “moving” is unnecessary; if, after being made to pass through *A*, it be found to pass through *B* also, the *second* “moving” is unnecessary; and if, after being made to pass through *A* and *B*, it be found to pass through *C* also, the *third* “moving” is unnecessary?’

Nie. Certainly.

Min. You would not, on finding some one ‘moving’ unnecessary, call it ‘an open question’ whether the result were attainable?

Nie. What? When it is already attained? By no means.

Min. Now read this, at p. 23.

(hands the book)

‘But if *C* happens to lie on the Line joining *A* and *B*, then a Plane through *A* and *B*, which did not pass through *C*, could never be made to pass through *C* by being rotated about *A* and *B*; for if it did contain *C* in one position, it would contain it in all positions, as this point would remain fixed during rotation.’ What do you say to that?

Nie. Well, it is his way of discussing your third exception. Of course, when he talks of ‘a Plane through *A* and *B*, which did not pass through *C*,’ he is describing a nonentity: but it is all logical as an argument.

Min. What kind of argument?

Nie. (doubtfully) I should call it a—kind of—*Reductio ad Absurdum*.

Min. I don’t wonder at your hesitation. A thoughtful boy might read it thus:—‘then a Plane through *A* and *B*, which did not pass through *C* (but no such Plane can exist!), could never be made to pass through *C* by being rotated about *A* and *B* (why, it needs no ‘making’!); for if it did contain *C* in one position (which it does!), it would contain it in all positions (which also it does!’)

You and I can recognise the *Reductio ad Absurdum*—though so abnormal and hideous—which the writer intends. But what do you think would be the effect, on a thoughtful boy, of a course of such arguments, where he is expected to accept as *data* what he knows to be absurd, and to recognise as an absurdity what he knows to be a necessary truth?

Nie. At first, Mania: ultimately. Dementia.

Min. Now read Mr. Henrici’s deduction from this fearful argument, at p. 24.

‘We ought, therefore, to limit the conclusion arrived at as follows:—Through three points *which do not lie in a Line* we may always pass a Plane. Whether a Plane may be drawn through three points which do lie in a Line, remains for the moment an open question.’

Are you prepared to back that statement? *Is* it an ‘open question’?

Nie. I cannot say that it is.

Min. Now here is a most curious bit of bad Logic. (reads)

‘If two Planes have two points, *A* and *B*, in common, they must necessarily have more points in common. For, since each extends continuously without

limit, a point moving in the one Plane through *A* or *B* will cross the other Plane at this point;' (p. 25.)

I pause to ask—will it *necessarily* do so? How if it moved along their Line of intersection?

Nie. That is an exception, I grant.

Min. (*reads*) 'hence one Plane will lie partly on the one and partly on the other side of the second Plane. They must therefore intersect.'

Now the conclusion—that the Planes intersect—is undoubtedly true, so long as we assume that, by 'two planes,' the writer means 'two *different* Planes.' But does it follow from the *premisses*? Have the words 'hence' and 'therefore' any logical value?

Nie. I fear not.

Min. At p. 74 I observe 'If two Lines be each perpendicular to a third, they will be parallel to one another.' This is not true. They might be coincidental. The same mistake is made in p. 75.

Now comes a wonderful specimen of slipshod writing. 'We understand by the angles of a Polygon those angles of which the part near the vertex lies within the Polygon.' Does not this oblige us to contemplate an angle as consisting of *two parts*—one 'near the vertex,' the other further off?

Nie. Undoubtedly.

Min. And if either part were gone, the angle would be less?

Nie. (*uneasily*) It would seem so.

Min. And this might be effected by shortening the Lines, so that they would not reach beyond the region 'near the vertex'?

Nie. I fear you have got us into a corner. Be merciful!

Min. You mean that I have driven you into 'that part of an angle which lies near the vertex.' Well, you may come out now. We will seek 'fresh fields and pastures new.'

Quoted from *Lycidas*
by John Milton

At pages 91 to 96 I find no less than forty-six theorems on Symmetry, arranged in two columns—one headed 'Axial Symmetry,' the other 'Central Symmetry.' Here is a specimen pair, at p. 95.

'Corresponding Polygons are congruent but of opposite sense.'		'Corresponding Polygons are congruent and of like sense.'
---	--	--

I hardly know which to pity most—the master who has to teach these Theorems, or the boy who has to learn them!

But I have neither the 'one-way spread with moments as elements' nor the 'three-way spread with points as elements' to—

Nie. (*gasping*) What *are* you talking about?

Min. Excuse me. I fear I am getting demoralised. I meant to say—I have neither the time nor the space to criticise this book throughout.

I will, however, try to sum up its faults in a general description.

'Olla Podrida' is perhaps the best name for it, its contents are so hopelessly jumbled together. Most of the Axioms, and all the Theorems, are without numbers, and, as there is no index, the difficulty of finding them when wanted is obvious: and none the less that they are imbedded in oceans of 'padding.' Dip into the book anywhere, and you find yourself in the midst of some discursive talk, which perhaps culminates in an Axiom. Then perhaps comes a Definition. Then comes a little more talk, which, after appealing to sentiment, or probability, or some other motive degrading to Pure Mathematics, gradually becomes

more and more logical, and at last warms into a regular proof—but of what? The reader has no warning as to *what* is to be proved. Unsuspectingly he glides on with the stream, till with a crash he is landed on an enunciation, and finds himself committed to an entire Theorem. This singular writer always reserves the enunciation for the *end* of the Proposition. It may be prejudice, but I cannot help thinking that Euclid's plan—of first clearly stating what he is going to prove and then proving it—is to be preferred to this conjurer's trick of 'forcing a card.'

The book is, I think, *very* hard for beginners to master: the majority of the new Theorems are much more fitted for 'exercises,' than to be embodied in a text-book: and, to crown all, the ambitious attempt to construct a *proof* of Playfair's Axiom is, as we have seen, a lamentable failure.

I think I cannot better conclude my review of this book than by giving you, in two parallel columns, Euclid's Props. I. 18, 19, and Mr. Henrici's proposed substitute for them, at p. 107.

(turn over.)

EUCLID.
The greater side of a Triangle is opposite to the greater angle.

Let ABC be a triangle having $AC > AB$: then shall the angle ABC be $>$ the angle C . From AC cut off AD equal to AB ; and draw BD . Then, $\because AB = AD$, \therefore the angle $ABD =$ the angle ADB ; but the angle ADB is exterior to the Triangle BCD , and $\therefore <$ the angle C ; \therefore the angle ABD also $>$ the angle C ; much more is the angle $ABC >$ the angle C . Q. E. D.

HENRICI.

Let us now suppose a Triangle ABC , in which the bisector of the angle BAC is not an axis of symmetry. Then the contra-positive form of the theorem of § 162 tells us that AB is not equal to AC , that the angle B is not equal to the angle C , and that the bisector AD of the angle A is not perpendicular to BC , and hence, that the two angles ADB and ADC are unequal. Between these angles there exists the relation

$$\text{'the angle } ABC + \text{the angle } BDA \\ = \text{the angle } C + \text{the angle } CDA,\text{'}$$

for each sum makes with half the angle A an angle of continuation. Hence it follows that, if the angle $ABC >$ the angle C , the angle $BDA <$ the angle CDA .

The greater angle of a Triangle is opposite to the greater side.

Let ABC be a Triangle having the $\angle B >$ the angle C : then shall AC be $> AB$.

For if not, it must be equal or less.

It is not equal, for then the angle B would = the angle C . It is not less, for then the angle B would $<$ the angle C .

$\therefore AC > AB$. Q. E. D.

If we now fold the figure along AD , then AB will fall along AC ; and B will fall between A and C if we suppose that AB is the shorter of the two unequal Lines AB and AC . The line DB therefore takes the position DB' within the angle ADC . But the angle $AB'D$, which = the angle ABC , is exterior to the triangle DCB' , and $\therefore >$ the angle C .

Conversely, if the angle $ADB <$ the angle ADC , the line DB will fall within the angle ADC , and $\therefore B$ will fall between A and C ; that is, AB will be less than AC . This always happens (see above) if the angle $ABC >$ the angle C , for then the angle $BDA <$ the angle ADC .

Theorem. In every Triangle the greater side is opposite to the greater angle, and conversely, the greater angle is opposite to the greater side.

Now, if you could get some schoolmaster—one who had no bias whatever in favour of Euclid or of Henrici—to teach these two columns (one containing 169, the other 282 words) to two ordinary boys of equal intelligence, or rather of equal stupidity, what result would you expect?

Nie. (with a cunning smile) I don't think I could find such a schoolmaster.

Min. Ah, crafty man! You evade the question! I can't resist giving you just one more tit-bit—the definition of a Square, at p. 123.

'A quadrilateral which is a kite, a symmetrical trapezium, and a parallelogram is a Square!'

And now, farewell, Henrici! 'Euclid, with all thy faults, I love thee still!' Indeed I might say 'with twice thy faults,' or 'with thrice thy faults,' if the alternative be Henrici! (returns the book, which Niemand receives in solemn silence.)

Quoted from *The Task, Book II: The Time-Piece* by William Cowper

Scene VI.

Treatment of Parallels by direction.

§ 1. WILSON.

'There is moreover a logic besides that of mere reasoning.'

WILSON, *Pref.* p. xiii.

Nie. You have made but short work of four of the five methods of treating Parallels.

Min. We shall have all the more time to give to the somewhat intricate subject of Direction.

Nie. I lay on the table '*Elementary Geometry*,' by J. M. WILSON, M.A., late Fellow of St. John's College, Cambridge, late Mathematical Master of Rugby School, now Head Master of Clifton College. The second edition, 1869. And I

warn you to be careful how you criticise it, as it is already adopted in several schools.

Min. *Tant pis pour les écoles.* So you and your client deliberately propose to supersede Euclid as a text-book?

Nie. 'I am of opinion that the time is come for making an effort to supplant Euclid in our schools and universities.' (Pref. p. xiv.)

Min. It will be necessary, considering how great a change you are advocating, to examine your book *very* minutely and critically.

Nie. With all my heart. I hope you will show, in your review, 'the spirit without the prejudices of a geometrician.' (Pref. p. xv.)

Min. We will begin with the Right Line. And first, let me ask, how do you define it?

Nie. As 'a Line which has the same direction at all parts of its length.' (p. 3)

Min. You do not, I think, make any practical use of that as a test, any more than Euclid does of the property of lying evenly as to points on it?

Nie. No, we do not.

Min. You construct and test it as in Euclid, I believe? And you have his Axiom that 'two straight Lines cannot enclose a space?'

Nie. Yes, but we extend it. Euclid asserts, in effect, that two Lines, which coincide in two points, coincide *between* those points: *we* say they 'coincide wholly,' which includes coincidence *beyond* those points.

Min. Euclid tacitly assumes that.

Nie. Yes, but he has not expressed it.

Min. I think the addition a good one. Have you any other Axioms about it?

Nie. Yes, 'that a straight Line marks the shortest distance between any two of its points.' (p. 5. Ax. 1.)

Min. That I have already fully discussed in reviewing M. Legendre's book (see p. 736).

Nie. We have also 'A Line may be conceived as transferred from any position to any other position, its magnitude being unaltered.' (p. 5. Ax. 3.)

Min. True of *any* geometrical magnitude: but hardly worth stating, I think. I have now to ask you how you define an Angle?

Nie. 'Two straight Lines that meet one another form an angle at the point where they meet.' (p. 5.)

Min. Do you mean that they form it 'at the point' and nowhere else?

Nie. I suppose so.

Min. I fear you allow your angle no magnitude, if you limit its existence to so small a locality!

Nie. Well, we *don't* mean 'nowhere else.'

Min. (*meditatively*) You mean 'at the point—and *somewhere* else.' *Where* else, if you please?

Nie. We mean—we don't quite know why we put in the words at all. Let us say 'Two straight Lines that meet one another form an angle.'

Min. Very well. It hardly tells us what an angle *is*, and, so far, it is inferior to Euclid's Definition: but it may pass. Do you put any limit to the *size* of an angle?

Nie. We have not named any, but the largest here treated of is what we call 'one revolution.'

Min. You admit reëntrant angles then?

Nie. Yes.

Min. Then your Definition only states half the truth: you should have said ‘form *two* angles.’

Nie. That would be true, no doubt.

Min. But this extension of limit will require several modifications in Euclid’s language: for instance, what is your Definition of an obtuse angle?

NIEMAND *reads.*

P. 8. Def. 13. ‘An *obtuse angle* is one which is greater than a right angle.’

Min. So you tumble headlong into the very first pitfall you come across! Why, that includes such angles as 180° and 360° . You would teach your pupil, I suppose, that one portion of a straight Line makes an obtuse angle with the other, and that every straight Line has an obtuse angle at each end of it!

Nie. It is an oversight—of course we ought to have added ‘but less than two right angles.’

Min. A very palpable oversight. I fear we shall find more as we go on. What Axioms have you about angles?

NIEMAND *reads.*

P. 5. Ax. 4. ‘An angle may be conceived as transferred to any other position, its magnitude being unaltered.’

Min. Hardly worth stating. Proceed.

NIEMAND *reads.*

P. 5. Ax. 5. ‘Angles are equal when they could be placed on one another so that their vertices would coincide in position, and their arms in direction.’

Min. ‘Placed on one another’! Did you ever see the child’s game, where a pile of four hands is made on the table, and each player tries to have a hand at the top of the pile?

Nie. I know the game.

Min. Well, did you ever see both players succeed at once?

Nie. No.

Min. Whenever that feat is achieved, you may *then* expect to be able to place two angles ‘on one another’! You have hardly, I think, grasped the physical fact that, when one of two things is *on* the other, the second is *underneath* the first. But perhaps I am hypercritical. Let us try an example of your Axiom: let us place an angle of 90° on one of 270° . I think I could get the vertices and arms to coincide in the way you describe.

Nie. But the one angle would not be *on* the other; one would extend round one-fourth of the circle, and the other round the remaining three-fourths.

Min. Then, after all, the angle is a mysterious entity, which extends from one of the Lines to the other? That is much the same as Euclid’s Definition. Let us now take your definition of a Right Angle.

Nie. We first define ‘one revolution,’ which is the angle described by a Line revolving, about one extremity, round into its original position.

Min. That is clear enough.

Nie. We then say (p. 7. Def. 9) ‘When it coincides with what was initially its continuation, it has described *half a revolution*, and the angle it has then described is called a *straight angle*.’

Min. How do you know that it has described *half a revolution*?

Nie. Well, it is not difficult to prove. Let that portion of the Plane, through which it has revolved, be rolled over, using as an axis the arm (in its initial position) and its continuation, until it falls upon the other portion of the Plane. The two angular magnitudes will now together make up 'one revolution': therefore each is 'half a revolution.'

Min. A proof, I grant: but you are *very* sanguine if you expect beginners in the subject to supply it for themselves.

Nie. It is an omission, we admit.

Min. And then 'a straight angle'! 'Straight' is necessarily unbending: while 'angle' is from ἄγκλος, 'a bend or hook': so that your phrase is exactly equivalent to 'an unbending bend'! In 'the Bairnslea Foaks' Almanack' I once read of 'a mad chap' who spent six weeks 'a-trying to maäk a straät hook': but he failed. He ought to have studied your book. Have you Euclid's Axiom 'all right angles are equal'?

Nie. We deduce it from 'all straight angles are equal': and that we prove by applying one straight angle to another.

Min. That is all very well, though I cannot think 'straight angles' a valuable contribution to the subject. I will now ask you to state your method of treating Pairs of Lines, as far as your proof of Euc. I. 32.

Nie. To do that we shall of course require parallel Lines: and, as our definition of them is 'Lines having the same direction,' we must begin by discussing direction.

Min. Undoubtedly. How do you define direction?

Nie. Well, we have not attempted *that*. The idea seemed to us to be too elementary for definition. But let me read you what we have said about it.

Reads

P. 2. Def. 2. 'A *geometrical Line* has position, and length, and at every point of it it has direction'

P. 3. Def. 4. 'A *straight Line* is a Line which has the *same* direction at all parts of its length. It has also the opposite direction A straight Line may be conceived as generated by a point moving always in the *same* direction.'

I will next quote what we have said about two Lines having 'the same direction' and 'different directions.'

Min. We will take that presently: I have a good deal to say first as to what you have read. I gather that you consider direction to be a *property* of a geometrical entity, but not itself an entity?

Nie. Just so.

Min. And you ascribe this property to a Line, and also to the motion of a point?

Nie. We do.

Min. For simplicity's sake, we will omit all notice of curved Lines, etc., and will confine ourselves to straight Lines and rectilinear motion, so that in future, when I use the word 'Line,' I shall mean 'straight Line.' Now may we not give a notion of 'direction' by saying—that a moving point must move in a certain 'direction'—that, if two points, starting from a state of coincidence, move along two equal straight Lines which do not coincide (so that their movements are alike in point of departure, and in magnitude), that quality of each movement,

which makes it differ from the other, is its 'direction'—and similarly that, if two equal straight Lines are terminated at the same point, but do not coincide, that quality of each which makes it differ from the other, is its 'direction' from the common point?

Nie. It is all very true: but you are using 'straight Line' to help you in defining 'direction.' *We*, on the contrary, consider 'direction' as the more elementary idea of the two, and use it in defining 'straight Line.' But we clearly agree as to the meanings of both expressions.

Min. I am satisfied with that admission. Now as to the phrase 'the same direction,' which you have used in reference to a single Line and the motion of a single point. May we not say that portions of the same Line have 'the same direction' as one another? And that, if a point moves along a Line without turning back, its motion at one instant is in 'the same direction' as its motion at another instant?

Nie. Yes. That expresses our meaning in other language.

Min. I have altered the language in order to bring out clearly the fact that, in using the phrase 'the same direction,' we are really contemplating *two* Lines, or *two* motions. We have now got (considering 'straight Line' as an understood phrase) accurate geometrical Definitions of at least *two* uses of the phrase. And to these we may add a third, viz. that two coincident Lines have 'the same direction.'

Nie. Certainly, for they are one and the same Line.

Min. And you intend, I suppose, to use the word 'different' as equivalent to 'not-same.'

Nie. Yes.

Min. So that if we have, for instance, two equal Lines terminated at the same point, but not coinciding, we say that they have 'different directions'?

Nie. Yes, with one exception. If they are portions of one and the same infinite Line, we say that they have 'opposite directions.' Remember that we said, of a Line, 'it has also the opposite direction.'

Min. You did so: but, since 'same' and 'different' are contradictory epithets, they must together comprise the whole genus of 'pairs of directions.' Under which heading will you put 'opposite directions'?

Nie. No doubt, strictly speaking, 'opposite directions' are a particular kind of 'different directions.' But we shall have endless confusion if we include them in that class. We wish to avoid the use of the word 'opposite' altogether, and to mean, by 'different directions,' all kinds of directions that are not the same, with the exception of 'opposite.'

Min. It is a most desirable arrangement: but you have not clearly stated it in your book. Tell me whether you agree in this statement of the matter. Every Line has a pair of directions, opposite to each other. And if two Lines be said to have 'the same direction,' we must understand 'the same *pair* of directions'; and if they be said to have 'different directions,' we must understand 'different *pairs* of directions.' And even this is not enough: for suppose I draw, on the map of England, a straight Line joining London and York; I may say 'This Line has a pair of directions, the first being "London-to-York" and the second "York-to-London."' I will now place another Line upon this, and *its* pair of directions shall be, first "York-to-London" and second "London-to-York." Then it has a different first-direction from the former Line, and also a different second-direction: that is, it has a 'different pair of directions.' Clearly *this* is not intended: but, in

order to exclude such a possibility, we must extend yet further the meaning of the phrase, and, if two Lines be said to have ‘the same direction,’ we must understand ‘pairs of directions which can be arranged so as to be the same’; and if they be said to have ‘different directions,’ we must understand ‘pairs of directions which cannot be arranged so as to be the same.’

Nie. Yes, that expresses our meaning.

Min. You must admit, I think, that your theory of direction involves a good deal of obscurity at the very outset. However, we have cleared it up, and will not use the word ‘opposite’ again. Tell me now whether you accept this as a correct Definition of the phrases ‘the same direction’ and ‘different directions,’ when used of a Pair of infinite Lines which have a common point:—

If two infinite Lines, having a common point, coincide, they have ‘the same direction’; if not, they have ‘different directions.’

Nie. We accept it.

Min. And, since a finite Line has the same direction as the infinite Line of which it is a portion, we may generalise thus:—‘Coincidental Lines have the same direction. Non-coincidental Lines, which have a common point, have different directions.’

But it must be carefully borne in mind that we have as yet no geometrical meaning for these phrases, *unless when applied to two Lines which have a common point.*

Nie. Allow me to remark that what *you* call ‘coincidental Lines’ *we* call ‘the same Line’ or ‘parts of the same Line,’ and that what *you* call ‘non-coincidental Lines’ *we* call ‘different Lines.’

Min. I understand you: but I cannot employ these terms, for two reasons: first, that your phrase ‘the same Line’ loses sight of a fact I wish to keep in view, that we are considering a *Pair* of Lines; secondly, that your phrase ‘different Lines’ might be used, with strict truth, of two different portions of the same infinite Line, so that it is not definite enough for my purpose.

Let us now proceed ‘to consider the relations of two or more straight Lines in one Plane in respect of direction.’

And first let me ask which of the propositions of Table II you wish me to grant you as an axiom?

Nie. (*proudly*) Not one of them! We have got a new patent process, the ‘direction’ theory, which will dispense with them all.

Min. I am *very* curious to hear how you do it.

NIEMAND *reads.*

P. 11. Ax. 6. ‘Two different Lines may have either the same or different directions.’

Min. That contains two assertions, which we will consider separately. First, you say that ‘two different Lines (i. e. ‘non-coincidental Lines,’ or ‘Lines having a separate point’) ‘may have the same direction’. Now let us understand each other quite clearly. We will take a fixed Line to begin with, and a certain point on it: there is no doubt that we can draw, through that point, a second Line coinciding with the first: the direction of this Line will of course be ‘the same’ as the direction of the first Line; and it is equally obvious that if we draw the second Line in any *other* direction, so as *not* to coincide with the first, its direction will *not* be ‘the same’ as that of the first: that is, they will

have 'different' directions. If we want a geometrical definition of the assertion that this second Line has 'the same direction' as the first Line, we may take the following:—'having such a direction as will cause the Lines to be the same Line.' If we want a geometrical construction for it, we may say 'take any other point on the fixed Line; join the two points, and produce the Line, so drawn, at both ends': this construction we know will produce a Line which will be 'the same' as the first Line, and whose direction will therefore be 'the same' as that of the first Line. If, in a certain diagram, whose geometrical history we know, we want to test whether two Lines, passing through a common point, have, or have not, 'the same direction,' we have simply to take any other point on one of the Lines, and observe whether the other Line does, or does not, pass through it. This relationship of direction, which *you* call 'having the same direction,' and *I* 'having identical directions,' we may express by the word 'co-directional.'

Nie. All very true. My only puzzle is, why you have explained it at such enormous length: my meerschaum has gone out while I have been listening to you!

Min. Allow me to hand you a light. As to the 'enormous length' of my explanation, we are in troubled waters, my friend! There are breakers ahead, and we cannot 'heave the lead' too often.

Nie. It is 'lead' indeed!

Min. Let us now return to our fixed Line: and this time we will take a point *not* on it, and through this point we will draw a second Line. You say that we can, if we choose, draw it in 'the same direction' as that of the first Line?

Nie. We do.

Min. In that case let me remind you of the warning I gave you a few minutes ago, that we have no geometrical meaning for the phrase 'the same direction,' *unless when used of Lines having a common point*. What geometrical meaning do you attach to the phrase when used of other Lines?

Nie. (*after a pause*) I fear we cannot give you a geometrical definition of it at present.

Min. No? Can you construct such Lines?

Nie. No, but really that is not necessary. We allow of 'hypothetical constructions' now-a-days.

Min. Well then, can you test whether a given Pair of Lines *have* this property? I mean, if I give you a certain diagram, and tell you its geometrical history, can you pronounce, on a certain Pair of finite Lines, which have no visible common point, as to whether they have this property?

Nie. We cannot undertake it.

Min. You ask me, then, to believe in the reality of a class of 'Pairs of Lines' possessing a property which you can neither define, nor construct, nor test?

Nie. We can do none of these things, we admit: but yet the class is not quite so indefinite as you think. We can give you a geometrical *description* of it.

Min. I shall be delighted to hear it.

Nie. We have agreed that a Pair of coincidental finite Lines have a certain relationship of direction, which we call 'the same direction,' and which you allow to be an intelligible geometrical relation?

Min. Certainly.

Nie. Well, all we assert of this new class is that their relationship of direction is identical with that which belongs to coincidental Lines.

Min. It cannot be identical in *all* respects, for it certainly differs in this, that we cannot reach the conception of it by the same route. I can form a conception of 'the same direction,' when the phrase is used of two Lines which have a common point, but it is only by considering that one 'falls on' the other—that they have all other points common—that they coincide. When you ask me to form a conception of this relationship of direction, when asserted of other Lines, you know that none of these considerations will help me, and you do not furnish me with any substitutes for them. To me the relationship does *not* seem to be identical: I should prefer saying that separational Lines have 'collateral,' or 'corresponding,' or 'separational' directions, to using the phrase 'the same direction' over again. It is, of course, true that 'collateral' directions produce the same results, as to angles made with a transversal, as 'identical' directions; but this seems to me to be a Theorem, not an Axiom.

Nie. You say that the relationship does *not* seem to you to be identical. I should like to know *where* you think you perceive any difference?

Min. I will try to make my meaning clearer by an illustration.

Suppose that I and several companions are walking along a railway, which will take us to a place we wish to visit. Some amuse themselves by walking on one of the rails; some on another; others wander along the line, crossing and recrossing. Now as we are all bound for the same place, we may say, roughly speaking, that we are *all* moving 'in the same direction': but that is speaking very roughly indeed. We make our language more exact, if we exclude the wanderers, and say that those who are walking along the rails are so moving. But it seems to me that our phrase becomes still more exact, if we limit it to those who are walking on one and the same rail.

As a second illustration, suppose two forces, acting on a certain body; and let them be equal in amount and opposite in direction. Now, if they are acting along the same Line, we know that they neutralise each other, and that the body remains at rest. But if one be shifted ever so little to one side, so that they act along parallel Lines, then, though still equal in amount and (according to the 'direction' theory) opposite in direction, they no longer neutralise each other, but form a 'couple.'

As a third illustration, take two points on a certain Plane. We may, first, draw a Line through them and cause them to move along that Line: they are then undoubtedly moving 'in the same direction.' We may, secondly, draw two Lines through them, which meet or at least would meet if produced, and cause them to move along those Lines: they are then undoubtedly moving 'in different directions.' We may, thirdly, draw two parallel Lines through them, and cause them to move along those Lines. Surely this is a new relationship of motion, not absolutely identical with either of the former two? But if this new relationship be not absolutely identical with that named 'in the same direction,' it must belong to the class named 'in different directions.'

Still, though this new relationship of direction is not identical with the former in *all* respects, it is in *some*: only, to prove this, we must use *some* disputed Axiom, as it will take us into Table II. For instance, they are identical as to angles made with transversals: this fact is embodied in Tab. II. 4. (See p. 725). Would you like to adopt that as your Axiom?

Nie. No. We are trying to dispense with Table II altogether.

Min. It is a vain attempt.

There is another remark I wish to make, before considering your second

assertion. In asserting that there is a real class of non-coincidental Lines that have 'the same direction,' are you not also asserting that there is a real class of Lines that have no common point? For, if they had a common point, they must have '*different* directions.'

Nie. I suppose we are.

Min. We will then, if you please, credit you with an Axiom you have not expressed, viz. 'It is possible for two Lines to have no common point.' And here I must express an opinion that this ought to be *proved*, not assumed. Euclid has proved it in I. 27, which rests on no disputed Axiom; and I think it may be recorded as a distinct defect in your treatise, that you have assumed, as axiomatic, a truth which Euclid has *proved*.

My conclusion, as to this first assertion of yours, is that it is most decidedly *not* axiomatic.

Let us now consider your second assertion, that some non-coincidental Lines have 'different directions.' Here I must ask, as before, are you speaking of Lines which have a common point? If so, I am quite ready to grant the assertion.

Nie. Not exactly. It is rather a difficult matter to explain. The Lines we refer to *would*, as a matter of fact, meet if produced, and yet we do not suppose that fact known in speaking of them. What we ask you to believe is that there is a real class of non-coincidental finite Lines, which we do not yet know to have a common point, but which have 'different directions.' We shall assert presently, in another Axiom, that such Lines will meet if produced; but we ask you to believe their reality independently of that fact.

Min. But the only geometrical meaning I know of, as yet, for the phrase 'different directions,' refers to Lines known to have a common point. What geometrical meaning do you attach to the phrase when used of other Lines?

Nie. We cannot define it.

Min. Nor construct it? Nor test it?

Nie. No.

Min. You ask me, then, to believe in the reality of *two* classes of 'pairs of Lines,' each possessing a property that you can neither define, nor construct, nor test?

Nie. That is true. But surely you admit the reality of the second class? Why, intersectional Lines are a case in point.

Min. Certainly. And so much I am willing to grant you. I allow that *some* non-coincidental Lines, viz. intersectional Lines, have 'different directions.' But as to 'the *same* direction,' you have given me no reason whatever for believing that there are *any* non-coincidental Lines which possess that property.

Nie. But surely there are two real distinct classes of non-coincidental Lines, 'intersectional' and 'separational'?

Min. Yes. Thanks to Euc. I. 27, you may now assume the reality of both.

Nie. And you will hardly assert that the relationship of direction, which belongs to a Pair of intersectional Lines, is identical with that which belongs to a Pair of separational Lines?

Min. I do not assert it.

Nie. And you allow that intersectional Lines have 'different directions'?

Min. Yes. Are you going to argue, from that, that separational Lines must have 'the *same* direction'? Why may I not say that intersectional Lines have *one* kind of 'different directions' and that separational Lines have *another* kind?

Nie. But *do* you say it?

Min. Certainly not. There is no evidence, at present, one way or the other. For anything we know, Pairs of separational Lines may always have ‘the same direction,’ or they may always have ‘different directions,’ or there may be Pairs of each kind. I fear I must decline to grant the first part of your Axiom altogether, and the second part in the sense of referring to Lines not known to have a common point. You may now proceed.

NIEMAND *reads.*

P. 11. Ax. 7. ‘Two different straight Lines which meet one another have different directions.’

Min. That I grant you, heartily. It is, in fact, a Definition for the phrase ‘different directions,’ when used of Lines which have a common point.

NIEMAND *reads.*

P. 11. Ax. 8. ‘Two straight Lines which have different directions would meet if prolonged indefinitely.’

Min. Am I to understand that, if we have before us a Pair of finite Lines which are not known to have a common point, but of which we *do* know that they have different directions, you ask me to believe that they will meet if produced?

Nie. That is our meaning.

Min. We had better heave the lead once more, and return to our fixed Line, and a point not on it, through which we wish to draw a second Line. You ask me to grant that, if it be drawn so as to have a direction ‘different’ from that of the first Line, it will meet it if prolonged indefinitely?

Nie. That is our humble petition.

Min. Will you be satisfied if I grant you that *some* Lines, so drawn, will meet the first Line? *That* I would grant you with pleasure. I could draw millions of Lines which would fulfil the conditions, by simply taking points at random on the given Line, and joining them to the given point. Every Line, so constructed, would have a direction ‘different’ from that of the given Line, and would also meet it.

Nie. We will *not* be satisfied, even with millions! We ask you to grant that *every* Line, drawn through the given point with a direction ‘different’ from that of the given Line, will meet the given Line: and we ask you to grant this independently of, and antecedently to, any other information about the Lines except the fact that they have ‘different’ directions.

Min. But what meaning am I to attach to the phrase ‘different directions,’ independently of, and antecedently to, the fact that they have a common point?

Nie. (after a long silence) I fear we can suggest none.

Min. Then I must decline to accept the Axiom.

Nie. And yet this Axiom is the converse of the preceding, which you granted so readily.

Min. The *technical* converse, my good sir, not the *logical*! I will not suspect you of so gross a logical blunder as the attempt to convert a universal affirmative *simpliciter* instead of *per accidens*. The only converse, as you are no doubt aware, to which you have any *logical* right, is ‘*Some* Lines, which have “different directions,” would meet if produced’; and *that* I grant you. It is true of intersectional Lines, and I would limit the Proposition *to* such Lines, so that

it would be equivalent to ‘Lines, which would meet if produced, would meet if produced’—an indisputable truth, but *not* remarkable for novelty! You may proceed.

Nie. I beg to hand in this diagram, and will read you our explanation of it:—

‘Thus *A* and *B* in the figure have the same direction; and *C* and *D*, which meet, have different directions; and *E* and *F*, which have different directions, would meet if produced far enough.’

Min. I grant the assertion about *C* and *D*; but I am wholly unable to guess on what grounds you expect me to grant that *A* and *B* ‘have the same direction,’ and that *E* and *F* ‘have different directions.’ Do you expect me to judge by eye? How if the lines were several yards apart? Is *this* what Geometry is coming to? Proceed.

NIEMAND reads.

Def. 19. ‘Straight Lines, which are not parts of the same straight Line, but have the same direction, are called *Parallels*.’

Min. A *Definition* is of course unobjectionable, since it does not assert the *existence* of the thing defined: in fact, it *asserts* nothing except the meaning which you intend to attach to the word ‘parallel.’ But, as this word is used in different senses, I will thank you to substitute for it, in what you have yet to say about this matter, the phrase ‘having a separate point, but the same direction,’ which you may condense into one compound word, if you like:—‘sepuncto-codirectional.’

Nie. (*sighing*) A terrible word! And I shall have to use it so often!

Min. I will try to abridge it for you. Let us take ‘sep-’ and ‘cod-’ from the beginnings of the two words, and ‘-al’ for a termination. That will give us ‘sepcodal.’

Nie. That sounds a little harsh.

Min. ‘What? Is it harder, Sirs, than Gordon,
Colkitto or Macdonald, or Galasp?’

Quoted from *Sonnet 11* by John Milton

Nie. (*doubtfully*) I *think* I prefer it to Colkitto. But it is from you Moderns I have learned to be so sensitive about long words. How I would have liked to take you to an Egyptian restaurant I used to frequent, centuries ago, in a phantasmic sort of way, if only to hear the names of some of the dishes! Why, one thought nothing of seeing a gentleman rush in, carpet-bag in hand, and shout out ‘ὦ ἄτερ!’ (that was the way we addressed the attendant in those days) ‘A plate of λεπαδοτεμαχοσελαχογαλεοκρανυολειψανοδριμυποτριμματοσιλφιοπαραομελιτοκατακεχυμενοκιχλεπικισσυφοφαττοπεριστεραλεκτρυονοπτεγεφαλοκιγκλοπελειολαγωσοσφραιοβαφητραγανοπτερύγων, and look sharp about it! I’m in a hurry!’

Min. If the gentleman wanted to catch his train—by the way, *had* they trains in Egypt in ancient days?

Nie. Certainly. Read your ‘Antony and Cleopatra,’ Act I, Scene 1. ‘*Exeunt*

Quoted from *Antony and Cleopatra* by William Shakespeare

Antony and Cleopatra with their train.'

Min. In that case, wouldn't it be enough to say 'A plate of λεπαδο'?

Nie. Most certainly *not*—at least not in a *fashionable* restaurant. But this is a digression. I am willing to adopt the word 'sepcodal.'

Min. Now, before you read any more, let us get a clear idea of your Definition. We know of two real classes of Pairs of Lines, 'coincidental' and 'intersectional'; and to these we may (if we credit you with a Corollary to Euc. I. 27, 'It is possible for two Lines to have no common point') add a third class, which we may call 'separational.'

We also know that if a Pair of Lines has a common point, and no separate point, it belongs to the first class; if a common point, and a separate point, to the second. Hence all Pairs of Lines, having a common point, must belong to one or other of these classes. And since a Pair, which has *no* common point, belongs to the third class, we see that *every* conceivable Pair of Lines must belong to one of these three classes.

We also know that—

Nie. (*sighing deeply*) You are heaving the lead again!

Min. I am: but we shall be in calmer water soon.

We also know that the 'Coincidental' class possesses two properties—they are coincidental and have identical directions; and that the 'Intersectional' class also possesses two properties—they are intersectional and have different directions.

Now if you choose to frame a Definition by denying one property of each of these two classes, any Pair of Lines, so defined, is excluded from both of these classes, and must, *if it exist at all*, belong to the 'Separational' class. Remember, however, that you *may* have so framed your Definition as to exclude your Pair of Lines from *existence*. For instance, if you choose to combine two contradictory conditions of direction, and to say that Lines, which have identical *and* intersectional directions, are to be called so-and-so, you are simply describing a nonentity.

Nie. That is all quite clear.

Min. Your Definition, then, amounts to this:—Lines, which are not coincidental, but which have identical directions, are said to be 'sepcodal.'

Nie. It does.

Min. Well, here is another Definition for Parallels, which will answer your purpose just as well:—'Lines, which are *not* intersectional, but which have different directions.'

Nie. But I think I can prove to you that you have now done the very thing you cautioned me against: you have annihilated your Pair of Lines.

Min. That is a matter which we need not consider at present. Proceed.

NIEMAND *reads.*

P. 11. 'From this Definition, and the Axioms above given, the following results are immediately deduced:

(1) That parallel—I beg your pardon—that 'sepcodal' Lines would not meet however far they were produced. For if they met—'

Min. You need not trouble yourself to prove it. I grant that, *if* such Lines existed, they would not meet. Your assertion is simply the Contranominal of Ax. 7 (p. 763), and therefore is necessarily true if the subject be real.

But remember that, though I have granted to you that, if we are given a Line and a point not on it, we can draw, through the point, *a certain* Line separational from the given Line, we do not yet know that it is *the only* such Line. *That* would take us into Table II. With our present knowledge, we must allow for the possibility of drawing any number of Lines through the given point, all separational from the given Line: and all I grant you is, that your ideal ‘sepcodal’ Line will, *if it exist at all*, be one of this group.

NIEMAND *reads*.

(2) ‘That Lines which are sepcodal with the same Line are sepcodal with each other. For——’

Min. Wait a moment. I observe that you say that such Lines are sepcodal with each other. Might they not be ‘*compuncto-codirectional*’?

Nie. Certainly they might: but we do not wish to include that case in our predicate.

Min. Then you must limit your subject, and say ‘*different* Lines.’

Nie. Very well.

Reads.

‘That different Lines, which are sepcodal with the same Line, are sepcodal with each other. For they each have the same direction as that Line, and therefore the same direction as the other.’

Min. I am willing to grant you, without any proof, that, *if* such Lines existed, they would have the same direction with regard to each other. The phrase ‘*they each have*’ is not remarkably good English. However, you may proceed.

NIEMAND *reads*.

P. 12. Ax. 9. ‘An angle may be conceived as transferred from one position to another, the direction of its arms remaining the same.’

Min. Let us first consider the right arm by itself. You assert that it may be transferred to a new position, its direction remaining the same?

Nie. We do.

Min. You might, in fact, have here inserted an Axiom ‘A Line may be conceived as transferred from one position to another, its direction remaining the same’?

Nie. That would express our meaning.

Min. And this is virtually identical with your Axiom ‘Two different Lines may have the same direction’?

Nie. Certainly. They embody the same truth. But the one contemplates a single Line in two positions, and the other contemplates two Lines: the difference is very slight.

Min. Exactly so. Now let me ask you, do you mean, by the word ‘angle,’ a constant or a variable angle?

Nie. I do not quite understand your question.

Min. I will put it more fully. Do you mean that the arms of the angle are rigidly connected, so that it cannot change its magnitude, or that they are merely hinged loosely together, as it were, so that it depends entirely on the

relative motions of the two arms whether the angle changes its magnitude or not?

Nie. Why are we bound to settle the question at all?

Min. I will tell you why. Suppose we say that the arms are merely hinged together: in that case all you assert is that each arm may be transferred, its direction remaining the same; that is, you merely assert your 6th Axiom twice over, once for the right arm and once for the left arm; and you do *not* assert that the angle will retain its magnitude. But in the Theorem which follows, you clearly regard it as a constant angle, for you say 'the angle AOD would coincide with the angle EKH . Therefore the angle $AOD = EKH$.' But the 'therefore' would have no force if AOD could change its magnitude. Thus you would be deducing, from an Axiom where 'angle' is used in a peculiar sense, a conclusion in which it bears its ordinary sense. You have heard of the fallacy '*A dicto secundum Quid ad dictum Simpliciter*'?

Nie. (*hastily*) We are not going to commit ourselves to *that*. You may assume that we mean, by 'angle,' a rigid angle, which cannot change its magnitude.

Min. In that case you assert that, when a pair of Lines, terminated at a point, is transferred so that its vertex has a new position, these three conditions can be simultaneously fulfilled:—

- (1) the right arm has 'the same direction' as before;
- (2) the left arm has 'the same direction' as before;
- (3) the magnitude of the angle is unchanged.

Nie. We do not dispute it.

Min. But any *two* of these conditions are sufficient, without the third, to determine the new state of things. For instance, taking (1) and (3), if we fix the position of the right arm, by giving it 'the same direction' as before, and also keep the magnitude of the angle unchanged, is not that enough to fix the position of the left arm, without mentioning (2)?

Nie. It certainly is.

Min. Your Axiom asserts, then, that any two of these conditions lead to the third as a necessary result?

Nie. It does.

Min. Your Axiom then contains *two* distinct assertions: the data of the first being (1) and (3) [or (2) and (3), which lead to a similar result], the data of the second being (1) and (2). These I will state as two separate Axioms:—

9 (α). If a Pair of Lines, terminated at a point, be transferred to a new position, so that the direction of one of the Lines, and the magnitude of the included angle, remain the same; the direction of the other Line will remain the same.

9 (β). If a Pair of Lines, terminated at a point, be transferred to a new position, so that their directions remain the same; the magnitude of the included angle will remain the same.

Have I represented your meaning correctly?

Nie. We have no objection to make.

Min. We will return to this subject directly. I must now ask you to read the enunciation of Th. 4, omitting, for simplicity's sake, all about supplementary angles, and assuming the Lines to be taken 'the same way.'

NIEMAND reads.

P. 12. Th. 4. 'If two Lines are respectively sepcodal with two other Lines, the angle made by the first Pair will be equal to the angle made by the second Pair.'

Min. The 'sep' is of course superfluous, for if the Lines are 'compuncto-codirectional,' it is equally true. May I re-word it thus?—

'If two Pairs of Lines, each terminated at a point, be such that the directions of one Pair are respectively the same as those of the other; the included angles are equal.'

Nie. Yes, if you like.

Min. But surely the only difference, between Ax. 9 (β) and this, is that in the Axiom we contemplated a single Pair of Lines transferred, while *here* we contemplate two Pairs?

Nie. That is the only difference, we admit.

Min. Then I must say that it is anything but good logic to take two Propositions, distinguished only by a trivial difference in form, and to call one an Axiom and the other a Theorem deduced from it! A very gross case of '*Petitio Principii*,' I fear!

Nie. (*after a long pause*) Well! We admit that it is *not* exactly a Theorem: it is only a new form of the Axiom.

Min. Quite so: and as it is a more convenient form for my purpose, I will with your permission adopt it as a substitute for the Axiom. Now as to the corollary of this Theorem: *that*, I think, is merely a particular case of Ax. 9 (β), one of the arms being slid along the infinite Line of which it forms a part, and thus of course having 'the same direction' as before?

Nie. It is so.

Min. And, as this is a more convenient form still, I will restate your assertions, limiting them to this particular case:—

Ax. 9 (α). Lines, which make equal corresponding angles with a certain transversal, have the same direction.

Ax. 9 (β). Lines, which have the same direction, make equal corresponding angles with any transversal.

Am I right in saying that these two assertions are virtually involved in your Axiom?

Nie. We cannot deny it.

Min. Now in 9 (α) you ask me to believe that Lines possessing a certain geometrical property, which can be defined, constructed, and tested, possess also a property which, in the case of different Lines, we can neither define, nor construct, nor test. There is nothing axiomatic in this. It is much more like a Definition of 'codirectional' when asserted of different Lines, for which we have as yet no Definition at all. Will you not permit me to insert it, as a Definition, before Ax. 6 (p. 759)? We might word it thus:—

'If two different Lines make equal angles with a certain transversal, they are said to have the same direction: if unequal, different directions.'

This interpolation would have the advantage of making Ax. 6 (which I have hitherto declined to grant) indisputably true.

Nie. (*after a pause*) No. We cannot adopt it as a Definition so early in the subject.

Min. You are right. You probably saw the pitfall which I had ready for you, that this same Definition would make your 8th Axiom (p. 763) exactly equivalent to Euclid's 12th! From this catastrophe you have hitherto been saved solely by

the absence of geometrical meaning in your phrase ‘the same direction,’ when applied to different Lines. Once define it, and you are lost!

Nie. We are aware of that, and prefer all the inconvenience which results from the absence of a Definition.

Min. The ‘inconvenience,’ so far, has consisted of the ruin of Ax. 6 and Ax. 8. Let us now return to Ax. 9.

As to 9 (β), it is of course obviously true with regard to *coincidental* Lines: with regard to *different* ‘Lines, which have the same direction,’ I grant you that, *if* such Lines existed, they *would* make equal corresponding angles with any transversal; for they would then have a relationship of direction identical with that which belongs to coincidental Lines. But all this rests on an ‘if’—*if* they existed.

Now let us combine 9 (β) with Axiom 6, and see what it is you ask me to grant. It is as follows:—

‘There can be a Pair of different Lines that make equal angles with *any* transversal.’

I am not misrepresenting you, I think, if I say that you propound this as axiomatic truth—which, I need hardly remark, is a corollary deducible from the fourth Proposition in Table II. (see p. 725).

Nie. We accept the responsibility of the two Axioms separately, but not of a logical deduction from the two.

Min. There are certainly *some* logical deductions from Axioms (Contra-nominals for instance) that are not so axiomatic as the Axioms from which they come: but surely if you tell me ‘it is axiomatic that X is Y ’ and ‘it is axiomatic that Y is Z ,’ it is much the same as saying ‘it is axiomatic that X is Z ’?

Nie. It is very like it, we admit.

Min. Now take one more combination. Take 9 (α) and 9 (β). We thus eliminate the mysterious property altogether, and get a Proposition whose subject and predicate are perfectly definite geometrical conceptions—a Proposition which you assert to be, if not perfectly axiomatic, yet so nearly so as to be easily deducible from two Axioms—a Proposition which again lands us in Table II, and which, I will venture to say, is less axiomatic than any Proposition in that Table that has yet been proposed as an Axiom. We get *this*:—

‘Lines which make equal corresponding angles with a certain transversal do so with *any* transversal,’ which is Tab. II. 4 (see p. 725).

Here we have, condensed into one appalling sentence, the whole substance of Euclid I. 27, 28, and 29 (for the fact that the lines are ‘separational’ may be regarded as merely a go-between). Here we have the whole difficulty of Parallels swallowed at one gulp. Why, Euclid’s much-abused 12th Axiom is nothing to it! If we had (what I fear has yet to be discovered) a unit of ‘axiomaticity,’ I should expect to find that Euclid’s 12th Axiom (which you call in your Preface, at p. xiii, ‘not axiomatic’) was twenty or thirty times as axiomatic as this! I need not ask you for any further proof of Euc. I. 32. This wondrous Axiom, or quasi-Axiom, is quite sufficient machinery for your purpose, along with Euc. I. 13, which of course we grant you. Have you thought it necessary to provide any other machinery?

Nie. No.

Min. Euclid requires, besides I. 13, the following machinery:—Props. 4, 5, 7, 8, 15, 16, Ax. 12, Props. 27, 28, and 29. And for all this you offer, as a sufficient substitute, one single Axiom!

Nie. *Two*, if you please. You are forgetting Ax. 6.

Min. No, I repeat it—one single Axiom. Ax. 6 is contained in Ax. 9 (α): when the subject is known to be real, the Proposition necessarily asserts the reality of the predicate.

Nie. That we must admit to be true.

Min. I need hardly say that I must decline to grant this so-called ‘Axiom,’ even though its collapse should involve that of your entire system of ‘Parallels.’ And now that we have fully discussed the subject of direction, I wish to ask you one question which will, I think, sum up the whole difficulty in a few words. It is, in fact, *the* crucial test as to whether ‘direction’ is, or is not, a logical method of proving the properties of Parallels.

You assert, as axiomatic, that different Lines exist, whose relationship of direction is identical with that which exists between coincidental Lines.

Nie. Yes.

Min. Now, does the phrase ‘the same direction,’ when used of two Lines not known to have a common point, convey to your mind a clear geometrical conception?

Nie. Yes, we can form a clear idea of it, though we cannot define it.

Min. And is that idea (this is the crucial question) *independent of all subsequent knowledge of the properties of Parallels?*

Nie. We believe so.

Min. Let us make sure that there is no self-deception in this. You feel certain you are not unconsciously picturing the Lines to yourself as being equidistant, for instance?

Nie. No, they suggest no such idea to us. We introduce the idea of equidistance later on in the book, but we do not feel that our first conception of ‘the same direction’ includes it at all.

Min. I think you are right, though Mr. Cuthbertson, in his ‘Euclidian Geometry,’ says (Pref. p. vi.) ‘the conception of a parallelogram is not that of a figure whose opposite sides will never meet . . . , but rather that of a figure whose opposite sides are equidistant.’ But do you feel equally certain that you are not unconsciously using your subsequent knowledge that Lines exist which make equal angles with all transversals?

Nie. We are not so clear about *that*. It is, of course, extremely difficult to divest one’s mind of all later knowledge, and to place oneself in the mental attitude of one who is totally ignorant of the subject.

Min. Very difficult, no doubt, but absolutely essential, if you mean to write a book adapted to the use of beginners. My own belief as to the course of thought needed to grasp the theory of ‘direction’ is this:—first you grasp the idea of ‘the same direction’ as regards Lines which have a common point; next, you convince yourself, by some *other* means, that different Lines exist which make equal angles with all transversals; thirdly, you go back, armed with this new piece of knowledge, and use it unconsciously, in forming an idea of ‘the same direction’ as regards different Lines. And I believe that the course of thought in the mind of a beginner is simply this:—he grasps, easily enough, the idea of ‘the same direction’ as regards Lines which have a common point; but when you put before him the idea of *different* Lines, and ask him to realise the meaning of the phrase, when applied to such Lines, he, finding that the former geometrical conception of ‘coincidence’ is not applicable in this case, and knowing nothing of the idea, which is latent in *your* mind, of Lines which make equal angles with

all transversals, simply fails to attach any idea at all to the phrase, and accepts it blindly, from faith in his teacher, and is from that moment, until he reaches the Theorem about transversals, walking in the dark.

Nie. If this be true, of course the theory of 'direction,' however beautiful in itself, is not adapted for purposes of teaching.

Min. That is my own firm conviction. But I fear I may have wearied you by discussing this matter at such great length. Let us turn to another subject. What is your practical test for knowing whether two finite Lines will meet if produced?

Nie. You have already heard our 8th Axiom (p. 11). 'Two straight lines which have different directions would meet if produced.'

Min. But, even if that were axiomatic (which I deny), it would be no *practical* test, for you have admitted that you have no means of knowing whether two Lines, not known to have a common point have or have not different directions.

Nie. We must refer you to p. 14. Th. 5. Cor. 2, where we prove that Lines, which make equal angles with a certain transversal, have the same direction.

Min. Which you had already asserted, if you remember, in Ax. 9.

Nie. Well then, we refer you to Ax. 9 as containing the same truth.

Min. And having got that truth, whether lawfully or not, what do you do with it?

Nie. Why, surely it is almost the same as saying that, if they make *unequal* angles, they have *different* directions.

Min. And what then?

Nie. Then, combining this with the Axiom you refused to grant, namely, that Lines having different directions will meet, we get a practical test, such as you were asking for.

Min. (*dreamily*) I see! You get rid of the 'different directions' altogether, and the result is that 'Lines, which make unequal angles with a certain transversal, will meet if produced,' which is Tab. II. 2 (see p. 725). And this you assert as axiomatic truth?

Nie. (*uneasily*) Yes.

Min. Surely I have read something like it before? Could it have been Euclid's 12th Axiom? And have I not somewhere read words like these:—'Euclid's treatment of parallels distinctly breaks down in Logic. It rests on an Axiom which is not axiomatic'?

Nie. We have nowhere *stated* this Axiom which you put into our mouth.

Min. No? Then how, may I ask, do you prove that particular Lines *will* meet? You *must* have to prove it sometimes, you know.

Nie. We have not had to prove it anywhere, that we are aware of.

Min. Then there must be some gaps in your arguments. Let us see. Please to turn to p. 46. Prob. 7. Here you make, at the ends of a Line CD , angles equal to two given angles (which, as you tell us below, 'must be together less than two right angles'), and you then say 'let their sides meet in O .' How do you know that they *will* meet?

Nie. You have found *one* hiatus, we grant. Can you point out another in the whole book?

Min. I can. At p. 70 I find the words 'Join QG , and produce it to meet FH produced in S .' And again at p. 88. 'Hence the centre must be at O , the point of intersection of these perpendiculars.' In both these cases I would ask, as before, how do you know that the Lines in question *will* meet?

Nie. We had not observed the omissions before, and we must admit that they constitute a serious hiatus.

Min. A most serious one. A student, who had been taught such proofs as these, would be almost sure to try the plan in cases where the Lines would *not* really meet, and his assumption would lead him to results more remarkable for novelty than truth.

Let us now take a general survey of your book. And First, as to the Propositions of Euclid which you omit—

Nie. You are alluding to Prop. 7, I suppose. Surely its only use is to prove Prop. 8, which we have done very well without it.

Min. That is quite a venial omission. The others that I miss are 27, 28, 29, 30, 33, 34, 35, 36, 37, 38, 39, 40, 41, and 43: rather a formidable list.

Nie. You are much mistaken! Nearly all of those are in our book, or could be deduced in a moment from theorems in it.

Min. Let us take I. 34 as an instance.

Nie. *That* we give you, almost in the words of Euclid, at p. 37.

Reads.

Th. 22. ‘The opposite angles and sides of a Parallelogram will be equal, and the diagonal, or the Line which joins its opposite angles, will bisect it.’

Min. Well, but *your* Parallelogram is not what Euclid contemplates. *He* means by the word that the opposite sides are separational—a property whose reality he has demonstrated in I. 27; whereas *you* mean that they have the same direction—a property whose reality, when asserted of different Lines, has nowhere been satisfactorily proved.

Nie. We have proved it at p. 14. Th. 5. Cor. 2.

Min. Which, if traced back, will be seen to depend ultimately on your 6th Axiom, where you *assume* the reality of such Lines. But, even if your Theorem *had* been shown to refer to a real figure, how would that prove Euc. I. 34?

Nie. You only need the link that separational Lines have the same direction.

Min. Have you supplied that link?

Nie. No: but the reader can easily make it for himself. It is the ‘Contranominal’ (as you call it) of our 8th Axiom, ‘two straight Lines which have different directions would meet if prolonged indefinitely.’

Min. Your pupils must be remarkably clever at drawing deductions and filling up gaps in an argument, if they usually supply that link, as well as the proof that separational Lines exist at all, for themselves. But, as *you* do not supply these things, it seems fair to say that your book omits all the Propositions which I have enumerated.

I will now take a general survey of your book, and select a few points which seem to call for remark.

MINOS *reads.*

P. 14. Th. 5. Cor. 1. ‘Hence if two straight Lines which are not parallel are intersected by a third, the alternate angles will be not equal, and the interior angles on the same side of the intersecting Line will be not supplementary.’ Excuse the apparent incivility of the remark, but this Corollary is false.

Nie. You amaze me!

Min. You have simply to take, as an instance, a Pair of *coincidental* Lines, which most certainly answer to your description of ‘not parallel.’

Nie. It is an oversight.

Min. So I suppose: it is a species of literary phenomenon in which your Manual is rich.

Your proof of Cor. 2. is a delicious collection of negatives.

Reads.

‘Cor. 2. Hence also if the corresponding angles are equal, or the alternate angles equal, or the interior angles supplementary, the Lines will be parallel.

‘For they cannot be *not* parallel, for then the corresponding and alternate angles would be *unequal* by Cor. 1.’

Should I be justified in calling this a somewhat *knotty* passage?

Nie. You have no right to make such a remark. It is a mere jest!

Min. Well, we will be serious again.

At p. 9, you stated *more* than the data authorised: we now come to a set-off against this, since we shall find you asserting *less* than you ought to do. I will read the passage:—

P. 26. Th. 15. ‘If two Triangles are equiangular to one another and have a side of the one equal to the corresponding side of the other, the Triangles will be equal in all respects.’

This contains a superfluous *datum*: it would have been enough to say ‘if two Triangles have two angles of the one equal to two angles of the other &c.’

Nie. Well, it is at worst a superfluity: the enunciation is really identical with Euclid’s.

Min. By no means. The logical effect of a superfluous *datum* is to *limit* the extent of a Proposition: and, if the Proposition be ‘universal,’ it reduces it to ‘particular’; i. e. it changes ‘all *A* is *B*’ into ‘some *A* is *B*.’ For suppose we take the Proposition ‘all *A* is *B*,’ and substitute for it ‘all that is both *A* and *X* is *B*,’ we may be *accidentally* making an assertion of the same extent as before, for it may happen that the whole class ‘*A*’ possesses the property ‘*X*’; but, so far as logical *form* is concerned, we have reduced the Proposition to ‘*some* things that are *A* (viz. those which are also *X*) are *B*.’

I turn now to p. 27, where I observe a new proof for Euc. I. 24.

Nie. New and, we hope, neat and short.

Min. Charmingly neat and short, *as it stands*: but this method really requires the discussion of *five* cases, each with its own figure.

Nie. How do you make that out?

Min. The five cases are:—

(1) Vertical angles together less than two right angles, and adjacent base angles acute (the case you give).

(2) Adjacent base-angles right.

(3) Adjacent base-angles obtuse.

These two cases are proved along with the first.

(4) Vertical angles together equal to two right angles.

This requires a new proof, as we must substitute for the words ‘the bisector of the angle *FAC*,’ the words ‘the perpendicular to *FC* drawn through *A*.’

(5) Vertical angles together greater than two right angles.

This also requires a new proof, as we must insert, after the words ‘the bisector of the angle FAC ,’ the words ‘produced through A ,’ and must then prove (by your Th. 1) that the angles OAC , OAF , are equal.

On the whole, I take this to be the most cumbrous proof yet suggested for this Theorem.

We now come to what is probably the most extraordinary Corollary ever yet propounded in a geometrical treatise. Turn to pages 30 and 31.

Th. 20. ‘If two triangles have two sides of the one equal to two sides of the other, and the angle opposite that which is not the less of the two sides of the one equal to the corresponding angle of the other, the triangles shall be equal in all respects.

‘Cor. 1. If the side opposite the given angle were less than the side adjacent, there would be two triangles, as in the figure; and the proof given above is inapplicable.

‘This is called *the ambiguous case*.’

The whole Proposition is a grand specimen of obscure writing and bad English, ‘is’ and ‘are,’ ‘could,’ and ‘would,’ alternating throughout with the most charming impartiality: but what impresses me most is the probable effect of this wondrous Corollary on the brain of a simple reader, coming breathless and exhausted from a death-struggle with the preceding theorem. I can imagine him saying wildly to himself ‘If two Triangles fulfil such and such conditions, such and such things follow: but, if one of the conditions were to fail, *there would be two Triangles!* I must be dreaming! Let me dip my head in cold water, and read it all again. If two Triangles . . . there *would* be two Triangles. Oh, my poor brains!’

Nie. You are pleased to be satirical: it *is* rather obscure writing, we confess.

Min. It is indeed! You do well in calling it *the ambiguous case*.

At p. 33, I see the heading ‘Theorems of equality’: but you only give *two* of them, the second being ‘the bisectors of the three angles of a triangle meet in one point,’ which, as a specimen of ‘Theorems of equality,’ is probably unique in the literature of Geometry. I cannot wonder at your not attempting to extend the collection.

At p. 40 I read, ‘It is assumed here that if a circle has one point inside another circle, the circumferences will intersect one another.’ This I believe to be the boldest assumption yet made in Modern Geometry.

At pp. 40, 42 you assume a length ‘greater than half’ a given Line, without having shewn how to bisect Lines. Two cases of ‘*Petitio Principii*.’ (See p. 58.)

P. 69. Here we have a Problem (which you call ‘the quadrature of a rectilineal area’) occupying three pages and a half. It is ‘approached’ by four ‘stages,’ which is a euphemism for saying that this fearful Proposition contains *four* of Euclid’s Problems, viz. I. 42, 44, 45, and II. 14.

P. 73. 2. ‘Find a point equally distant from three given straight lines.’ Is it fair to give this without any limitation? What if the given lines were parallel?

P. 84. ‘If A, B, C . . . as conditions involve D as a result, and the failure of C involves a failure of D ; then A, B, D . . . as conditions involve C as a result.’ If not- C proves not- D , then D proves C . A and B are irrelevant and obscure the statement. I observe, in passing, the subtle distinction which you suggest between ‘*the failure of C* ’ and ‘*a failure of D* .’ D is a habitual bankrupt, who has often passed through the court, and is well used to failures: but, when C fails, his collapse is final, and ‘leaves not a wrack behind’!

P. 90. ‘Given a curve, to ascertain whether it is an arc of a circle or not.’ What does ‘given a curve’ mean? If it means a line drawn with ink on paper, we may safely say at once ‘it is *not* a circle.’

P. 96. Def. 15. ‘When one of the points in which a secant cuts a circle is made to move up to, and ultimately coincide with, the other, the ultimate position of the secant is called *the tangent* at that point.’ (The idea of *the position of a Line* being itself a Line is queer enough: I suppose you would say ‘*the ultimate position* of Whittington was the Lord Mayor of London.’ But this is by the way: of course you mean ‘the secant in its ultimate position.’) Now let us take three points on a circle, the middle one fixed, the others movable; and through the middle one let us draw two secants, each passing through one of the other points; and then let us make the other points ‘move up to, and ultimately coincide with,’ the middle one. We have no ground for saying that these two secants, in their ultimate positions, will coincide. Hence the phrase ‘*the tangent*’ assumes, without proof, Th. 7. Cor. 1, viz. ‘there can be only one tangent to a circle at a given point.’ This is a ‘*Petitio Principii*.’

P. 97. Th. 6. The secant consists of two portions, each terminated at the fixed point. All that you prove here is that the portion which has hitherto cut the circle is ultimately outside: and you jump, without a shadow of proof, to the conclusion that the same thing is true of the *other* portion! Why should not the second portion begin to cut the circle at the precise moment when the first ceases to do so? This is another ‘*Petitio Principii*.’

P. 129, line 3 from end. ‘Abstract quantities are the means that we use to express the concrete.’ Excluding such physical ‘means’ as pen and ink or the human voice (to which you do not seem to allude), I presume that the ‘means’ referred to in this mysterious sentence are ‘pure numbers.’ At any rate the only instances given are ‘seven, five, three.’ Now take P. 130, l. 5, ‘*Abstract quantities* and *ratios* are precisely the same things.’ Hence all ratios are numbers. But in the middle of the same page we read that ‘all numbers are ratios, but all ratios are *not* numbers.’ I leave this without further remark.

I will now sum up the conclusions I have come to with respect to your Manual.

(1) As to ‘straight Lines’ you suggest a useful extension of Euclid’s Axiom.

(2) As to angles and right angles, your extension of the limit of size is, in my opinion, objectionable. In other respects your language, though hazy, agrees on the whole with Euclid.

(3) As to ‘Parallels,’ there is a good deal to be said, and that not very flattering, I fear.

In Ax. 6, you assert the reality of different Lines having the same direction—a property you can neither define, nor construct, nor test.

You also assert (by implication) the reality of separational Lines, which Euclid *proves*.

You also assert the reality of Lines, not known to have a common point, but having different directions—a property you can neither define, nor construct, nor test.

In Ax. 8, you assert that the undefined Lines last mentioned would meet if produced.

These Axioms, therefore, are not axiomatic.

In proving result (2), you are guilty of the fallacy ‘*Petitio Principii*.’

In Ax. 9 and Th. 4 taken together, if the word ‘angle’ in Ax. 9 means ‘variable angle,’ you are guilty of the fallacy ‘*A dicto secundum Quid ad dictum Simpliciter*’; if ‘constant angle,’ of the fallacy ‘*Petitio Principii*.’

In Ax. 9 (α), you assert that Lines possessing a certain real geometrical property, viz. making equal angles with a certain transversal, possess also the before-mentioned undefined property. This is not axiomatic.

In Ax. 9 (β) combined with Ax. 6, you assert the reality of Lines which make equal angles with all transversals. This is not more axiomatic than Euc. Ax. 12.

In Ax. 9 (α) combined with Ax. 9 (β), you assert that Lines, which make equal angles with a certain transversal, do so with all transversals. This I believe to be the most unaxiomatic Axiom ever yet proposed.

(4) You furnish no practical test for the meeting of finite Lines, and consequently you never prove (however necessary for the matter in hand) that any particular Lines *will* meet. And when we come to examine what practical test can possibly be extracted from your Axioms, the only result is an imperfect edition of Euclid’s 12th Axiom!

The sum total of the chief defects which I have noticed is as follows:—
fourteen of Euclid’s Theorems in Book I. omitted;
seven unaxiomatic Axioms;
six instances of ‘*Petitio Principii*.’

The abundant specimens of logical inaccuracy, and of loose writing generally, which I have here collected would, I feel sure, in a mere popular treatise be discreditable—in a scientific treatise, however modestly put forth, deplorable—but in a treatise avowedly put forth as a model of logical precision, and *intended to supersede Euclid*, they are simply monstrous.

My ultimate conclusion on your Manual is that it has *no claim whatever* to be adopted as *the* Manual for purposes of teaching and examination.

§ 2. PIERCE.

*‘dum brevis esse laboro,
Obscurus fio.’*

Quoted from Horace

Nie. I lay before you ‘*An Elementary Treatise on Plane and Solid Geometry*’ by BENJAMIN PIERCE, A.M., Perkins Professor of Astronomy and Mathematics in Harvard University, published in 1872.

Min. As I have already considered, at great length, the subject of direction as treated by Mr. Wilson, I need not trouble you as to any matters where Mr. Pierce’s treatment does not materially differ from his. Is there any material difference in the treatment of a straight line?

Nie. He has a Definition of direction which will, I think, be new to you:—

Reads.

P. 5. § 11, Def. ‘The *Direction of a Line* in any part is the direction of a point at that part from the next preceding point of the Line.’

Min. That sounds mysterious. Which way along a Line are ‘preceding’ points to be found?

Nie. *Both* ways. He adds, directly afterwards, ‘a Line has two different directions,’ etc.

Min. So your Definition needs a postscript? That is rather clumsy writing. But there is yet another difficulty. How far from a point is the 'next' point?

Nie. At an infinitely small distance, of course. You will find the matter fully discussed in any work on the Infinitesimal Calculus.

Min. A most satisfactory answer for a teacher to make to a pupil just beginning Geometry! I see nothing else to remark on in your treatment of the Line, except that you state, as an Axiom, that 'a straight Line is the shortest way from one point to another.' I have already given, in my review of M. Legendre, my reasons for thinking that this is not a fair Axiom, and ought to be a Theorem (see p. 736).

There is nothing particular to notice in your treatment of angles and right angles. Let us go on to Parallels. How do you prove Euc. I. 32?

NIEMAND reads.

P. 9. § 27, Def. '*Parallell* Lines are straight Lines which have the same Direction.'

Min. I presume you do not mean to include coincidental Lines?

Nie. Certainly not. We see the omission. Allow us to insert the word 'different.'

Min. Very well. Then your Definition combines the two properties 'different' and 'having the same direction.' Bear in mind that you have yet to prove the *reality* of such Lines. And may I request you in future to call such Lines 'sepcodal'? But if you wish to assert any thing of them which is also true of coincidental Lines, you had better drop the 'sep-' and simply call them 'Lines which have the same direction,' so as to include both classes.

Nie. Very well.

NIEMAND reads.

P. 9. § 28. Th. 'Sepcodal Lines cannot meet, however far they are produced.'

Min. Or rather '*could* not meet, if they existed.' Proceed.

NIEMAND reads.

P. 9. § 29. Th. 'Two angles are equal, when their sides have the same direction.'

Min. How do you define 'same direction' for different Lines?

Nie. We cannot define it.

Min. Then I cannot admit that such Lines exist. But even if I *did* admit their reality, why should the angles be equal?

Nie. Because 'the difference of direction' is the same in each case.

Min. But how would that prove the angles equal? Do you define 'angle' as the 'difference of direction' of two lines?

Nie. Not exactly. We have stated (p. 6, § 19) 'The *magnitude* of the angle depends solely upon the *difference of direction* of its sides at the vertex.'

Min. But the difference of direction also possesses 'magnitude.' Is that magnitude a wholly *independent* entity? Or does it, in its turn, depend to some extent upon the *angle*? Seriously, all these subtleties must be very trying to a beginner. But we had better proceed to the next Theorem. I am anxious to see

where, in this system, these creatures of the imagination, these sepcodal Lines, are to appear as actually existent.

Nie. We next prove (p. 9. § 30) that Lines, which have the same direction, make equal angles with all transversals.

Min. That is merely a particular case of your last Theorem.

Nie. And then that two Lines, which make equal angles with a transversal, have the same direction.

Min. Ah, *that* would bring them into existence at once! Let us hear the proof of that.

Nie. The proof is that if, through the point where the first Line is cut by the transversal, a Line be drawn having the same direction as the second, it makes equal angles with the transversal, and therefore coincides with the first Line.

Min. You assume, then, that a Line *can* be drawn through that point, having the same direction as the second Line?

Nie. Yes.

Min. That is, you assume, without proof, that different Lines can have the same direction. On the whole, then, though Mr. Pierce's system differs slightly from Mr. Wilson's, both rest on the same vicious Axiom, that different Lines *can* exist, which possess a property called 'the same direction'—a phrase which is intelligible enough when used of two Lines which have a common point, but which, when applied to two Lines *not* known to have a common point, can neither be defined, nor constructed. We need not pursue the subject further. Have you provided any test for knowing whether two given finite Lines will meet if produced?

Nie. We have not thought it necessary.

Min. Then the only other remark I have to make on this singularly compendious treatise is that, of the 35 Theorems which Euclid gives us in his First Book, it reproduces just sixteen: the omissions being 16, 17, 25, 26 (2), 27 and 28, 29, 30, 33, 34, 35, 36, 37, 38, 39, 40, 41, 43, 47, and 48.

Nie. Most of those are in the book. For example, § 30 answers to Euc. I. 29.

Min. Only by proving that separational Lines have the same direction: which you have not done.

Nie. At any rate we have Euc. I. 47 in our § 256.

Min. Oh, no doubt! Long after going through ratios, which necessarily include incommensurables; and long after the Axiom (§ 99) 'Infinitely small quantities may be neglected'! No, no: so far as *beginners* are concerned, there is no Euc. I. 47 in *this* book!

My conclusion is that, however useful this Manual may be to an advanced student, it is *not* adapted to the wants of a beginner.

§ 3. WILLOCK

'This work . . . no doubt, has its faults.'

WILLOCK, *Pref.* p. 1.

Nie. I lay before you '*The Elementary Geometry of the Right Line and Circle*' by W. A. WILLOCK, D.D., formerly Fellow of Trinity College, Dublin, published in 1875.

Min. I have gone through the subject of 'direction' so minutely in reviewing Mr. Wilson's book, that I need not discuss with you any points in which your

client essentially agrees with him. We may, I think, pass over the subject of the Right Line altogether?

Nie. Yes.

Min. And as to Angles and Right Angles, I see no novelty in Dr. Willock's book, except that he defines an Angle as 'the divergence of two directions,' which is virtually the same as Euclid's Definition.

Nie. That I think is all.

Min. Then we can proceed at once to the subject of Parallels. Will you kindly give me your proof of Euc. I. 32 from the beginning?

NIEMAND *reads.*

P. 10. Th. 1. '*Two Directives can intersect in only one point.*'

Min. By 'Directive' you mean an 'infinite Line'?

Nie. Yes.

Min. Well, I need hardly trouble you to prove it as a Theorem, being quite willing to grant it as an Axiom. What is the next Theorem?

NIEMAND *reads.*

P. 11. Th. 5. '*Parallel Directives cannot meet.*'

Min. We will call them 'sepcodal,' if you please. I grant it, provisionally. *If* such Lines exist, they cannot meet.

NIEMAND *reads.*

P. 11. Th. 7. '*Only one Line, sepcodal to a Directive, can be drawn through a point.*'

Min. Does that assert that one *can* be drawn? Or does it simply deny the possibility of drawing *two*?

Nie. The *proof* only applies to the denial: but the assertion is certainly involved in the enunciation. At all events, if not assumed here, it *is* assumed later on.

Min. Then I will at this point credit you with *one* unwarrantable Axiom, namely, that different Lines can have the same direction. The Theorem itself I grant.

NIEMAND *reads.*

P. 12. Th. 8. '*The angles of intersection of a Transversal with two sepcodal Directives are equal.*'

Min. Do you prove that by Mr. Wilson's method?

Nie. Not quite. *He* does it by transferring an angle: *we* do it by divergence of directions.

Min. I prefer *your* method. All it needs to make it complete is the proof of the reality of such Lines: but *that* is unattainable, and its absence is fatal to the whole system. Nay, more: the fact, that the reality of such Lines leads by a logical necessity to the reality of Lines which make equal angles with *any* transversal, reacts upon that unfortunate Axiom, and destroys the little hope it ever had of being granted without proof. In point of fact, in asking to have the Axiom granted, you were virtually asking to have this other reality granted as axiomatic—but all this I have already explained (p. 769).

NIEMAND reads.

P. 13. Th. 10. ‘*If a Transversal cut two Directives and make the angles of intersection with them equal, the Directives are sepcodal.*’

Min. The subject of your Proposition is indisputably real. If then you can prove this Theorem, you will thereby prove the reality of sepcodal Lines. But I fear you have assumed it already in Th. 7. There is still, however, a gleam of hope: perhaps you do not need Th. 7 in proving this?

Nie. We do not: but I fear that will not mend matters, as we assume, in the course of this Theorem, that a Line can be drawn through a given point, so as to have the same direction as a given Line.

Min. Then we need not examine it further: it must perish with the faulty Axiom on which it rests. What is your next Theorem?

Nie. It answers to Euc. I. 16, 17, and is proved by the Theorem you have just rejected.

Min. Then I must reject its *proof*, but I will grant you the Theorem itself, if you like, as we know it *can* be proved from undisputed Axioms. What comes next?

NIEMAND reads.

P. 14. Th. 13. ‘*If a Transversal meet two Directives, and make angles with them, the External greater than the Internal, or the sum of the two Internal angles less than two right angles, the two directives must meet.*’

Min. A proof for Euclid’s Axiom? That is interesting.

NIEMAND reads.

‘For, suppose they do not meet. Then, they should be sepcodal——’

Min. (*interrupting*) ‘Should be sepcodal?’ Does that mean that they *are* sepcodal?

Nie. Yes, I think so.

Min. That is, you assume that separational Lines have the same direction?

Nie. We do.

Min. A fearful assumption! (*A long silence*) Well?

Nie. I am waiting to know whether you grant it.

Min. Unquestionably not! I must mark it against you as an Axiom of the most monstrous character! Mr. Wilson himself does not assume this, though he *does* assume its Contranominal, that Lines having different directions will meet (see p. 763). And what I said then I say now—unaxiomatic! But supposing it granted, how would you prove the Theorem?

NIEMAND reads.

‘Then, they should be sepcodal; and the external angle should be equal (Th. 8) to the internal; which is contrary to the supposition.’

Min. Quite so. But Th. 8, which you quote, itself depends on the reality of sepcodal Lines. Your Theorem rests on two legs, and *both*, I fear, are rotten!

Nie. The next Theorem is equivalent to Euc. I. 32. Do you wish to hear it?

Min. It is unnecessary: it follows easily from Th. 8.

And I need not ask you what practical test you provide for the meeting of two Lines, seeing that you have Euclid’s 12th Axiom itself.

Nie. Proved as a Theorem.

Min. *Attempted* to be proved as a Theorem. I will now take a hasty general survey of your client's book.

The first point calling for remark is the arrangement. You begin by dragging the unfortunate beginner straight into the most difficult part of the subject. Your first chapter positively bristles with difficulties about 'direction.' Then comes a long chapter on circles, including some very complicated figures, and a theory of tangents which depends upon moving lines and vanishing chords—all most disheartening to a beginner. What do you suppose he is likely to make of such a sentence as 'the direction of the motion of the generating point of any curve is that of the tangent to the curve at that point'? (p. 29.) Or this again, 'it is also evident that, the circle being a simple curve, there can be only *one* tangent to it at any point'? (p. 29.) What *is* 'a simple curve'?

Nie. I do not know.

Min. Then comes a chapter of Problems, and *then*—when your pupil has succeeded in mastering thirty-four pages of your book, and has become tolerably familiar with tangents and segments, with diametral lines and reëntrant angles, with 'oval forms' and 'forms semi-convex, semi-concave,'—you at last confront him with that abstruse and much dreaded Theorem, Euc. I. 4! True, he has the 'Asses' Bridge' to help him in proving it, that in its turn being proved, apparently, by properties of the circle; but, even with all these assistances, it is an arduous task!

Nie. You are hard on my client.

Min. Well, jesting apart, let me say in all seriousness that I think it would require very great ingenuity to make a worse arrangement of the subject of Geometry, for purposes of teaching, than is to be found in this little book.

I do not think it necessary to criticise the book throughout: but I will mention one or two passages which have caught my eye in glancing through it.

Here, for instance, is something about 'Directives,' which seem to be a curious kind of Loci—quite different from Right Lines, I should say.

Nie. Oh no! They are exactly the same thing!

Min. Well, I find, at p. 4, 'Directives are either divergent or parallel': and again, at p. 11, 'Parallel Directives cannot meet.' Clearly, then, Directives can never by any possibility *coincide*: but ordinary Right Lines occasionally do so, do they not?

Nie. It is a curious *lapsus pennae*.

Min. At p. 7, I observe an article headed 'The principle of double conversion,' which I will quote entire.

Reads.

'If four magnitudes, a, b, A, B , are so related, that when a is greater than b , A is greater than B ; and when a is equal to b , A is equal to B : then, *conversely*, when A is greater than B , a is greater than b ; and, when A is equal to B , a is equal to b .

'The truth of this principle, which extends to every kind of magnitude, is thus made evident:—If, when A is greater than B , a is not greater than b , it must be either less than or equal to b . But it cannot be less; for, if it were, A should, by the antecedent part of the proposition, be less than B , which is contrary to the supposition made. Nor can it be equal to b ; for, in that case, A

should be equal to B , also contrary to supposition. Since, therefore, a is neither less than nor equal to b , it remains that it must be greater than b .'

Now let a and A be variables and represent the ordinates to two curves, mnr and MNR , for the same abscissa; and let b and B be constants and represent their intercepts on the Y -axis; i. e. let $On = b$, and $ON = B$.

Does not this diagram fairly represent the *data* of the proposition? You see, when we take a negative abscissa, so as to make a greater than b , we are on the left-hand branch of the curve, and A is also greater than B ; and again, when a is equal to b , we are crossing the Y -axis, where A is also equal to B .

Nie. It seems fair enough.

Min. But the conclusion does not follow? With a positive abscissa, A is greater than B , but a less than b .

Nie. We cannot deny it.

Min. What then do you suppose would be the effect on a simple-minded student who should wrestle with this terrible theorem, firm in the conviction that, being in a printed book, it must *somehow* be true?

Nie. (*gravely*) *Insomnia*, certainly; followed by acute *Cephalalgia*; and, in all probability, *Epistaxis*.

Min. Ah, those terrible names! Who would suppose that a man could have all those three maladies, and survive? And yet the thing is possible!

Let me now read you a statement (at p. 112) about incommensurables:—

‘When one of the magnitudes can be represented only by an interminable decimal, while the other is a finite whole number, or finite decimal, no finite common submultiple can exist; for, though a unit be selected in the last place of the whole number or finite decimal, yet the decimal represented by all the figures which follow the corresponding place in the interminable decimal, being

less than that unit in that place and unknown in quantity, cannot be a common measure of the two magnitudes, and is only a remainder.'

Now can you lay your hand upon your heart and declare, on the word of an honest man, that you understand this sentence—beginning at the words 'yet the decimal'?

Nie. (*vehemently*) I cannot!

Min. Of the two reasons which are mentioned, to explain why it 'cannot be a common measure of the two magnitudes,' does the first—that it is 'less than that unit in that place'—carry conviction to your mind? And does the second—that it is 'unknown in quantity' ripen that conviction into certainty?

Nie. (*wildly*) Not in the least!

Min. Well, I will not 'slay the slain' any longer. You may consider Dr. Willock's book as rejected. And I think we may say that the whole theory of 'direction' has collapsed under our examination.

Nie. I greatly fear so.

Act III.

Scene I.

§ 1. The other Modern Rivals.

*'But mice, and rats, and such small deer,
Have been Tom's food for seven long year.'*

Quoted from *King
Lear* by William
Shakespeare

Min. I consider the question, as to whether Euclid's system and numeration should be abandoned or retained, to be now set at rest: the subject of Parallels being disposed of, no minor points of difference can possibly justify the abandonment of our old friend in favour of any Modern Rival. Still it will be worth while to examine the other writers, whose works you have brought with you, as they may furnish some valuable suggestions for the improvement of Euclid's Manual.

Nie. The other writers are CHAUVENET, LOOMIS, MORELL, REYNOLDS, and WRIGHT.

Min. There are a few matters, as to which we may consider them all at once. How do they define a straight Line?

Nie. All but Mr. Reynolds define it as the shortest distance between two points, or more accurately, to use the words of Mr. Chauvenet, 'a Line of which every portion is the shortest Line between the points limiting that portion.'

Min. We discussed that Definition in M. Legendre's book. How does Mr. Reynolds define it?

Nie. Not at all.

Min. Very cautious. What of angles?

Nie. Some of them allow larger limits than Euclid does. Mr. Wright talks about 'angles of continuation' and 'angles of rotation.'

Min. Good for Trigonometry: not so suitable to early Geometry. How do they define Parallels?

Nie. As in Euclid, all of them.

Min. And which Proposition of Tab. II. do they assume?

Nie. Playfair's, or else its equivalent, 'only one Line can be drawn, parallel to a given Line, through a given point outside it.'

Min. Now let us take them one by one.

§ 2. CHAUVENET.

*'Where Washington hath left
His awful memory
A light for after times!'*

Quoted from Robert Southey

Nie. I lay before you '*A Treatise on Elementary Geometry*,' by W. CHAUVENET, LL.D., Professor of Mathematics and Astronomy in Washington University, published in 1876.

Min. I read in the Preface (p. 4) 'I have endeavoured to set forth the elements with all the rigour and completeness demanded by the present state of the general science, *without seriously departing from the established order of the Propositions.*' So there would be little difficulty, I fancy, in introducing into Euclid's own Manual all the improvements which Mr. Chauvenet can suggest.

P. 14. Pr. I, and p. 18. Pr. v, taken together, tell us that only one perpendicular can be drawn to a Line from a point. And various additions, about obliques, are made in subsequent Propositions. All these may well be embodied in a new Proposition, which we might interpolate as Euc. I. 12. B.

P. 26. Pr. xv; asserts the equidistance of Parallels. This might be interpolated as Euc. I. 34. B.

Another new Theorem, that angles whose sides are parallel, each to each, are equal (which I observe is a great favourite with the Modern Rivals), seems to me a rather clumsy and uninteresting extension of Euc. I. 29.

I see several Propositions which might well be inserted as *exercises* on Euclid (*e. g.* Pr. XXXIX, 'Every point in the bisector of an angle is equally distant from the sides'), but which are hardly of sufficient importance to be included as Propositions: and others (*e. g.* Pr. XL, 'The bisectors of the three angles of a Triangle meet in the same point') which seem to belong more properly to Euc. III or IV. I have no other remarks to make on this book, which seems well and clearly written.

§ 3. LOOMIS.

'Like—but oh! how different!'

Quoted from *The Mountain Echo* by William Wordsworth

Nie. I lay before you '*Elements of Geometry*,' by ELIAS LOOMIS, LL.D., Professor of Natural Philosophy and Astronomy in Yale College, a revised edition, 1876.

Min. I read in the Preface (p. 10) 'The present volume follows substantially the order of Blanchet's Legendre, while the form of the demonstrations is modeled after the more logical method of Euclid,' He has not, however, adopted the method of infinite series, which constitutes the crucial distinction between that writer and Euclid.

The Propositions are pretty nearly in Euclid's order: with a few changes in order and numeration, the book would be a modernised Euclid, the only important differences being the adoption of Playfair's Axiom and the omission of the diagonals in Euc. II. I have no hostile criticisms to offer. Our American cousins set us an excellent example in the art of brief, and yet lucid, mathematical writing.

§ 4. MORELL.

*‘Quis custodiet ipsos custodes?
Quis inspiciet ipsos inspectores?’*

Quoted from *Satire*
VI by Juvenal

Nie. I lay before you ‘*Euclid Simplified, compiled from the most important French works, approved by the University of Paris and the Minister of Public Instruction,*’ by Mr. J. R. MORELL, formerly H. M. Inspector of Schools, published in 1875.

Min. What have you about Lines, to begin with?

Nie. Here is a Definition. ‘The place where two surfaces meet is called a Line.’

Min. Really! Let us take two touching spheres, for instance?

Nie. Ahem! We abandon the Definition.

Min. Perhaps we shall be more fortunate with the Definition of a *straight* Line.

Nie. It is ‘an indefinite Line, which is the shortest between any two of its points.’

Min. An ‘*indefinite*’ Line! What in the world do you mean? Is a curved Line more definite than a straight Line?

Nie. I don’t know.

Min. Nor I. The rest of the sentence is slightly elliptical. Of course you mean ‘the shortest which can be drawn’?

Nie. (*eagerly*) Yes, yes!

Min. Well, we have discussed that matter already. Go on.

Nie. Next we have an Axiom, ‘that from one point to another only one straight Line can be drawn, and that if two portions of a straight Line coincide, these Lines coincide throughout their whole extent.’

Min. You bewilder me. How can one portion of a straight Line coincide with another?

Nie. (*after a pause*) It can’t, of course, *in situ*: but why not take up one portion and lay it on another?

Min. By all means, if you like. Let us take a certain straight Line, cut out an inch of it, and lay it along another inch of the Line. What follows?

Nie. Then ‘these Lines coincide throughout their whole extent.’

Min. Do they indeed? And pray who *are* ‘these Lines’? The two inches?

Nie. (*gloomily*) I suppose so.

Min. Then the Axiom is simple tautology.

Nie. Well then, we mean the whole straight Line and—and—

Min. And what else? You can’t talk of ‘one straight Line’ as ‘these Lines,’ you know.

Nie. We abandon the Axiom.

Min. Better luck next time! Try another Definition.

Nie. ‘A broken Line is a Line composed of straight Lines.’

Min. But a *straight* Line also is ‘a Line composed of straight Lines,’ isn’t it?

Nie. Well, we abandon the Definition.

Min. This is quite a new process in our navigation. Instead of heaving the lead, we seem to be throwing over-board the whole of our cargo! Let us hear something about Angles.

Nie. ‘The figure formed by two Lines that intersect is called an Angle.’

Min. What do you mean by ‘figure’? Do you define it anywhere?
Nie. Yes. ‘The name of figure is given to volumes, surfaces, and lines.’
Min. Under which category do you put ‘Angle’?
Nie. I don’t know.
Min. Anything new about the Definition, or equality, of right angles?
Nie. No, except that we *prove* that all right angles are equal.
Min. That we have discussed already (see p. 737). Let us go on to Pairs of Lines, and your proof of Euc. I. 29, 32.

NIEMAND *reads.*

‘Th. 19. Two Lines perpendicular to the same Line are parallel.’
Min. Do you mean ‘separational’?
Nie. Yes.
Min. Have you defined ‘parallel’ anywhere?
Nie. (*after a search*) I can’t find it.
Min. A careless omission. Moreover, your assertion isn’t always true. Suppose your two Lines were drawn from the same point?
Nie. We beg to correct the sentence. ‘Two *different* Lines.’
Min. Very well. Then you assert Table I. 6. (See p. 722.) I grant it.

NIEMAND *reads.*

‘Th. 20. Through a point situated outside a straight Line a Parallel, and only one, can be drawn to that Line.’
Min. ‘A Parallel,’ I grant at once: it is Table I. 9. But ‘*only one*’! That takes us into Table II. What axiom do you assume?
Nie. ‘It may be admitted that only one Parallel can be drawn to it.’
Min. That is Table II. 15 (*b*)—a contranominal of Playfair’s Axiom. We need not pursue the subject: all is easy after that. Now hand *me* the book, if you please: I wish to make a general survey of style, &c.
 At p. 4 I read:—‘Two Theorems are reciprocal when the hypothesis and the conclusion of one are the conclusion and the hypothesis of the other.’ (They are usually called ‘converse’—the *technical*, not the *logical*, converse, as was mentioned some time ago (p. 732); but let that pass.) ‘Thus the Theorem—*if two angles are right angles, they are equal*—has for its reciprocal—*if two angles are equal, they are right angles.*’
 (This, by the way, is a capital instance of the distinction between ‘technical’ and ‘logical.’ Here the *technical* converse is wild nonsense, while the *logical* converse is of course as true as the Theorem itself: it is ‘*some cases of two angles being equal are cases of their being right.*’)
 ‘All Propositions are direct, reciprocal, or contrary—all so closely connected that either of the two latter’ (I presume he means ‘the latter two’) ‘is a consequence of the other two.’
 A ‘consequence’! Can he mean a *logical* consequence? Would he let us make a syllogism of the three, using the ‘direct’ and ‘reciprocal’ (for instance) as premisses, and the ‘contrary’ as the conclusion?
 However, let us first see what he means by a ‘contrary’ Proposition.
 ‘It is a direct Proposition to prove that all points in a circle enjoy a certain property, *e. g.* the same distance from the centre.’

(This notion of sentient points, by the way, is very charming. I like to think of all the points in a circle really feeling a placid satisfaction in the thought that they are equidistant from the centre! They are infinite in number, and so can well afford to despise the arrogance of a point within, and to ignore the envious murmurs of a point without!)

‘The contrary Proposition shows that all points taken outside or inside the figure do not enjoy this property.’

So then this is his trio:—

1. Direct. ‘All X are Y .’
2. Reciprocal. ‘All Y are X .’
3. Contrary. ‘All not- X are not- Y .’

Here of course No. 2 and No. 3, being Contranominals, are logically deducible from each other, No. 1 having no logical connection with either of them.

And yet he calls the three ‘so closely connected that either of the two latter is a consequence of the other two’! Shade of Aldrich! Have we come to this? You say nothing, mein Herr?

Nie. I say that, if you grant what you call the ‘premisses,’ you cannot deny the conclusion.

Min. True. It reminds me of an answer given some years ago in the Schools at Oxford, when the Examiner asked for an example of a syllogism. After much patient thought, the candidate handed in

‘All men are dogs;
All dogs are men:
Therefore, All men are dogs.’

This certainly has the *form* of a syllogism. Also it avoids, with marked success, the dangerous fallacy of ‘four terms.’ And it has the great merit of Mr. Morell’s syllogism, that, if you grant the premisses, you cannot deny the conclusion. Nevertheless I feel bound to add that it was *not* commended by the Examiner.

Nie. I can well believe it.

Min. I proceed. ‘The direct and the reciprocal proofs are generally the simpler, and do not require a fresh construction.’ Why ‘fresh’? The ‘direct’ comes *first*, apparently; so that, if it requires a construction at all, it must be a ‘fresh’ one.

Nie. Be not hypercritical.

Min. Well, it *is* rather ‘small deer,’ I confess: let us change the subject.

Here is a pretty proof in Th. 4.

‘Then $m + o = m + x$.
But $m = m$.
Therefore $o = x$.’

Isn’t that ‘but $m = m$ ’ a delightfully cautious parenthesis? Your client seems to be nearly as much at home in Algebra as in Logic, which is saying a great deal!

At p. 9, I read ‘The base of an isosceles Triangle is the unequal side.’

‘*The unequal side*’! Is an equilateral Triangle isosceles, or is it not? Answer, mein Herr!

Nie. Proceed.

Min. At p. 17, I read ‘From one and the same point three equal straight Lines cannot be drawn to another straight Line; for if that were the case, *there would be on the same side of a perpendicular two equal obliques*, which is impossible.’

Kindly prove the italicised assertion on this diagram, in which I assume FD , FC , FE , to be equal Lines, and have made the *middle* one of the three a perpendicular to the ‘other straight Line.’

Nie. (*furiously*) I will not!

Min. Look at p. 36. ‘A circumference is generally described in language by one of its radii.’ Let us hope that the language is complimentary—at least if the circumference is within hearing! Can’t you imagine the radius gracefully rising to his feet, rubbing his lips with his table-napkin? ‘Gentlemen! The toast I have the honour to propose is &c. &c. Gentlemen, I give you *the Circumference!*’ And then the chorus of excited Lines, ‘For he’s a jolly good felloe!’

Nie. (*rapturously*) Ha, ha! (*checking himself*) You are insulting my client.

Min. Only filling in his suggestive outlines. Try p. 48. ‘Th. 13. If two circumferences are interior,’ &c. Can your imagination, or mine, grasp the idea of two circumferences, each of them inside the other? No! *We* are mere prosaic mortals: it is beyond us!

In p. 49 I see some strange remarks about ratios. First look at Def. 44. ‘When a magnitude is contained an exact number of times in two magnitudes of its kind, it is said to be their common measure.’ (The wording is awkward, and suggests the idea of their having only *one* ‘common measure’; but let that pass.) ‘The ratio of two magnitudes of the same kind is the number which would express the measure of the first, if the second were taken as unity.’

‘*The measure of the first!*’ Do you understand that? Is it a ‘measure’ such as you have just defined? or some other kind?

Nie. Some other kind, I *think*. But there is a slight obscurity somewhere.

Min. Perhaps this next enunciation will clear it up. ‘If two magnitudes of the same kind, A and B , are mutually commensurable’ (by the way, ‘mutually’ is tautology), ‘their ratio is a whole or fractional number, which is obtained by dividing the two numbers one by the other, and which expresses how many times these magnitudes contain their common measure M .’ Do you understand *that?*

Nie. Well, no!

Min. Let us take an instance—£3 and 10s. A shilling is a common measure of these two sums: will you accept it as ‘*their* common measure’?

Nie. We will do it, provisionally.

Min. Now the number, ‘obtained by dividing the two numbers’ (I presume you mean ‘the two magnitudes’) ‘one by the other,’ is ‘6,’ is it not?

Nie. It would seem so.

Min. Well, does this number ‘express how many times these magnitudes contain their common measure,’ viz. a shilling?

Nie. Hardly.

Min. Did you ever meet with any *one* number that could ‘express’ *two* distinct facts?

Nie. We would rather change the subject.

Min. Very well, though there is plenty more about it, and the obscurity deepens as you go on. We will ‘vary the verse’ with a little bit of classical criticism. Look at p. 81. ‘Homologous, from the Greek ὁμοιος, like or similar, λόγος, word or reason.’ Do you think this school-inspector ever heard of the great Church controversy, where all turned on the difference between ὅμοιος and ὁμοιος?

Nie. (*uneasily*) I think not. But this is not a *mathematical* slip, you know.

Min. You are right. *Revenons à nos moutons.* Turn to p. 145, art. 65. ‘To measure areas, it is usual to take a square as unity.’ To me, who have always been accustomed to regard ‘a square’ as a concrete magnitude and ‘unity’ as a pure number, the assertion comes rather as a shock. But I acquit the author of any intentional roughness. Nothing could surpass the delicacy of the next few words:—‘It has been already stated that surfaces are measured indirectly’! Lines, of course, may be measured anyhow: *they* have no sensibilities to wound; but there is an open-handedness—a breadth of feeling—about a surface, which tells of noble birth—‘every (square) inch a King!’—and so we measure it with averted eyes, and whisper its area with bated breath!

Nie. Return to other muttons.

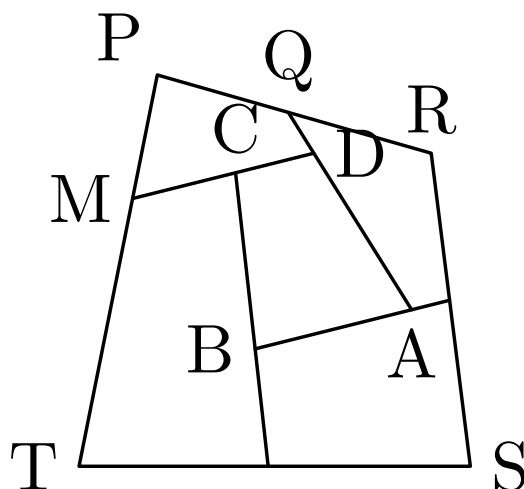

Min. Well, take p. 156. Here is a ‘scholium’ on a theorem about the area of a sector of a circle. The ‘scholium’ begins thus:—‘If α is the number of degrees in the arc of a sector, we shall have to find the length of this arc——.’ I pause to ask ‘If β were the number, should we have to find it *then*?’

Nie. (*solemnly*) We should!

Min. ‘For the two Lines which are multiplied in all rules for the measuring of areas must be referred to the same linear unity.’ *That*, I take it, is fairly obscure: but it is luminous when compared with the note which follows it. ‘If the linear unit and angular unit are left arbitrary, any angle has for measure the ratio of the numbers of linear units contained in the arcs which the angle in question and the irregular unit intercept in any circumference described from their summit as common centres.’ Is not that a useful note? ‘The irregular unit’! Linear, or angular, I wonder? And then ‘common centres’! How many centres does a circumference usually require? I will only trouble you with one more extract, as a *bonne bouche* to wind up with.

‘Th. 9. (P. 126.) *Every convex closed Line ABCD enveloped by any other closed Line PQRST is less than it.*

Quoted from *King Lear* by William Shakespeare

‘All the infinite Lines $ABCD$, $PQRST$, &c.’—by the way, these are curious instances of ‘infinite Lines’?

Nie. (*hastily*) We mean ‘infinite’ in *number*, not in *length*.

Min. Well, you express yourself oddly, at any rate ‘—which enclose the plane surface $ABCD$, cannot be equal. For drawing the straight Line MD , which does not cut $ABCD$, MD will be less than $MPQD$; and adding to both members the part $MTSRQD$, the result will be $MDQRSTM$ less than $MPQRSTM$.’ Is that result proved?

Nie. No.

Min. Is it true?

Nie. Not necessarily so.

Min. Perhaps it is a *lapsus pennæ*. Try to amend it.

Nie. If we add to MD the part $MTSRQD$, we do get $MDQRSTM$, it is true: but, if we add it to $MPQD$, we get QD twice over; that is, we get $MPQRSTM$ together with twice QD .

Min. How does that addition suit the rest of the proof?

Nie. It ruins it: all depends on our proving the perimeter $MDQRSTM$ less than the perimeter $MPQRSTM$, which this method has failed to do—as of course all methods must, the thing not being capable of proof.

Min. Then the whole proof breaks down entirely?

Nie. We cannot deny it.

Min. Let us turn to the next author.

§ 5. REYNOLDS.

‘*Though this be madness, yet there’s method in’t.*’

Quoted from *Hamlet*
by William
Shakespeare

Nie. I lay before you ‘*Modern Methods in Elementary Geometry*,’ by E. M. REYNOLDS, M.A., Mathematical Master in Clifton College, Modern Side; published in 1868.

Min. The first remark I have to make on it is, that the Definitions and Axioms are scattered through the book, instead of being placed together at the beginning, and that there is no index to them, so that the reader only comes on them by chance: it is quite impossible to refer to them.

Nie. I cannot defend the innovation.

Min. In Th. I (p. 3), I read ‘the angles CDA , CDB are together equal to two right angles. *For they fill exactly the same space.*’ Do you mean finite or infinite space? If ‘finite,’ we increase the angle by lengthening its sides: if ‘infinite,’ the idea is unsuited for elementary teaching. You had better abandon the idea of an angle ‘filling space,’ which is no improvement on Euclid’s method.

P. 61. Th. II (of Book III) it is stated that Parallelograms, on equal bases and between the same Parallels, ‘may always be placed so that their equal bases coincide,’ and it is clearly assumed that they will still be ‘between the same Parallels.’ And again, in p. 63, the altitude of a Parallelogram is defined as ‘*the perpendicular distance of the opposite side from the base,*’ clearly assuming that there is only *one* such distance. In both these passages the Theorem is assumed ‘Parallels are equidistant from each other,’ of which no proof has been given, though of course it might have been easily deduced from Th. XVI (p. 19).

The Theorems in Euc. II are here proved algebraically, which I hold to be emphatically a change for the worse, chiefly because it brings in the difficult subject of incommensurable magnitudes, which should certainly be avoided in a book meant for beginners.

I have little else to remark on in this book. Several of the new Theorems in it seem to me to be premature, e. g. Th. XIX, &c. on ‘Loci’: but the sins of *omission* are more serious. He actually leaves out Euc. I. 7, 17, 21 (2nd part), 24, 25, 26 (2nd part), 48, and II. 1, 2, 3, 8, 9, 10, 12, 13. Moreover he separates Problems and Theorems, which I hold to be a mistake. I will not trouble you with any further remarks.

§ 6. WRIGHT.

‘Defects of execution unquestionably exist.’

WRIGHT, *Pref.* p. 10

Nie. I lay before you ‘*The Elements of Plane Geometry,*’ by R. P. WRIGHT, Teacher of Mathematics in University College School, London; the second edition, 1871.

Min. Some of the changes in Euclid’s method, made in this book, are defended in the Preface.

First, he claims credit for having more Axioms than Euclid, whom he blames for having demonstrated ‘much that is obvious.’ I need hardly pause to remind you that ‘obviousness’ is not an invariable property: to a *perfect* intellect the whole of Euclid, to the end of Book XII, would be ‘obvious’ as soon as the Definitions had been mastered: but Geometricians must write for *imperfect* intellects, and it cannot be settled on general principles where Axioms should end and Theorems begin. Let us look at a few of these new Axioms. In p. viii of the Preface, I read ‘with the conception of straightness in a Line we naturally associate that of the utmost possible shortness of path between any two of its points; allow this to be assumed, &c.’ This I consider a most objectionable Axiom, obliging us, as it does, to contemplate the lengths of *curved* lines. This matter I have already discussed with M. Legendre (p. 736).

Secondly, for the host of new Axioms with which we are threatened in the Preface, I have searched the book in vain: possibly I have overlooked some, as he never uses the heading ‘Axiom,’ but really I can only find one new one, at p. 5. ‘Every angle has one, and only one bisector,’ which is hardly worth stating.

Perhaps the writer means that his proofs are not so full as those in Euclid, but take more for granted. I do not think this any improvement in a book meant for beginners.

Another change, claimed in the Preface as an improvement, is the more constant use of superposition. I have considered that point already (p. 47) and have come to the conclusion that Euclid's method of constructing a new figure has all the advantages, without the obscurity, of the method of superposition.

I see little to remark on in the general style of the book. At p. 21 I read 'the straight Line AI satisfies the four following conditions: it passes through the vertex A , through the middle point I of the base, is a perpendicular on that base, and is the bisector of the vertical angle. Now, two of these four conditions suffice to determine the straight Line AI , ... Hence a straight Line fulfilling any two of these four conditions necessarily fulfils the other two.' All this is strangely inaccurate: the fourth condition is sufficient by itself to determine the line AI .

At p. 40 I notice the startling announcement that 'the simplest of all Polygons is the *Triangle*!' This is surely a new use for 'many'? I wonder if the writer is prepared to accept the statement that '*many* people have swum across the Bosphorus' on the strength of Byron's

'As once (a feat on which ourselves we prided)
Leander, Mr. Ekenhead, and I did.'

Quoted from *Don Juan* by Lord Byron

As a specimen of the wordy and unscientific style of the writer, take the following:—

'From any point O , one, and only one, perpendicular can be drawn to a given straight Line AB .

'Let O' be the point on which O would fall if, the paper being folded along AB , the upper portion of the figure were turned down upon the lower portion. If from the points O , O' straight Lines be drawn to any point whatever I on the line AB , the adjacent angles OIB , $O'IB$ will be equal; for folding the paper again along AB and turning the upper portion down upon the lower, O falls on O' , I remains fixed, and the angle OIB exactly coincides with $O'IB$. Now in order that the Line OI may be perpendicular to AB , or, in other words, that OIB may be a right angle, the sum of the two adjacent angles OIB , $O'IB$ must be equal to two right angles, and consequently their sides IO , IO' in the same straight Line. But since we can always draw one, and only one, straight Line

between two points O and O' , it follows that from a point O we can always draw one, and only one, perpendicular to the line AB .'

Do you think you could make a more awkward or more obscure proof of this almost axiomatic Theorem?

Nie. (*cautiously*) I would not undertake it.

Min. All that about folding and re-folding the paper is more like a child's book of puzzles than a scientific treatise. I should be very sorry to be the school-boy who is expected to *learn* this precious demonstration! In such a case, I could not better express my feelings than by quoting three words of this very Theorem:—'*I remains fixed*'!

In conclusion, I may say as to all five of these authors, that they do not seem to me to contain any desirable novelty which could not easily be introduced into an amended edition of Euclid.

Nie. It is a position I cannot dispute.

Scene II.

§ 1. SYLLABUS OF THE ASSOCIATION FOR THE IMPROVEMENT OF GEOMETRICAL TEACHING. 1878.

'Nos numerus sumus.'

Quoted from *Epistles*
by Horace

Nie. The last book to be examined is Mr. Wilson's new Manual, founded on the Syllabus of the Geometrical Association.

Min. We had better begin by examining the Syllabus itself. I own that I could have wished to do this in the presence of some member of the Committee, who might have supplied a few details for what is at present little more than a skeleton, but that I fear is out of the question.

Nie. Nay, you shall not have far to seek. I am a member of the Committee.

Min. (*astonished*) You! A German professor! No such member is included in the final list of the Committee, which a friend showed me the other day.

Nie. The final list, was it? Well, ask your friend whether, since the drawing up of that list, any addition has been made: he will say 'Nobody has been added.'

Min. Quite so.

Nie. You do not understand. *Nobody*—*Niemand*—see you not?

Min. What? You mean—

Nie. (*solemnly*) I do, my friend. I have been added to it!

Min. (*bowing*) The Committee are highly honoured, I am sure.

Nie. So they ought to be, considering that I am a more distinguished mathematician than Newton himself, and that *my* Manual is better known than Euclid's! Excuse my self-glorification, but any moralist will tell you that I—I alone among men—*ought* to praise myself.

Min. (*thoughtfully*) True, true. But all this is word-juggling—a most misleading analogy. However, as you now appear in a new character, you must at least have a new name!

Nie. (*proudly*) Call me *Nostradamus*!

[*Even as he utters the mystic name, the air grows dense around him, and gradually crystallizes into living forms. Enter a phantasmic procession, grouped about a banner, on which is emblazoned in letters of gold the title 'ASSOCIATION FOR THE IMPROVEMENT OF THINGS IN GENERAL.'* Foremost in the line

marches NERO, carrying his unfinished ‘Scheme for lighting and warming Rome’; while among the crowd which follow him may be noticed—GUY FAWKES, President of the ‘Association for raising the position of Members of Parliament’—THE MARCHIONESS DE BRINVILLIERS, Inventress of the ‘Application of Alteratives to the Digestive Faculty’—and THE REV. F. GUSTRELL (the being who cut down Shakspeare’s mulberry-tree), leader of the ‘Association for the Refinement of Literary Taste.’ Afterwards enter, on the other side, Sir Isaac Newton’s little dog ‘DIAMOND,’ carrying in his mouth a half-burnt roll of manuscript. He pointedly avoids the procession and the banner, and marches past alone, serene in the consciousness that he, single-pawed, conceived and carried out his great ‘Scheme for throwing fresh light on Mathematical Research,’ without the aid of any Association whatever.]

Min. *Nostra*, the plural of *nostrum*, ‘a quack remedy’; and *damus*, ‘we give.’ It is a suggestive name.

Nos. And, trust me, it is a suggestive book that I now lay before you. ‘*Syllabus*—’.

Min. (interrupting) You mean ‘a Syllabus’, or ‘the Syllabus’?

Nos. No, no! In this railroad-age, we have no time for superfluous words! ‘*Syllabus of Plane Geometry, prepared by the Association for the Improvement of Geometrical Teaching.*’ Fourth Edition, 1877.

Min. How do you define a Right Line?

NOSTRADAMUS reads.

P. 7. Def. 5. ‘A straight line is such that any part will, however placed, lie wholly on any other part, if its extremities are made to fall on that other part.’

Min. That looks more like a *property* of a Right Line than its *essence*. Euclid makes an Axiom of that property. Of course you omit his Axiom?

Nos. No. We have the Axiom (p. 10, Ax. 2) ‘Two straight lines that have two points in common lie wholly in the same straight line.’

Min. Well! That is certainly the strangest Axiom I ever heard of! The idea of asserting, as an Axiom, that Right Lines answer to their Definition!

Nos. (bashfully) Well, you see there were several of us at work drawing up this Syllabus: and we’ve got it a little mixed: we don’t quite know which are Definitions and which are Axioms.

Min. So it appears: not that it matters much: the practical test is the only thing of importance. Do you adopt Euc. I. 14?

Nos. Yes.

Min. Then we may go on to the next subject. Be good enough to define ‘Angle.’

NOSTRADAMUS reads.

P. 8. Def. 11. ‘When two straight lines are drawn from the same point, they are said to contain, or to make with each other, a *plane angle*.’

Min. Humph! You are very particular about drawing them *from* a point. Suppose they were drawn *to* the same point, what would they make then?

Nos. An angle, undoubtedly.

Min. Then why omit that case? However, it matters little. You say ‘a plane angle,’ I observe. You limit an angle, then, to a magnitude less than the sum of two right angles.

Nos. No, I can't say we do. A little further down we assert that 'two angles are formed by two straight lines drawn from a point.'

Min. Why, these are like Falstaff's 'rogues in buckram suits'! Are there more coming?

Nos. No, we do not go beyond the sum of four right angles. These two we call *conjugate* angles. 'The greater of the two is called the *major conjugate*, and the smaller the *minor conjugate*, angle.'

Min. These Definitions are wondrous! This is the first time I ever heard 'major' and 'minor' defined. One feels inclined to say, like that Judge in the story, when a certain barrister, talking against time, insisted on quoting authorities for the most elementary principles of law, 'Really, brother, there are *some* things the Court may be assumed to know!' Any more definitions?

Nos. We define 'a straight angle.'

Min. That I have discussed already (see p. 757).

Nos. But *this*, I think, is new:—

Reads.

P. 9. Def. 12. 'When three straight Lines are drawn from a point, if one of them be regarded as lying between the other two, the angles which this one (the mean) makes with the other two (the extremes) are said to be *adjacent* angles.'

Min. That is new indeed. Let us try a figure:—

Now let us regard *OA* 'as lying between the other two.' Which are 'the angles which it makes with the other two'? For this line *OA* (which you rightly call 'the mean'—lying is always mean) makes, be pleased to observe, *four* angles altogether—two with *OB*, and two with *OC*.

Nos. I cannot answer your question. You confuse me.

Min. I need not have troubled you. I see that I can obtain an answer from the Syllabus itself. It says (at the end of Def. 11) 'when *the angle contained by two lines* is spoken of without qualification, the *minor conjugate* angle is to be understood.' Here we have a case in point, as *these* angles are spoken of 'without qualification.' So that the angles alluded to are both of them 'minor conjugate' angles, and lie on the same side of *OA*. And these we are told to call 'adjacent' angles!

Quoted from *Henry IV, Part 1* by William Shakespeare

How do you define a Right Angle?

Nos. As in Euclid.

Min. Let me hear it, if you please. You know Euclid has no major or minor conjugate angles.

NOSTRADAMUS *reads.*

P. 9. Def. 14. ‘When one straight line stands upon another straight line and makes the adjacent angles equal, each of the angles is called a *right angle*.’

Min. Allow me to present you with a figure, as I see the Syllabus does not supply one.

Here *AB* ‘stands upon’ *BC* and makes the adjacent angles equal. How do you like these ‘right angles’?

Nos. Not at all.

Min. These same ‘conjugate angles’ will get you into many difficulties.

Have you Euclid’s Axiom ‘all right angles are equal’?

Nos. Yes; only *we* propose to prove it as a Theorem.

Min. I have no objection to that: nor do I think that your treatment of angles, as a whole, is actually *illogical*. What I chiefly object to is the general ‘slipshoddity’ (if I may coin a word) of the language of your Syllabus.

Does your proof of Euc. I. 32 differ from his?

Nos. No, except that we propose Playfair’s Axiom, ‘two straight Lines that intersect one another cannot both be parallel to the same straight Line,’ as a substitute for Euc. Ax. 12.

Min. Is this your only test for the meeting of two Lines, or do you provide any other?

Nos. This is the only one.

Min. But there are cases where this is of no use. For instance, if you wish to make a Triangle, having, as *data*, a side and the two adjacent angles. Have you such a Problem?

Nos. Yes, it is Pr. 10, at p. 19.

Min. And how do you prove that the Lines will meet?

Nos. (*smiling*) We *don’t* prove it: that is the reader’s business: we only provide enunciations.

Min. You are like the *gourmand* who would eat so many oysters at supper that at last his friend could not help saying ‘They are sure to disagree with you in the night.’ ‘That is *their* affair,’ the other gaily replied. ‘*I* shall be asleep!’

Your Syllabus has the same hiatus as the other writers who have rejected Euclid’s 12th Axiom. If you will not have it as an Axiom, you ought to prove it as a Theorem. Your treatise is incomplete without it.

The Theorems contained in the first 26 Propositions of Euclid are thus re-arranged in the Syllabus. The only advantage that I can see in the new arrangement is that it places first the three which relate to Lines, thus getting all

those which relate to Triangles into a consecutive series. All the other changes seem to be for the worse, and specially the separation of Theorems from their converses, *e. g.* Props. 5, 6, and 24, 25.

13–15
4, 5
26 α
6
16
18–24
8
25
26 β
17

The third part of Prop. 29 is put after Prop. 32: and Props. 33, 34 are transposed. I can see no reason for either change.

Prop. 47 is put next before Prop. 12 in Book II. This would be a good arrangement (if it were ever proved to be worth while to abandon Euclid's order), as the Theorems are so similar; and the placing Prop. 48 next after II. 13 is a necessary result.

In Book II, Props. 9, 10 are placed after Props. 12, 13. I see no reason for it.

It does not appear to me that the new arrangements, for the sake of which it is proposed to abandon the numeration of Euclid, have anything worth mentioning to offer as an advantage.

I will now go through a few pages of 'this many-headed monster,' and make some general remarks on its *style*.

P. 4. 'A *Theorem* is the formal statement of a Proposition that may be demonstrated from known Propositions. These known Propositions may themselves be Theorems or Axioms.'

This is a truly delightful jumble. Clearly, 'a Proposition that may be demonstrated from known Propositions' is itself a Theorem. Hence a Theorem is 'the formal statement' of a Theorem. The question now arises—of itself, or of some other Theorem? That a Theorem should be 'the formal statement' of *itself*, has a comfortable domestic sound, something like 'every man his own washer-woman,' but at the same time it involves a fearful metaphysical subtlety. That one Theorem should be 'the formal statement' of *another* Theorem, is, I think, degrading to the former, unless the second will consent to act on the 'claw me, claw thee' principle, and to be 'the formal statement' of the first.

Nos. You bewilder me.

Min. Perhaps, however, it is intended that the teacher who uses this Manual should, on reaching the words 'a Proposition that may be demonstrated,' recognise the fact that this is itself 'a Theorem,' and at once go back to the beginning of the sentence. He will thus obtain a Definition closely resembling a Continued Fraction, and may go on repeating, as long as his breath holds out, or until his pupil declares himself satisfied, 'a *Theorem* is the formal statement of the formal statement of the formal statement of the——'

Nos. (*wildly*) Say no more! My brain reels!

Min. I spare you. Let us go on to p. 5, where I find the following:—

'*Rule of Conversion.* If of the hypotheses of a group of demonstrated Theorems it can be said that one must be true, and of the conclusions that no two can be true at the same time, then the converse of every Theorem of the group will necessarily be true.'

Let us take an instance:—

If $5 > 4$, then $5 > 3$.

If $5 < 2$, then $5 < 3$.

Those will do for 'demonstrated Theorems,' I suppose?

Nos. I suppose so.

Quoted from *History of the Civil War* by Samuel Daniel

Min. And the ‘hypothesis’ of the first ‘must be true,’ simply because it *is* true.

Nos. It would seem so.

Min. And it is quite clear that ‘of the conclusions no two can be true at the same time,’ for they contradict each other.

Nos. Clearly.

Min. Then it ought to follow that ‘the converse of every Theorem of the group will necessarily be true.’ Take the converse of the second, i. e.

If $5 < 3$, then $5 < 2$.

Is this ‘necessarily true’? Is every thing which is less than 3 necessarily less than 2?

Nos. Certainly not. I think you have misinterpreted the phrase ‘it can be said that one must be true,’ when used of the hypotheses. It does not mean ‘it can be said, from a knowledge of the subject-matter of some *one* hypothesis, that it *is*, and therefore must be, true,’ but ‘it can be said, from a knowledge of the mutual logical relation of *all* the hypotheses, as a question of *form* alone, and without any knowledge of their subject-matter, that one must be true, though we do not know which it is.’

Min. Your power of uttering long sentences is one that does equal honour to your head and your—lungs. And most sincerely do I pity the unfortunate learner who has to make out all that for himself! Let us proceed.

P. 9. Def. 13. ‘The *bisector* of an angle is the straight Line that divides it into two equal angles.’

This assumes that ‘an angle has one and only one bisector,’ which appears as Ax. 4, at the foot of p. 10.

P. 10. Def. 21. ‘The opposite angles made by two straight Lines that intersect &c.’

This seems to imply that ‘two Lines that intersect’ always *do* make ‘opposite angles.’

Nos. Surely they do?

Min. By no means. Look at p. 12, Def. 32, where, in speaking of a Triangle, you say ‘the intersection of the other two sides is called the vertex.’

Nos. A slip, I confess.

Min. One of many.

P. 12, Def. 31. ‘All other Triangles are called acute-angled Triangles.’ What? If a Triangle had two right angles, for instance?

Nos. But there *is* no such Triangle.

Min. *That* is a point you do not prove till we come to Th. 18, Cor. 1, two pages further on. The same remark applies to your Def. 33, in the same page. ‘The side . . . which is opposite to *the* right angle,’ where you clearly assume that it cannot have more than one.

P. 12, Def. 32. ‘When two of the sides have been mentioned, the remaining side is often called the base.’ Well, but how if two of the sides have *not* been mentioned?

Nos. In that case we do not use the word.

Min. Do you not? Turn to p. 22, Th. 2, Cor. 1, ‘Triangles on the same or equal bases and of equal altitude are equal.’

Nos. We abandon the point.

Min. You had better abandon the Definition.

P. 12, Def. 34. Is not 'identically equal' tautology? Things that are 'identical' must surely be 'equal' also. Again, 'every part of one being equal,' &c. What do you mean by 'every part' of a rectilinear figure?

Nos. Its sides and angles, of course.

Min. Then what do you mean by *Ax (b)* in p. 3. 'The whole is equal to the sum of its parts'? This time, I think I need not 'pause for a reply'!

P. 15, Def. 38. 'When a straight Line intersects two other straight Lines it makes with them eight angles etc.'

Let us count the angles at *G*. They are, the 'major' and 'minor' angles which bear the name *EGA*; do. for *EGB*; do. for *AGH*; and do. for *BGH*. That is, eight angles at *G* alone. There are sixteen altogether.

P. 17, Th. 30. 'If a quadrilateral has two opposite sides equal and parallel, it is a Parallelogram.'

This re-asserts part of its own data.

P. 17, Th. 31. 'Straight Lines that are equal and parallel have equal projections on any other straight Line; conversely, parallel straight Lines that have equal projections on another straight Line are equal.'

The first clause omits the case of Lines that are equal and in one and the same straight Line. The second clause is not true: if the parallel Lines are

at right angles to the other Line, their projections are equal, both being zero, whether the Lines are equal or not.

P. 18, Th. 32. 'If there are three parallel straight Lines, and the intercepts made by them on any straight Line that cuts them are equal, then etc.'

The subject of this Proposition is inconceivable: there are *three* intercepts, and by no possibility can these three be equal.

P. 25, Prob. 5. 'To construct a rectilinear Figure equal to a given rectilinear Figure and having the number of its sides one less than that of the given Figure.'

May I ask you to furnish me with the solution of this Problem, taking, as your 'given rectilinear Figure,' a Triangle?

Nos. (*indignantly*) I decline to attempt it!

Min. I will now sum up the conclusions I have come to with respect to your Syllabus.

In the subjects of Lines, Angles, and Parallels, the changes you propose are as follows:—

You give a very unsatisfactory Definition of a 'Right Line,' and then most illogically re-state it as an Axiom.

You extend the Definition of Angle—a most disastrous innovation.

Your Definition of 'Right Angle' is a failure.

You substitute Playfair's axiom for Euclid's 12th.

All these things are very poor compensation indeed for the vital changes you propose—the separation of Problems and Theorems, and the abandonment of Euclid's order and numeration. Restore the Problems (which are also Theorems) to their proper places, keep to Euclid's numbering (interpolating your new Propositions where you please), and your Syllabus may yet prove to be a valuable addition to the literature of Elementary Geometry.

§ 2. WILSON'S 'SYLLABUS'-MANUAL.

'No followers allowed.'

Times' advertisement-sheet, passim.

Nie. I lay before you '*Elementary Geometry, following the Syllabus prepared by the Geometrical Association,*' by J. M. WILSON, M.A., 1878.

Min. In what respects is this book a 'Rival' of Euclid?

Nie. Well, it separates Problems from Theorems—

Min. Already discussed (see p. 717).

Nie. It adopts Playfair's Axiom—

Min. Discussed (see p. 728).

Nie. It abandons diagonals in Book II—

Min. Discussed (see p. 733).

Nie. And it adopts a new sequence and numeration.

Min. *That*, of course, prevents us from taking" it as merely a new edition of Euclid. It will need very strong evidence indeed to justify its claim to set aside the sequence and numeration of our old friend. We must now examine the book *seriatim*. When we come to matters that have been already condemned, either in Mr. Wilson's book, or in the 'Syllabus,' I shall simply note the fact. We need have no new discussion, except as to new matter.

Nie. Quite so.

Min. In the 'Introduction,' at p. 2, I read '*A Theorem is the formal statement of a Proposition,*' &c. Discussed at p. 797.

At p. 3 we have the 'Rule of Conversion,' which I have already endeavoured to understand (see p. 797).

At p. 6 is a really remarkable assertion. '*Every Theorem may be shewn to be a means of indirectly measuring some magnitude.*' Kindly illustrate this on Euc. I. 14.

Nie. (*hastily*) Oh, if you pick out one single accidental excep—

Min. Well, then, take 16, if you like: or 17, or 18—

Nie. Enough, enough!

Min. (*raising his voice*)—or 19, or 20, or 21, or 24, or 25, or 27, or 28, or 30!

Nie. We abandon '*every.*'

Min. Good. At p. 8 we have the Definitions of '*major conjugate*' and '*minor conjugate*' (discussed at p. 795).

At p. 9 is our old friend the '*straight angle*' (see p. 757).

In the same page we have that wonderful triad of Lines, one of which is '*regarded as lying between the other two*' (see p. 795).

And also the extraordinary result that follows when one straight Line '*stands upon another*' (see p. 796).

At p. 27, Theorem 14, is a new proof of Euc. I. 24, apparently an amended version of Mr. Wilson's five-case proof, which I discussed at p. 773. He has now reduced it to three cases, but I still think the '*bisector of the angle*' a superfluity.

At p. 37 we have those curious specimens of '*Theorems of Equality,*' which I discussed at p. 774.

At p. 53 is the Theorem which asserts, in its conclusion, part of its own *data* (see p. 799).

At p. 54 we are told that '*parallel Lines, which have equal projections on another Line, are equal*' (see p. 800).

At p. 55 we have the inconceivable triad of '*equal intercepts*' made by a Line cutting three Parallels (see p. 800).

At p. 161 I am surprised to see him fall into a trap in which I have often seen unwary students caught, while trying to say Euc. III. 30 ('To bisect a given arc') After proving two chords equal, they at once conclude that *certain* arcs, cut off by them, are equal; forgetting to prove that the arcs in question are both *minor* arcs.

But I must go no further: I have already wandered beyond the limits of Euc. I, II. The one great merit of this book—

Nie. You have mentioned all the *faults*, then?

Min. By no means. You are too impatient. The one great merit, as I was saying, of Mr. Wilson's new book (and a most blessed change it is!) is that it ignores the whole theory of '*direction.*' That he has finally abandoned that night-mare of Elementary Geometry, I dare not hope: so all I have said about it had better stand, lest in some future fit of inspiration he should bring out a yet more agonising version of it.

But it has the usual hiatus of a system which replaces Euclid's Axiom by Playfair's: it provides no means of proving that the Lines contemplated by Euclid will meet if produced. (This I have discussed at p. 796.)

Its proposed changes in the *sequence* of Euclid I have discussed at p. 797.

It has a few other faults, which I have already discussed in Mr. Wilson's own book, and a few peculiar to the Syllabus; but I spare you such minute criticisms.

But what I have now to ask you is simply this. What possible pretext have you left for suggesting that Euclid's Manual, and specially his sequence and numeration, should be abandoned in favour of this far from satisfactory infant?

Nie. There are some new Theorems——

Min. Those constitute no reason: you might easily interpolate them.

Nie. I fear there are no other grounds to urge. But I should like to consult the *doppelgänger* of the Association before I throw up my brief.

Min. By all means.

[For a minute or two there is heard a rustling and a whispering, as of ghosts. Then NIEMAND speaks again.]

Nie. They think that, considering that this book is but just published, and that it is definitely put forward as *the* Manual to supersede Euclid, it ought to be examined more in detail, with reference to what is *new* in it—that is, new proofs of Euclid's Propositions, and new Propositions.

Min. (with a weary sigh) Very well. It will perhaps be more satisfactory to do this, if only to ascertain exactly how much this new Manual contains that is really new and really worthy of adoption. But I shall limit my examination to the subject-matter of Euc. I, II.

Nie. That is all we ask.

Min. We begin, then, at p. 12.

Theorem 1. 'All right angles are equal.' This is proved by their being halves of a 'straight angle,' a phrase which I have already criticised. There is a rather important omission in the proof, no distinction being drawn between the 'straight angle' on one side of a Line, and the other (of course named by the same letters) which lies on the other side and completes the four right angles. This Theorem, if proved without 'straight angles,' might be worth adding to a new edition of Euclid.

Th. 2 (p. 13) is Euc. I. 13, proved as in Euclid.

Th. 3 (p. 14) is Euc. I. 14, where, unfortunately, a new proof is attempted, which involves a fallacy. It is deduced from an 'Observation' in p. 9, that 'a straight Line makes with its continuation at any point an angle of two right angles,' which deduction can be effected only by the process of converting a universal affirmative '*simpliciter*' instead of '*per accidens*.'

Th. 4 (p. 14) is Euc. I. 15, proved as in Euclid.

At p. 17 I find a 'Question.' 'State the fact that "all geese have two legs" in the form of a Theorem.' This I would not mind attempting; but, when I read the additional request, to 'write down its converse theorem,' it is so powerfully borne in upon me that the writer of the Question is probably himself a biped, that I feel I must, however reluctantly, decline the task.

Th. 5 (p. 18) is Euc. I. 4, proved as in Euclid.

Th. 6 (p. 20) is Euc. I. 5, proved by supposing the vertical angle to be bisected, thus introducing a 'hypothetical construction' (see p. 718).

Th. 7 (p. 21) is Euc. I. 26 (1st part), proved by superposition. Euclid's proof, by making a new Triangle, is quite as good, I think. The areas are here proved to be equal, a point omitted by Euclid: I think it a desirable addition to the Theorem.

Th. 8 (p. 22) is Euc. I. 5, proved by reversing the Triangle and then placing it *on itself* (or on the trace it has left behind), a most objectionable method (see p. 732).

Theorems 9 to 13 (pp. 22 to 26) are Euc. I. 16, 18, 19, 20, 21, with Euclid's proofs.

Th. 14 (p. 27) is Euc. I. 24, proved by supposing an angle to be bisected: another 'hypothetical construction.'

Th. 15 (p. 28) is Euc. I. 8, for which two proofs are offered:—one by Euc. I. 24 (which seems to be reversing the natural order)—the other by an application of Euc. I. 5, a method involving *three* cases, of which only one is given. All this is to save the introduction of Euc. I. 7, a Theorem which I think should by no means be omitted. (See p. 811.) Here, as in Th. 7, the equality of the areas is, I think, a desirable addition to Euclid's Theorem.

Th. 16 (p. 29) is Euc. I. 25, with old proof.

Th. 17 (p. 30) is Euc. I. 26 (2nd part) proved by superposition instead of Euclid's method (which I prefer) of constructing a new Triangle.

Th. 18 (p. 32) is Euc. I. 17, with old proof.

Th. 19 (p. 33) is new. '*Of all the straight Lines that can be drawn from a given point to meet a given straight Line, the perpendicular is the shortest; and of the others, those making equal angles with the perpendicular are equal; and that which makes a greater angle with the perpendicular is greater than that which makes a less.*' This I think deserves to be interpolated.

Th. 20 (p. 34) is new. '*If two Triangles have two sides of the one equal to two sides of the other, each to each, and the angles opposite to two equal sides equal, the angles opposite to the other two equal sides are either equal or supplementary, and in the former case the Triangles are equal in all respects.*' I do not think it worth while to trouble a beginner with this rather obscure Theorem, which is of no practical use till he enters on Trigonometry.

Th. 21 (p. 43) is Euc. I. 27: old proof.

Th. 22 (p. 44) is Euc. I. 29 (1st part), proved by Euc. I. 27 and Playfair's Axiom (see p. 728).

Th. 23 (p. 45) is new. '*If a straight Line intersects two other straight Lines and makes either a pair of alternate angles equal, or a pair of corresponding angles equal, or a pair of interior angles on the same side supplementary; then, in each case, the two pairs of alternate angles are equal, and the four pairs of corresponding angles are equal, and the two pairs of interior angles on the same side are supplementary.*' This most formidable enunciation melts down into the mildest proportions when superfluities are omitted, and only so much of it proved as is really necessary to include the whole. Euclid proves all that is valuable in it in the course of I. 29, and I do not see any sufficient reason for stating and proving it as a separate Theorem.

Th. 23, Cor. (p. 46) is the rest of Euc. I. 29: old proof.

Th. 24 (p. 46) is Euc. I. 30, proved as a Contranomial of Playfair's Axiom.

Th. 25, 26, and Cor. (pp. 47, 48) are Euc. I. 32 and Corollaries: old proof.

Th. 27, 1st part (p. 50), is a needless repetition of part of the Corollary to Th. 23.

Th. 27, 2nd part (p. 50), is part of Euc. I. 34: old proof.

Th. 28 (p. 51) is the rest of Euc. I. 34, proved as in Euclid.

Th. 29 (p. 52) is new. '*If two Parallelograms have two adjacent sides of the one respectively equal to two adjacent sides of the other, and likewise an angle of*

the one equal to an angle of the other; the Parallelograms are identically equal.' This might be a useful *exercise* to set; but really it does not seem of sufficient importance to be selected for a Manual.

Th. 30 (p. 53) is Euc. I. 33: old proof.

Th. 31 (p. 54) is new. '*Straight Lines which are equal and parallel have equal projections on any other straight Line; conversely, parallel straight Lines which have equal projections on another straight Line are equal; and equal straight Lines, which have equal projections on another straight Line, are equally inclined to that Line.*' The first and third clauses might be interpolated, though I think their value doubtful. The second is false. (See p. 800.)

Th. 32 (p. 55) is new. '*If there are three parallel straight Lines, and the intercepts made by them on any straight Line that cuts them are equal, then the intercepts on any other straight Line that cuts them are equal.*' This is awkwardly worded (in fact, as it stands, its subject, as I pointed out in p. 800, is inconceivable), and does not seem at all worth stating as a Theorem.

At p. 57 I see an 'Exercise' (No. 5). '*Shew that the angles of an equiangular Triangle are equal to two-thirds of a right angle.*' In this attempt I feel sure I should fail. In early life I was taught to believe them equal to *two right angles*—an antiquated prejudice, no doubt; but it is difficult to eradicate these childish instincts.

Problem 1 (p. 61) is Euc. I. 9: old proof. It provides no means of finding a radius 'greater than half AB ,' which would seem to require the previous bisection of AB . Thus the proof involves the fallacy '*Petitio Principii.*'

Pr. 2 (p. 62) is Euc. I. 11, proved nearly as in Euclid.

Pr. 3 (p. 62) is Euc. I. 12, proved nearly as in Euclid. It omits to say how a 'sufficient radius' can be secured, a point not neglected by Euclid.

Pr. 4 (p. 63) is Euc. I. 10, proved nearly as in Euclid. This also, like Pr. 1, involves the fallacy '*Petitio Principii.*'

Pr. 5 (p. 64) is Euc. I. 32, proved nearly as in Euclid, but claims to use compasses to transfer distances, a Postulate which Euclid has (properly, I think) treated as a Problem. (See p. 808.)

Pr. 6, 7 (pp. 65, 66) are Euc. I. 23, 31: old proofs.

Problems 8 to 11 (pp. 66 to 69) are new. Their object is to construct Triangles with various *data*: viz. A, B , and c ; A, B , and a ; a, b , and C ; a, b , and A . They are good exercises, I think, but hardly worth interpolating as Theorems. The first of them is remarkable as one of the instances where Mr. Wilson assumes Euc. Ax. 12, without giving, or even suggesting, any proof. If he intends to assume it as an *Axiom*, he makes Playfair's *Axiom* superfluous. No Manual ought to assume *both* of them.

Theorem 1 (p. 82) is Euc. I. 35, proved as in Euclid, but incompletely, as it only treats of one out of three possible cases.

Th. 2 (p. 83) is new. '*The area of a Triangle is half the area of a rectangle whose base and altitude are equal to those of the Triangle.*' This is merely a particular case of Euc. I. 41, and may fairly be reserved till we enter on Trigonometry, where it first begins to have any practical value.

Th. 2, Cor. 1 (p. 84) is Euc. I. 37, 38: old proofs.

Th. 2, Cor. 2 (p. 84) is new. '*Equal Triangles on the same or equal bases have equal altitudes.*' No proof is offered. It is an easy deduction, of questionable value.

Th. 2, Cor. 3 (p. 84) is Euc. I. 39, 40. No proof given.

Th. 3 (p. 84) is new. ‘*The area of a trapezium [by which Mr. Wilson means ‘a quadrilateral that has only one pair of opposite sides parallel’] is equal to the area of a rectangle whose base is half the sum of the two parallel sides, and whose altitude is the perpendicular distance between them.*’ I have no hesitation in pronouncing this to be a mere ‘fancy’ Proposition, of no practical value whatever.

Th. 4 (p. 86) is Euc. I. 43: old proof.

Th. 5 (p. 87) is Euc. II. 1: old proof.

Th. 6, 7, 8 (p. 88, &c.) are Euc. II. 4, 7, 5. The sequence of Euc. II. 5, and its Corollary, is here inverted. Also the diagonals are omitted, and nearly every detail is left unproved, thus attaining a charming brevity—of *appearance!*

Th. 9 (p. 91) is Euc. I. 47: old proof.

Th. 10, 11 (pp. 94, 95) are Euc. 12, 13: old proof.

Th. 12 (p. 95) is new. ‘*The sum of the squares on two sides of a Triangle is double the sum of the squares on half the base and on the line joining the vertex to the middle point of the base.*’ This, Mr. Wilson tells us, is ‘Apollonius’ Theorem’: but, even with that mighty name to recommend it, I cannot help thinking it rather more curious than useful.

Th. 13 (p. 96) is Euc. II. 9, 10. Proved algebraically, and thus degraded from the position of a (fairly useful) geometrical Theorem to a mere addition-sum, of no more value than millions of others like it.

In the next proposition we suddenly transfer our allegiance, for no obvious reason, from Arabic to Latin numerals.

Problem I (p. 99) is Euc. I. 42: old proof.

Pr. II. (p. 100) is Euc. I. 44: proved nearly as in Euclid, but labours under the same defect as Pr. 8 (p. 66) in that it assumes, without proof, Euc. Ax. 12.

Pr. III (p. 100) is Euc. I. 45: old proof.

Pr. IV (p. 101) is Euc. II. 14: old proof.

Pr. V (p. 103) is new. ‘*To construct a rectilinear Figure equal to a given rectilinear Figure and having the number of its sides one less than that of the given figure; and thence to construct a Triangle equal to a given rectilinear Figure.*’ This I have already noticed (see p. 800). It really is not worth interpolating as a new Proposition. And its concluding clause is, if I may venture on so harsh an expression, childish: it reminds me of nothing so much as the Irish patent process for making cheap shoes—by taking boots and cutting off the tops!

Pr. VI (p. 103) is ‘*To divide a straight Line, either internally or externally, into two segments such that the rectangle contained by the given Line and one of the segments may be equal to the square on the other segment.*’ The case of *internal* division is Euc. II. 11, with the old proof. The other case is new, and worth interpolating.

I have now discussed, with as much care and patience as the lateness of the hour will permit, so much of this new Manual as corresponds to Euc. I, II, and I hope your friends are satisfied.

[*A gentle cooing, as of satisfied ghosts, is heard in the air.*]

I will now give you in a few words the net result of it all, and will show you how miserably small is the basis on which Mr. Wilson and his coadjutors of the ‘Association’ rest their claim to supersede the Manual of Euclid.

[*An angry moaning, as of ghosts suffering from neuralgia, surges round the room, till it dies away in the chimney.*]

By breaking up certain of the Propositions of Euc. I, II, and including some of the Corollaries, we get 73 Propositions in all—57 Theorems and 16 Problems. Of these 73, this Manual omits 14 (10 Theorems and 4 Problems); it proves 43 (32 Theorems and 11 Problems) by methods almost identical with Euclid's; for 10 of them (9 Theorems and a Problem) it offers new proofs, against which I have recorded my protest, one being illogical, 2 (needlessly) employing 'superposition,' 2 deserting Geometry for Algebra, and the remaining 4 omitting the diagonals in Euc. II; and finally it offers 6 new proofs, which I think may fairly be introduced as alternatives for those of Euclid.

In all this, and in all the matters previously discussed, I fail to see one atom of reason for abandoning Euclid. Have you any yet-unconsidered objections to urge against my proposal 'that the sequence and numeration of Euclid be kept unaltered'?

[*Dead silence is the only reply.*]

Carried, *nemine contragemente!* And now, Prisoner at the Bar (I beg your pardon, I should say 'Professor on the Sofa'), have you, and your attendant phantoms, any other reasons to urge for regarding this Manual as in any sense a substitute for Euclid's—as in any sense anything else than a revised edition of Euclid?

Nie. We have nothing more to say.

Min. Then I can but repeat with regard to this newborn 'follower' of the Syllabus, what I said of the Syllabus itself. Restore the Problems (which are also Theorems) to their proper places; keep to Euclid's numbering (interpolating your new Propositions where you please); and your new book may yet prove a valuable addition to the literature of Elementary Geometry.

[*A tremulous movement is seen amid the ghostly throng. They waver fitfully to and fro, and finally drift off in the direction of one corner of the ceiling. When the procession has got well under way, NIEMAND himself becomes hazy, and floats off to join them. The whole procession gradually melts away into vacancy, DIAMOND going last, nibbling at the heels of NERO, for which a pair of gorgeous Roman sandals seem to afford but scanty protection.*]

Act IV.

'*Old friends are best.*'

Quoted from *Table talk* by John Selden

[*Scene as before. Time, the early dawn. MINOS slumbering uneasily, having fallen forwards upon the table, his forehead resting on the inkstand. To him enter EUCLID on tip-toe, followed by the phantasms of ARCHIMEDES, PYTHAGORAS, ARISTOTLE, PLATO, &c., who have come to see fair play.*]

§ 1. Treatment of Pairs of Lines.

Euc. Are all gone?

Min.

Our revels now are ended: these our actors,
As I foretold you, were all spirits, and
Are melted into air, into thin air!

'Be cheerful, sir:

Quoted from *The Tempest* by William Shakespeare

Euc. Good. Let us to business. And first, have you found any method of treating Parallels to supersede mine?

Min. No! A thousand times, no! The infinitesimal method, so gracefully employed by M. Legendre, is unsuited to beginners: the method by transversals, and the method by revolving Lines, have not yet been offered in a logical form: the 'equidistant' method is too cumbrous: and as for the method of 'direction,' it is simply a rope of sand—it breaks to pieces wherever you touch it!

Euc. We may take it as a settled thing, then, that you have found no sufficient cause for abandoning either my sequence of Propositions or their numbering, and that all that now remains to be considered is whether any important modifications of my Manual are desirable?

Min. Most certainly.

Euc. Have you met with any striking novelty on the subject of a practical test for the meeting of Lines?

Min. There is *one* rival to your 12th Axiom which is formidable on account of the number of its advocates—the one usually called 'Playfair's Axiom.'

Euc. We have discussed that matter already (p. 728).

Min. But what have you to say to those who reject Playfair's Axiom as well as yours?

Euc. I simply ask them what practical test, as to the meeting of two given finite Lines, they propose to employ. Not only will they find it necessary to prove, in certain Theorems, that two given finite Lines will meet if produced, but they will even find themselves sometimes obliged to prove it of two Lines, of which the only geometrical fact known is that they possess the very property which forms the subject of my Axiom. I ask them, in short, this question:—'Given two Lines making, with a certain transversal, two interior angles together less than two right angles, how do you propose to prove, without my Axiom, that they will meet if produced?'

Min. The advocates of the 'direction' theory would of course reply, 'We can prove, from the given property, that they have different directions: and then we bring in the Axiom that Lines having different directions will meet if produced.'

Euc. All *that* you have satisfactorily disposed of in your review of Mr. Wilson's Manual.

Min. The only other substitute, that I know of, belongs to the 'equidistant' theory, which replaces your Axiom by three or four new Axioms and six new Theorems. *That* substitute, also, I have seen reason to reject.

My general conclusion is that your method of treatment of all these subjects is the best that has yet been suggested.

Euc. Any noticeable innovations in the treatment of Right Lines and Angles?

Min. Those subjects I should be glad to talk over with you.

Euc. With all my heart. And now how do you propose to conduct this our final interview?

Min. I should wish, in the first place, to lay before you the general charges which have been brought against you: then to discuss your treatment of Lines and Angles, as contrasted with that of your 'Rivals'; and lastly the omissions, alterations, and additions proposed by them.

Euc. Good. Let us begin.

Min. I will take the general charges under three headings:—Construction, Demonstration, and Style. And first as to Construction:—

§ 2. Euclid's Constructions.

I am told that you indulge too much in 'arbitrary restrictions.' Mr. Reynolds says (Pref. p. vi.) 'The arbitrary restrictions of Euclid involve him in various inconsistencies, and exclude his constructions from use. When, for instance, in order to mark off a length upon a straight Line, he requires us to describe five Circles, an equilateral Triangle, one straight line of limited, and two of unlimited length, he condemns his system to a divorce from practice at once and from sound reason.'

Euc. Mr. Reynolds has misunderstood me: I do not require all that construction in Prop. 3. To explain my meaning I must go back to Prop. 2, and I must ask your patience while I make a few general remarks on construction. The machinery I allow consists of a pencil, a ruler, and a pair of compasses to be used for drawing a Circle about a given centre and *passing through a given point* (that is what I mean by 'at any distance'), but *not* to be used for transferring distances from one part of a diagram to another *until it has been shown that such transference can be effected by the machinery already allowed.*

Min. But why not allow such transference without proving that possibility?

Euc. Because it would be introducing as a *Postulate* what is really a *Problem*. And I go on the general principle of never putting a *Problem* among my *Postulates*, nor a *Theorem* among my *Axioms*.

Min. I heartily agree in your general principle, though I need scarcely remind you that it has been frequently charged against you, as a *fault*, that you state as an *Axiom* what is really a *Theorem*.

Euc. That charge has been met (see p. 728). To return to my subject. I merely prove, once for all, in Prop. 2, that a Line *can* be drawn, from a given point, and equal to a given Line, by the original machinery alone, and *without* transferring distances. After that, my reader is welcome to transfer a distance by any method that comes handy, such as a bit of string &c.: and of course he may now transfer his compasses to a new centre. And this is all I expect him to do in Prop. 3.

Min. Then you *don't* expect these five Circles &c. to be drawn whenever we have to cut off, from one Line, a part equal to another?

Euc. *Pas si bête, mon ami.*

Min. Some of your Modern Rivals are, however, a little discontented with the very scanty machinery you allow.

Euc. 'A bad workman always quarrels with his tools.'

Min. Their charge against you is 'the exclusion of hypothetical constructions.' Mr. Wilson says (Pref. p. i.) 'The exclusion of hypothetical constructions may be mentioned as a self-imposed restriction which has made the confused order of his first book necessary, without any compensating advantage.'

Euc. In reply, I cannot do better than refer you to Mr. Todhunter's Essay on Elementary Geometry (p. 186). 'Confused order is rather a contradictory expression,' &c. (see p. 241).

Min. Your reply is satisfactory. Mr. Wilson himself is an instance of the danger of such a method. Three times at least (pp. 46, 70, 88) he produces Lines to meet without attempting to prove that they *will* meet.

§ 3. Euclid's Demonstrations.

Min. The next heading is 'Demonstration.' You are charged with an 'invariably syllogistic form of reasoning.' (Wilson, Pref. p. i.)

Euc. Do you know, I am vain enough to think that a merit rather than a defect? Let me quote what Mr. Cuthbertson says on this point (Pref. p. vii.). 'Euclid's mode of demonstration, in which the conclusion of each step is preceded by reasoning expressed with all the exactness of the minor premiss of a syllogism, of which some previous proposition is the major premiss, has been adopted as offering a good logical training, and also as being peculiarly adapted for teaching large classes, rendering it possible for the teacher to call first upon one, then upon another, and so on, to take up any link in the chain of argument.' Perhaps even Mr. Wilson's own book would not be the worse if the reasoning were a *trifle* more 'syllogistic'!

Min. A fair retort. You are also charged with 'too great length of demonstration.' Mr. Wilson says (Pref. p. i.) 'The real objections to Euclid as a text-book are . . . the length of his demonstrations.' And Mr. Cooley says (Pref. p. 1.) 'The important and fertile theorems, which crown the heights in this field of knowledge, are here all retained, and those only are omitted which seem to be but the steps of a needlessly protracted ascent. The short road thus opened will be found perfectly solid in construction, and at the same time far less tedious and fatiguing than the circuitous one hitherto in vogue.'

Euc. I think Mr. Wilson's Th. 17 (p. 27), with its five figures (all necessary, though he only draws one), and still more his marvellous Problem, 'approached by four stages,' which fills pages 69 to 72, are pretty good instances of lengthy demonstration. And Mr. Cooley's 'short and solid road' contains, if I remember right, a rather break-neck crevasse!

Min. The next charge against you is 'too great *brevity* of demonstration.' Mr. Leslie (a writer whom I have not thought it necessary to review as a 'Modern Rival,' as his book is nearly seventy years old) says (Pref. p. vi.) 'In adapting it' (the Elements of Euclid) 'to the actual state of the science, I have . . . sought to enlarge the basis . . . The numerous additions which are incorporated in the text, so far from retarding will rather facilitate progress, by rendering more continuous the chain of demonstration. To multiply the steps of ascent, is in general the most expeditious mode of gaining a summit.'

Euc. I think you had better refer him to Mr. Wilson and Mr. Cooley: they will answer *him*, and he in his turn will confute *them*!

Min. The last charge relating to demonstration is, in Mr. Wilson's words (Pref. p. viii.) 'the constant reference to general Axioms and general Propositions, which are no clearer in the general statement than they are in the particular instance,' which practice, he says, makes the study of Geometry 'unnecessarily stiff, obscure, tedious and barren.'

Euc. One advantage of making a general statement, and afterwards referring to it instead of repeating it, is that you have to go through the mental process of affirming or proving the truth *once for all*: apparently Mr. Wilson would have you begin *de novo* and think out the truth every time you need it! But the great reason for always referring back to your universal, instead of affirming the particular (Mr. Wilson is merely starting the old logical hare 'Is the syllogism a *Petitio Principii*?'), is that the truth of the particular does not rest on any data peculiar to itself, but on general principles applicable to all similar cases;

and that, *unless those general principles prove the conclusion for all cases, they cannot be warranted to prove it for any one selected case.* If, for instance, I see a hundred men, and am told that some assertion is true of ninety-nine of them, but am *not* told that it is true of *all*, I am not justified in affirming it of any selected man; for he *might* chance to be the excepted one. Now the assertion, that the truth of the particular case under notice depends on general principles, and not on peculiar circumstances, is neither more nor less than the assertion of the *universal* affirmative which Mr. Wilson deprecates.

§ 4. Euclid's Style.

Min. Quite satisfactory. I will now take the third heading, namely 'Style.'

You are charged with Artificiality, Unsuggestiveness, and Want of Simplicity. Mr. Wilson says (Pref. p. i.) 'The real objections to Euclid as a text-book are his artificiality . . . and his unsuggestiveness,' and again, 'he has sacrificed, to a great extent, simplicity and naturalness in his demonstrations, without any corresponding gain in grasp or cogency.'

Euc. Well, really I cannot deal with general charges like these. I prefer to abide by the verdict of my readers during these two thousand years. As to 'unsuggestiveness,' that is a charge which cannot, I admit, be retorted on Mr. Wilson: his book is *very* suggestive—of remarks which, perhaps, would not be *wholly* 'music to his ear'!

§ 5. Euclid's treatment of Lines and Angles.

Min. Let us now take the subjects of Right Lines and Angles; and first, the 'Right Line.'

I see, by reference to the original, that you define it as a Line 'which lies evenly as to points on it.' That of course is only an attempt to give the mind a grasp of the idea. It leads to no geometrical results, I think?

Euc. No: nor does *any* definition of it, that I have yet seen.

Min. I have no rival Definitions to propose. Mr. Wilson's 'which has the same direction at all parts of its length' has perished in the collapse of the 'direction' theory: and M. Legendre's 'the shortest course from one point to another' is not adapted for the use of a beginner. And I do not know that any change has been suggested in your test of a right Line in Prop. 14.

The next subject is 'Angles.'

Your definition would perhaps be improved, if for 'inclination to' we were to read 'declination from,' for, the greater the angle the greater the *declination*, and the less (as it seems to me) the *inclination*.

Euc. I agree with you.

Min. The next point is that you limit the size of an angle to something less than the sum of two right angles.

Euc. What advantage is claimed for the extension of the Definition?

Min. It is a prospective rather than an immediate one. It must be granted you that the larger angles are not needed in the first four Books—

Euc. In the first *six* Books.

Min. Nay, surely you need them in the Sixth Book?

Euc. Where?

Min. In Prop. 33, where you treat of ‘any equimultiples whatever’ of an angle, of an arc, and of a sector. You cannot possibly assume the multiple angle to be always less than two right angles.

Euc. You think, then, that a multiple of an angle must itself be an angle?

Min. Surely.

Euc. Then a multiple of a man must itself be a man. If I contemplate a man as multiplied by the number ten thousand, I must realise the idea of a man ten thousand times the size of the first?

Min. No, you need not do *that*.

Euc. Thanks: it *is* rather a strain on the imaginative faculty.

Min. You mean, then, that the multiple of an angle may be conceived of as so many separate angles, not in contact, nor added together into one?

Euc. Certainly.

Min. But you have to contemplate the case where two such angular magnitudes are equal, and to infer from that, by III. 26, that the subtending arcs are equal. How can you infer this when your angular magnitude is not one angle but many?

Euc. Why, the sum total of the first set of angles is equal to the sum total of the second set. Hence the second set can clearly be broken up and put together again in such amounts as to make a set equal, each to each, to the first set: and then the sum total of the arcs, and likewise of the sectors, will evidently be equal also.

But if you contemplate the multiples of the angles as single angular magnitudes, I do not see how you prove the equality of the subtending arcs: for *my* proof applies only to cases where the angle is less than the sum of two right angles.

Min. That is very true, and you have quite convinced me that we ought to observe that limit, and not contemplate ‘angles of rotation’ till we enter on the subject of Trigonometry.

As to right angles, it has been suggested that your Axiom ‘all right angles are equal to one another’ is capable of proof as a Theorem.

Euc. I do not object to the interpolation of such a Theorem, though there is very little to distinguish so simple a Theorem from an Axiom.

Min. Let us now consider the omissions, alterations, and additions, which have been proposed by your Modern Rivals.

§ 6. Omissions, alterations, and additions, suggested by Modern Rivals.

Euc. Which of my Theorems have my Modern Rivals proposed to omit?

Min. Without dwelling on such extreme cases as that of Mr. Pierce, who omits no less than 19 of the 35 Theorems in your First Book, I may say that the only two, as to which I have found anything like unanimity, are I. 7 and II. 8.

Euc. As to I. 7, I have several reasons to urge in favour of retaining it.

First, it is useful in proving I. 8, which, without it, is necessarily much lengthened, as it then has to include *three* cases: so that its omission effects little or no saving of space.

Secondly, the modern method of proving I. 8 independently leaves I. 7 still unproved.

Min. That reason has no weight unless you can prove I. 7 to be valuable for itself.

Euc. True, but I think I *can* prove it; for, thirdly, it shows that, of all plane Figures that can be made by hingeing rods together, the *three*-sided ones (and these only) are *rigid* (which is another way of stating the fact that there cannot be *two* such figures on the same base). This is analogous to the fact, in relation to solids contained by plane surfaces hinged together, that *any* such solid is rigid, there being no maximum number of sides.

And fourthly, there is a close analogy between I. 7, 8 and III. 23, 24. These analogies give to Geometry much of its beauty, and I think that they ought not to be lost sight of.

Min. You have made out a good case. Allow me to contribute a 'fifthly.' It is one of the very few Propositions that have a direct bearing on practical science. I have often found pupils much interested in learning that the principle of the rigidity of Triangles is of constant use in architecture, and even in so homely a matter as the making of a gate.

The other Theorem which I mentioned, II. 8, is now so constantly ignored in examinations that it is very often omitted, as a matter of course, by students. It is believed to be extremely difficult and entirely useless.

Euc. Its difficulty has, I think, been exaggerated. Have you tried to teach it?

Min. I *have* occasionally found pupils amiable enough to listen to what they felt sure would be of no service in examinations. My experience has been wholly among undergraduates, any one of whom, if of average ability, would, I think, master it in from five to ten minutes.

Euc. No very exorbitant demand on your pupil's time. As to its being 'entirely useless,' I grant you it is of no *immediate* service, but you will find it eminently useful when you come to treat the Parabola geometrically.

Min. That is true.

Euc. Let us now consider the new methods of proof suggested by my Rivals.

Min. Prop. 5 has been much attacked—I may say trampled on—by your Modern Rivals.

Euc. Good. So that is why you call it 'The Asses' Bridge'? Well, how many new methods do they suggest for crossing it?

Min. One is 'hypothetical construction,' M. Legendre bisecting the base, and Mr. Pierce the vertical angle, but without any proof that the thing can be done.

Euc. So long as we agree that beginners in Geometry shall be limited to the use of Lines and Circles, so long will it be unsafe to assume a point as found, or a Line as drawn, merely because we are sure it *exists*. For example, it is axiomatic, of course, that every angle has a bisector: but it is equally obvious that it has two trisectors: and if I may assume the one as drawn, why not the others also? However we have discussed this matter already (p. 718).

Min. A second method is 'superposition,' adopted by Mr. Wilson and Mr. Cuthbertson—a method which here involves the *reversing* of the triangle, before applying it to its former position.

Euc. That also we have discussed (p. 732). What is the method adopted in the new Manual founded on the Syllabus of the Association?

Min. The same as Mr. Pierce's. Mr. Reynolds has a curious method: he treats the sides as obliques 'equally remote from the perpendicular.'

Euc. Curious, indeed.

Min. But perhaps the most curious of all is Mr. Willock's method: *he* treats the sides as radii of a circle, and the base as a chord.

Euc. He had better have made them asymptotes of a hyperbola at once! *C'est magnifique, mais ce n'est pas la—Géométrie.*

Min. Two of your Rivals prove Prop. 8 from Prop. 24.

Euc. 'Putting the cart before the horse,' in my humble opinion.

Min. For a brief proof of Prop. 13, let me commend to your notice Mr. Reynolds'—consisting of the seven words 'For they fill exactly the same space.'

Euc. Why so lengthy? The word 'exactly' is superfluous.

Min. Instead of your chain of Theorems, 18, 19, 20, several writers suggest 20, 19, 18, making 20 axiomatic.

Euc. That has been discussed already (p. 737).

Min. Mr. Cuthbertson's proof of Prop. 24 is, if I may venture to say so, more complete than yours. He constructs his diagram without considering the lengths of the sides, and then proves the 3 possible cases separately.

Euc. I think it an improvement.

Min. There are no other noticeable innovations, that have not been already discussed, except that Mr. Cuthbertson proves a good deal of Book II by a quasi-algebraical method, without exhibiting to the eye the actual Squares and Rectangle: while Mr. Reynolds does it by pure algebra.

Euc. I think the actual Squares, &c. most useful for beginners, making the Theorems more easy to understand and to remember. *Algebraical* proofs of course introduce the difficulty of 'incommensurables.'

Min. We will now take the new Propositions, &c. which have been suggested. Here is an Axiom:—'*Two lines cannot have a common segment.*'

Euc. Good. I have tacitly assumed it, but it may as well be stated.

Min. Several new Theorems have been suggested, but only two of them seem to me worth mentioning. They are:—
'*All right angles are equal.*'

Euc. I have already approved of that (p. 811).

Min. The other is one that is popular with most of your Rivals:—
'*Of all the Lines which can be drawn to a Line from a point without it, the perpendicular is least; and, of the rest, that which is nearer to the perpendicular is less than one more remote; and the lesser is nearer than the greater; and from the same point only two equal Lines can be drawn to the other Line, one on each side of the perpendicular.*'

Euc. I like it on the whole, though so long an enunciation will be alarming to beginners. But it is strictly analogous to III. 7. Introduce it by all means in the revised edition of my Manual. It will be well, however, to lay it down as a general rule, that no Proposition shall be so interpolated, unless it be of such importance and value as to be thought worthy of being quoted as proved, in the same way in which candidates in examinations are now allowed to quote Propositions of mine.

Min. (*with a fearful yawn*) Well! I have no more to say.

§ 7. The summing-up.

Euc. 'The cock doth crow, the day doth daw,' and all respectable ghosts ought to be going home. Let me carry with me the hope that I have convinced you of

Quoted from *The Wife of Usher's Well*

the importance, if not the necessity, of retaining my order and numbering, and my method of treating straight Lines, angles, right angles, and (most especially) Parallels. Leave me these untouched, and I shall look on with great contentment while other changes are made—while my proofs are abridged and improved—while alternative proofs are appended to mine—and while new Problems and Theorems are interpolated.

In all these matters my Manual is capable of almost unlimited improvement.

[*To the sound of slow music, EUCLID and the other ghosts 'heavily vanish,' according to Shakespeare's approved stage-direction. MINOS wakes with a start, and betakes himself to bed, 'a sadder and a wiser man.'*]

Quoted from *The Tempest* by William Shakespeare

Quoted from *The Rime of the Ancient Mariner* by Samuel Taylor Coleridge

Appendix III.

Proof that, if any one Proposition of Table II be granted as an Axiom, the rest can be deduced from it. (See pp. 725, 728.)

"... and so we make it quite a merry-go-rounder." I was obliged to consider a little before I understood what Mr. Peggotty meant by this figure, expressive of a complete circle of intelligence.

Quoted from *David Copperfield* by Charles Dickens

It is to be proved that, if any one of the Propositions of Table II be granted, the rest can be proved.

It is assumed that the lesser of two unequal finite magnitudes of the same kind may be multiplied so as to exceed the greater.

Euclid I, 1 to 28, is assumed as proved.

It is assumed that, where two Propositions are Contranominals, so that each can be proved from the other, it is not necessary to include *both* in the series of proofs.

Lemma 1.

A Pair of Lines, of which one contains two points equidistant from the other, have a common perpendicular.

Let AB contain 2 points E, F , equidistant from CD . From E, F , draw $EG, FH, \perp CD$; bisect GH in K , and EF in L , and join KL .

Now $EG = FH$;

[*hyp.*

hence, if the diagram be reversed, and so placed on its former traces that G coincides with H , and H with G , K retaining its position, GE coincides with HF , and HF with GE ;

$\therefore E$ coincides with F , and F with E ;

$\therefore L$ retains its position;

$\therefore \angle GKL$ coincides with $\angle HKL$, and is equal to it;

$\therefore \angle$ s at K are right.

Similarly \angle s at L are right.
Therefore a Pair of Lines, &c.

Q. E. D.

(α). II. 1.

A Pair of separational Lines are equally inclined to any transversal.

[N.B. The Contranomial of this will be proved at the end of the series.]

(β). II. 16 (a).

Two intersecting Lines cannot both be separational from the same Line.

Let AEB, GEH be two intersecting Lines, and CD another Line. It is to be proved that they cannot both be separational from CD .

In CD take any point F ; and join EF .

Now, if possible, let AB, GH both be separational from CD ;

$\therefore \angle$ s AEF, GEF are both equal to $\angle EFD$;

[(α).

\therefore they are equal to each other; which is absurd.

Therefore two intersecting Lines &c.

Q. E. D.

(γ) II. 6.

A Pair of separational Lines are equidistantial from each other.

Let AB, CD be separational Lines: it shall be proved that they are equidistantial from each other.

In AB take any 2 points E, F ; and draw $EG, FH, \perp CD$.

Now, if $FH > EG$, from it cut off KH equal to EG ; and join EK ;

then, $\therefore EG = KH$,

$\therefore EK, CD$ have a common perpendicular;

[Lemma 1.

$\therefore EK$ is separational from CD ;

[Euc. I. 27.

$\therefore AB, EK$, intersecting Lines, are both separational from CD ; which is absurd;

[(β).

$\therefore FH$ is not $> EG$.

Similarly it may be proved that EG is not $> FH$.

Therefore $EG = FH$.

Similarly it may be proved that any 2 points in AB are equidistant from CD , and that any 2 points in CD are equidistant from AB .

Therefore AB, CD are equidistantial from each other.

Therefore a Pair &c.

Q. E. D.

(δ). II. 11.

A Pair of Lines, which are equally inclined to a certain transversal, are equidistantial from each other.

A Pair of Lines, which are equally inclined to a certain transversal, are separational; [Euc. I. 27.

also a Pair of separational Lines are equidistantial from each other; [(γ).

\therefore a Pair of Lines, &c.

Q. E. D.

(ε) II. 8.

Through a given point, without a given Line, a Line may be drawn such that the two Lines are equidistantial from each other.

For, if through the given point there be drawn a transversal, there can also be drawn through it a Line such that the two Lines make equal \angle s with the transversal; [Euc. I. 23.

and this Line will be such that the two Lines are equidistantial from each other.

[(δ).

Therefore, &c.

Q. E. D.

(ζ). II. 17.

A Line cannot recede from and then approach another; nor can one approach and then recede from another on the same side of it.

If possible, let ABC first recede from, and then approach, DE ; that is, let the perpendicular BG be $>$ each of the two perpendiculars AF, CH .

From GB cut off $GK >$ each of the two, AF, CH .

Now a Line may be drawn, through K , equidistantial from DE ; [(ε).

and the points A, C will lie on the side of it next to DE , and B on the other side;

\therefore it will cut AB between A and B , and BC between B and C .

Let L, M be the points of intersection; and join LM ;

\therefore the 2 Lines LBM, LKM contain a space; which is absurd.

Similarly it may be proved that ABC cannot first approach and then recede from DE on the same side of it.

Therefore a Line &c.

Q. E. D.

(η). II. 13.

A Pair of Lines, of which one has two points on the same side of, and equidistant from, the other, are equidistantial from each other.

Let AB contain two points E, F , equidistant from CD . From E, F , draw $EG, FH, \perp CD$; bisect GH in K , and EF in L , and join KL .

Now $EG = FH$; [hyp.]

hence, if the diagram be reversed, and so placed on its former traces that G coincides with H , and H with G , K retaining its position, GE coincides with HF , and HF with GE ;

$\therefore E$ coincides with F , and F with E ;

$\therefore L$ retains its position;

\therefore , if there be a point in LA whose distance is $< LK$, there is another such point in LB , and the Line AB will first recede from and then approach CD ; which is absurd. [(C)].

Similarly if there be one whose distance is $> LK$.

$\therefore AB$ is equidistant from CD .

Similarly it may be proved that CD is equidistant from AB .

Therefore a Pair of Lines, &c.

Q. E. D.

Lemma 2.

Through a given point may be drawn a common perpendicular to a given Pair of Lines, of which each is equidistant from the other.

Let AB, CD be the given Pair of Lines.

Through the given point draw a Line perpendicular to AB , and let it meet AB in L . In AB take any 2 points E, F , equidistant from L . From E, F , draw EG, FH , perpendicular to CD . Bisect GH at K ; and join KL .

Now E, F are 2 points, in AB , equidistant from CD ; and GH is bisected in K , and EF in L ;

$\therefore KL$ is a common perpendicular; [Lemma 1.]

\therefore it coincides with the Line drawn, through the given point, perpendicular to AB , since both meet AB at L ;

$\therefore KL$ is the Line required.

Q. E. F.

(θ). II. 9.

A Pair of Lines, of which one has two points on the same side of, and equidistant from, the other, are equally inclined to any transversal.

Let AB contain two points equidistant from CD , and let EF be a certain transversal: it shall be proved that $\angle AEF = \angle EFD$.

Now AB, CD , are equidistantial from each other. [(η)].

Bisect EF at G ; through G let HGK be drawn a common perpendicular to AB and CD . [Lemma 2.]

Hence, in Triangles GEH, GFK , side GE and $\angle s$ EGH, GHE , are respectively equal to side GF and $\angle s$ FGK, GKF ;

$\therefore \angle GEH = \angle GFK$. [Euc. I. 26.]

Therefore a Pair of Lines, &c. Q. E. D.

(κ). II. 3.

Through a given point, without a given Line, a Line may be drawn such that the two Lines are equally inclined to any transversal.

Take a second point, on the same side of the given Line and at the same distance from it; and join the 2 points.

Then the Line, so drawn, and the given Line, are equally inclined to any transversal. [(θ)].

Therefore through a given point, &c. Q. E. D.

(λ). II. 18 (b).

The angles of a Triangle are together equal to two right angles.

Let ABC be a Triangle. It is to be proved that its 3 angles are together equal to 2 right angles.

Through A let DAE be drawn, such that DAE, BC are equally inclined to any transversal. [(κ)].

Then $\angle B = \angle DAB$, and $\angle C = \angle EAC$;

$\therefore \angle s$ $B, C, BAC = \angle s$ DAB, EAC, BAC ;

$= 2$ rt $\angle s$.

Therefore the angles &c.

[Euc. I. 13.]

Q. E. D.

(μ). II. 4.

A Pair of Lines, which are equally inclined to a certain transversal, are so to any transversal.

Let AB, CD be equally inclined to EF ; and let GH be any other transversal. It shall be proved that they are equally inclined to GH .

Join EH .

Because \angle s of Triangle EFH together = 2 rt \angle s, and likewise those of Triangle EGH , [(λ)].

\therefore angles of Figure FG together = 4 rt angles;

also, by hypothesis, \angle s GEF, EFH together = 2 rt \angle s;

\therefore remaining \angle s EGH, GHF together = 2 rt \angle s;

$\therefore AB, CD$ are equally inclined to GH .

Therefore a Pair of Lines, &c.

Q. E. D.

Contranominal of (α). II. 2.

A Pair of Lines, which make with a third Line two interior angles, on one side of it, together less than two right angles, will meet on that side if produced.

Let ABC, DEF be two Triangles such that \angle s, A, D are equal, and DE, DF equimultiples of AB, AC .

From DE cut off successive parts equal to AB ; and let the points of section be G, H . At G, H make \angle s equal to $\angle E$.

Then the Lines, so drawn, are separational from EF and from one another; [Euc. I. 28.

\therefore these Lines meet DF between D and F ; call these points K, L .

At G, H make \angle s equal to $\angle D$.

Then the Lines, so drawn, are separational from DF ;

\therefore they respectively meet HL between H and L , and EF between E and F ; call these points M, N .

Because Triangles DGK, GHM, HEN are on equal bases and have their base- \angle s respectively equal,

$\therefore DK, GM, HN$ are equal.

[Euc. I. 26.

Join GL .
 Because DL, GM are equally inclined to DE ,
 \therefore they are equally inclined to GL ; [[(μ)].
 $\therefore \angle s KLG, LGM$ are equal.
 Similarly, $\therefore GK, HL$ are equally inclined to DE ,
 \therefore they are equally inclined to GL ;
 $\therefore \angle s KGL, GLM$ are equal.
 Because Triangles LGK, GLM are on same base LG and have their base- $\angle s$ respectively equal,
 $\therefore KL = GM$, i. e. $= DK$. [I. 26.
 Similarly it may be proved that $LF = HN$, i. e. $= DK$.
 Hence DE, DF are equimultiples of DG, DK , i. e. of AB, DK ;
 but they are also equimultiples of AB, AC ;
 $\therefore DK = AC$.
 Because Triangles ABC, DGK have $\angle s A, D$ equal, and AB, AC respectively equal to DG, DK ,
 $\therefore \angle s B, DGK$ are equal, and likewise $\angle s C, DKG$. [I. 4.
 Because GK, EF are equally inclined to DE ,
 \therefore they are equally inclined to DF ; [[(μ)].
 i. e. $\angle s DKG, DFE$ are equal;
 $\therefore \angle s B, C$ are respectively equal to $\angle s E, F$.
 Hence, two Triangles, which have their vertical angles equal, and the 2 sides of the one respectively equimultiples of those of the other, have their base-angles respectively equal.

Now let AB, CD make with AC two interior $\angle s BAC, ACD$ together < 2 right $\angle s$. It shall be proved that they will meet if produced towards B, D .
 In CD take any point D . Join AD . At A make $\angle DAH$ equal to $\angle CDA$.
 Hence AH, CD are equally inclined to all transversals; [[(μ)].
 $\therefore \angle s HAC, ACD$ together $= 2$ right $\angle s$;
 \therefore they together $> \angle s BAC, ACD$;

$\therefore \angle HAC > \angle BAC$, i. e. $\angle HAD > \angle BAD$;⁵

$\therefore \angle CDA > \angle BAD$.

At D , in Line DA , make an \angle equal to $\angle BAD$;

then the Line, so drawn, will fall within $\angle CDA$, and will meet CA between C and A . Call this point K .

In CA produced take CL a multiple of CK , and $> CA$. And in CD produced take CM the same multiple of CD that CL is of CK . And join LM .

Because Triangles CKD , CLM have a common vertical \angle , and the 2 sides of the one respectively equimultiples of those of the other,

\therefore , by what has been already proved, \angle s CKD , CLM are equal.

Because AB , KD are equally inclined to AD ,

\therefore they are equally inclined to CL ;

$[(\mu)]$.

$\therefore \angle CAB = \angle CKD$ i. e. $= \angle CLM$;

$\therefore AB$ is separational from LM ;

[Euc. I. 28.

\therefore if produced, it will meet CM .

Therefore a Pair of Lines, &c.

Reviews of ‘Euclid and his Modern Rivals,’ with the Author’s remarks thereon.

From the ‘English Mechanic and World of Science,’ May 2, 1879.

After serving for upwards of two thousand years as essentially the standard text-book, and as an unsurpassable and unsurpassed system of mathematical gymnastics to millions, it has been found or asserted in these latter days that the ‘Elements of Geometry’ of the mighty Alexandrian are deficient in some of the most rudimentary qualifications that they have been heretofore conceived to possess; and that the sooner they are remodelled or superseded altogether the better for the rising generation of mathematicians, and for the cause of education generally. Thus it has come to pass that Legendre among the French; Pierce, Chauvenet, and Loomis among the Americans; and Cooley, Cuthbertson, Morell, Reynolds, Willock, Wilson, and Wright among our own country-men, have each and everyone embodied his own idea of the way in which geometry should be taught, in treatises designed to supplant Euclid’s time-honoured work entirely. Nay, lest the authority of any individual should fail to prevail against that of the great Greek geometer, an Association for the Improvement of Geometrical Teaching has been formed, and, under Mr. Wilson’s editorship, has issued a ‘Syllabus Manual’ of its own.

Now it is to combat the views propounded by the authors whom we have just named, and to show what indifferent substitutes they have provided for the book they attack, that Mr. Dodgson’s remarkable work has been written—a work which takes the astonishing form of a drama in four acts and ten scenes! with six appendices, four of them bristling with formulæ. The argument of the play (if play it can be called) is briefly this: A college examiner, Minos, utterly wearied out by marking papers containing the most heterogeneous and illogical ‘proofs’ of the same theorem, falls asleep over his work; and to him appears the phantasm of Euclid himself. In the course of the conversation which ensues Euclid stoutly defends his own method of treatment and arrangement of propositions. The dramatic interest of this, by the way, is rather marred by the introduction of a somewhat repulsive symbolism (involving perpetual reference to the pages on which it is first explained), the notion of which is obviously taken from one of the common text-books on logic; but, putting this on one side, the ideas intended to be conveyed are clearly and definitely expressed, and Euclid quite holds his own. ‘Audi alteram partem,’ however, and it becomes necessary that Minos should hear what the modern rivals of the great Alexandrian have to say for themselves. But they being still in the flesh, the spirit of a certain German Professor, Niemand, is sent, who produces their works and acts as their

advocate *seriatim*. We cannot, we confess, congratulate those whom we may provisionally call the heterodox party on the strength of this spiritual champion of theirs, whose advocacy strongly suggests to us the old story of the youthful and nervous barrister, who, after stammering out three or four times, 'My lord, my unfortunate client; I say, my lord, my unfortunate client,' was summarily arrested by the exclamation of the judge, 'Go on, Mr. Smith; so far the Court is quite with you.' Herr Niemand being in truth but a kind of straw giant set up by our author merely to be knocked down again. We should really prefer to hear the personal replies of Messrs. Cuthbertson and Wilson to Mr. Dodgson's attack on their principles and methods, rather than those of their ghostly representative. It seems to us that they might one or both take much more formidable objections to certain pieces of hypercriticism on the part of 'Minos' than the spirit of the German professor does on their behalf.

On the whole, though, we regard our author as having triumphantly proved that, so far, no work has been produced which is comparable with Euclid's immortal 'Elements,' as an introduction to geometry for *beginners*. Legendre's proofs, for example, are very beautiful, but he treats of parallels by methods involving infinite series; a method presupposing a kind and amount of knowledge not ordinarily possessed by lads at the age at which they usually begin the study of Euclid. The chief points on which Mr. Dodgson is at issue with the innovators are the separation of problems and theorems; the substitution of Playfair's Axiom for Euclid's XIIth one; the treatment of parallels by (*a*) angles made with transversals; (*b*) by equidistances; and (*c*) by direction, as contradistinguished from the Euclidean method. He further assails the modern treatment of lines and angles; and the attacks on Euclid's style, constructions, and demonstrations. He is particularly severe upon Mr. Wilson for the manner in which he handles the subjects of angles, the direction of lines, and parallels; and there can be no doubt that he does convict that writer both of logical inaccuracy and of loose writing, both defects fatal to a book claiming to supersede the time-honoured 'Elements.' Mr. Cuthbertson, too, by no means comes unscathed out of the fray; while our author points out how Mr. Morell and others have proved 'theorems' by illogical processes which furnish no proofs at all! His chief praise is given to the American books; but these he shows possess the cardinal fault of inapplicability to rudimentary instruction, however elegant and adapted to the advanced student their mode of treatment may be. In two out of his six appendices, he invokes the high authority of Mr. Todhunter and of the late Professor De Morgan, in favour of the views he has been advocating; and the testimony they give is as valuable as it is unhesitating. The remaining appendices call for no especial notice.

We fear that the brief account which we have given of Mr. Dodgson's curious book must convey but an imperfect idea of its contents. This, however, has its origin in the nature of the work itself, which is indescribable, save at a length to which our limited space prevents us from extending this notice. It is essentially a book to be carefully and deliberately read, as it doubtless will be by everyone interested in the teaching of geometry. Here and there the author has his adversaries unmistakably on the hip; in other places, we must repeat our impression that Herr Niemand has scarcely done so much for his clients as they might fairly have been expected to do for themselves. That the writers attacked will, some of them, reply to their assailant may only reasonably be expected; and we shall look forward with no little interest to any response which one

or more of them may make. Meanwhile, we may reiterate our conviction that Mr. Dodgson has shown irrefragably that, whatever merits individual works may possess, there has not as yet appeared one destined to supplant Euclid's 'Elements of Geometry,' as a means of instruction for the beginner; and we hold that *pro tanto* he has rendered good service to the cause of mathematical education, and to that of intellectual discipline generally.

From the 'Saturday Review,' May 10, 1879.

The movement for innovation in the teaching of elementary geometry has gone so far that the discussion is no longer a merely academical one, and Mr. Dodgson has thought it high time for a champion who is prepared to defend Euclid against all comers to arm himself and enter the lists. Mr. Dodgson has brought great knowledge and acuteness to his task, but we must regret the form in which he has cast his book—not on the score of his 'abandoning the dignity of a scientific writer' by putting his argument into dialogues between the ghost of Euclid, an examiner, and an imaginary German Professor—but, because to our mind the effect is to make the argument much harder reading than it would be otherwise. It is chopped up and frittered away, and what Mr. Dodgson has to say on any one point must be pieced out from half-a-dozen scraps of imaginary conversation. Mr. Dodgson's own account of his method is this:—'It is presented in a dramatic form, partly because it seemed a better way of exhibiting in alternation the arguments on the two sides of the question; partly that I might feel myself at liberty to treat it in a rather lighter style than would have suited an essay, and thus to make it a little less tedious and a little more acceptable to unscientific readers.'

We agree that the subject is one which might very fairly be treated by way of dialogue, provided the writer were impartial or versatile enough really to exhibit the arguments on both sides. But this Mr. Dodgson has hardly attempted. His phantasm of Herr Niemand, who brings up for discussion and judgment the various treatises of Euclid's modern rivals, is a very poor ghost indeed—a mere ninepin of a ghost who stands up only just enough to be knocked down. The work is an argument for Euclid all through, and would have been more forcible and intelligible if presented consecutively. As to the 'lighter style' making the book 'less tedious' and 'more acceptable to unscientific readers,' that is a matter of taste; to our own taste few things are more tedious or less acceptable than to have the tenor of a closely reasoned discussion constantly interrupted by small jokes. [*Against this remark of the SATURDAY REVIEW my be set the following from the SPECTATOR: 'We only wish that Mr. Dodgson could have seen his way to putting more jokes into his pleadings than he has.' Similar advice has reached me from private friends—some pleading earnestly for 'more jokes,' others, with equal earnestness, for 'fewer jokes.' It is not easy to express in words how practical and helpful I have found such advice, in preparing my second edition.*] Certainly the little repartees exchanged between Euclid, Minos, and Niemand will not help any one to master the elaborate apparatus of tabular comparisons and symbolic vocabulary by which Mr. Dodgson brings into one view all hitherto imagined ways of treating the vexed doctrine of parallels. This last piece of work, on which Mr. Dodgson must have spent infinite pains and minute attention, is alone sufficient to make reference to his book almost indispensable for whoever treats the subject after him. Whether the symbolic

notation really has a convenience in use proportionate to the author's trouble in inventing it, and the reader's in learning it, is a question on which we hesitate to offer a positive opinion. To some extent Mr. Dodgson seems to have been driven to the adoption of new terms by the ambiguous manner in which the word *parallel* is used by different writers. Of course we cannot follow him through his exhaustive account of the various plans which have been put forward as improvements on Euclid's method in this point. But we must note one rather important omission. A review of Mr. Wilson's book on Elementary Geometry by De Morgan is quoted in an appendix; but there is no reference either to De Morgan's admirable article on Euclid in the *Dictionary of Biography and Mythology*, which is probably less known to mathematical readers than it ought to be, or to his article on 'Parallels' in the *Penny Cyclopædia*. What De Morgan says in the last-mentioned article is so much to the purpose that we make no scruple of repeating it here:—

'Euclid obviously puts the *whole* difficulty into an assumption; which, though the most direct course, is not that which is best calculated to give the highest degree of evidence to geometrical truths. For it is a more obvious proposition that two lines which intersect one another cannot *both* be parallel to a third line, and, this being granted, Euclid's axiom readily follows. If it should be objected that this is merely Euclid's axiom in another form, it is replied that the form is a more easy one, and therefore preferable; just as it would be wiser to assume "Every A is B and every B is A," than the identical but more complicated proposition, "Every A is B, and everything which is not A is not B."

The 'more obvious proposition' thus recommended by De Morgan is Playfair's axiom; and it so happens that the point of his recommendation is not very successfully met by Mr. Dodgson. It is an easy victory to show that the axiom in this form is equivalent to Euclid's; and then Mr. Dodgson proceeds to give reasons why Euclid's should be preferred. He makes out that Euclid's axiom is actually easier, since it puts before the learner 'a Pair of Lines, a transversal, and two angles whose sum is less than two right angles—all clear *positive* conceptions'; while 'Playfair requires him to realize a Pair of Lines which never meet, though produced to infinity—a *negative* conception which does not convey to the mind any clear notion of the relative position of the Lines.' This appears to us to be little more than a play upon words. Positive conceptions are not necessarily easier to grasp than negative ones; and the picture of two parallels, whether on paper or in the mind, is a much simpler object of intuition than that of a pair of straight lines met by a transversal which makes two interior opposite angles less than two right angles. [*When this reviewer talks of 'the picture of two parallels,' he cannot, surely, be using the word in Euclid's sense? Perhaps he means 'equidistant': the picture of two equidistant lines, of (say) six inches long, would be a fairly simple object of apprehension ('intuition' is the apprehension of facts, not of things): but who ever succeeded in forming a picture, whether on paper or in the mind, of two lines produced to infinity? For that is what you must do, to realise Euclid's parallels as 'a picture.' A pair of lines, a million miles long, would be of no use whatever: the fact that they had not met, so far, would be no evidence whatever that they would not meet afterwards—but would have the exactly opposite effect; it would leave a future meeting still possible, whereas, if they had met in the first million miles, they could not possibly do so again.*]

But a more formidable objection is behind, which Mr. Dodgson fully brings

out only when he comes to discuss Mr. Wilson's treatment of the subject in detail. It may be most clearly seen by substituting for Playfair's axiom the equivalent statement:—Through a given point outside a straight line only one parallel can be drawn to it. This at once raises the question, What business have you to assume that *any* parallel can be drawn? in other words, that parallels can and do exist in plane geometry, and that there is no external point through which a parallel cannot be drawn? The assumption, be it observed, is not made by Euclid. And we may further observe that it is not such a small one as it looks, especially in the light of modern geometrical speculations. [*But who in the world wants to make this assumption?*] For it results from the work of Lobatschewsky and others that our actual geometry is not an elucidation of eternal and immutable and unique relations, but is rather in the nature of a purely physical science. That is to say, it is the investigation of properties of space, or of things in so far as they occupy space, which might quite conceivably have been different. A consistent geometry (though of course inapplicable to our real experience) can be, and has been, founded on the categorical denial of Playfair's axiom. Euclid's geometry is the science, not of space absolutely, but of a particular kind of space; and in this view the doctrine of parallels lays down very characteristic and important properties of that kind of space. When we are investigating the properties of anything, our knowledge of them is not thoroughly scientific until it is connected, as far as possible, by proofs. We must know not only that the properties co-exist, but how far one implies the other. Now Euclid does not assume, but proves, the real existence of parallels to be a property of the space he is dealing with; and here he has a great advantage over most of the innovators. They commit precisely the same oversight of making a large tacit assumption which they are ready enough to charge Euclid with on other occasions. [*This is news indeed! 'Most of the innovators,' as this reviewer seems to believe, assume Euc. I. 27!*] The substance of the objection would be the same without appealing to imaginary geometry. But it appears to us (paradoxical as it may sound) that the considerations above suggested give it more reality. For one sees that it is a question, not of logical arrangement, but of real physical explanation. The assumption of Playfair's axiom in the lump is objectionable in precisely the same way that it would be objectionable in physics to assume the conservation of energy as an axiom, and also to assume that a perpetual motion is impossible. Still the objection is not insuperable. [*Oh joyful tidings! We breathe again.*] It is possible to prove the general part of the alternative form of Playfair's axiom—namely, that a parallel can always be drawn to a given straight line through an external point—before assuming the special part, on which depends the peculiar quality of the space we have the happiness to live in, namely that only one parallel can be so drawn. This was done by Mr. Hirst in a course of lectures on elementary geometry given by him several years ago. [*This is perhaps the most extraordinary statement ever made by a writer professing to discuss a mathematical subject. It is as though one were to say 'The all-important fact, that seven times eight is fifty-six, was pointed out by Colenso, in his treatise on Arithmetic!' Mr. Hirst, thus kindly immortalised, may perhaps modestly reply 'but it was done 2000 years before I was born!'*] Whether it is done in the published works of any of the 'modern rivals' whose claims are discussed by Mr. Dodgson is more than we can say. [*Why, of course it is! By every one of them, except Pierce, Willock, and Wilson, who do not need it, as they use another definition of 'parallel.'* Does the reviewer know of any

writer on elementary geometry, who uses Euclid's definition, and has omitted to prove this proposition?]

Mr. R. P. Wright's auxiliary proposition (which Mr. Dodgson takes as a specimen of his treatise, in order to pass on it a rather supercilious criticism, apparently without seeing what it is meant to lead to, and what difficulties are being encountered) is that one, and only one, perpendicular can be drawn to a straight line from an external point. [*My criticism (p. 792) was that the theorem is proved in a 'wordy and unscientific style'—to which statement the questions 'what it is meant to lead to,' and 'what difficulties are being encountered,' are totally irrelevant. Yet I should like, very much, to know what difficulties are being encountered—in proving a proposition which is simply a deduction—of infantine simplicity—from Euc. I. 17! One is almost tempted to think that scientific books are occasionally reviewed by writers who do not entirely understand what they are talking about!*] But he has to prove it by folding over the paper, which is a proceeding of doubtful fairness, and in fact involves assumptions about the nature of space of three dimensions. If such assumptions were made openly from the first; if surfaces and lines were defined and conceived as boundaries; if projections and other modern methods were freely introduced as soon as they could be made useful; if, in short, geometry were frankly treated as a physical science—then we should have before us a scheme of innovation really worth discussing.

From the 'Scotsman,' May 15, 1879.

Mr. Dodgson's book on *Euclid and His Modern Rivals* will, or at least should, command a good deal of attention in academic circles. It is an attempt to demonstrate the inutility and positive mischief of having a large number of text-books for the teaching of elementary geometry. Mr. Dodgson does not take his stand on any narrow principle, or oppose modern attempts to supersede Euclid merely from a dislike to innovation. What he tries, and with very considerable success, to show is, that none of the recent text-books contain anything of importance that is not in Euclid; that the axioms and definitions which have been proposed in addition to, or in substitution for, those laid down by him will not, for the most part, stand the test of close examination; and that in simplicity and logical sequence of method he has the advantage of all his rivals. In order to establish these points, Mr. Dodgson subjects the distinctive features of the modern text-books of geometry to a very close and strongly reasoned criticism and comparison with Euclid; but nevertheless his book has not the solemnity and dryness of tone which might be thought inseparable from the treatment of such a subject. It is cast in dialogue form, and is full of a quaint satiric humour, which does not in the least diminish its scientific value, but which certainly makes it much pleasanter reading than most books on mathematical topics.

From the 'British Quarterly Review,' July, 1880.

The object of the present work, to use the words of the author, 'is to furnish evidence, first, that it is essential, for the purpose of teaching or examining in elementary geometry, to employ one text-book only; secondly, that there are strong *a priori* reasons for retaining, in all its main features, and especially in its sequence and numbering of propositions, and in its treatment of parallels,

the manual of Euclid; and, thirdly, that no sufficient reasons have yet been shown for abandoning it in favour of any one of the modern manuals which have been offered as substitutes.' The evidence is presented in a dramatic form, as affording a better opportunity of marshalling the arguments on both sides of the question, and of a more lively and interesting treatment than the usual essay-form. The main object of the work is the vindication of Euclid's masterpiece, with certain modifications, against its modern rivals. The *dramatis personæ* who uphold this view are borrowed from ancient history, *e. g.*, Minos, Rhadamanthus, Plato, Aristotle, and, of course, Euclid himself, and the views of the modern rivals are represented by Herr Niemand, who is introduced as carrying a pile of books, the works of the following authors: Legendre, Cooley, Cuthbertson, Wilson, Pierce, Willock, Chauvenet, Loomis, Morell, Reynolds, and Wright. The arguments brought forward in favour of geometrical text-books are discussed with great clearness and acuteness, and, what is more, with a good amount of sound common-sense, while ample justice is done to the advantage of substituting different methods of proof from those employed by Euclid himself. The perplexing difficulties which harass examiners and examined alike are vividly described, and very satisfactory reasons are given why the text-book which is adopted as the standard should follow more closely the line of argument pursued in the original masterpiece. For details we must refer our mathematical readers to the work itself, the reading of which will amply repay them on whichever side of the question they may have taken their position. We ourselves agree with Mr. Dodgson, that no modern text-book has as yet made good its claim to the place of the ancient geometrician. A text-book constructed somewhat after the plan suggested by the author would be an unmistakable boon both to teachers and taught.

From the 'Journal of Science,' July, 1879.

The chief points of attack on Euclid's Modern Rivals are Mr. Wilson's two works—'Elementary Geometry' and the 'Manual founded on the Association Syllabus.' The author makes comparatively short work of Legendre's book as unsuited to beginners, though doubtless valuable to advanced students; and of Cooley's, in which a certain theorem breaks down through a faulty definition of parallel lines. [*'A certain theorem'! This is as if a builder were to say 'They actually presumed to condemn the bridge I had built, because a certain stone had given way!' (Said 'certain stone' being the key-stone.)*] But to Mr. Wilson's two Manuals he devotes nearly a third of his volume. Much of the criticism on these, however, is mere cavilling: for instance, at page 804, Minos says, speaking of Wilson's 'Syllabus' Manual:—'At p. 57 I see an Exercise (No. 5). "*Show that the angles of an equiangular triangle are equal to two-thirds of a right angle.*" In this attempt I feel sure I should fail. In early life I was taught to believe them equal to *two right angles*—an antiquated prejudice no doubt; but it is difficult to eradicate these childish instincts.' This is mere straw-splitting; *strictest* accuracy would of course require the insertion of '*each*' before 'equal,' but if the sum of the interior angles had been intended to be understood '*together*' before 'equal' would have been absolutely necessary. [*Thus we never say '2 and 2 are 4.'*]

At page 796 there is a criticism on the definition of a right angle as given by the Association for the Improvement of Geometrical Teaching in their Syllabus.

This is—‘When one straight line stands upon another straight line, and makes the adjacent angles equal, each of the angles is called a right angle.’ Since the Association Syllabus admits of angles equal to or greater than two right angles, this is open to the objection that it does not debar the case in which one line stands on the *end* of the other, making the adjacent angles equal to one another, and to *two* right angles as right angles are generally considered. That is certainly a grave objection, but the same applies equally to Euclid’s definition, or else a proof must be supplied, which is not that in the case mentioned the two lines are in one and the same straight line; and so this interpretation is debarred by Euclid’s limiting clause.’ [*This is beyond my comprehension.*]

In fact, though Mr. Dodgson’s book is interesting and often witty, he fails to prove his point, because he takes a one-sided view of the question, and merely exhibits the blunders of Euclid’s Rivals without balancing them against Euclid’s own. [*The wonderful calmness of this assumption is worthy of all praise. Perhaps the writer will kindly furnish me with a list of ‘Euclid’s blunders’?*] Besides which—though perhaps it is more readable than an essay—a dialogue does not seem to be the clearest form for setting forth arguments and facts. [*Compare with this the remark of the SATURDAY REVIEW (see p. 824): ‘We agree that the subject is one which might very fairly be treated by way of dialogue.’ So hard is it to please everybody.*]

From the ‘Nature,’ July 10, 1879.

By a curious chance these two works reached our hands nearly on the same day, and as Mr. Dodgson devotes a great portion of his space (62 pp.) to the consideration of Mr. Wilson’s Geometries, we have thought it well to notice the two authors at the same time. As however it is patent from the fact of Mr. Wilson’s work having reached a fourth edition, that his method is not unknown to, and, may we add, not unappreciated by, a large section of mathematical teachers, we shall at once pass on to a consideration of Mr. Dodgson’s book, only noticing Mr. Wilson’s book in connection with the criticisms put forward in ‘Euclid and His Modern Rivals.’

A few words by way of introduction. Mr. Dodgson has been a teacher of geometry at Oxford, we believe, for nearly five-and-twenty years, and during that time has had frequent occasion to examine candidates in that subject. For a great part of the above-stated period things went pretty smoothly, and King Euclid held undisputed sway in the ‘Schools;’ but eleven years ago a troubler of the geometrical Israel came upon the scene, and read a paper before the Mathematical Society, entitled ‘Euclid as a Text-Book of Elementary Geometry.’ The agitation thus commenced acquired strength, and at length, in consequence of a correspondence carried on in these columns, the Geometrical Association was formed. A prime mover in this matter was that Mr. Wilson who wrote the paper, and subsequently brought out the geometry cited. Mr. Dodgson is one of the gentlemen opposed to this change, and the moving cause of the present Iliad is the ‘vindication of Euclid’s master-piece.’ Another consequence of the agitation is that many have tried their prentice hands on the production of new geometries—‘rivals,’ our author calls them—‘forty-five were left in my rooms to-day.’ Can we wonder then, that, his soul being stirred within him, he should overhaul a selection of them to see what blots he could ‘spot’ in them? He might well have taken for his motto one once familiar to us—

‘If there’s a hole in a’ your coats,
 I rede ye tent it;
 A chiel’s amang ye takin’ notes,
 An’ faith he’ll prent it!’

Quoted from *On The Late Captain Grose’s Peregrinations Thro’ Scotland: Collecting The Antiquities Of That Kingdom* by Robert Burns

Our author’s criticism takes a peculiar form, but we shall not blame him for this, for he has afforded us much amusement, and we quite hold with the Horatian line he cites in extenuation of his mode of procedure: ‘Ridentem dicere verum quid vetat?’ We believe he has made a good many hits, but at times his wit, we think, has led him too far. We shall not, however, here give any account of his plot—we prefer to refer our readers to the work itself—but confine our notice to the remarks upon Mr. Wilson’s books, and upon Mr. Morell’s ‘Euclid Simplified.’

Quoted from Horace

Mr. Dodgson devotes forty-eight pages to Mr. Wilson’s ‘Elementary Geometry’ (second edition, 1869). We can hardly see why so much space should be devoted to a work which seems tacitly to have been withdrawn by the author, or, at any rate, to have been considered inferior to the work under review. [*I have given my reasons at the foot of p. 801*]. Is it that the ‘scene’ was written some time since, and was considered to be too good to be sacrificed? Happily it is not our business to defend Mr. Wilson’s views on ‘direction’; he is perfectly competent to defend his own views, and no doubt, should he see fit, will do so at the right time.

We pass over many passages we had marked, with saying that in many cases the objections are sound but trivial. Objection is taken to Mr. Wilson’s remark, ‘Every theorem may be shown to be a means of indirectly measuring some magnitude,’ and Niemand abandons ‘every’. We think, however, that Niemand might have made a better fight of it and suggested that what is intended is that, for instance, all the theorems of the first book are directly or indirectly required for the proof of the 47th Proposition, which is surely a proposition concerned with the measurement of magnitude.

A word or two on Morell’s (J. R.) ‘Euclid Simplified.’ It is very easy work to pick this little book to pieces, but we cannot understand a statement of Mr. Dodgson’s on p. 148. Of the proposition ‘Every convex closed line $ABCD$ enveloped by any other closed line $PQRST$ is less than it,’ he says the method used fails, ‘as of course all methods must, the thing not being capable of proof.’ We cannot call to mind any English text-book in which the proposition is proved, but there is what we have thought was a proof in Sannia and D’Ovidio’s ‘Elementi di Geometria,’ p. 32. [*The sentence, from which the above words are quoted, is ‘all depends on our proving the perimeter $MDQRSTM$ less than the perimeter $MPQRSTM$, which this method has failed to do—as of course all methods must, the thing not being capable of proof.’ Surely, according to the ordinary laws of English grammar, the antecedent to ‘which’ is the clause immediately preceding it. Why should the reviewer go a whole page back in search of an antecedent?*]

From ‘The Examiner,’ Oct. 25, 1879.

It is generally known that for some time past dissatisfaction has been felt with Euclid’s Elements as a text-book on Geometry. Professor Sylvester was among the first to suggest that Euclid ought to be banished from our schools; and the

cry has been taken up by a small host of modern rivals, who have gone so far as to publish books intended to supersede the time-honoured work of the Alexandrian geometer. The 'unsuggestiveness,' the 'tediousness,' and the circuitous and cumbrous methods' of Euclid had been tacitly admitted long before any serious attempt had been made to displace the Elements by any other text-book. The *vis inertiae*, or difficulty of change, seemed to render Euclid's position practically secure, and consequently the various attacks to which from time to time his work was exposed remained unchallenged, even by his supporters. The fear of being thought old-fashioned, prejudiced, or indifferent to progress, prevented many, who honestly believed that they owed to the discipline of Euclid their skill and accuracy in reasoning, from undertaking his defence. Moreover, the example of foreign teachers was not without its influence on Englishmen, who found themselves alone in using Euclid as a school text-book.

Thus it came about that attempts were made to introduce into our schools systems of geometry, diverging more or less widely from Euclid's Elements; and such well-known teachers as Wright and Wilson ventured to publish works that were avowedly intended as substitutes for Euclid. The cry for reform became so loud that an Association was formed for the express purpose of improving geometrical teaching, and a 'Syllabus' was issued setting forth the new lines on which geometrical teaching ought to proceed. Euclid's supporters had now, at length, the opportunity of declaring themselves. Their enemies had written books. Mr. Wilson's work was subjected to the cutting criticism of the late Professor De Morgan. Mr. Todhunter, the well-known writer of many text-books, and author of an edition of Euclid free from any modern improvements, published an essay in defence of his master; and now, whilst the battle is still raging hotly, Mr. Dodgson writes a book in which, single-handed, he fights with the most conspicuous of Euclid's rivals, and professes to have slain them all.

Whilst these changes have been under contemplation, and partly adopted, (for some schools have introduced modern methods of teaching this subject,) professional examiners have been sorely troubled. Fear and trembling have taken hold of them. For if candidates are to be permitted to use other works than Euclid's in preparation for their examination, how is it possible for the examiner to test the validity of a proof presented to him? With Euclid for a text-book, examination was rendered easy and satisfactory. Half-a-dozen propositions were set, three or four deductions were added, which were seldom answered, and the candidate's knowledge of geometry was infallibly ascertained. No mechanical appliance for examination could be more satisfactory. But if the order of Euclid's propositions be once changed, if other proofs be substituted for the time-honoured demonstrations of past generations, examinations in this subject must become hopelessly confusing. Examiners would be expected to know every system of geometry which candidates might have studied; and candidates, by disregarding Euclid's established sequence of proofs, would be free to indulge in the fallacy of *petitio principii* without fear of detection. These considerations have helped to rouse Euclid's defenders from their apathy, by showing that the requirements of examinations necessitate the retention of Euclid as a school text-book. The Universities of Oxford and Cambridge have realised this fact; and as they exert, through their local examinations, considerable influence on school-teaching, Euclid's rivals have fared but badly. So decided a corporate feeling exists on this question, that we find in the Report of the Oxford and Cambridge Schools Examination Board for last year the following remark on the

subject:—‘At one or two schools there is some departure from Euclid’s methods. This practice has generally led to confusion and inaccuracy without any compensating advantage in power of working riders.’ This observation cannot be without effect on those schools which have ventured to tread the new paths, and will doubtless drive them back into the beaten track, in which ‘the propositions are generally written out clearly and accurately’ (Report, p. 9). Rebellion against the supremacy of Euclid must be crushed out at all costs! There can be no doubt that Mr. Dodgson deserves well of University examiners; but it is open to question whether the advocates of improved geometrical teaching will give that weight to this form of argument which Mr. Dodgson and his friends attach to it. [*It is in the interests of teachers, rather than of examiners, that I have written.*]

On first opening Mr. Dodgson’s book we must acknowledge to having felt somewhat uncertain whether the defence of Euclid against his rivals was intended as a piece of serious reasoning, or was a mere attempt on the part of the author to give us ‘a glimpse of the comic side of things,’ even in the study of Geometry, as an instance of his versatility of humour. But a glance through the contents of the book showed us that Mr. Dodgson was in grim earnest; and we venture to think that no one who has made himself master of the pages of symbols, of which $st_a \llbracket SX \llbracket T_{e''i''}$ may be taken as a type, will be inclined to regard the book as a ‘mere *jeu d’esprit*.’ No, Mr. Dodgson has come forward to show that the Universities of Oxford and Cambridge have other reasons than the convenience of examiners for advising, if not insisting on, the retention of Euclid in our schools. He desires to silence Euclid’s rivals by force of argument; and to this end he lays down the chief points of difference between Euclid and those who wish to supersede him, and discusses them *seriatim*, showing, it is needless to remark, that in nearly every instance, the advantages are strongly in favour of retaining Euclid.

The plan of the book is original. It is cast into a dramatic mould. In the first Act the ghost of Euclid appears and defends himself with respect to certain contested points, which he agrees to consider as crucial questions between him and his opponents. These having been satisfactorily and rather summarily disposed of, Euclid is made to say: ‘This then concludes our present interview; we will meet again when you have reviewed my modern rivals one by one. If you had any slow music handy, I would vanish to it, as it is ‘—*vanishes without slow music*. In the second and third Acts, an omniscient and ubiquitous German, Herr Niemand, undertakes the introduction and defence of Euclid’s several rivals, including Legendre, Cooley, Wilson, Willock, Wright, the Society’s Syllabus, and others. In Act IV, Euclid comes back triumphant; but before finally returning to his shady home, he generously confesses that so long as the order and numbering of his propositions (presumably for the sake of examiners) are retained, he is content that his proofs should be ‘abridged and improved,’ and that new problems and new theorems should be interpolated—which is rather a wholesale concession. The last words of the book are those in which scientific teachers will perhaps most cordially agree: ‘In all these matters my Manual (Euclid) is capable of almost unlimited improvement.’

In his treatment of the rival systems, Mr. Dodgson cannot be said to reason without a strong bias in favour of Euclid. His objections in most cases amount to little more than verbal quibbles, and we doubt sometimes whether in his client’s cause he has not purposely criticised unimportant differences and passed over

those of greater moment. He is very great on the definitions and axioms of the rival systems. The various definitions of that undefinable thing, 'a straight line,' are successively shown to be inadequate or redundant, or not in strict accordance with the ordinary canons of formal logic. At the same time not a word is said in defence of Euclid's definition, for which these are intended as substitutes. If our author before writing this book had read Henrici's *Geometry*, which appeared in the early part of this year, he would have seen what is probably the only scientific way of treating this part of the subject, and would have learned how comparatively unimportant to the study of geometry are these verbal definitions on the accuracy of which he so vainly insists. [*I now present to the reader a review of 'what is probably the only scientific way of treating this part of the subject'!*] In the matter of axioms, he defends Euclid's 12th axiom, which no schoolboy ever yet regarded as a self-evident proposition, by pointing out that 'it is not axiomatic till Prop. 28, Bk. I. has been proved,' without apparently seeing that this statement reduces the proposition to a corollary to Prop. 28, and takes away from it its axiomatic character altogether. [*The Reviewer is no doubt aware of the essential distinction between an 'axiom' and a 'corollary': but he has got the two ideas so hopelessly mixed in this sentence, that it may be worth while to explain it. An 'axiom,' then, always requests the voluntary assent of the reader to some truth, for which no proof is offered, and which he is not logically compelled to grant: a 'corollary' is logically deduced from what has been already granted, and the reader must accept it, however unwilling he may be to do so. But though he has free choice as to whether he will, or will not, accept any axiom that may be proposed, his willingness to do so largely depends on the amount of truth he has already grasped in connection with it.*]

In answer to the charge that Euclid's proofs are in many cases unnecessarily tedious, Mr. Dodgson admits that alternative proofs might be allowed, although he is very unwilling to grant that the proposed alterations are real improvements. In the same way he suggests that one or two propositions, omitted by Euclid, might be interpolated into the text, without interfering with the order and numbering of the propositions. Mr. Dodgson endeavours to reduce to a minimum the changes and interpolations which are required to make Euclid a serviceable text-book of geometry; and amongst various omissions we may notice that he does not refer to Euclid's improper [!] treatment of the several cases in which two triangles can be proved to coincide. [*I cannot fairly be expected to 'refer to' what I deny to exist!*] To point out the various reasons not mentioned by our author for superseding Euclid by some other text-book, would occupy us far too long. Suffice it to say, that if Euclid were amended according to the notions of modern teachers of geometry, or even according to the suggestions of our author, there would be little left of the original text; and under such circumstances it is difficult to see any reason, save the convenience of examiners, for retaining the order and numbers of the propositions. [*If amended 'according to the suggestions of our author,' there would be, I should think, at least 99-100ths of the original text left without any material change.*]

Mr. Dodgson admits some few imperfections in Euclid; but those of his modern rivals are far more numerous and unpardonable. Of Mr. Wilson's Manual, which he justly considers a formidable rival, he speaks in unmeasured terms of disapproval. 'The abundant specimens of logical inaccuracy, and of loose writing generally, which I have here collected would, I feel sure, in a more popular treatise be discreditable—in a scientific treatise, however modestly put forth,

deplorable—but in a treatise avowedly put forth as a model of logical precision, and *intended to supersede Euclid*, they are simply monstrous.’ Strong language! But Mr. Dodgson is well versed in logic and his statements are not loose utterances. Let us test one of them—the most ‘monstrous’ of the charges brought against Mr. Wilson. In his book we are told there is found one instance of ‘*Illicit process of the Minor*’ (p. 776). We will examine it.

Mr. Dodgson says (p.773):—

‘At p. 9 we have a deduction from a definition, and an axiom which involves the fallacy “*Illicit process of the Minor*.” The passage is as follows:—Def. II. “A straight line is said to be *perpendicular* to another straight line when it makes a right angle with it. Hence there can be only one perpendicular to a given line at a given point, on one side of that line, because only one line can make a right angle with the given line at that point.”

‘Thrown into syllogistic form the argument may be stated thus:—

‘All lines drawn at right angles to a given line at a given point, on one side of it, are coincident; all lines drawn at right angles to a given line, &c., are *perpendiculars* to that line, &c.; therefore, all perpendiculars to a given line, &c., are coincident.’ That is, “All X is Y; all X is Z; therefore all Z is Y.”

Not so at all. The syllogism expressed formally should be stated thus:—

All X is Y,
All X is *all* Z,
∴ All Z is Y;

which is logically sound, involving no illicit process at all.

Has Mr. Dodgson never heard that it is a logical postulate *to state explicitly what is thought implicitly*, or does he suppose that the logic of the Stagirite is sufficient for all reasoning processes? Surely, Sir Wm. Hamilton and the Archbishop of York might have taught him otherwise, not to speak of Mill, Boole, and Jevons! We have quoted this—the most formidable of Mr. Dodgson’s charges—as an instance of the style of reasoning adopted throughout the work. [*I can only say, again, that the Definition in question is of the form ‘all X is Z,’ and is not of the form ‘all X is all Z.’ Let us try it on new subject-matter. ‘A man is said to be honest, when he pays his friend a debt which that friend had forgotten.’ I say this is equivalent to ‘All who pay forgotten debts are honest men.’ My reviewer identifies it with ‘All who pay forgotten debts are all honest men’ (i. e. they are the only honest men alive). Let the reader judge between us. And why should this be called ‘the most formidable’ of my charges? Surely it is not quite so important as (say) the treatment of Parallels, which so entirely collapses in Mr. Wilson’s hands?*]

From the ‘Educational Times,’ March 1, 1880.

[Extract from a Paper read by Mr. Philip Magnus at an Evening Meeting of the College of Preceptors.]

To all foreigners it appears very strange that Geometry should be taught to English school children by aid of a treatise not designed for school purposes, and written more than two thousand years ago. In Germany and France, modern methods of teaching Geometry have for many years been adopted; and, although

it is not a good thing that Englishmen should imitate too readily the educational methods of foreigners, still the fact that we stand alone among European nations in using Euclid's Elements as our school text-book of Geometry requires explanation, and suggests the reflection that we are not wise in doing so. [*At the present moment, we learn from the best authority, namely, the testimony of anti-Euclideans, that both in France and Italy dissatisfaction is felt with the system hitherto used, accompanied with more or less desire to adopt ours.*' *Todhunter's Essay on Elementary Geometry.*] The explanation probably consists in the difficulty and inconvenience of change. There is a manifest advantage in having a fixed and recognised text-book, to which both teachers and examiners can refer; and there is, moreover, the very natural apprehension that, if Euclid is abandoned, a number of different text-books may come into use, which, however much they might improve the teaching of Geometry, would terribly perplex the examiner.

The way of Euclid is not always smooth and easy. The difficulties are not slight which the beginner has to surmount; and those who have practice in teaching well know that the artificiality of Euclid proves a stumbling-block which many pupils never succeed in overcoming. When this is the case, the pupil draws upon his memory for the assistance which his reason ought to afford, and endeavours to deceive his teacher and examiner by learning his propositions by heart. Unfortunately this utter waste of time is not so uncommon as it might be thought. The difficulty of mastering the proposition, together with the necessity of adhering to the exact words of the text, tempt the unhappy pupil to this assumption of knowledge. [*This 'necessity of adhering to the exact words of the text' is, I venture to say, one that could only arise with a thoroughly incompetent examiner. The reasoning may be given correctly, with an almost unlimited variety of language.*] An oral teacher cannot be deceived; he may vary the letters, alter the figure, and adopt a number of other simple devices to test the real knowledge of his pupil. But in written examinations deception is less easily detected. The examiner who finds the propositions 'written out clearly and accurately,' cannot withhold marks from his candidates, although no single rider may have been attempted, and although the work presented to him may be the result of a mere exercise of memory.

I have said that the Conservatives admit that Euclid's proofs may be advantageously modified, and that other changes may be introduced into the 'Elements' without interfering with the Euclidian method. This view is maintained with considerable ability by Mr. Dodgson, Mathematical Lecturer of Christ Church, Oxford, in a work entitled 'Euclid and his Modern Rivals,' which should be read by all persons interested in the question we are now considering. Mr. Dodgson's discussion of the various systems of Geometry that have been put forth as rivals to Euclid, is enlivened by occasional flashes of humour which make the work as amusing as it is profound. Mr. Dodgson's ultimate conclusions seem to be hardly worthy of the efforts he has made to establish them. For, whilst he subjects the definitions and demonstrations of Wilson, Wright, and others to the most searching criticism, and establishes in each case the superiority of Euclid to any modern writer, he ultimately concedes that, so long as Euclid's sequence and numbering of propositions is retained, together with his doctrine of parallels, his proofs may be altered, abridged, and indefinitely improved. 'Leave me [Euclid] these untouched, and I shall look on with great contentment while other changes are made—while my proofs are abridged and

improved—while alternative proofs are appended to mine—and while new problems and theorems are interpolated. In all these matters my Manual is capable of almost unlimited improvement' (p. 814).

The reason for insisting so strongly on the retention of the numbering and sequence of Euclid's propositions can be none other than the convenience of external examiners; for the precautions against assuming propositions subsequent to the one to be proved, cannot be necessary in examinations conducted by the teacher himself, since he would of course know very well how much his own pupils might legitimately take for granted. But it is easily understood that an external examiner who is familiar with no other than Euclid's method of teaching Geometry, would be somewhat bewildered if, for instance, Euclid I. 24 were assumed in the proof of Euclid I. 8. But, surely, it must be admitted that methods of teaching a subject ought not to be considered from the standpoint of examinational requirements. [*If examinations were done away with altogether, there would still be abundant reason for adopting the same logical sequence in all sciences where some logical sequence is essential: otherwise any attempt at communication between one mathematical student and another is merely a revival of the scenes enacted around the Tower of Babel.*]

4.6 Euclid. Books I, II

Source: Euclid. Books I, II, second edition
Currently only introduction

Part I. Addressed to the Teacher.

In preparing this edition of the first Two Books of Euclid, my aim has been to show what Euclid's method really is in itself, when stripped of all accidental verbiage and repetition. With this object, I have held myself free to alter and abridge the language wherever it seemed desirable, so long as I made no real change in his methods of proof, or in his logical sequence.

This logical sequence, which has been for so many centuries familiar to students of Geometry—so that 'The Forty-Seventh Proposition' is as clear a reference as if one were to quote the enunciation in full—it has lately been proposed to supersede: partly from the instinctive passion for novelty which, even if Euclid's system were the best possible, would still desire a change; partly from the tacitly assumed theory that modern lights are necessarily better than ancient ones. I am not now speaking of writers who retain unaltered Euclid's sequence and numbering of propositions, and merely substitute new proofs, or interpolate new deductions, but of those who reject his system altogether, and, taking up the subject *de novo*, attempt to teach Geometry by methods of their own.

Some of these rival systems I have examined with much care (I may specify Chauvenet, Cooley, Cuthbertson, Henrici, Legendre, Loomis, Morell, Pierce, Reynolds, Willock, Wilson, Wright, and the Syllabus put forth by the Association for the Improvement of Geometrical Teaching), and I feel deeply convinced that, for purposes of teaching, no treatise has yet appeared worthy to supersede that of Euclid.

It can never be too constantly, or too distinctly, stated that, for the purpose of teaching *beginners* the subject-matter of Euclid I, II, we do *not* need a complete collection of all known propositions (probably some thousands) which come within that limit, but simply a selection of some of the best of them, in a logically arranged sequence. In both these respects, I hold that Euclid's treatise is, at present, not only unequalled, but unapproached.

For the diagrams used in this book I am indebted to the great kindness of Mr. Todhunter, who has most generously allowed me to make use of the series prepared for his own edition of Euclid.

I will here enumerate, under the three headings of 'Additions,' 'Omissions' and 'Alterations,' the chief points of difference between this and the ordinary editions of Euclid, and will state my reasons for adopting them.

1. Additions.

DEF. &c. § 11. The Axiom 'Two different right Lines cannot have a common segment' (in 3 equivalent forms). This is tacitly assumed by Euclid, all through the two Books (see Note to Prop. 4), and it is so distinctly analogous to his 'two right Lines cannot enclose a Superficies' that it seems desirable to have it formally stated.

DEF. &c. § 20. Here, to Euclid's Postulate 'A Circle can be described about any Centre, and at any distance from it,' I have added the words 'i. e. so that its Circumference shall pass through any given Point.' This I believe to be Euclid's real meaning. Modern critics have attempted to identify this given 'distance' with 'length of a given right Line,' and have then very plausibly pointed to Props. 2, 3, as an instance of unnecessary length of argument. 'Why does he not,' they say, 'solve Prop. 3 by simply drawing a Circle with radius equal to the given Line?' All this involves the tacit assumption that the 'distance' (διάστημα, i. e. 'interval' or 'difference of position') between two Points is equal to the length of the right Line joining them. Now it may be granted that this 'distance' is merely an abbreviation for the phrase 'length of the shortest path by which a Point can pass from one position to the other:' and also that this path is (as any path would be) a *Line*: but that it is a *right* Line is just what Euclid did *not* mean to assume: for this would make Prop. 20 an Axiom. Euclid contemplates the 'distance' between two Points as a magnitude that exists quite independently of any Line being drawn to join them (in Prop. 12 he talks of the 'distance CD ' without joining the points C, D), and, as he has no means of *measuring* this distance, so neither has he any means of *transferring* it, as the critics would suggest. Hence Props. 2, 3, are logically necessary to prove the *possibility*, with the given Postulates, of cutting off a Line equal to a given Line. When once this has been proved, it can be done *practically* in any way that is most convenient.

AXIOMS, § 9. This is quite as axiomatic as the one tacitly assumed by Euclid (in Props. 7, 18, 21, 24), viz. 'If one magnitude be greater than a second, and the second greater than a third: the first is greater than the third.' Mine is shorter, and has also the advantage of saving a step in the argument: e. g. in Prop. 7, Euclid proves that the angle ADC is greater than the angle BCD , a fact that is of no use in itself, and is only needed as a step to another fact: this step I dispense with.

PROP. 8. Here I assert of all *three* angles what Euclid asserts of *one* only. But his Proposition *virtually* contains mine, as it may be proved three times over, with different sets of bases.

PROP. 24. Euclid contents himself with proving the first case, no doubt assuming that the reader can prove the rest for himself. The ordinary way of making the argument complete, viz. to interpolate 'of the two sides DE, DF , let DE be not greater than DF ,' is very unsatisfactory: for, though it is *true* that, on this hypothesis, F will fall outside the Triangle DEG , yet no *proof* of this is given. The Theorem, as here completed, is distinctly analogous to Prop. 7.

BOOK II, DEF. § 4. The introduction of this one word 'projection' enables us to give, in Props. 12, 13, alternative enuntiations which will, I think, be found much more easy to grasp than the existing ones.

BOOK II, PROP. 8. Considering that this Proposition, with the ordinary proof, is now constantly omitted by Students, under the belief that Examiners never set it, I venture to suggest this shorter method of proving it, in hopes of recalling attention to a Theorem which, though not quoted in the Six Books of Euclid, is useful in Conic Sections.

(Another proof of *Eucl. II. 8.*)

[Instead of 'On AD describe' &c, read as follows:—

A C B D

Square of AD is equal to
squares of AB, BD , with twice rectangle of AB, BD ; [II. 4.
i. e. to squares of AB, BC , with twice rectangle of AB, BC ;
i. e. to twice rectangle of AB, BC , with square of AC , [II. 7.
with twice rectangle of AB, BC ;
i. e. to four times rectangle of AB, BC , with square of AC . Q. E. D.]

2. Omissions.

Euclid gives separate Definitions for ‘plane angle’ and ‘plane rectilinear angle.’ I have ignored the existence of any angles other than rectilinear, as I see no reason for mentioning them in a book meant for beginners.

PROP. 11. Here I omit the Corollary (introduced by Simson) ‘Two Lines cannot have a common segment,’ for several reasons. First, it is not Euclid’s: secondly, it is assumed as an Axiom, at least as early as Prop. 4: thirdly, the proof, offered for it, is illogical, since, in order to draw a Line from B at right angles to AB , we must produce AB ; and as this can, *ex hypothesi*, be done in two different ways, we shall have two constructions, and therefore two perpendiculars to deal with.

PROP. 46. Here instead of drawing a Line, at right angles to AB , *longer* than it, and then cutting off a piece equal to it, I have combined the two processes into one, following the example which Euclid himself has set in Prop. 16.

3. Alterations.

DEFINITIONS, &c. § 7. Instead of the usual ‘A straight Line is that which lies evenly between its extreme Points,’ I have expressed it ‘A right Line,’ (‘right’ is more in harmony, than ‘straight,’ with the term ‘rectilinear’) ‘is one that lies evenly as to Points in it.’ This is Euclid’s expression: and it is applicable (which the other is not) to infinite Lines.

PROP. 12. Here I bisect the angle FCG instead of the Line FG : i. e. I use Prop. 9 instead of Prop. 10. The usual construction really uses *both*, for Prop. 10 requires Prop. 9.

PROP. 16. Here, instead of saying that it ‘may be proved, by bisecting BC &c. that the angle BCG is greater than the angle ABC ,’ I simply point out that it *has* been proved—on the principle that, when a Theorem has once been proved for *one* case, it may be taken as proved for all similar cases.

PROP. 30. Here Euclid has contented himself, as he often does, with proving *one* case only. But unfortunately the one he has chosen is the one that least needs proof: for, if it be given that neither of the outside Lines cuts the (infinitely producible) middle Line, it is obvious that they cannot meet each other.

BOOK II, PROP. 14. Here, instead of producing DE to H , I have drawn EH at right angles to BF . This at once supplies us with the fact that GEH is a right angle, without the necessity of tacitly assuming, as Euclid does, that ‘if one of the two adjacent angles, which one Line makes with another, be right, so also is the other.’

Part II. Addressed to the Student.

The student is recommended to read the Two Books in the following order, making sure that he has thoroughly mastered each Section before beginning the next.

BOOK I.	
	PAGE
§ 1. Magnitude.	
Axioms, §§ 1 to 9	7
§ 2. Triangles, &c.	
Definitions, §§ 1 to 20	1
Props. I to X	11
§ 3. Right angles, &c.	
Definitions, &c. §§ 21 to 23	4
Props. XI to XXVI	25
§ 4. Parallel Lines, &c.	
Definitions, § 24	4
Props. XXVII, XXVIII	44
Axioms, § 16	9
Props. XXIX to XXXII	46
§ 5. Parallelograms, &c.	
Definitions, &c. §§ 25 to 27	4
Props. XXXIII to XLV	53
§ 6. Squares, &c.	
Definitions, &c. §§ 28 to 31	5
Props. XLVI to XLVIII	70
BOOK II.	
§ 1. Rectangles, &c.	
Definitions, §§ 1 to 3	75
Axioms, § 1	76
Props. I to XI	77
§ 2. Triangles, &c.	
Definitions, § 4	75
Axioms, § 2	76
Props. XII to XIV	96

4.7 Euclid's Theory of Parallels

Source: Knowledge, November 7, 1884

[1495]—In your “Chats about Geometrical Measurement,” p. 337, line 5 from end, you say that Euclid's 12th Axiom is “no axiom,” as “the converse is demonstrated in the 17th Proposition.” If this were the *logical* “converse” of the axiom, so as to follow immediately from it, there *would* be some absurdity in making the first statement an axiom and the second a theorem. But this is not so. The two statements are of the form “all X is Y,” and “all Y is X;” and it is so far from being the case that, if one of these be axiomatic, the other is axiomatic, that it may easily happen that one is axiomatic, while the other is not even true.

Again, at p. 334, col. 1, last line, you say “it is evident that $KL = CH$.” If this were once granted, you would not need the diagram in col. 2, you need only say “join HK . These triangles have all their sides equal. Therefore angle CKH is equal to angle KHL . Therefore the three angles of the triangle HCK are equal to the three angles KCH , HCK , KHL , *i. e.*, to two right-angles. But *any* given right-angled triangle may be treated like this, and any triangle may be divided into two right-angled triangles. Hence the angles of any triangle are equal to two right-angles.” This proves Euc. I. 32, after which all is easy.

Again, in col. 2, you claim to have *proved* Simson's axiom that two lines through a point cannot both be parallel to a third line. But you have only proved this for “parallels” as you define them, *viz.*, “lines which have a common perpendicular;” and so have not proved *Simson's* axiom at all. This is, I fear, a logical flaw in your argument.

*C. L. Dodgson.
Ch. Ch., Oxford.*

4.8 A New Theory of Parallels (Curiosa Mathematica. Part I)

Source: Curiosa Mathematica. Part I: A New Theory of Parallels, fourth edition (third edition differs only by having “ $2R$ ” instead of “two right angles” and similar in a few places)

In every Circle, the inscribed equilateral Tetragon is greater than any one of the Segments which lie outside it.

Preface to Third Edition

The chief novelty, in the First Edition of this treatise, was the Axiom, by means of which I proved Euc. I. 32 without making use of his 12th Axiom. And the chief novelty, in this Third Edition, is the change I have made in that Axiom, by substituting ‘Tetragon’ for ‘Hexagon’. The new Figure is more simple, and more easily constructed, than its predecessor: while the Axiom is, I hope, as obviously true as ever.

The proof of my “New Theory of Parallels” is, I think, greatly simplified and improved in this new Edition—the Propositions, which do *not* require any disputable Axiom, being placed by themselves in ‘Book I,’ while those, which require the new Axiom for their proof, are placed in ‘Book II.’ At the end of Book II will be found a proof (so far as *finite* magnitudes are concerned) for Euclid’s celebrated 12th Axiom, preceded by, and dependent on, the Axiom tacitly assumed by him in his Book X, Prop. 1, and also assumed, I believe,

by every subsequent writer who has attempted to *prove* his 12th Axiom. My proof is borrowed, with some slight alterations, from Cuthbertson's 'Euclidean Geometry.'

One advantage, in thus separating the Propositions into two classes, is that it calls attention to the very remarkable and interesting fact that the Theorem "There is a Triangle whose angles are together not-greater than two right angles" is actually provable without any disputable Axiom whatever. If only it could be proved, with equal ease, that "there is a Triangle whose angles are together not-less than two right angles"! But alas, *that* is an *ignis fatuus* that has never yet been caught! The man, who first proves *that* Theorem, without using Euclid's 12th Axiom or any substitute for it, will certainly deserve a place among the world's great discoverers.

I take this opportunity of replying to one or two criticisms, which have been published, on the Second Edition—earnestly assuring the writers of those criticisms that, in treating the questions at issue between us from a not-wholly-solemn point of view, I have been actuated by no feeling of disrespect towards them, but simply from the wish to lighten a subject, naturally somewhat too heavy and sombre, and thus to make it a little more palatable to the general Reader.

At p. 12 of the 2nd Edition, the enunciation of Prop. VI (which re-appears, in a modified form, at p. 868 of the 3rd Edition) stood thus:—

"If the vertical angle of a Sector of a Circle be divided by radii into 2^n equal angles, thus forming 2^n equal Sectors; and if the chord of each such Sector be not less than the radius of the Circle: the original Sector is not less than 2^n times the Triangle cut off from it by its chord." My controversy with *Nature*, on this enunciation, will be best given in the form of a dialogue. (Of course I quote *verbatim*.)

Nature. (Dec. 6, 1888.) "How are the figures to be constructed, if n be greater than 2?"

Author. (In the Preface to the 2nd Edition, at p. x.) "Well, suppose n were equal to 4: i. e. we have to divide the vertical angle into 2^n equal parts. Bisect it: that gives halves. Bisect the halves: that gives quarters. Bisect again: that gives eighths. Bisect once more: that give sixteenths. *Voila tout!*"

Nature. (June 13, 1889.) "Shade of Euclid! Who knows not such things? We admitted the same, but stated that our difficulty in the construction was the condition imposed in the enunciation: viz., 'the chord of each such sector not less than the radius of the circle.' Take Mr. Dodgson's illustration of a sixteenth: this would necessitate that the original angle should be at least 960° we . . . have further noted that no one of the chords in Mr. Dodgson's figures is even equal to the radius."

Author. "What you call 'the condition imposed' is introduced with an 'if': it is merely an *hypothesis*: all I undertake to prove is that, *if* certain things were true, certain other things *would* be true. Surely I need not remind you that the *validity* of a Syllogism is quite independent of the *truth* of its Premises! 'I have sent for you, my dear Ducks', said the worthy Mrs. Bond, 'to enquire with what sauce you would like to be eaten?' 'But we don't want to be *killed!*' cried the Ducks. 'You are wandering from the point' was Mrs. Bond's perfectly logical reply. So here. 'I beg you to observe, my dear *Nature*, that, *if* the chord of each Sector were not less than the radius, the logical result would be so-and-so.'

Quoted from *David Copperfield* by Charles Dickens

‘But the chord is less than the radius!’ you cry. All I need say, in reply, is ‘*You are wandering from the point.*’”

“But I will be generous, and will say more. I take exception to *two* assertions of yours. Remember our logical stand-point. We may use Euclid’s Axioms, all but the last; and his Propositions as far as I. 28. Now be good enough to prove to me, with this machinery, first, that my hypothesis ‘necessitates that the original angle should be at least 960° ’; secondly, that ‘no one of the chords’ in my Figure ‘is even equal to the radius.’ Your logical position is, I fear, this. You dispute the *validity* of a certain argument, on the ground that its *premisses* are false. My reply is, first, that you cannot *prove* them false; and secondly, that, even if you *could*, it wouldn’t affect the question!”

At p. 19 of the 2nd Edition, the new Axiom, on which my Theory rests, (which re-appears, in a modified form, at p. 857 of the 3rd Edition), stood thus:—“In every Circle, the inscribed equilateral Hexagon is greater than any one of the Segments which lie outside it.” My controversy with the *Athenæum*, on this Axiom, shall also be given in the form of a dialogue.

Athenæum. (Oct. 27, 1888.) “... a stronger objection, in our opinion, is the implied assumption of the *possibility* of the inscribed equilateral Hexagon, a possibility which is not demonstrated till we reach the fifteenth Proposition of Euclid’s fourth book.

Author. (In the Preface to the 2nd Edition, at p. xi). “But does it *need* demonstrating? May we not *assume* (1) that the Magnitude ‘four right angles’ contains 6-6ths of itself; (2) that it is *theoretically* possible to draw radii dividing it into these 6-6ths? Once grant me this, and I ask no more. I have then the logical *right* to join the ends of these radii, and to prove (by Euc. I. 4) that the chords are equal.”

Athenæum. (Oct. 5, 1889.) “We objected that it was not consistent with the spirit or practice of Euclid’s reasoning to assume the ‘theoretical possibility’ of a regular Hexagon inscribed in a Circle, without first proving that such a figure could be actually constructed from his three postulates. Euclid’s restrictions may be arbitrary, unnecessary, cramping, vexatious, absurd—indeed, we think they deserve these and many other epithets—but there they are, and, if Mr. Dodgson accepts them, he is bound to keep his assumptions within the boundaries which they prescribe.”

Author. “You’re particular to a shade (as Scrooge said to Marley’s ghost): however, I’ll do what I can to oblige you. I presume you will be satisfied if I can, without using more of Euclid than his first 28 Propositions, construct an angle which shall be 1-6th of 4 right angles? Very good. First, then, with the help of his arbitrary Prop. I, I construct an equilateral Triangle. Next, by his unnecessary Prop. IX, I draw the bisectors of 2 of its angles. Next, by his cramping Post. 1, I join their point of intersection to the third vertex. Next, by his vexatious Prop. IV, I prove the 3 angles, whose common vertex is this point, to be equal. From which I draw the absurd conclusion that each of them is 1-3rd (and that therefore its half is 1-6th) of 4 right angles. How does that strike *you*?”

Another objection, to this same Axiom, appeared in the *Academy* for Feb. 9, 1889, viz. “What the Axiom practically assumes is the existence of similar figures.” Permit me to reply, to this Reviewer, as follows:—“In what sense do you use the word ‘similar’? In *Euclid’s*, no doubt. That is to say, you charge me

Quoted from *A Christmas Carol* by Charles Dickens

with assuming that, if the Circle and its inscribed Hexagon were supposed to expand, the magnitude of each angle and the ratio subsisting between the sides which contain it, would remain constant? The ‘ratio’ part of the question we may set aside at once: there is no doubt that, since the figure continues to be equilateral, the ratio continues to be a ratio of *unity*: hence, if I needed this assumption (which I don’t), I should have a perfect right to make it. All that remains for discussion, is the assumption, which you say I have made, that each *angle* of the expanding Hexagon remains constant in magnitude. Will you, then, be kind enough to point out, first, where the *need* for any such assumption arises; secondly, where I have *made* any such assumption? For myself, I cannot in the least see why, in estimating the *area* of the Hexagon, I should trouble myself about the size of its *angles*.”

Let me take this opportunity of pointing out, once more, that *not one Proposition in this Treatise depends, in the slightest degree, on the speculations about Infinities, &c., which occur in the Appendices.*

The one merit, the one novelty, of my Theory (if it *has* any merit, or any novelty) is that, while *every* other Theory (that I have seen), which attempts to supersede Euclid’s 12th Axiom, introduces the ideas of Infinities and Infinitesimals, *mine* dispenses *wholly* with their aid, and deals with nothing but what is, by universal consent, absolutely *within* the field of Human Reason.

Introduction

It may well be doubted whether, in all the range of Science, there is any field so fascinating to the explorer—so rich in hidden treasures—so fruitful in delightful surprises—as that of Pure Mathematics. The charm lies chiefly, I think, in the absolute *certainty* of its results: for that is what, beyond almost all mental treasures, the human intellect craves for. Let us only be sure of *something*! More light, more light! Ἐν δὲ φάει καὶ ἀλέσσον. ‘And, if our lot be death, give light and let us die!’ This is the cry that, through all the ages, is going up from perplexed Humanity, and Science has little else to offer, that will really meet the demands of its votaries, than the conclusions of Pure Mathematics. Most other Sciences are in a state of constant flux—the precious truths of one generation being smiled at as paradoxes by the second generation, and contemptuously swept away as childish nonsense by the third. If you would see a specimen of the rapidity of this process of decomposition, take Biology for a sample: quote, to any distinguished Biologist you happen to meet, some book published thirty years ago, and observe his pitying smile!

But neither thirty years, nor thirty centuries, affect the clearness, or the charm, of Geometrical truths. Such a theorem as ‘the square of the hypotenuse of a right-angled triangle is equal to the sum of the squares of the sides’ is as dazzlingly beautiful now as it was in the day when Pythagoras first discovered it, and celebrated its advent, it is said, by sacrificing a hecatomb of oxen—a method of doing honour to Science that has always seemed to me *slightly* exaggerated and uncalled-for. One can imagine oneself, even in these degenerate days, marking the epoch of some brilliant scientific discovery by inviting a convivial friend or two, to join one in a beefsteak and a bottle of wine. But a

Quoted from *Iliad* by
Homer

hecatomb of oxen! It would produce a quite inconvenient supply of beef.

Now this field of Mathematical research, with all its wealth of hidden treasure, is all too apt to yield nothing to our research: for it is haunted by certain *ignes fatui*—delusive phantoms, that float before us, and seem so fair, and are *all but* in our grasp, so nearly that it never seems to need more than *one* step further, and the prize shall be ours! Alas for him who has been turned aside from real research by one of these spectres—who has found a music in its mocking laughter—and who wastes his life and energy in the desperate chase!

One of these—the chief one, I think—is the old old problem of ‘Squaring the Circle,’ which has certainly wasted many a human life. Whether it has actually driven any one mad, I know not—most of its victims were, I fancy, partly crazed before they entered on the quest—but it clearly has the powder of demolishing such slender reasoning powers as they may ever have chanced to possess.

With two of these misguided visionaries I have myself corresponded.

The first who addressed me filled me with a great ambition—to do a feat I had never yet heard of as accomplished by man, namely, to convince a ‘Circle-Squarer’ of his error! The value my friend had selected for ‘ π ’ was *not* an original one—being 3·2: but the enormous error, beginning as early as the *first* decimal place, tempted one with the idea that it could be easily demonstrated to *be* an error. I should think more than a score of letters were interchanged before I became sadly convinced that I had no chance. What man could still hope on, after receiving such a rebuff as the following? “You persuade yourself,” so my friend wrote, “that you have made your circumscribed polygon equal to the circle, *which you know cannot be*, and have thereby pushed the quadrant beyond 90°, valuing the circumference at 360°.” I meekly begged to be referred to the actual words in which I had advanced this startling assertion: but I never succeeded in getting the quotation verified.

My second ‘Circle-Squarer’ went to work in quite another fashion. His object was not so much to obtain an *arithmetical* value for ‘ π ,’ as to construct a geometrical straight Line which, given the radius, should exhibit to the eye the actual length of the circumference. His diagram was a most imposing one—Triangles and Parallels were interlaced in bewildering profusion—and it used up no less than 23 letters of the alphabet. Some of the Lines had arithmetical values assigned to them: and there was one value, ‘1·8879020478639098461 &c.’, which for a long time baffled all my endeavours to guess how in the world he had invented it. Of course one *might* have taken exception to such a construction at the very outset, and have said “I will admit the possibility of constructing a Line, which shall bear to the unit-line any arithmetical ratio you like, so long as you express it as an *exact* decimal: but what *can* I do with your ‘&c.’?” But his was not the kind of mind to which the geometrical construction of an ‘&c.’ presents any difficulty. At length, after many failures, I chanced on the discovery that this portentous number was $\frac{40}{3}$ of the decimal part of ‘ π ’! After this it was no wonder, considering that, in the course of construction, he had taken $\frac{3}{4}$ of this Line, and afterwards divided by 10, that the resulting Line, added to 3 times the unit-Line, was triumphantly proved to represent ‘ π ’! I ventured to ask if this was the way he had obtained the long decimal quoted above, namely, by multiplying the decimal part of ‘ π ’ by $\frac{40}{3}$, and received the courteous reply “your suggestion is perfectly correct”!

Another *ignis fatuus*—though not numbering so many victims as the ‘Quadrature of the Circle’—is ‘the Trisection of an Angle’ (that is, its trisection by

Euclid's machinery).

And yet another *ignis fatuus*—the one with which the following treatise is concerned—is the attempt to dispense with Euclid's celebrated 12th Axiom.

I may as well state briefly what the feat actually is, which Mathematicians have been vainly trying, since Euclid's day, to perform.

In I. 27, 28, he proves (so far, without invoking the aid of any doubtful Axiom) that “two Lines, which are equally inclined to a certain transversal (whether by making a pair of alternate angles equal, or an exterior equal to its interior opposite angle, or two interior, on the same side of the transversal, together equal to two right angles), will never meet.”

Next, in logical order, comes his 12th Axiom, viz. that “two Lines, which are unequally inclined to a certain transversal (he only *names* the case where they make two interior angles together less than two right angles, but he might fairly have included the others), *will* meet.” This Axiom, as I hope to prove in Appendix III, is only *partially*, and not *universally*, true.

Next, in I. 29, he proves (with the aid of this Axiom, of which it is what De Morgan calls the ‘contranominal’) the partially-true Theorem that “two Lines, which never meet, are equally inclined to any transversal.”

And from this, in I. 32, he proves that “the three angles of a Triangle are together equal to two right angles.”

These are only specimens of a set of Theorems which can be proved when once Axiom 12 is granted (e. g. there are several about ‘equidistantial Lines,’ which Euclid has altogether ignored): but they are all so connected as to follow easily from these.

Now the great difficulty, which besets this subject, is that Euclid's Axiom (this, I think, is universally admitted) is *not* axiomatic—the intellect has not yet occurred, among that species of Vertebrates which may be defined as ‘bimanous bipeds,’ which accepts it as a genuine Axiom—and the great question to be answered is “can a better Axiom be found?”

In Appendix IV, I will mention some of the substitutes that have been suggested, and will give some account of the ‘outlook’ in the direction of the new Axiom I have chanced on. In this place it will suffice, first, to explain what the task is that the long-desiderated Axiom has to perform, and secondly, to state the grounds on which I claim acceptance for my Axiom.

First, then, what is ‘the coming Axiom’ expected to do for us?

It will be convenient to divide the whole class, of Theorems needing proof, into two sub-classes—one including those which are *universally* true: the other those which are only *partially* true—the error, if any, being *infinitesimal* when compared with the Magnitudes with which the Theorem is concerned.

Euc. I. 32 is a specimen of the one kind, and Euc. I. 29 of the other.

In proving the *latter* class, no substitute for Euclid's Axiom has yet been suggested, that I know of, which does not suffer from the same defect as Euclid's Axiom—the being only *partially*, and not *universally*, true—and which does not, if we attempt to modify the language so as to remedy this defect, in *some* way lead us into the bewildering region of Infinities and Infinitesimals.

But the *former* class can, as I believe, be more easily proved. This is what I attempt in the following treatise—which owes its inspiration to a sudden thought (it occurred to me some two months ago) that it *might* be possible to prove Euc. I. 32 without getting mixed up with those spectral Infinities.

Moreover, it is quite possible to bring into this class all that is valuable in Euc. I. 29. Regarding the ‘separateness’ of the Lines merely as a link between Props. 27, 28, and 29, we may combine the three into one grand Theorem, thus:—“Two Lines, which are equally inclined to a certain transversal, are so to every transversal.” This Theorem, as well as Euc. I. 32, I prove in the following treatise. But the feat of proving them, without assuming any new Axiom *at all*, is at present beyond my grasp. Like the goblin ‘Puck,’ it has led me “up and down, up and down,” through many a wakeful night: but always, just as I thought I had it, some unforeseen fallacy was sure to trip me up, and the tricky sprite would “leap out, laughing ho, ho, ho!”

And now, to come to the real gist of this over-long Preface—however, nobody ever reads a Preface, so really it does not matter—am I not right in thinking that, on mere inspection of this diagram, any sane intellect will be ready to grant that “in any Circle, the inscribed Tetragon is greater than any one of the Segments that lie outside it”?

I shall be told, no doubt, that this is too *bizarre* and unprecedented an Axiom—that it is an appeal to the *eye*, and not to the reason. That it is somewhat *bizarre* I am willing to admit—and am by no means sure that this is not rather a *merit* than a defect. But, as to its being an appeal to the *eye*, what is “two straight Lines cannot enclose a space” but an appeal to the *eye*? What is “all right angles are equal” but an appeal to the *eye*?

In all Axioms, where an appeal is made to the eye on a question of *magnitude*, we shall find, I think, that the whole region of certainty and probability may be roughly mapped out into three districts—an out-lying district of certainty in *one* direction, a similar one of certainty in the *opposite* direction, and a middle district of probability—the boundaries being shadowy and liable to be shifted hither and thither according to the fancies or prejudices of each individual mind.

Permit me to illustrate this by an example taken from ordinary life.

You enter a room, where there is a book-case containing (say) five shelves, and your eye wanders carelessly along a shelf, making a rough estimate of the number of books in it. Now shut your eyes, and try to guess how many books there are altogether. Your hasty reckoning of one shelf gave a total (say) of 19 or 20, you are not sure which: so you feel safe in saying “I think there are *about* a hundred.” “Are you *certain*,” I ask, “that there are more than fifty?” “*Quite* certain,” you reply. “And also certain that there are less than a hundred and fifty?” “*Quite* certain,” you repeat. Here, then, are the three districts. The numbers up to 50 are *certainly* too small; the numbers over 150 are *certainly* too great; the intermediate numbers contain some doubtful ones—the most doubtful being very near 100—and this doubt shades off into certainty as we approach either of the outlying districts. You would not risk five shillings on the chance of the true number being *under* 100, or on the chance of its being *over* 100, but you would feel quite at your ease, if told that you would forfeit a thousand pounds, in case the number turned out to be under 50, or over 150.

Another objection, that has already been raised to my Axiom, and so will

Quoted from *A Midsummer Night's Dream* by William Shakespeare

Quoted from *The merry Pranks of Robin Goodfellow*

probably be raised again, and which I may as well meet here by anticipation, is that, on the supposition of Euclid I. 32 *not* being true, it may be proved that this relationship of magnitude, between the Tetragon and the Segment, changes as the Circle increases, until, with an infinitely great Circle, the Tetragon may actually be proved to be *less* than the Segment! This phenomenon, however, does not appal me so much as might be expected: for I have often observed it to occur that, when Theorem α logically leads to Theorem β , then, on the supposition of Theorem β *not* being true, it may be proved that Theorem α also is not true. (The second sequence is, in fact, what De Morgan calls the ‘contranominal’ of the first.) Hence this objection, if worth anything, *proves too much*: to dispute the validity of an argument, on the ground that, if it were valid, its contranominal would also be valid, is to upset the whole edifice of Logic itself: and, if you tell me, on such grounds as these, that I cannot prove what I assert, I may fairly retort upon you, that *you* cannot prove anything *at all!* You have destroyed the only machinery available for the purpose, and must henceforth dispense with all Logical methods, and console yourself with the cynical American adage “There’s nothing true: and there’s nothing new: and it don’t signify!”

To return to our Tetragon. It really contains the area of the Segment a little over 7 times. Hence anybody, I should suppose, would be ready to say “I am *certain* it contains the Segment more than twice: and I am equally certain it does *not* contain it twelve times.” In guessing the *actual* number, observers would greatly differ: some might guess 4, others 10: but *all* would agree in putting it above 2. And now see how modest is the demand of my Axiom! Merely that you will find room in the Tetragon for one single Segment! If *that* is not a matter of certainty, is *anything* certain in this world of ours?

I have yet one more arrow in my quiver: let me shoot it, and have done. If the gentle reader feels any the smallest demur to granting me that *once* this Tetragon is greater than the Segment lying below it, will he grant me that *twice* it will suffice? Or four times it? Or eight times it? He may go on doubling as long as he likes, and, so long as he keeps among finite numbers, he will have granted me all I need for a logical proof (which will be found in Appendix I) of Euc. I. 32. Surely he will not need to go into the Infinities? And may I add, in conclusion, that, if any gentle reader be found, who cannot *quite* bring himself to believe it impossible to squeeze 512 of these Tetragons into the Segment, but is willing to allow that no amount of skilful packing will dispose of 1024 of them—it will give me *real* satisfaction to be supplied with that gentle reader’s name and address?

C. L. D.
Ch. Ch., Oxford.
July, 1888.

Book I.

Certain universally-true Propositions, provable from genuine Axioms.

Definitions

1.

The sum of the angles of a Triangle is called its '**amount.**'

2.

Any angular magnitude is called a '**possible amount,**' if there be a Triangle whose 'amount' is equal to it: but, if there be no such Triangle, it is called an '**impossible amount.**'

3.

If any such angular magnitude vary continuously: whenever it changes from a 'possible amount' to an 'impossible amount,' it is said to pass from a '**possible region,**' to an '**impossible region:**' and *vice versâ.*

4.

If there be two fixed angular magnitudes such that the varying magnitude, while it continues between them, is always a 'possible amount,' but becomes an 'impossible amount' when it passes beyond them: they are called the '**superior limit,**' and the '**inferior limit,**' of the 'possible region' which lies between them.

Axioms

1.

If a Magnitude change from one value to another; and if, in doing so, it vary continuously; and if a certain value, intermediate to its first and last values, be selected: the Magnitude must, at some moment during the process of change, have that selected value.

2.

If two or more Magnitudes be such that, whenever any one of them varies, it varies continuously: then, whenever their sum varies, it varies continuously.

3.

If AB , CD , be two Lines intersecting at E ; and if CD be turned about E , AB remaining stationary: each of the angles at E varies continuously.

4.

If AB , CD , be two intersecting Lines; and if CD be turned about C , AB remaining stationary: then, so long as the Lines continue to intersect, each of the 4 angles at the Point of intersection varies continuously.

Propositions

Prop. I. Theorem.

If a Pair of Lines make, with a certain transversal, either (1) a pair of alternate angles equal, or (2) an exterior angle equal to its interior opposite angle on the same side of the transversal, or (3) a pair of interior angles on the same side of the transversal supplementary: they will make, with that transversal, (4), each pair of alternate angles equals and (5) each of the four exterior angles equal to its interior opposite angle on the same side of the transversal, and (6) each pair of interior angles on the same side of the transversal supplementary.

This Proposition is easily deduced from Euc. I. 13, 15.

Definitions (continued)

5.

Such a Pair of Lines may be said to be '**equally inclined**' to that transversal.

Prop. II. Theorem.

If two isosceles Triangles have equal bases but unequal sides: that Triangle, which has the greater sides, has the greater area.

Let the Triangles be set on the same base, and call them ABC , ABD . And let AD , DB , be respectively greater than AC , CB .

Now D cannot fall within the Triangle ACB , or upon either of its sides; for then AD , DB would be less than AC , CB ; [Euc. I. 21.

neither can it fall on C ; for then AD , DB would be equal to AC , CB ;

neither can AD intersect CB , nor AC intersect DB ; for, in either case, if CD were joined, there would be two Triangles, on the same base CD , having their coterminous sides equal; which is impossible; [Euc. I. 7.

$\therefore AB$, DB fall outside the Triangle ACB ;

\therefore Triangle ADB is greater than Triangle ACB .

Therefore, if two isosceles Triangles &c.

Q. E. D.

Prop. III. Problem.

Given a certain angle; and given that any isosceles Triangle, whose vertical angle is not-greater than the given angle, has its base not-greater than either of its sides: to describe, on a given base, an isosceles Triangle having each base-angle equal to the given angle.

Let AB be given base.

At A , in Line AB , make angle BAC equal to given angle, making $AC = AB$; and join BC .

Then, by hypothesis, BC is not-greater than AC : i. e. it is either equal to it, or less than it.

First let BC be equal to AC . (Fig. 1.)

Then Triangle ABC is equilateral: i. e. it is an isosceles Triangle, on given base AB , and having each base-angle equal to given angle.

Q. E. F.

Secondly, let BC be less than AC . (Fig. 2.)

Then angle BAC is less than angle ABC . [Euc. I. 18.]

At B make angle ABF equal to angle BAC . [Euc. I. 23.]

Then Triangle ABF is isosceles, and is on given base AB , and has each base-angle equal to given angle.

Q. E. F.

Corollary *The isosceles Triangle, so described, has its vertical angle not-less than either of its base-angles.*

For, in Fig. 1, $AB = AC$;

\therefore angle $ACB =$ angle ABC .

Q. E. D.

Again, in Fig. 2, $AB = AC$;

\therefore angle $ACB =$ angle ABC .

But angle AFB is greater than angle ACB ; [Euc. I. 16.]

and angle ABF is less than angle ABC ;

\therefore angle AFB is greater than angle ABF .

Q. E. D.

Prop. IV. Theorem.

Either all Triangles have the same 'amount'; or else, if α , β , be two 'possible amounts,' that is, 'amounts' belonging to existing Triangles, then any 'amount' intermediate to α and β , in also 'possible.'

If all Triangles have the same amount, the Proposition is true. If not, let ABC , ADE be two Triangles whose amounts are different. Call their ‘amounts’ ‘ α , β .’ And let the two Triangles be placed so as to have a common vertex at A , and their bases in the same straight Line.

Now Triangle ABC may be converted into Triangle ABF by making the point, where AC intersects BC , move from C to F , BC remaining stationary.

And, during this process, the angle at A will vary continuously, [Ax. 4.]

and the angle, at the point where the revolving Line intersects BC , will vary continuously; [Ax. 5.]

\therefore the sum of these angles will, if it vary at all, vary continuously. [Ax. 3.]

Similarly, Triangle ABF may be converted, first, into Triangle ABE , by making the point, where BF intersects AE , move from F to E , AE remaining stationary, and then into Triangle ADE , by making the point, where EB intersects AD , move from B to D , AD remaining stationary.

And, during the whole process, the ‘amount’ of the changing Triangle will, if it vary at all, vary continuously.

Hence, in changing from the value α to the value β , it must pass through all intermediate ‘amounts’: i. e. all intermediate ‘amounts’ are ‘possible.’ [Ax. 2.]

Therefore either all Triangles have &c.

Q. E. D.

Corollaries.

1. *Among angular magnitudes there is one, and only one, ‘possible region.’*

2. *This ‘possible region’ either consists of one single angular magnitude, such that it, and it alone, is a ‘possible amount’; or it consists of a continuous series of angular magnitudes, lying between 2 ‘limits,’ which 2 limits are such that any magnitude, lying between them, is a ‘possible amount,’ and any magnitude, lying outside them, is an ‘impossible amount.’*

Prop. V. Theorem.

The angles of any Triangle are together less than three right angles.

Let a right angle be represented by ' R .'
 Now any 2 of the angles of a Triangle are together less than $2R$; [Euc. I. 17.
 \therefore , adding together the 3 pairs which may be taken, the 3 angles of a Triangle,
 taken twice over, are together less than $6R$;
 \therefore , taken once only, they are together less than $3R$.
 Therefore the angles of any Triangle &c.

Q. E. D.

Prop. VI. Theorem.

There is a Triangle whose angles are together not-greater than two right angles.

If we deny this, we must assert that any 'amount' is greater than $2R$.
 Let this be our First Hypothesis.
 Now any 'amount' is less than $3R$. [Prop. 5.
 Hence the 'possible region' lies below $3R$; i. e. it has a 'superior limit.'
 Now let a 'possible amount' be selected, more than halfway from $2R$ to the
 'superior limit' of this region; and call it ' $(2R + \alpha)$.' Then it is evident that
 ' $(2R + 2\alpha)$ ' will lie *above* this limit, and will therefore be an 'impossible amount.'
 Now any Triangle, whose 'amount' is $(2R + \alpha)$, must be either obtuse-angled,
 or right-angled, or acute-angled.
 Hence we must assert that there is either an obtuse-angled Triangle, or a
 right-angled Triangle, or an acute-angled Triangle, whose 'amount' is $(2R + \alpha)$.
 Let these be our Second, our Third, and our Fourth Hypothesis.
 Call the Triangle ' ABC .'

First, let it be obtuse-angled; and let C be the obtuse angle.
 At Point C , in Line BC , make angle BCB equal to angle BCA , making CD
 equal to CA ; and join BD and AD .
 Then Triangle BCD is equal, in all respects, to Triangle BCA ; [Euc. I. 4.
 \therefore its 'amount' = $(2R + \alpha)$;
 also 'amount' of Triangle ACD is, by our First Hypothesis, greater than $2R$;
 \therefore 'amounts' of the 3 Triangles are together greater than $(6R + 2\alpha)$.
 But these make up 'amount' of Triangle ABD , plus angles about C , which
 = $4R$; [Euc. I. 13. Cor.
 \therefore 'amount' of Triangle ABD , plus $4R$, is greater than $(6R + 2\alpha)$;
 \therefore this 'amount,' alone, is greater than $(2R + 2\alpha)$; which is absurd, since the
 latter lies above the 'superior limit,' and is therefore an 'impossible amount.'
 Hence our Second Hypothesis is false; i. e. no obtuse-angled Triangle can
 have the amount $(2R + \alpha)$.

Secondly, let it be right-angled; and let C be the right angle.
 At Point C , in Line BC , make angle BCB equal to angle BCA , i. e. equal to R ; and make $CD = CA$; and join BD ,
 Then AC, CD , are in one straight Line. [Euc. I. 14.
 Also Triangle BCD is equal, in all respects, to Triangle BCA ; [Euc. I. 4.
 \therefore its 'amount' = $(2R + \alpha)$;
 \therefore 'amounts' of the 2 Triangles together = $(4R + 2\alpha)$.
 But these make up 'amount' of Triangle ABD , plus angles at C , which = $2R$;
 \therefore 'amount' of Triangle ABD , plus $2R$, = $(4R + 2\alpha)$; \therefore this 'amount,' alone, = $(2R + 2\alpha)$; which is absurd.
 Hence our Third Hypothesis is false; i. e. no right-angled Triangle can have the amount $(2R + \alpha)$.

Thirdly, let it be acute-angled.
 Bisect AC at D ; join BD , and produce it to E , making $DE = BD$; and join CE .
 Now angles ADB, CDE , are equal, being vertical; [Euc. I. 15.
 \therefore Triangles ADB, CDE , are equal in all respects; [Euc. I. 4.
 \therefore angle $BCE =$ angle A ; and angle $CEB =$ angle ABD ;
 \therefore 'amount' of Triangle $BCE =$ that of Triangle ABC .
 Again, \therefore angle $CED =$ angle ABD ;

\therefore angles CED, CBD together = angle ABC ;
 \therefore they are together less than R ;
 \therefore angle BCE is, by our First Hypothesis, greater than R ;
 i. e. Triangle BCE is obtuse-angled;
 \therefore its 'amount' cannot be $(2R + \alpha)$;
 \therefore 'amount' of Triangle ABC cannot be $(2R + \alpha)$.
 Hence our Fourth Hypothesis is false; i. e. no acute-angled Triangle can have the 'amount' $(2R + \alpha)$.
 Hence, no Triangle can have this amount.
 Hence our First Hypothesis, that any 'amount' is greater than $2R$, is false.
 Therefore there is a Triangle &c.

Q. E. D.

Corollary *The 'possible region' does not lie wholly above two right angles.*

Book II.

Certain universally true Propositions, not provable from genuine Axioms, but provable if the following Axiom be accepted.

[N.B. This Axiom cannot claim to be more than a 'Quasi-Axiom,' i. e. one whose *self-evident* character is disputable.]

Axioms

1.

In any Circle, the inscribed equilateral Tetragon is greater than any one of the Segments which lie outside it.

Note.—If, in any Circle, 2 Diameters be drawn at right angles to each other, and their extremities joined, the joining Lines will, by Euc. I. 4 be equal to each other. Hence the Figure, thus formed, will be an inscribed equilateral Tetragon. (It will also be *equiangular*; but that is of no importance for our present purpose.)

Prop. I. Theorem.

An isosceles Triangle, whose vertical angle is one-eighth of a right angle, has its base less than either of its sides.

Let ABC be an isosceles Triangle, whose vertical angle at A is one-eighth of a right angle.

It shall be proved that BC is less than AB .

If we deny this, we must assert that BC is not-less than AB .

Let this be our Hypothesis.

Construct 7 more Triangles ACD , &c., equal to ABC . With centre A , and distance AB , describe quadrant passing through C , D , &c. (See Note.) And join BK , BF , FK , BD , DF , FH , HK .

Then Triangle ABK is one-fourth of an equilateral Tetragon inscribed in the Circle.

Hence, 4 times this Triangle is greater than Segment BCK . [II. Ax. 1.

Because angle BCD is greater than angle ACD , and that angle BDC is less than angle ADC ;

\therefore angle BCD is greater than angle BDC ;

\therefore BD is greater than BC .

[Euc. I. 19.

Similarly, BF is greater than BC .

Hence, on our Hypothesis, BD and BF are both of them greater than AB .

Also, \therefore BF is greater than AB ;

\therefore Triangle BFK is greater than Triangle ABK ;

[I. Prop. 2.

to each of these add Triangle ABK ;

\therefore Figure $ABFK$ is greater than twice Triangle ABK .

Note.—The Reader is requested to imagine chords drawn to the arcs BC , CD , &c.

Again, \because BD is greater than AB ;
 \therefore Triangle BDF is greater than Triangle ABF ; [I. Prop. 2.
 \therefore Triangles BDF, FHK are together greater than Figure $ABFK$;
to each of these add Figure $ABFK$;
 \therefore Figure $ABDFHK$ is greater than twice Figure $ABFK$, i. e. greater than
4 times Triangle ABK ,
Again, \because BC is not-less than AB ;
 \therefore Triangle BCD is not-less than Triangle ABD ; [I. Prop. 2.
 \therefore Triangles BCD, DEF, FGH, HJK are together not-less than Figure
 $ABDFHK$; i. e. they are together greater than 4 times Triangle ABK ;
 \therefore , *a fortiori*, Segment BCK is greater than 4 times Triangle ABK .
But this is absurd, since it has been already proved less than 4 times this
Triangle.
Hence our Hypothesis, that BC is not-less than AB , is false; i. e. BC is less
than AB .
Therefore an isosceles Triangle &c.

Q. E. D.

Corollary Hence, by Book I, Prop. III, it is possible to describe, on a given
base, an isosceles Triangle having each base-angle equal to one-eighth of a right
angle.

Prop. II. Theorem.

The angles of any Triangle are together not-less than one-eighth of a right angle.
Let one-eighth of a right angle be represented by ' θ .'

Let ABC be a Triangle; it shall be proved that its 'amount' is not-less than
 θ .
If we deny this, we must assert that its 'amount' is less than θ .
Let this be our Hypothesis.

Hence each of its angles is less than θ .
 On AB describe an isosceles Triangle ABD having each base-angle equal to θ ; [II. Prop. 1. Cor.]
 hence AC, BC , must lie within this Triangle;
 i. e. Triangle ABC must lie within it;
 \therefore angle ADB is less than angle ACB ; [Euc. I. 21.]
 i. e. less than θ ;
 but angle ADB is not-less than angle DAB ; [I. Prop. 8. Cor.]
 i. e. not-less than θ ; which is absurd.
 Hence our Hypothesis, that ‘amount’ of Triangle ABC is less than θ , is false;
 i. e. it is not less than θ .
 Therefore the angles of any Triangle &c. Q. E. D.

Corollary. *The ‘possible region’ does not extend below one-eighth of a right angle.*

Prop. III. Theorem.

There is a Triangle whose angles are together not-less than two right angles.

If we deny this, we must assert that any ‘amount’ is less than $2R$.
 Let this be our First Hypothesis.
 It shall be proved that, if we assert this, we must also assert that any ‘amount’ is not-less-than 2θ , where ‘ θ ’ represents one-eighth of a right angle.
 If we deny this, we must assert that there is an ‘amount’ less than 2θ .
 Let this be our Second Hypothesis.
 Now we know that the ‘possible region’ does not extend below θ ; [II. Prop. 2. Cor.]
 i. e. it has an ‘inferior limit.’
 Let a ‘possible amount’ be selected, more than half-way from 2θ to this ‘inferior limit,’ and call it ‘ $(2\theta - \alpha)$.’ Then it is evident that $(2\theta - 2\alpha)$ will lie below the ‘inferior limit,’ and will therefore be an ‘impossible amount.’
 Let a Triangle be taken, whose ‘amount’ is $(2\theta - \alpha)$;
 \therefore any one of its angles, which is not-greater than either of the others, is not-greater than $\frac{2\theta - \alpha}{3}$; i. e. is less than θ .
 Call this angle ‘ A .’
 Now one, at least, of the remaining angles must be acute. [Euc. I. 17.]
 Call this ‘ B ’; and call the third angle C .
 Let 2 such Triangles, ABC and $A'B'C'$, be taken; and let them be so placed that their B -vertices coincide and their BA -sides lie in one straight line; and join CC' .

On AA' describe an isosceles Triangle $AA'D$, having each base-angle equal to θ . [II. Prop. 1. Cor.]

Now each of the angles $BAC, BA'C'$, is less than θ .

\therefore Lines $AC, A'C'$, will fall within angles $BAD, BA'D$;

i. e. Figure $AA'C'C$ will fall within Triangle $AA'D$.

Join DC, DC' .

Now 'amounts' of Triangles $ABC, A'BC'$, together = $2(2\theta - \alpha)$, and those of the other 4 Triangles are, by our First Hypothesis, together less than $8R$;

\therefore 'amounts' of all 6 Triangles are together less than $(8R + 4\theta - 2\alpha)$;

but these make up 'amount' of Triangle $AA'D$, plus angles at B, C, C' , which together = $10R$;

\therefore 'amount' of Triangle $AA'D$, plus $10R$, is less than $(8R + 4\theta - 2\alpha)$.

Now we know that 2θ is not-greater than $2R$;

\therefore , adding these inequalities, 'amount' of Triangle $AA'D$, plus $(10R + 2\theta)$, is less than $(10R + 4\theta - 2\alpha)$;

\therefore , this 'amount,' alone, is less than $(2\theta - 2\alpha)$; which is absurd, since the latter lies below the 'inferior limit,' and is therefore an 'impossible amount';

\therefore one of our two Hypotheses must be false;

i. e. either there is an 'amount' not-less than $2R$, or else any 'amount' is not-less than 2θ .

Suppose we maintain our First Hypothesis: then we must abandon our Second; i. e. we must admit that any 'amount' is not-less than 2θ .

It shall be proved that, in this case, we must also admit that any 'amount' is not-less than 4θ .

For, if we deny this, we must assert that there is an 'amount' less than 4θ .

Let this be our Third Hypothesis.

Then, in the above proof, θ and 2θ may be replaced by 2θ and 4θ , and a similar absurdity will follow.

Hence either our First or our Third Hypothesis must be false;

i. e. either there is an 'amount' not-less than $2R$, or else any amount is not-less than 4θ .

A similar proof, will hold for 8θ ; and then for 16θ .

Hence, either there is an 'amount' not-less than $2R$, or else any amount is not-less than 16θ .

But $16\theta = 2R$.

Hence the second clause of this alternative contains the first.

Hence the first clause must be true.

That is, there is a Triangle &c.

Q. E. D.

Corollary. *The 'possible region' does not lie wholly below two right angles.*

Prop. IV. Theorem.

There is a Triangle whose angles are together equal to two right angles.
