For the 'possible region' does not lie wholly above $2R$; [I. Prop. 6. Cor.
 neither does it lie wholly below $2R$; [II. Prop. 3. Cor.
 \therefore it includes $2R$. [I. 4. Cor. 2.
 That is, there is a Triangle &c.

Q. E. D.

Prop. V. Theorem.

There is a quadrilateral Figure which is 'rectangular,' that is, which has all its angles right angles.

Let ABC be a Triangle whose 'amount' = $2R$. [II. Prop. 4.
 At C make angle ACD equal to angle CAB , and angle BCE equal to angle CBA ;
 hence angles ACD , ACB , BCE , together = $2R$;
 $\therefore DC, CE$, are in a straight Line. [Euc. I. 14.
 Bisect AC at F ; from F draw

FG perpendicular to AB ; from CD cut off CH equal to AG ; and join FH .
 \therefore in Triangles FAG, FCH , FA, AG , are respectively equal to FC, CH , and angle A to angle FCH , [Euc. I. 4.
 \therefore the Triangles are equal in all respects;
 \therefore angle FHC is a right angle;
 and angle $AFG =$ angle CFH ;
 \therefore angles AFG, AFH , together = angles CFH, AFH ; i. e. together = $2R$;
 $\therefore GF, FH$ are in a straight line; [Euc. I. 14.
 $\therefore GH$ is a common perpendicular to Lines AB, DE ,
 Similarly, by bisecting BC at J , it may be proved that KL is a common perpendicular.
 Hence Figure HK is rectangular.
 Therefore there is a quadrilateral Figure &c.

Q. E. D.

Definition.

A rectangular quadrilateral Figure may be called a '**Rectangle.**'

Prop. VI. Theorem.

The opposite sides of a Rectangle are equal.

Let $ABCD$ be a Rectangle; and let it be reversed so that A, B , may change places.

Then AB will lie along BC , and BC along AD .

Now, if AD were not equal to BC , D, C , would not change places, but would take new positions, as $D'C'$;

hence exterior angle ADC would be greater than interior opposite angle $AC'D'$; [Euc. I. 18.

but they are also equal, being right angles; which is absurd;

$\therefore AD = BC$.

Similarly it may be proved that $AB = DC$.

Therefore the opposite sides &c.

Q. E. D.

Prop. VII. Theorem.

There is a Pair of Lines, each of which is 'equidistant' from the other, that is, is such that all Points on it are equally distant from the other Line.

Let $ABCD$ be a Rectangle; and let a vertical Line be supposed, first to coincide with AD and then to move along AB , continuing always at right angles to it, till it reaches some intermediate position $A'D'$.

Now, if its top be not now on DC , it must have either dropped below it or risen above it.

First, let it be supposed to have dropped below it: and join DD' , $D'C$.

Then, if the Figure $AA'D'D$ be reversed, and applied to the same base, it is evident that D and D' will exchange places;

\therefore angle $A'D'D =$ angle ADD' , i. e. it is less than R ;

Similarly angle $A'D'C$ is less than R ;

but angle $DD'C$ is less than $2R$.

\therefore angles at D' are together less than $4R$; which is absurd; [Euc. I. 13. Cor.]

\therefore top of vertical Line has not dropped below DC .

Similarly it may be proved that it has not risen above DC .

Hence it moves along DC ; i. e. it describes a straight Line, and will evidently continue to do so, however far the vertical Line move, either way, along AB .

Therefore there is a Pair of Lines &c.

Q. E. D.

Corollaries.

1. *If a Pair of Lines have a common perpendicular: each of them is equidistant from the other.*

Corollary 2. *It is possible to form a Rectangle of any given width and height.*

For, in the above Pair of horizontal equidistant Lines, 2 common perpendiculars may be drawn, at a given width apart; and the Figure, so formed, will be a Rectangle; and its sides will be a Pair of vertical equidistant Lines, which may be treated in the same way.

Prop. VIII. Theorem.

The angles of any Triangle are together equal to two right angles.

Let ABC be a Triangle, so placed that each base-angle is acute; from C draw CD perpendicular to AB ; and make Rectangles $ADCF$, $BDCE$. [II. Prop. 7. Cor. 2.]

$\therefore FD$ has its opposite sides equal, [II. Prop. 6.]

\therefore , in Triangles ADC , CFA , the sides of the one are respectively equal to the sides of the other;

\therefore angle $CAD =$ angle ACF [Euc. I. 8.]

Similarly angle $CBD =$ angle BCE ;

\therefore the angles of the Triangle ABC together = the angles FCA , ACB , BCE ;
i. e. together = $2R$.

Therefore the angles of any Triangle &c.

Q. E. D.

Prop. IX. Theorem.

A Pair of Lines, which are equally inclined to a certain transversal, are so to any transversal.

Let AB , CD , be equally inclined to transversal EF ; and let GH be any other transversal.

Join EH .

Now 'amounts' of Triangles EFH , EGH , together = $4R$. [II. Prop. 8.]

But these make up angles of Figure FG ;

\therefore angles of Figure FG together = $4R$;

but angles GEF , EFH together = $2R$; [I. Prop. 1.]

\therefore angles EGH, GHF , together = $2R$;
 $\therefore AB, CD$, are equally inclined to GH .
 Therefore a Pair of Lines &c.

[I. Prop. 1.]

Q. E. D.

Axioms (continued).

2.

If two homogeneous magnitudes be both of them finite: the lesser may be so multiplied, by a finite number, as to exceed the greater.

Prop. X. Theorem.

If a Pair of Lines make, with a certain transversal, two interior angles, on the same side of it, which are together less than two right angles, the defect being a finite angle: these Lines are intersectional on that side of the transversal.

Let AB, CD make with EF the interior angles BEF, EFD together less than $2R$.

Make angle FEG equal to angle EFD ; produce GE to H ; from E draw EK at right angles to AB , and EL at right angles to CD .

Hence EL is also at right angles to GH ; [II. Prop. 9.

i. e. CD, GH have a common perpendicular;

\therefore each is equidistant from the other; [II. Prop. 7, Cor. 1.

also $EL =$ the common distance between them.

Now angle BEH is the defect, from $2R$ of the sum of the 2 interior angles BEF, EFD ;

hence, by hypothesis, it is finite;

\therefore it may be so multiplied, by a finite number, as to exceed angle BEK .

[II. Ax. 2.

Call this finite number ' n .'

In EB , produced if necessary, take EM n -times EL ; from M draw MN at right angles to EH ; turn Triangle ENM about EN into position ENR ; then, about ER , into position ERS , and so on, till there are n such Triangles altogether; and let its final portion be EYZ .

Then angle MEZ is n -times angle MEH ; i. e. it is greater than angle MEK .

Let EK cut broken-Line $MRTZ$ at V ; and join MV .

Then $MRTZ$ is greater than $MRTV$, which is greater than MV , which is greater than EM ; [Euc. I. 20, 17, 19.

\therefore $MRTZ$ is greater than EM ;

but MN is the same fraction of $MRTZ$ which EL is of EM :

\therefore MN is greater than EL ; i. e. the distance of M , from GH , is greater than the common distance between CD and GH .

\therefore AB, CD are intersectional towards B, D .

Therefore, if a Pair of Lines &c,

Q. E. D.

Appendix I.

Containing an alternative Axiom, which may be substituted for Axiom 1 at p. 857.

Definition

The Segment, cut off, from any Sector of a Circle, by its Chord, may be called its '**outer Segment**'; and the Triangle, contained by its Chord and its two Radii, may be called its '**central Triangle**.' And, if its Arc be bisected and the point of bisection joined to the ends of its Chord, the isosceles Triangle, so formed, may be called its '**inscribed isosceles Triangle**.'

Propositions

Prop. A. Theorem.

If, in any Sector of a Circle, its Chord be not-less than its Radius: then, in a Sector whose vertical angle is twice as great, its outer Segment is greater than its central Triangle.

Let ABD be a Sector whose Chord BD is not-less than its Radius AB . Make angle DAC equal to angle BAD ; and join BC, CD .

Then vertical angle of Sector $ABDC$ is twice as great as that of Sector ABD .

It shall be proved that its outer Segment BDC is greater than its central Triangle ABC .

Because BD is not-less than AB ;

\therefore Triangle BDC is not-less than Triangle ABC ;

[I. Prop. 2.

\therefore , *a fortiori*, Segment BDC is greater than Triangle ABC .

Hence if, in any Sector &c.

Q. E. D.

Prop. B. Theorem.

If, in any Sector of a Circle, each of the equal Sides of its inscribed isosceles Triangle be not-less than its Radius; and if its outer Segment be greater than a certain multiple of its central Triangle: then, in a Sector, whose vertical angle is twice as great, its outer Segment is greater than twice that multiple of its central Triangle.

Let $ABED$ be a Sector such that each of the equal sides of its inscribed isosceles Triangle BED is not-less than its Radius AB , and such that its outer Segment BED is greater than m times its central Triangle ABD . Make angle DAC equal to angle BAD ; bisect angles BAD , DAC by Lines AE , AF ; and join BC , CD , CF , FD .

Then vertical angle of Sector $ABDC$ is twice as great as that of Sector $ABED$.

It shall be proved that its outer Segment BDC is greater than $2m$ times its central Triangle ABC .

Because angle BED is greater than angle AED , and that angle BDE is less than angle ADE ;

\therefore angle BED is greater than angle BDE ;

\therefore BD is greater than BE ;

[Euc. I. 25.]

but BE is not-less than AB ;

\therefore BD is greater than AB ;

\therefore Triangle BDC is greater than Triangle ABC ;

[I. Prop. 2.]

to each of these add Triangle ABC ;

\therefore Figure $ABDC$ is greater than twice Triangle ABC .

Again, \because Segment BED is given to be greater than m times Triangle ABD ;

\therefore Segments BED , DFC are together greater than m times Figure $ABDC$;

i. e. are together greater than $2m$ times Triangle ABC ;

\therefore , *a fortiori*, Segment BDC is greater than $2m$ times Triangle ABC .

Hence if, in any Sector &c.

Q. E. D.

Axiom.

[An alternative Axiom, to be substituted for Axiom I, at p. 857, if the Reader feel any difficulty in granting that Axiom. In this case, certain portions of the foregoing Propositions will also need to be replaced by new matter, which is hereto appended.]

In every Circle, the inscribed equilateral Tetragon, multiplied by 2^a (' a ' being a certain selected finite number), is greater than any one of the Segments which lie outside it.

Prop. C. Theorem.

[To be substituted for Prop. I, at p. 858.]

An isosceles Triangle, whose vertical angle is $\frac{1}{2^{a+3}}$ of a right angle, has its base less than either of its sides.

Let $\frac{1}{2^{a+3}}$ of a right angle be represented by ' ϕ .'
 Let ABC be an isosceles Triangle, whose vertical angle at A is ϕ .
 It shall be proved that BC is less than AB .
 Draw AD at right angles to AB , and, with centre A , and distance AB , describe Quadrant. (See Note.) And join BD .

Note.—The reader can assign to ' a ' any finite value which he finds large enough to induce him to accept this Axiom. For example, if he be willing to grant that 1024 times the Tetragon is greater than the Segment, he can assign to it the value '10.'

Note.—The Reader is requested to imagine a chord drawn to the arc BC .

Then Triangle ABD is one-fourth of an equilateral Tetragon inscribed in the Circle.

Hence 2^{a+2} times this Triangle is greater than Segment BCD , [Alternative Axiom.]

Now, if we deny that BC is less than AB , we must assert that BC is not-less than AB .

Let this be our Hypothesis.

Hence it may be proved, as in Book II, Prop. I, that any Chord, drawn from B to any Point on the Arc CD , is greater than BC , and therefore not-less than AB .

Now, on our Hypothesis, ABC is a Sector whose Chord is not-less than its Radius;

\therefore , in a Sector whose vertical angle is 2ϕ , its outer Segment is greater than its central Triangle; [Prop. A.]

i. e., in a Sector whose vertical angle is 2ϕ , each of the equal sides of its inscribed isosceles Triangle is not-less than its Radius, and its outer Segment is greater than once its central Triangle;

\therefore , in a Sector, whose vertical angle is 4ϕ , its outer Segment is greater than twice its central Triangle; [Prop. B.]

\therefore , similarly, in a Sector, whose vertical angle is 8ϕ , its outer Segment is greater than 4 times its central Triangle;

and so on;

\therefore , ultimately, in a Sector, whose vertical angle is $2^{a+3}\phi$, its outer Segment is greater than 2^{a+2} times its central Triangle;

but $2^{a+3}\phi = R$;

\therefore , in Sector $ABCD$, Segment BCD is greater than 2^{a+2} times Triangle ABD .

But this is absurd, since it has been already proved less than 2^{a+2} times this Triangle.

Hence our Hypothesis, that BC is not-less than AB , is false; i. e. BC is less than AB .

Therefore an isosceles Triangle &c.

Q. E. D.

Corollary to Prop. C. Hence, by Book I, Prop. III, it is possible to describe, on a given base, an isosceles Triangle having each base-angle equal to $\frac{1}{2^{a+3}}$ of a right angle.

[N.B. If the Reader be willing to grant, as axiomatic, that 1024 times the Tetragon is greater than the Segment, he must now admit, as logically proved, that an isosceles Triangle, whose vertical angle is $\frac{1}{8192}$ of a right angle, has its base less than either of its sides. If such a Triangle were actually drawn, having each side 140 yards long, its base would be found to be less than an inch!]

Prop. D. Theorem.

[To be substituted for Prop. II, at p. 859.]

The angles of any Triangle are together not-less than $\frac{1}{2^{a+3}}$ of a right angle.

[The proof of Prop. II will serve here, without any change, except the substitution of ' ϕ ' for ' θ '.]

[N.B. If the Reader be willing to grant, as axiomatic, that 1024 times the Tetragon is greater than the Segment, he must now admit, as logically proved, that the angles of any Triangle are together not-less than $\frac{1}{8192}$ of a right angle.]

Prop. E. Theorem.

[To be substituted for Prop. III, at p. 860.]

There is a Triangle whose angles are together not-less than two right angles.

[The proof of Prop. III will serve here, without any change, except the substitution of ‘ ϕ ’ for ‘ θ ,’ and ‘ $\frac{1}{2^{a+3}}$ ’ for ‘one-eighth,’ down to the words ‘A similar proof &c.’ at foot of p. 861; for which the following is to be substituted.]

A similar proof will hold for 8ϕ , 16ϕ , and so on; and ultimately for $2^{a+4}\phi$. Hence, either there is an ‘amount’ not-less than $2R$, or else every ‘amount’ is not-less than $2^{a+4}\phi$.

But $2^{a+4}\phi = 2R$.

Hence the second clause of this alternative contains the first.

Hence the first clause must be true.

That is, there is a Triangle &c.

Q. E. D.

Appendix II.

Is Euclid’s Axiom true?

§ 1. Infinite and Finite Magnitudes

The answer I propose to give to this alarming question is that, though true for Finite Magnitudes—the sense in which, as I believe, Euclid *meant it to be taken*—it is *not* universally true.

Will the gentle Reader be so kind as to join me in contemplating, for a few minutes, the Infinite Space which surrounds our tiny planet? We believe—those of us, at least, who answer *fully* to the ancient definition of Man, ‘*animal rationale*’—that it is infinite. And that, not because we profess to have grasped the conception of Infinity, but because the *contrary* hypothesis *contradicts* Reason: and what contradicts Reason we feel ourselves authorised to deny. *Both* conceptions—that Space has a limit, and that it has none—are *beyond* our Reason: but the former is also *against* our Reason: for we may fairly say “When we have reached the limit, what then? What do we come to? There *must* be either Something, or Nothing. If Something, it is *full* Space, ‘*plenum*’: if Nothing, it is *empty* Space, ‘*vacuum*.’ That there should be *neither* of these is a logical impossibility. Such an hypothesis would be—in the words of Master Constable Dogberry—‘most tolerable and not to be endured.’”

I propose to show, by certain considerations which begin with Infinite Space, but will speedily condescend to Finite Magnitudes, that it is possible for two homogeneous Magnitudes to be so related to each other that *no* multiple of the lesser will exceed the greater. (It is of course assumed that a ‘multiple’ of a Magnitude is the result produced by the use of a ‘multiplier,’ and that a ‘multiplier’ is a *nameable*—and therefore a *finite*—number.)

Quoted from *Much Ado About Nothing* by William Shakespeare

“Yet surely,” the gentle Reader will protest, “Euclid has assumed the exact *contrary* of this? Does he not, in Book X, Prop. 1, tacitly assume the Axiom that the lesser of two Magnitudes may be so multiplied as to exceed the greater?”

Gentle Reader, he *does!* But *my* contention is that, in so doing, he excludes from his view both Infinities and Infinitesimals, and is contemplating *Finite Magnitudes only*.

For consider Euclid’s Definitions of the word ‘Ratio’ and of the phrase ‘to have a Ratio to.’ (Book V. Def. 3, 4.)

(3) λόγος ἐστὶ δύο μεγεθῶν ὁμογενῶν ἢ κατὰ πελικότητα πρὸς ἄλληλα ποιά σχέσις.

(4) λόγον ἔχειν πρὸς ἄλληλα μεγέθη λέγεται, ἃ δύναται πολλαπλασιαζόμενα ἀλλήλων ὑπερέχειν.

Quite literally, these are:—

(3) “Ratio is a certain relationship, as to size, of two homogeneous Magnitudes, each to the other.”

(4) “Magnitudes, which can, (on) being multiplied, exceed each the other, are said to have a Ratio, each to the other.”

But they become more intelligible when less literally translated:—

(3) “Ratio is a certain relationship, as to size, borne, by a Magnitude, to another Magnitude homogeneous with it.”

(4) “A Magnitude is said ‘to bear a Ratio to’ another Magnitude, homogeneous with it, when either of them, that is not greater than the other, can be made so by multiplication.”

Some translators introduce the word ‘mutual’ into No. (3), and tell us that Ratio is ‘a *mutual* relation of two Magnitudes’: but this seems to me incorrect, as seeming to imply that the Ratio, borne by *A* to *B*, is *identical* with that borne by *B* to *A*. But, if *A* were 3-4ths of *B*, *B* would not be 3-4ths, but 4-3ds, of *A*: and the Ratio ‘4-3ds,’ though of the same *nature* as the Ratio ‘3-4ths,’ is not *identical* with it.

Now it seems to me clear that Euclid does not mean to imply that *any* two homogeneous Magnitudes bear ‘Ratios’ to each other: for in No. (4) he gives us a test, by which to know in what cases two such Magnitudes *do*, and in what cases they do *not*, bear ‘Ratios’ to each other. This test would be wholly superfluous if it were true, of any two homogeneous Magnitudes, that one could be said ‘to bear a Ratio to’ the other.

What cases then, does Euclid mean to *exclude* by this test? My answer is “all cases in which one of the Magnitudes is *infinitely greater than the other*.” Take, as an example, these two Magnitudes—a Cubic Inch, and Infinite Space. It is *not* possible, by multiplying a Cubic Inch by any finite number, however great, to make it exceed, or even equal, Infinite Space: hence Euclid’s test *fails* in this case, and Euclid would, no doubt, *decline* to say that either of these Magnitudes, though they are strictly *homogeneous*, bears a ‘Ratio’ to the other.

My conclusion, then, is that, in Book X. Prop. 1, Euclid is limiting his view to the case of two homogeneous Magnitudes *which are such that neither of them is infinitely greater than the other*: nay, more—for such a limitation would not exclude the case of two Infinities of the same order—that he is contemplating *Finite Magnitudes only*.

§ 2. Infinitesimal Lines and Strips.

We have already seen that, in the case of two homogeneous Magnitudes, one Finite and the other Infinite, *no* multiple of the lesser will exceed the greater: and I now propose to show that it is possible for the same thing to happen in the case of two homogeneous Magnitudes, *neither of them being Infinite*.

Let us imagine an Infinite Plane, placed upright, and facing us—as if we were standing in front of a waU, which extended to infinity, upwards, downwards, to the right-hand, and to the left. If we divide this Plane by a single horizontal straight line, extended to infinity to the right-hand and to the left, we get *half* of the whole Plane *above* the Line, and *half below* it, wherever we choose to place the Line. This may be deduced from the logical principle that we have no reason for believing *either* to be greater than the other; or we may adopt M. Bertrand's Axiom, "Two spaces, whether finite or infinite, are equal, when one can be placed upon the other so that any point whatsoever of either coincides with a point of the other"—a condition which seems, theoretically, readily attainable, by making one portion of the Plane revolve round the boundary-line, as a hinge, till it coincides with the other portion. Each portion is, of course, an Infinity of the *same* order as the whole Plane.

Now let us imagine *two* such infinite horizontal straight Lines, 'separational' from each other (i. e. never intersecting), placed at a finite distance apart, and therefore having between them a Strip, finite in width, infinite in length, and therefore infinite in area.

Now it clearly is *not* possible, by multiplying this Infinite Strip by any finite number, however great, to make it exceed, or even equal, the whole Infinite-Plane. Here again, then, Euclid's test fails, and neither of these Magnitudes, though they are *homogeneous*, can be said to have a 'Ratio' to the other. In fact, the Infinite-Strip is an Infinity *of a lower order* than the Infinite-Plane.

Comparing this Strip with a single square-inch, you will, I fancy, be willing to grant at once that *no* multiple of the latter can possibly reach—much less exceed—the former. We have, in fact, established the existence of *three* kinds of Area, viz. Finite Areas (e. g. a square inch). Infinities of the first order (e. g. the Infinite-Strip we have been considering), and Infinities of the second order (e. g. the upper half of the whole Infinite-Plane).

Now let us go a step further. Let the two sides of this Strip be supposed to gradually approach each other—still maintaining their 'separational' character—and let us consider the effect of this process on the intervening area.

When the width of the Strip has been reduced to half-an-inch, you will grant, I suppose, that the area is exactly half what it was at first—since *two* such Strips, laid side by side, evidently make up the original Strip. And so, by reducing the width to a quarter-inch, &c., we obtain a number of different areas, all Infinite alike, and yet having finite ratios to one another: in fact, so long as the width continues to be a *finite fraction* (i. e. a fraction with a finite numerator and denominator) of an inch, the area continues to be an Infinity *of the same order* as the original Strip. (It seems obvious that Infinities *of the same order* have finite ratios to one another, and that any one of them can be so multiplied, by a finite number, as to exceed any other.)

But this narrowing process may be continued until the two Lines absolutely *coincide*: and what *then* becomes of the area? It cannot be denied that it is then *Zero*.

Now I have ventured (see p. 850) to lay it down, as an Axiom, that, when a Magnitude varies *continuously*, and has changed from a certain value to a certain other value, it must have passed through *every intermediate value*. And what intermediate values do we find between an Infinite Area and Zero? Surely every *Finite* Area, that can be named, lies between them? The Reader can, if he likes, part company with me at this point: but to my Reason it seems absolutely clear—first, that the Strip does diminish *continuously*, and not ‘*per saltum*’; and secondly, that its area has, at some time or other during the process, every conceivable *finite* value. At one time, for instance, it contains a square-mile: and, rather later in its career, it is reduced to a single *square-inch*.

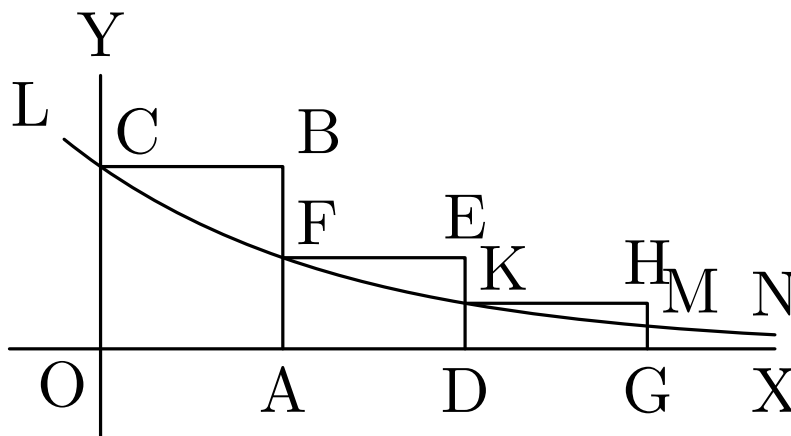

Let us contemplate it in this last-named condition. Its length? As Infinite, clearly, as it was at first. Its Area? One square-inch, undoubtedly. *And what is its width?*

Can you, oh gentle Reader, find any reasonable answer to this question, except the following? “Its width is *infinitely small*—having, in fact, exactly the same relation to a linear inch which that linear inch has to an infinite Line.”

If this be so (and I see no way out of it), we have found two Magnitudes, both linear, neither of them infinite, and yet *such that no multiple of the lesser can possibly exceed the greater*. They are, in fact, *not of the same order*; one of them being Finite, and the other an Infinitesimal of the first order.

But is not the gentle Reader saying to himself, all this time, “I *cannot* believe in the existence of a Strip, Infinite in length, and yet Finite in Area! No doubt, if such a Strip *could* exist, its width must be what you call ‘Infinitesimal’; since a Finite width must give an Infinite area. But I don’t believe in the existence of an Infinitesimal width! My belief is that, if you make the edges of the Infinite-Strip gradually approach till they coincide, its width will continue *Finite* till the last moment, and will then suddenly become Zero; and that its area will continue an *Infinity of the first order* till the last moment, and will then suddenly become Zero.”

Very good. My gentle Reader has formulated his views, very clearly and definitely. Permit me now to offer to his consideration a Strip, which I will *prove* to be at once Infinite in length and Finite in area.

Let OX , OY , be rectangular Axes of Reference; and let us trace the Curve $y = 2^{-x}$, where $OC = OA = AD = DG =$ unit-line. Hence, when $x = 0$, $y = 1$;

when $x = 1, y = \frac{1}{2}$; when $x = 2, y = \frac{1}{4}$; when $x = 3, y = \frac{1}{8}$; and so on. Hence the Curve is *LCFKMN*. Also, however large x becomes, y can *never* be Zero; i. e. the Strip, intercepted between the Curve and the x -Axis, and bounded at the left-hand end by CO , is Infinite in length. And now let us estimate its area. Its first portion, $COAF$, is less than the rectangle OB ; its second portion is less than AE ; and so on. Hence its area is less than $(OB + AE + \&c. \text{ for ever})$; i. e., is less than $(1 + \frac{1}{2} + \frac{1}{4} + \&c. \text{ for ever})$; therefore, *a fortiori*, it is less than 2.

Now an area, which is less than '2,' is surely *Finite*? Does the gentle Reader see any escape from admitting this? And, if he admits this, does he *still* maintain that the *width* of this Infinite-Strip (which obviously dwindles, as you go along the Strip, but never becomes Zero) *never ceases to be Finite*? Yet surely a Strip, Infinite in *length*, and *nowhere less than Finite in width*, must be *Infinite* in area?

In brief, I place before my gentle Reader that savouriest of Logical dishes, a *Trilemmia*! Either he must assert that a Strip, Infinite in length, and nowhere less than Finite in width, is only Finite in area; or he must assert that the *length* of this Strip is *Finite*, i. e. he must assert that *the Curve meets the x-Axis*; or else he must admit that its *width* ceases to be Finite without becoming Zero, i. e. he must admit that its width becomes *Infinitesimal*! Let him take his choice, and help himself. 'May good digestion wait on appetite, And health on both!'

Now let us cut off, from the infinitely-long Strip named in p. 875, whose area is a square-inch, a piece just an inch long. What will its area be? It is evident that no multiple of this short Strip can ever make up the infinitely-long Strip; that is, no multiple of its area can make up a square-inch. Hence its area must be an Infinitesimal of the first order.

But this Infinitesimal area, inconceivably small as it is, is nevertheless *greater than Zero*. Hence our continuously-diminishing Strip is bound, before reaching Zero, to pass through this singularly unassuming value. And, at that moment, *what will be its width*? Its length will be Infinite, as usual: its area will be an Infinitesimal of the first order: but its width cannot be an Infinitesimal of the same order as the previous width; for *that* would yield a finite area, as we have seen. What else, then, can it be but *an Infinitesimal of the second order*? A Line of such stupendous brevity that no finite multiple of it can even make up an Infinitesimal of the first order. Evidently we might repeat this process *ad libitum*, and so get Infinitesimals of the third order, the fourth order, and so on.

To sum up our results, so far. We see that a Line may be either Finite, or may extend to an Infinity of the first order, or may dwindle to an Infinitesimal of the first, second, or any order we choose: and that an Area may be either Finite, or may extend to an Infinity of the first order (an Infinite-Strip), or of the second order (e. g. the whole Infinite-Plane), or may dwindle to an Infinitesimal of any order we choose.

Now we may reasonably expect to find that all, that has been here said, is equally applicable to *any* kind of Magnitude that is capable of *continuous* increase and decrease. Let us consider, then, whether it is possible to have Infinitesimal *Angles* of the various orders.

§ 3. Infinitesimal Angles and Sectors.

For this purpose, let us return to our upright Infinite-Plane, and, taking some Point at random as a centre, let us imagine two Lines radiating from it (say at an angle of 45°), and both of them extended to infinity, and therefore having between them a Sector, finite in angular magnitude, infinite in length, and therefore infinite in area.

I named 45° as my specimen-angle, because it is the *one single angle*, other than a right angle, with which Society is acquainted. Enquire of some chatty traveller, who is relating his experiences of an Alpine Pass, what *slope* it was that he had to climb. "The ground sloped at an angle of forty-five," he is sure to reply. Nay, I once met a gentleman who, on hearing it mentioned that the 'dip' of a certain river-bed was, in one place, "one in forty-five," cautiously remarked "I suppose that means an angle of forty-five degrees?" Imagine a *river* sloping at that angle! And then imagine the labour of rowing *up* it, and the headlong, wild delight of rowing *down* it! But this is a digression.

Now it clearly *is* possible, this time, by multiplying this Infinite-Sector by a certain finite number, namely '8,' to make it equal to the whole Infinite-Plane. Hence this Infinite-Sector is an Infinity *of the same order* as the whole Infinite-Plane; i. e. it is of the *second* order.

Now let us suppose that the two sides of this Infinite Sector gradually approach each other until they coincide. It cannot be denied that the area then becomes Zero. It has dwindled, then, from an Infinity of the second order (when its angular magnitude was *finite*), down to absolute Zero. And there seems no room to doubt that it has done this *continuously*, and not 'per saltum.' What values, then, has it gone through on the way? Can we reasonably doubt that it has gone through, first, all Infinities of the *first* order (during which process its angular magnitude would be an Infinitesimal of the *first* order), secondly, all *Finite* values (its angular magnitude being an Infinitesimal of the *second* order), thirdly, all Infinitesimals of the *first* order (its angular magnitude being an Infinitesimal of the *third* order), and so on—the angular magnitude being always *two* degrees ahead of the area, in this long and fatiguing competition in the Dwindling-Race.

§ 4. Pairs of Lines.

We are now in a position to examine the phenomena of intersection, or non-intersection, with regard to a Pair of Lines, by imagining one of them to revolve about a fixed Point.

Let AB be one of the 2 Lines: and let X_1VY_1 be, at first, at right angles to it: and let it then revolve, about V , so as to take the successive positions X_2VY_2 , X_3VY_3 , CVD , its final position being at right angles to its first position, and therefore parallel to AB .

Let us further suppose that the angle, contained between CV and the upper part of the revolving Line, dwindles, from a right angle, through all possible *finite* lesser values, while its upper edge revolves from VX_1 to VX_2 ; that, the moment the upper edge goes *below* VX_2 , this angle becomes an *Infinitesimal of the first degree*, and so dwindles, through all such values, while its upper edge revolves from VX_2 to VX_3 ; that, the moment the upper edge goes *below* VX_3 , this angle becomes an *Infinitesimal of the second degree*; and so on.

Now let us suppose all the Lines in the diagram produced to infinity both ways: and let us call the Infinite-Sector, intercepted between VC -produced and the upper part of the revolving-Line, 'No. 1'; the semi-Infinite-Strip (I mean, by 'semi-Infinite,' that it is terminated at *one* end), intercepted between the Lines VC -produced and Y_1A -produced, and bounded at the right-hand end by VY_1 , 'No. 2'; the surface, intercepted between the Line Y_1B -produced and the lower part of the revolving-Line, and bounded at the left-hand end by VY_1 , (which will be a Triangle, so long as Y_1B -produced and the lower part of the revolving-Line continue, to intersect, and will become a semi-Infinite-Strip when they cease to intersect,) 'No. 3'; and, with regard to the Infinite-Sector intercepted between the Line VD -produced and the lower part of the revolving-Line, let us call that portion of it, which lies *above* Y_1B -produced (which portion will be a semi-

Infinite-Strip, so long as Y_1B -produced and the lower part of the revolving-Line continue to intersect, and will become the whole Infinite-Sector if they should cease to intersect before the revolving-Line reaches the position VD), ‘No. 4’; and that portion of it, which lies *below* Y_1B -produced (which portion will cease to exist as soon as these Lines cease to intersect) ‘No. 5.’

Let us now investigate the changes, in the *areas* of these 5 surfaces, caused by the changes in the position of the revolving-Line.

First as to No. 1. This is clearly, throughout its history, an Infinite-Sector, whose vertical-angle is at first a right angle, and ultimately Zero. Also its area is at first one-quarter of the whole Infinite-Plane, and ultimately Zero. Also, so long as the upper part of the revolving-Line ranges between VX_1 and VX_2 , the area continues to be an Infinity of the second order; and, as the revolving-Line crosses the position VX_2 , the area changes, from a very small (!) *Infinity of the second order*, to a very large *Infinity of the first order*. Similarly, as the revolving-Line crosses the position VX_3 , the area changes, from a very small *Infinity of the first order*, to a very large *Finite value*.

A little further on, it will of course become an *Infinitesimal of the first order*; and so on, through the other orders, till it finally reaches the value *Zero*.

Next, as to No. 2. This is clearly, throughout its history, one-half of the Infinite-Strip contained between AB and CD , and is therefore an *Infinity of the first order*. Its area is a constant quantity, being unaffected by the revolving-Line.

Next, as to Nos. 4, 5. (I take these next, because they will help us to investigate the properties of No. 3.) It is evident that, so long as No. 5 continues to exist, the two together constitute—and that, when No. 5 has ceased to exist. No. 4 by itself constitutes—an Infinite-Sector, which is the exact counterpart of No. 1—the two having what Euclid calls ‘opposite vertical angles.’ Hence, while the lower part of the revolving-Line ranges between VY_1 and VY_2 , the area of No. 4 continues to be an Infinity of the second order, and entirely declines to be ‘cribb’d, cabin’d, and confined’ within such narrow limits as our Infinite-Strip! Hence the revolving-Line continues, all this time, to intersect Y_1B -produced. (N.B. Here we have a proof of the truth of Euclid’s Axiom, when amended, as I have done at p. 866, by inserting the words ‘the defect being a finite angle.’)

Quoted from *Macbeth*
by William
Shakespeare

Let us now, reserving for future consideration the phenomena of the period while the upper part of the revolving-Line is crossing from VX_2 to VX_3 suppose it to have passed VX_3 , so that the angle, which it makes with VC , has become an Infinitesimal of the *second* order. Will its lower part continue to intersect VD -produced? It may easily be shown, by a *reductio ad absurdum*, that it will *not*: for, if it did, Nos. 1, 2, 3 would then make up an Infinite-Sector, whose vertical angle would be an Infinitesimal of the *second* order, and whose area would therefore be *finite*. But the area of No. 2 is always an *Infinity* of the first order. Which is absurd. Hence, after the upper part of the revolving-Line has passed VX_3 , its lower part does *not* intersect Y_1B -produced.

We have now to answer a far more puzzling question, namely, what happens while the upper part of the revolving-Line is crossing from VX_2 to VX_3 ? Does its lower part intersect Y_1B -produced, all the while? Or does it fall clear of it, all the while? Or does it at first intersect it, and afterwards cease to do so?

First, suppose it to intersect Y_1B -produced. In this case No. 3 is clearly a closed Triangle, whose vertical-angle is an Infinitesimal of the first order. This looks as if its *area* must also be an Infinitesimal of the first order: but this, we

know, *cannot* be, since it contains within it the finite area possessed by No. 3 while the upper part of the revolving-Line was passing from VX_1 to VX_2 , Hence its area must be, at least, *finite*. The only way I can see out of this difficulty is to assume that the *sides* of this Triangle have become *infinite*; i. e. that the revolving-Line intersects Y_1B -produced at *an infinite distance*.

Next, suppose it to fall clear of Y_1B -produced, In this case No. 3 is a semi-Infinite-Strip, but we cannot be certain that its *area* is, like such Strips when of a uniform width, *infinite*; for its width dwindles so much towards the right-hand that it may possibly be, in the early part of the period, *finite*. I see no way of settling this question; but, luckily, it is not relevant to the question of *intersection*.

My own inclination is to believe that, during this second period of revolution, the lower part of the revolving-Line at first intersects Y_1B -produced, at an infinite distance, and then ceases to intersect it.

After the revolving-Line has once ceased to intersect Y_1B -produced, No. 4 is of course equal to No. 1. That is to say, the surface, contained between the whole revolving-Line and AB , is, from that moment until the revolving-Line coincides with CD , of a constant area, since it is the sum-total of Nos. 1, 2, 3, which is equal to the sum-total of Nos. 2, 3, 4, i. e. to the whole Infinite-Strip. And this will continue true, while No. 1 and No. 4 dwindle down, through all finite and infinitesimal values, till they finally reach Zero.

The results we have arrived at will perhaps be more easily understood by examining the following Table of values. The symbols used in it are as follows:—

Symbols.	Meanings.
R	a right angle.
F	a large finite magnitude.
f	a small „ „
M	a large Infinitesimals of 1st order.
M^2	„ „ 2nd „
J	a large Infinity of 1st order.
S	area of the semi-Infinite-Strip No. 2. [an Infinity of 1st order.]
P	area of one-fourth of the Infinite-Plane. [an Infinity of 2nd order.]

Position of upper part of revolving-Line	Vertical angle of Space No. 1.	Areas of Spaces.				
		No. 1.	No. 2.	No. 3.	No. 4.	No. 5.
X_1V	R	P	S	Zero	S	P
	F	J^2	„	f	„	J^2
	f	j^2	„	F	„	j^2
X_2V	M	J	„	?	?	?
	m	j	„			
X_3V	M^2	F	„	S	F	does not exist
	m^2	f	„	„	f	
	M^3	M	„	„	M	„
	m^3	m	„	„	m	„
CV	&c.	&c.	„	„	&c.	„
	Zero.	Zero.	„	„	Zero.	„

The sum of the whole matter appears to be this. If a Pair of Lines make, with a certain transversal, two interior angles on the same side of it together less than two right angles, then, so long as the defect is *finite*, there is no doubt that the Lines intersect: also, if the theory be true, that the area of an Infinite-Sector, whose vertical-angle is finite, and whose area is therefore undoubtedly an Infinity of the second order, passes, as its vertical angle dwindles to Zero, through infinite values of the first order, and then through finite values, its vertical angle meanwhile passing through infinitesimal values of the first and second order—if all this be true, it follows that, when the ‘defect from two right angles’ becomes an Infinitesimal of the *first* order, the Lines may possibly intersect, but can only do so at an infinite distance; and that, when the defect has become an Infinitesimal of the *second* order, the Lines have ceased to intersect.

The theory, here discussed, may be bewildering; but it is at least consistent with itself: and it seems to me to be *quite* as credible as the theory that ‘Infinitesimals’ are mythical, and that a Finite Magnitude, dwindling down to Zero, continues Finite to its last gasp.

Another process—a *negative* one—has occurred to me, for disproving the *absolute* truth of Euclid’s Axiom. It is a very simple process, and has the great recommendation of not requiring any belief in the existence of Infinitesimals.

On an upright Infinite-Plane let us suppose 2 horizontal Infinite-Lines, having a common perpendicular, and therefore of course never intersecting. Let us call them ‘No. 1’ and ‘No. 2,’ No. 1 being above No. 2: and let us suppose the common perpendicular to be an inch long, so that the 2 Lines are the edges of an Infinite-Strip, whose uniform width is an inch.

Now let us suppose Line No. 1 to begin to revolve about the upper end of the common perpendicular. The believer in the *absolute* truth of Euclid’s Axiom is bound to believe that, *in the very act of beginning to revolve*, it also begins to intersect No. 2: he cannot allow the one process any such *start* of the other as might enable him to say “No. 1 has begun to revolve, but has *not* yet begun to intersect No. 2”: such a state of things *must* be, in *his* view, *absolutely* impossible. ‘And what’s impossible ca’n’t be. And never never comes to pass!’

Very good. The actual process of *beginning* to intersect No. 2 is a deep mystery, no doubt: but that the thing *happens* is quite undeniable. We are able to say “Now it *isn't* intersecting No. 2—and now it is!” So, though we cannot conceive *how* it managed to begin, it has certainly *done* it.

Now let us suppose *another* horizontal Line, ‘No. 3,’ lying an inch below No. 2. The believer in Euclid’s Axiom is bound to assert, as to No. 3, *exactly* what he asserted as to No. 2. Has he, then, any logical escape from the conclusion that the revolving Line begins to intersect Nos. 2 and 3 *together*? I see none, myself. And yet how can it get at No. 3, without *first* going through No. 2? *Any* point on No. 1 (I am careful not to say ‘every’: I know how gleefully the logical Reader would swoop down upon me with the crushing sarcasm “What does ‘every’ mean, when there is no limit to the number of points?”: but ‘any’ is a safe epithet) is amenable to the simple rule of “First come, first served. Cross No. 2 first: and *afterwards* (not by any means *simultaneously*) you have our gracious permission to cross No. 3.” Now, what is true of *any* point on the Infinite-Line No. 1 is surely true of that Infinite-Line itself? To say “No. 1 intersects No. 3” is tantamount to saying “A certain *point* of No. 1 has reached No. 3.” And *how did that Point get below No. 2*?

Of two things, one. Either *some* point of No. 1 has crossed Nos. 2 and 3 *at the same moment*: or else *no* point of No. 1 has crossed No. 3 until *after* it had crossed No. 2. That is a logical Dilemma. Which of its two horns does the Reader prefer?

The choice of the *first* horn involves the Reader’s acceptance of *ubiquitous points*! In the event of his choosing the *second* horn, he seems logically bound to admit it as a *possible* state of things, that No. 1 should have *begun* to revolve, and yet should *not* have begun to intersect No. 3—which is a surrender of his belief in the *universal* truth of Euclid’s Axiom.

My final answer, then, to the question “*Is Euclid’s Axiom true?*” is as follows:—

“If the defect, from the sum of two right angles, be *finite*, the Lines *certainly meet*; if it be an Infinitesimal of the *first* order, they may meet, or not, according to circumstances: if it be an Infinitesimal of the *second*, third, or any higher order, they *certainly do not meet*.”

The question, with which this Appendix is headed, was sufficiently startling: but a more startling one remains to be answered. “If Euclid’s Axiom be not *universally* true, what becomes of all the Propositions which he has made to depend upon it, such as I. 29? Has he done no more than prove them to be *partially* true?”

To this disheartening question I will give as re-assuring an answer as the case seems to admit of. It must be admitted that Euc. I. 29 requires—if we would make it *strictly* true—the same limitation as the Axiom: it should run as follows:—“Two Lines, which do not meet, make, with all transversals, angles which are equal *so far as finite differences are concerned*” (i. e. angles so nearly equal that the difference, if any, is *infinitesimal*). And of course Euc. I. 32, as proved from Euc. I. 29, would need a similar qualification. It seems to me very doubtful whether Euclid ever noticed this defect in his Axiom. If he did, it is possible that he may have thought fit to ignore it, on the ground that, when Finite Magnitudes differ only by an Infinitesimal, they are, for all *practical* purposes, equal.

But I feel bound to admit that, for the purpose of proving Euc. I. 32 to be, as it really is, *universally* true, neither Euclid's Axiom, nor any other that deals with *intersection* of Lines, will suffice: and that some Axiom, not involving that principle, must be substituted for it.

Let me say in conclusion that, though I assert the *absolute* truth of Euclid's Axiom—with the limiting clause I have introduced, '*the defect being a finite angle*'—it still remains, in my opinion, a 'disputable' Axiom; i. e. it is not properly admissible as an *Axiom*, but ought to be, if possible, proved as a *Theorem*.

Appendix III.

How should Parallels be defined?

We know that, if a, Pair of Lines has either of the following properties

- (1) they are equally inclined to a certain transversal,
- (2) one of them contains 2 Points on the same side of, and equidistant from, the other,

it has all the following properties

- (3) they are equally inclined to all transversals,
- (4) any 2 Points, on either of them, are on the same side of, and equidistant from, the other,
- (5) they do not meet, however far produced.

Any one of these properties may be used as a Definition. Let us take them one by one.

No. (1). This has the advantage that we need not begin by proving that such Lines *exist*, but may assume it as axiomatic. It has been used as a Definition by Varignon, Bezout, Cooley, &c.: at least, they say "which make equal angles with a transversal," leaving it uncertain whether they mean "a *certain* transversal" or "*any* transversal": if the latter, it is of course No. (3) they are proposing to use. From No. 1 we can prove No. (5) without using any disputable Axiom (see Euc. I. 27, 28), but not No. 3 or No. 4.

No. (2). This has the same advantage as No. (1). It has been used as a Definition by D'Alembert. From *it*, also, we can prove No. (5) without using any disputable Axiom; and it, also, fails to prove No. 3 or No. 4.

No. (3). This cannot be used, as a Definition, till we have proved that such Lines *exist*—which has not yet been done without employing some disputable Axiom. If Varignon, &c. mean *this* to be their Definition, they are assuming the *existence* of such Lines,—a *very* un-axiomatic Axiom. But, when once their *existence* has been granted, or proved, No. 4 can be deduced.

No. (4). This cannot be used, as a Definition, till we have proved that such Lines *exist*—which has not yet been done without employing some disputable axiom. When once their *existence* has been granted, or proved, No. 3 can be deduced. No. 4 has been used as a Definition by Wolf, Boscovich, T. Simpson, and Bonycastle.

No. (5). This has the advantage that it is easy to prove (as in Euc. I. 27, 28) that such Lines *exist*. It has been used as a Definition by Euclid and a host of other geometers. It has, however, the enormous *disadvantage* that, whereas

Nos. (3), (4), give us a *unique* Pair of Lines (e. g. given a Line and a Point not on it, we can prove that only *one* Line can be drawn, through the Point, such that the Pair shall have property No. (3)), No. (5) does *not*: on the contrary, given a Line and a Point not on it, a whole ‘pencil’ of Lines may be drawn, through the Point, and not meeting the given Line: all we need to do is to take care, after drawing *one* such Line, that the others shall make with it angles which are *Infinitesimals of the second order with regard to a right angle*.

We see, then, that the word “Parallels” has been already used with *four*, and possibly with *five*, different meanings: so that any fresh writer, who uses the word, is liable to be misunderstood unless he first defines it. The derivation of the word would seem to suggest No. (4) as its Definition; but Euclid’s adoption of No. (5) has led to that being the popular meaning attached to the word.

It is easy, however, to avoid all this ambiguity by the use of new terms. Rejecting Nos. (1) and (2), as useless for the purpose of definition, we may call a Pair of Lines, which possesses

No. (3), “equiangular”;

No. (4), “equidistantial”;

No. (5), “separational”;

and thus avoid the dangerous word “parallel” altogether.

My own belief is that No. (3) is, on the whole, the property best adapted for practical use as a Definition.

Appendix IV.

How the Question stands to-day.

I will first enumerate certain Theorems connected with Pairs of Lines.

I will then notice three other methods which have been suggested for superseding Euclid’s Axiom.

And, in conclusion, I will indicate what seem to me the most hopeful directions for future efforts at exploring this fascinating, but very obscure, region of mathematical research.

§ 1. Certain universally-true Theorems, provable from genuine Axioms (i. e. from Axioms whose self-evident character is indisputable).

(1) A Pair of Lines, which are equally inclined to a certain transversal, are separational (i. e. never intersect, however far produced). [Euc. I. 27, 28.]

(2) [*contranominal of (1)*] A Pair of intersectional Lines (i. e. which either intersect or would do so if produced) are unequally inclined to any transversal. [Euc. I. 16, 17.]

(3) A Pair of Lines, such that two Points on one of them are on the same side of, and equidistant from, the other, are separational.

(4) [*contranominal of (3)*] A Pair of intersectional Lines are non-equidistantial (i. e. are such that any two Points on either of them, which are on the same side of the other, are non-equidistant from it, that which is further from the Point of intersection being also further from the other Line).

(5) If there be a Triangle whose angles are together equal to two right angles: the angles of any Triangle are together equal to two right angles.

(6) There is a Triangle whose angles are together not-greater than two right angles.

§ 2. Certain universally-true Theorems, not provable from genuine Axioms, but provable if any one of them be accepted as an Axiom.

[N.B. These will be hereafter referred to as the ‘Nine Quasi-Axioms,’ their self-evident character being disputable.]

(1) Through a given Point, outside a given Line, a Line may be drawn, such that the Pair shall be equally inclined to any transversal.

(2) A Pair of Lines, which are equally inclined to a certain transversal, are so to any transversal. [Deducible from Euc. I. 27, 28, 29.]

(3) [*contranominal of (2)*] A pair of Lines, which are unequally inclined to a certain transversal, are so to any transversal.

(4) If a Point move so as to be at a constant distance from a given Line, its path shall be a straight Line.

* (5) Through a given Point, outside a given Line, a Line may be drawn equidistant from the given Line (i. e. such that any two Points on it shall be equidistant from the given Line).

(6) A Pair of Lines, such that two Points on one of them are on the same side of, and equidistant from, the other, are equidistant (i. e. are such that any two Points on either of them are equidistant from the other).

(7) [*contranominal of (6)*] A Pair of Lines, such that two Points on one of them are non-equidistant from the other, are non-equidistant (i. e. are such that any two Points on either of them, which are on the same side of the other, are non-equidistant from the other).

* (8) A Line cannot recede from and then approach another; nor can it approach and then recede from another while on the same side of it.

* (9) In any Circle, the inscribed equilateral Tetragon is greater than any one of the Segments which lie outside it.

If any one of these 9 Theorems be granted as an Axiom, the rest can be proved from it. But only 3 of them, so far as I know, have been used as Axioms—No. 5 by Clavius, No. 8 by Dr. R. Simson, and No. 9 by myself. Clavius’ Axiom requires us to assure ourselves that it will continue true when the Lines are produced *without limit*; and the strain on the imagination, caused by the effort of following them into Infinite Space, is one to be, if possible, avoided. Dr. R. Simson’s Axiom gains a certain plausibility from the fact that, for *intersecting* Lines, it admits of actual *proof* (see § 1. (4)): where, however, the Lines are *not* known to intersect, it is an appeal to the eye, of *very* doubtful force.

§ 3. Certain universally-true Theorems, not provable from genuine Axioms, but provable if any one of the ‘Nine Quasi-Axioms’ be accepted.

(1) There is a finite angular magnitude such that the angles of any Triangle are together not-less than it.

(2) There is a Triangle whose angles are together not-less than two right angles.

(3) There is a Triangle whose angles are together equal to two right angles.

(4) The angles of any Triangle are together equal to two right angles. [Euc. I. 32.]

§ 4. Certain partially-true Theorems, not provable from any universally-true Axioms, whether genuine or ‘quasi,’ but provable if any one of themselves be accepted as an Axiom.

[N.B. By ‘partially-true’ is meant ‘true for *finite* magnitudes.’ They become universally-true, if ‘magnitude’ be taken to mean ‘*finite* magnitude’; ‘equal’ to mean ‘not differing by a *finite* difference’; ‘unequal’ to mean ‘differing by a *finite* difference’; ‘multiplied’ to mean ‘multiplied by a *finite* number’; and ‘intersectional’ to mean ‘intersectional at a *finite* angle.’

These Theorems will be hereafter referred to as the ‘Nine Pseudo-Axioms,’ the name being chosen to indicate that they are not even universally *true*—far less *self-evident*.]

(1) The lesser of two homogeneous Magnitudes may be so multiplied as to exceed the greater.

(2) A Pair of Lines, which are unequally inclined to a certain transversal, are intersectional. [Euclid’s Axiom.]

(3) [*contranominal of (2)*] A Pair of separational Lines are equally inclined to any transversal. [Euc. I. 29.]

(4) A Pair of Lines, such that two Points on one of them are non-equidistant from the other, are intersectional.

(5) [*contranominal of (4)*] A Pair of separational Lines are equidistantial.

(6) On either of two intersectional Lines a Point may be found, whose distance from the other Line shall exceed any assigned length.

(7) On either of two intersectional Lines a Point may be found, such that the distance, from its projection on the other Line to the point of intersection of the two Lines, shall exceed any assigned length.

(8) A Pair of intersectional Lines cannot be, both of them, separational from a third Line.

(9) [*contranominal of (8)*] A Pair of Lines, which are, both of them, separational from a third Line, are not intersectional.

Six of these have been used as Axioms, viz. (2), which is Euclid’s celebrated Axiom; (4), by T. Simpson; (6), by Proclus; (7), by Franceschini; (8), by Ludlam, Playfair, &c.; (1), by Legendre, in the 12th Volume of the ‘Memoirs of the Institute,’ being his “latest attempt” (I quote from De Morgan’s article on Parallels in Knight’s Cyclopaedia) “at the solution of the problem.” He only succeeds, however, in proving Prop. 6 at p. 10 of this book, and in proving that Prop. 8, at p. 26, follows logically from Prop. 4, at p. 22. In order to prove Euc. I. 32, he introduces the principle of Limits and Vanishing Quantities, which takes us at once into the region of Infinities and Infinitesimals. But a greater success than this has, I understand, rewarded some recent investigations made by Professor J. Cook Wilson, of Oriel College, Oxford, who has deduced Euclid’s 12th Axiom from No. (1) of this Section.

In all these systems, however, including Euclid’s, the deductions, from the proposed Axiom, labour under the same defect as the Axiom itself, that is, they are only *partially*, and not *universally*, true.

§ 5. Other methods of treatment.

Three other methods of treating this subject call for notice.

Playfair and (more recently) Wilson have tried to deduce the properties of Parallels (and thence Euc. I. 32) from the idea of *sameness of direction*, as predicated of two non-coincidental Lines (i. e. which do not lie in one and the same straight Line).

The foundation-stones of this Theory—without which it has no *raison d'être* whatever—are the two Axioms, which must necessarily be *somewhere* assumed, whether expressly or tacitly, first, that it is possible for non-coincident Lines to have ‘the same direction’; and secondly, that Lines, which have the same direction, make equal angles with all transversals.

Before discussing the first of these two Axioms, permit me to remind the Reader that the question before us is not “is it *true*?” but “is it *axiomatic*?”, that is, ‘does the average human intellect *accept* it as true, *without proof*?’ It is a question in Mental Physiology rather than in Geometry. The 47th Proposition of Euclid is quite as *true* as the Axiom ‘things that are equal to the same are equal to one another’; but the average human intellect, while accepting the latter without proof, does most certainly demand a good deal of proof before it will accept the former. Intellectual beings may conceivably exist, to whom Euc. I. 47 is axiomatic; but our books are not written for *them*.

Now there is one preliminary step, that is absolutely indispensable before the human intellect can accept any Axiom whatever: and that is, it must attach some *meaning* to it. We cannot, rationally, either assent to, or deny, any Proposition the words of which convey to us no idea.

AVE have, then, *two* questions to answer: first, “what *idea* is conveyed to the average human intellect by the phrase ‘*in the same direction*,’ when applied to non-coincident Lines?”, secondly, “in accepting the Axiom, that ‘Lines, which have the same direction, make equal angles with all transversals,’ to what other assertions are we committing ourselves?”

If we contemplate a fixed Point in a Plane, and imagine one or more Lines passing through it, it is not difficult to grasp the following ideas—that the ‘direction’ of any such Line is that property of it which determines its *position*, now that one Point in it is already fixed—that any *two* such Lines form 4 angles, whose common vertex is the fixed Point—that, if one of those 4 angles be zero, the 2 Lines *coincide*; if not, they *intersect*—that, in the first case, they have *the same direction*, in the second, *different directions*—and that the difference of the directions of such Lines is measured by *the angle between them*.

But these ideas are of little use to us, when confronted with a given Line and a given Point *outside* it, and when told to imagine a new Line drawn, through the given Point, and ‘*in the same direction*’ as the given Line, the 2 Lines having no common Point. For the directions of the Lines are no longer *directly comparable*. There is no use in asking “do they contain a zero-angle?” when they contain no angle *whatever*. An angle cannot exist without a *vertex*: and *where is the vertex*?

What idea, then, is conveyed to the mind by the phrase “these Lines have *the same direction*”? If they were finite Lines, and the question concerned sameness of *length*, the process, of grasping this idea, would be a very simple one. We could either imagine one of the 2 Lines laid upon the other, and then apply the Axiom ‘magnitudes which coincide are equal’: or we could imagine a movable third Line, first applied to one of the 2 Lines and ascertained to have ‘*the same length*’ with it, and then carried across the intervening space and applied to the other Line; and, on finding it to have ‘the same length’ with *that* also, we

should pronounce the 2 Lines to have ‘the same length,’ in full confidence that our movable Line had preserved its length *unchanged during the journey*.

Can we, then, use a similar process in grasping the idea of sameness of *direction*? That is, can we imagine a movable third Line, first applied to one of the 2 Lines and ascertained to have ‘*the same direction*’ with it, and then carried across the intervening space and applied to the second Line, to see if it has ‘*the same direction*’ with *it* also? But this process would convey to the mind no idea of ‘*sameness of direction*,’ unless we had some guarantee that the movable Line had preserved its direction *unchanged during the journey*. The only process, for securing this, that presents itself to my mind, is to imagine a *transversal*, cutting the 2 Lines, and thus bridging over the intervening space, and then to imagine the movable Line shifted along it, so as always to cut it *at a constant angle*.

I have thought this matter out very carefully, and I feel convinced that *this* is the mental process by which we grasp the idea of ‘*sameness of direction*,’ when predicated of Lines that have no common Point, and therefore cannot be said to contain a zero-angle.

Now this ‘constant angle’ is of course the angle at which the transversal cuts the first Line. Hence, the mental picture of a Line moving away from another, and yet maintaining ‘*sameness of direction*’ with it, is the picture of its so moving as that a certain transversal shall cut the two Lines *at the same angle*. And this is my answer to our *first* question, namely, “what idea is conveyed to the average human intellect by the phrase ‘*in the same direction*,’ when applied to non-coincident Lines?”

If this be granted, our *second* question, “in accepting the Axiom that ‘Lines, which have the same direction, make equal angles with all transversals,’ to what other assertions are we committing ourselves?”, must be answered “we are consciously committing ourselves to the assertion that Lines, which make equal angles with a certain transversal, *make equal angles with all transversals*.”

We see, then, that, if this be so, the advocates of the Direction-Theory have not escaped the necessity of assuming, as axiomatic, the second Theorem enunciated in § 2. (See p. 63.)

I must ask the Reader’s pardon for this long digression: but the fallacy, which (as I believe) lies at the root of the Direction-Theory, is a very subtle one, and has cost me a great many hours of hard thinking to un-earth it.

Yet another process has been invented—quite fascinating in its brevity and its elegance—which, though involving the same fallacy as the Direction-Theory, proves Euc. I. 32 without even mentioning the dangerous word ‘Direction.’

We are told to take any Triangle ABC ; to produce CA to D ; to make part of CD , viz. AD , revolve, about A , into the position ABE ; then to make part of this Line, viz. BE , revolve, about B , into the position BCF ; and lastly to make part of this Line, viz. CF , revolve, about C , till it lies along CD , of which it originally formed a part. We are then assured that it must have revolved through 4 right angles: from which it easily follows that the interior angles of the Triangle are together equal to 2 right angles.

The disproof of this fallacy is almost as brief and elegant as the fallacy itself. We first quote the general principle that we cannot reasonably be told to make a Line fulfil *two* conditions, either of which is enough by itself to fix its position: e. g. given 3 Points, X, Y, Z , we cannot reasonably be told to draw a Line, from X , which shall pass through Y and Z : we can make it pass through Y , but it must then take its chance of passing through Z ; and *vice versa*.

Now let us suppose that, while one part of AE , viz. BE , revolves into the position BF , another little bit of it, viz. AG , revolves, through an equal angle, into the position AH ; and that, while CF revolves into the position of lying along CD , AH revolves—and here comes the fallacy. You must not say “revolves, through an equal angle, into the position of lying along AD ,” for this would be to make AH fulfil *two conditions at once*. If you say that the one condition involves the other, you are virtually asserting that the Lines CF, AH are equally inclined to CD —and this in *consequence* of AH having been so drawn that these same Lines are equally inclined to AE , That is, you are asserting § 2. (2). (See p. 885.)

One other proof—a very beautiful one, though largely dealing with Infinities and Infinitesimals—may here be mentioned, that of M. Bertrand. It rests on the principle that an infinite *Sector* (with a vertical angle which has a finite ratio to a right angle) is an Infinity of the *same* order as an infinite Plane, whereas an infinite *Strip* (i. e. the area contained between 2 ‘separational’ Lines) is an Infinity of a *lower* order. Hence he concludes that no such Sector, however small its vertical angle, will lie wholly between 2 such ‘separational’ Lines, however far apart: hence, if a Line intersect one of 2 ‘separational’ Lines, it must, if produced, intersect the other. He thus proves the Theorem numbered (8) in § 4: but his results are, of course, only *partially*, and not *absolutely*, true.

As a rather interesting example of the ease with which an unwary explorer may tumble into a pit-fall, I may refer to a “Note on Euclid’s 12th Axiom” by a Mr. W. Hanna, which will be found at p. 27 of Vol. XIII of “Mathematical

Questions" reprinted from the "Educational Times." Mr. Hanna takes two Lines, situated as in Euclid's Axiom, and drops a perpendicular, from a point on one, upon the other: from the foot of this he drops a second perpendicular back upon the first line: and so on, backwards and forwards, till the diagram slightly resembles the side of a laced-up boot. He then easily proves that these perpendiculars continually decrease in length. From this he infers that "the perpendicular will ultimately become less than any assignable line"! The fallacy is really too obvious to be worth pointing out.

Another writer in the "Educational Times" (Mr. J. Walmsley, B.A.: his article will be found at p. 103 of Vol. XVII of the Reprint) has fallen into a rather less obvious trap. He endeavours to prove that "any straight line, perpendicular to one of two parallel straight lines, will meet the other." (This, if it could be proved without assuming any disputable Axiom, would indeed be a splendid success! Mr. J. Walmsley has hardly realised, as yet, the *fearful* difficulty of persuading two Lines, under any conceivable circumstances, to do such a thing as "meet." Whether, at the outset of geometrical discovery, Lines were not properly introduced to each other—or whether some mischief-making Point has been insinuating that one of til em went and intersected another when it was looking the other way—certain it is, that Lines will do almost *anything* you like to propose, rather than "meet" one another!) Mr. Walmsley assumes, as axiomatic, that when one Line lies between two others (whatever "between" may mean), those two others lie on *opposite* sides of it. Now let Mr. Walmsley (or any other champion of his theory) draw three Lines diverging from a Point at equal angles (of 120° each), and thus dividing the infinite Plane into three equal Sectors. In each of these Sectors let him draw a branch of a Hyperbola, having the sides of the Sector as its Asymptotes. Now, each of these Hyperbolæ lies (in a way) "between" the other two: and yet no two can be said to lie on opposite sides of the other one! "But," says Mr. Walmsley (or the champion aforesaid) "these are *Curves*, not *straight Lines*!" Most true: but how are you to know that straight Lines will not behave just like Hyperbolæ, if only they are put far enough apart? Produce those three radiating Lines, that we began with, until each is a million miles long (paper, pen, and ink, provided regardless of expense): then, across their extremities, draw three Lines perpendicular to them. Why shouldn't these three Lines (of course shunning a "meeting," as all Lines do) perpetually face inwards, so that no one of them ever commits the discourtesy of turning its back upon either of the other two? "It cannot be," say Messrs. Walmsley and Co.: "these Lines *must* intersect, if produced far enough." What? In consequence of their relative situation? That relative situation being, for each pair of them, that they make with a certain transversal two interior angles together less than two right angles? In assuming *this*, I very much fear that Messrs. Walmsley and Co. are performing the not-wholly-unprecedented feat of assuming Euclid's 12th Axiom!

§ 6. The Outlook.

In conclusion let me address myself to the young and eager explorer who, Alpine-staff in hand, and duly furnished with all the necessaries for his perilous quest—pick-axe, theodolite, paper-collars, Brown's Sticking-Plaster, Jones's Cough-Pills, and Robinson's Insect-Powder, "the only known remedy for Phlebitis"—is preparing to sally forth, to do or die!

To him let me address myself, as being, perchance, an older and a more experienced traveller—one who has wandered much, and pondered long, and who can best describe himself in the words of a lady well-known in the literary world (I am glad to have this opportunity of recording them, as they have never been printed. They were written “for music,” for which purpose, I imagine, the amount of sense required is not excessive).

*“I have wandered,
I have pondered,
I have squandered
Many a boon:
In the sadness,
In the gladness,
In the madness
Of the moon.

“Seek thy pillow
By the billow,
Where the willow
Doth not weep:
Few will wonder
Who lies under,
Hearing thunder,
Fast asleep!”*

Quoted from *The Fate of Genius* in *Punch's Pocket Book for 1861*

Poetry like this speaks for itself: vain were it to hope that any poor words of mine could serve to illuminate, or even elucidate, its almost ethereal beauty!

To what point of the compass, then, should this young and eager explorer be advised to direct his steps?

I think his *best* chance—and that only a slender one—is to find some elementary proof for my Axiom, or for one of the many Theorems which will serve the same purpose, a few of which I will enumerate. In the first place, *any* Polygon will do, and *any* ratio, between it and the out-lying Segment, so long as it is a *finite* ratio. What I want it for is to prove that there is *some* isosceles Triangle, with a definite vertical angle (i. e. some named fraction of a right angle), whose base is less than one of its sides. And that, again, is wanted in order to prove it possible to draw, on a given base, an isosceles Triangle, whose base-angles shall have some nameable value. And that, again, is wanted in order to prove that there is *some* finite minimum value for the sum of the angles of a Triangle. And that, again, is wanted in order to prove Prop. 3, at p. 860. So, if any one of these propositions could be either assumed as an Axiom or granted as a Theorem, it would suffice for the proof of Euc. I. 32 and Co.

If, for example, you will grant me, as an Axiom, that there is *some* finite minimum value for the sum of the angles of a Triangle, no matter how small you make it, all is easy at once: grant me, for instance, that no Triangle can possibly have the sum of its angles less than a millionth of a right angle, and I am happy!

Finally, I am inclined to believe that, if ever Euc. I. 32 is proved without a new Axiom, it will be by some new and ampler definition of *the Right Line*—some definition which shall connote that peculiar and mysterious property, which it must somehow possess, which causes Euc. I. 32 to be true. Try

that track, my gentle Reader! It is not much trodden as yet. And may success attend your search!

Part 5

Texts about Voting

Most texts about voting deal with mathematical aspects, which is why this chapter is among the other mathematical chapters. See also *The Proposed Procuratorial Cycle* (→ 12.22, p. 1810) and following texts.

5.1 A Discussion of the Various Methods of Procedure in Conducting Elections

Source: A Discussion of the Various Methods of Procedure in Conducting Elections

The following paper has been written and printed in great haste, as it was only on the night of Friday the 12th that it occurred to me to investigate the subject, which proved to be much more complicated than I had expected. Still I hope that I have given sufficient thought to it to escape the commission of any serious mistake.

I commence by considering certain known Methods of Procedure, in the case where *some* candidate *must* be elected, proving that each Method is liable, under certain circumstances, to fail in giving the proper result.

I then consider the question of ‘Election or no Election?’ proving that the two ordinary Methods of deciding it are unsound.

And I conclude by describing a Method of Procedure (whether new or not I cannot say) which seems to me not liable to the same objections as have been proved to exist in other cases.

C. L. D.
Ch. Ch., Dec. 18, 1873.

Chapter I. On the failure of certain Methods of Procedure, in the case where an Election is *necessary*.

§ 1. The Method of a Simple Majority.

In this Method, each elector names the *one* candidate he prefers, and he who gets the greatest number of votes is taken as the winner. The extraordinary injustice of this Method may easily be demonstrated. Let us suppose that there are eleven electors, and four candidates, *a*, *b*, *c*, *d*; and that each elector has

arranged in a column the names of the candidates, in the order of his preference; and that the eleven columns stand thus:—

Case (α)

<i>a</i>	<i>a</i>	<i>a</i>	<i>b</i>	<i>b</i>	<i>b</i>	<i>b</i>	<i>c</i>	<i>c</i>	<i>c</i>	<i>d</i>
<i>c</i>	<i>c</i>	<i>c</i>	<i>a</i>	<i>a</i>	<i>a</i>	<i>a</i>	<i>a</i>	<i>a</i>	<i>a</i>	<i>a</i>
<i>d</i>	<i>d</i>	<i>d</i>	<i>d</i>	<i>c</i>	<i>c</i>	<i>c</i>	<i>d</i>	<i>d</i>	<i>d</i>	<i>c</i>
<i>b</i>	<i>b</i>	<i>b</i>	<i>d</i>	<i>d</i>	<i>d</i>	<i>d</i>	<i>b</i>	<i>b</i>	<i>b</i>	<i>b</i>

Here *a* is considered best by *three* of the electors, and second by all the rest. It seems clear that he ought to be elected; and yet, by the above method, *b* would be the winner—a candidate who is considered *worst* by *seven* of the electors!

§ 2. The Method of an Absolute Majority.

In this Method, each elector names the *one* candidate he prefers; and if there be an absolute majority for any one candidate, he is taken as the winner.

Case (β)

<i>b</i>	<i>b</i>	<i>b</i>	<i>b</i>	<i>b</i>	<i>b</i>	<i>a</i>	<i>a</i>	<i>a</i>	<i>a</i>	<i>a</i>
<i>a</i>	<i>a</i>	<i>a</i>	<i>a</i>	<i>a</i>	<i>a</i>	<i>c</i>	<i>c</i>	<i>c</i>	<i>d</i>	<i>d</i>
<i>c</i>	<i>c</i>	<i>c</i>	<i>d</i>	<i>d</i>	<i>d</i>	<i>d</i>	<i>d</i>	<i>d</i>	<i>c</i>	<i>c</i>
<i>d</i>	<i>d</i>	<i>d</i>	<i>c</i>	<i>c</i>	<i>c</i>	<i>b</i>	<i>b</i>	<i>b</i>	<i>b</i>	<i>b</i>

Here *a* is considered best by nearly half the electors (one more vote would give him an absolute majority), and never put lower than second by any; while *b* is put last by *five* of the electors, and *c* and *d* by three each. There seems to be no doubt that *a* ought to be elected; and yet, by the above Method, *b* would win.

§ 3. The Method of Elimination, where the names are voted on by two at a time.

In this Method, two names are chosen at random and proposed for voting; the loser is struck out from further competition, and the winner taken along with some other candidate, and so on, till there is only one candidate left.

Case (γ)

<i>a</i>	<i>a</i>	<i>a</i>	<i>a</i>	<i>a</i>	<i>b</i>	<i>b</i>	<i>c</i>	<i>d</i>	<i>d</i>	<i>d</i>
<i>c</i>	<i>c</i>	<i>c</i>	<i>c</i>	<i>d</i>	<i>a</i>	<i>a</i>	<i>b</i>	<i>b</i>	<i>b</i>	<i>b</i>
<i>b</i>	<i>d</i>	<i>d</i>	<i>d</i>	<i>c</i>	<i>c</i>	<i>c</i>	<i>a</i>	<i>a</i>	<i>a</i>	<i>a</i>
<i>d</i>	<i>b</i>	<i>b</i>	<i>b</i>	<i>b</i>	<i>d</i>	<i>d</i>	<i>d</i>	<i>c</i>	<i>c</i>	<i>c</i>

Here it seems clear that *a* ought to be the winner, as he is considered best by nearly half the electors, and never put lower than third; while *b* and *d* are each put last by *four* electors, and *c* by *three*. Nevertheless, by the above Method, if (*a*, *b*) were put up first for voting, *a* would be rejected, and ultimately *c* would be elected. Again, if (*a*, *c*) were put up first, *c* would be rejected, and if (*a*, *b*) were put up next, *d* would be elected—but if (*a*, *d*), *b* would be elected.

Such preposterous results, making the Election turn on the mere accident of *which* couple is put up first, seem to me to prove *this* Method to be entirely untrustworthy.

§ 4. The Method of Elimination, where the names are voted on all at once.

In this Method, each elector names the *one* candidate he prefers: the one who gets fewest votes is excluded from further competition, and the process is repeated.

Case (δ)

<i>b</i>	<i>b</i>	<i>b</i>	<i>c</i>	<i>c</i>	<i>c</i>	<i>d</i>	<i>d</i>	<i>d</i>	<i>a</i>	<i>a</i>
<i>a</i>	<i>a</i>	<i>a</i>	<i>a</i>	<i>a</i>	<i>a</i>	<i>a</i>	<i>a</i>	<i>a</i>	<i>b</i>	<i>c</i>
<i>d</i>	<i>c</i>	<i>d</i>	<i>b</i>	<i>b</i>	<i>b</i>	<i>c</i>	<i>c</i>	<i>b</i>	<i>d</i>	<i>d</i>
<i>c</i>	<i>d</i>	<i>c</i>	<i>d</i>	<i>d</i>	<i>d</i>	<i>b</i>	<i>b</i>	<i>c</i>	<i>c</i>	<i>b</i>

Here, while *b* is put last by *three* of the electors, and *c* and *d* by *four* each, *a* is not put lower than second by any. There seems to be no doubt that *a*'s election would be the most generally acceptable: and yet, by the above rule, he would be excluded at once, and ultimately *c* would be elected.

§ 5. The Method of Marks.

In this Method, a certain number of marks is fixed, which each candidate shall have at his disposal; he may assign them all to one candidate, or divide them among several candidates, in proportion to their eligibility; and the candidate who gets the greatest total of marks is the winner.

This Method would, I think, be absolutely perfect, if only each elector wished to do all in his power to secure the election of *that candidate who should be the most generally acceptable*, even if that candidate should *not* be the one of his own choice: in this case he would be careful to make the marks exactly represent his estimate of the relative eligibility of *all* the candidates, even of those he *least* desired to see elected; and the desired result would be served.

But we are not sufficiently unselfish and public-spirited to give any hope of this result being attained. Each elector would feel that it was *possible* for each other elector to assign the entire number of marks to his favorite candidate, giving to all the other candidates zero: and he would conclude that, in order to give his *own* favorite candidate any chance of success, he must do the same for him.

This Method is therefore liable, in practice, to coincide with 'the Method of a Simple Majority,' which has been already discussed, and, as I think, provided to be unsound.

§ 6. The Method of Nomination.

In this Method, some one candidate is proposed, seconded, and the votes taken for and against. This Method is fair for those electors *only* who prefer that candidate to *any* other, or else *any* other to him. But any other elector might say 'I do not know whether to vote for or against *a* till I know *who* would come in if he failed. If I were sure *b* would come in, I would vote against *a*: otherwise, I vote *for a*.'

If this Method leads to a *majority* of votes being obtained for the proposed candidate, it is identical with 'the Method of an absolute Majority,' which was discussed in § 2. If a *minority* only is obtained, it may be thus represented:—

<i>b</i>	<i>b</i>	<i>c</i>	<i>c</i>	<i>d</i>	<i>d</i>	<i>a</i>	<i>a</i>	<i>a</i>	<i>a</i>	<i>a</i>
<i>a</i>	<i>a</i>	<i>a</i>	<i>a</i>	<i>a</i>	<i>a</i>	<i>b</i>	<i>b</i>	<i>c</i>	<i>c</i>	<i>d</i>
<i>c</i>	<i>c</i>	<i>b</i>	<i>b</i>	<i>b</i>	<i>b</i>	<i>c</i>	<i>c</i>	<i>b</i>	<i>b</i>	<i>b</i>
<i>d</i>	<i>d</i>	<i>d</i>	<i>d</i>	<i>c</i>	<i>c</i>	<i>d</i>	<i>d</i>	<i>d</i>	<i>d</i>	<i>c</i>

Here there seems no doubt that *a* ought to be elected; and yet, by the above Method, he would be rejected at once, and, *whichever* candidate came in, *nine* of the electors would say ‘We would rather have had *a*.’

Chapter II. On the failure of certain Methods of Procedure, in the case where it is *allowable* to have ‘no Election.’

§ 1. The Method of *commencing* with a vote on the question ‘Election or no Election?’

This Method has the strong recommendation that if ‘no Election’ be carried, it saves all further trouble, and it *might* be a just method to adopt, provided the electors were of two kinds only—one, which prefers ‘no Election’ to *any* candidate, even the best; the other, which prefers *any* candidate, even the worst, to ‘no Election.’ But it would seldom happen that *all* the electors could be so classed: and any elector who preferred certain candidates to ‘no Election,’ but preferred ‘no Election’ to certain other candidates, would not be fairly treated by such a procedure. He might say ‘It is premature to ask me to vote on this question. If I knew that *a* or *b* would be elected, I would vote to *have* an election; but if neither *a* nor *b* can get in, I vote for having none.’

Let us, however, test this Method by a case—representing ‘no Election’ by the symbol ‘o.’

Case (ϵ)

<i>a</i>	<i>a</i>	<i>b</i>	<i>b</i>	<i>c</i>	<i>c</i>	o	o	o	o	o
o	o	o	o	o	o	<i>a</i>	<i>a</i>	<i>b</i>	<i>b</i>	<i>c</i>
<i>c</i>	<i>c</i>	<i>a</i>	<i>a</i>	<i>b</i>	<i>b</i>	<i>d</i>	<i>d</i>	<i>c</i>	<i>c</i>	<i>b</i>
<i>d</i>	<i>d</i>	<i>d</i>	<i>d</i>	<i>d</i>	<i>d</i>	<i>b</i>	<i>c</i>	<i>a</i>	<i>a</i>	<i>a</i>
<i>b</i>	<i>b</i>	<i>c</i>	<i>c</i>	<i>a</i>	<i>a</i>	<i>c</i>	<i>b</i>	<i>d</i>	<i>d</i>	<i>d</i>

Here there seems no doubt that ‘no election’ would be the most satisfactory result: and yet, by the above Method, an Election would take place, and in all probability *b* would be elected—a candidate regarding whom *nine* of the electors would say ‘I would rather have had no Election.’

§ 2. The Method of *concluding* with a vote on the question ‘Shall *x* (the successful candidate) be elected, or shall there be no Election?’

Here again a voter who preferred certain candidates to ‘no Election,’ but preferred ‘no Election’ to certain other candidates, would not be fairly treated. He might say ‘If you had taken *a* or *b*, I would have been content, but as you have taken *c*, I vote for no Election,’ and his vote might decide the point: while the other electors might say ‘If we had only known how it would end, we would willingly have taken *a* instead of *c*.’

But let us test this Method also by a case.

Case (ζ)

<i>b</i>	<i>b</i>	<i>b</i>	<i>b</i>	<i>b</i>	○	<i>a</i>	<i>a</i>	<i>a</i>	<i>a</i>	<i>a</i>
<i>a</i>	<i>a</i>	<i>a</i>	<i>a</i>	<i>a</i>	<i>b</i>	○	○	○	○	○
<i>c</i>	<i>c</i>	<i>c</i>	<i>c</i>	<i>c</i>	<i>a</i>	<i>b</i>	<i>b</i>	<i>b</i>	<i>b</i>	<i>b</i>
<i>d</i>	<i>d</i>	<i>d</i>	<i>d</i>	<i>d</i>	<i>c</i>	<i>c</i>	<i>c</i>	<i>c</i>	<i>c</i>	<i>c</i>
○	○	○	○	○	<i>d</i>	<i>d</i>	<i>d</i>	<i>d</i>	<i>d</i>	<i>d</i>

Here there seems to be no doubt that the election of *a* would be much more satisfactory than having no Election: and yet, by the above Method, *b* would first be selected from all the candidates, and ultimately rejected on the question of ‘*b* or no Election?’ while *ten* of the electors would say ‘We would rather have taken *a* than have no Election at all.’

The conclusion I come to is that, where ‘no Election’ is allowable, the phrase should be treated exactly as if it were the name of a candidate.

Chapter III. On a proposed Method of Procedure.

The Method now to be proposed is, *in principle*, a modification of No. 5, viz. ‘The Method of Marks,’ since it assigns to each candidate a mark for every vote given to him, when taken in competition with any other candidate.

Suppose that, in the opinion of a certain elector, the candidates stand in the order *a, b, c, d*: then his votes may be represented by giving *a* the number 3, *b* 2, *c* 1, and *d* 0.

Hence all that is necessary is that each elector should make out a list of the candidates, arranging them in order of merit.

If ‘no Election’ is allowable, this phrase should be placed somewhere in the list.

If the elector cannot arrange all in secession, but places two or more in a bracket, a question arises as to how the bracketed names should be marked. The tendency of many electors being, as explained in Chap. I. § 5, to give to the favorite candidate the maximum mark, and bracket all the rest, in order to reduce their chances as much as possible, it is proposed, in order to counteract this tendency, to give to each bracketed candidate the same mark that the *highest* would have if the bracket were removed. This plan will furnish a strong inducement to avoid brackets as far as possible.

In order to illustrate this process, let us apply it to the various ‘Cases’ already considered.

	α	β	γ	δ	ϵ	ζ
<i>a</i>	25	27	23	24	21	37
<i>b</i>	12	18	15	15	21	33
<i>c</i>	20	11	14	14	20	16
<i>d</i>	9	10	14	13	10	5
○					38	19

It will be seen that in each case the candidate, whose election is obviously most to be desired, obtains the greatest number of marks.

Chapter IV. Summary of Rules.

1. Let each elector make out a list of the candidates, (treating ‘no Election’ as if it were the name of a candidate), arranging them as far as possible in the order

of merit, and bracketing those whom he regards as equal.

2. Let the names on each list be marked with the numbers 0, 1, 2, &c., beginning at the last.

3. Whenever two or more names are bracketed, each must have the mark which would belong to the highest, if there were no bracket.

4. Add up the numbers assigned to each candidate.

The *first* Rule is all with which the electors need trouble themselves. Rules 2, 3, 4 can all be carried out by one person, as it is merely a matter of counting.

5.2 Suggestions As to the Best Method of Taking Votes

Source: printed 1874

Where More Than Two Issues Are to Be Voted On

In the immediate prospect of a meeting of the Governing Body, where matters may be debated of very great importance, on which various and conflicting opinions are known to be held, I venture to offer a few suggestions as to the mode of taking votes. On this subject I printed a paper some little time ago, but have since seen reason to modify some of the views therein expressed. Especially, I do not now advocate the method, there proposed, as a good one to *begin* with. When other means have failed, it may prove useful, but that is not likely to happen often, and, when the difficulty does arise, the question what should next be done may fairly be debated on its own merits.

C. L. D.
Ch. Ch., June 13, 1874.

§ 1. Votes to be taken in writing.

The method here suggested is to divide a sheet of paper into as many columns as there are issues to be voted on, and place the name of each at the head of a column. The paper is then passed round, each voter placing his name in the column he prefers.

The only objection to this method, that I can think of, is that it takes rather more time than voting *vivâ voce*; and even *this* is not always the case, as it is by no means unusual for a doubt to arise as to the result of a *vivâ voce* vote, which makes it necessary to take the votes over again.

Its advantages are, that it enables the division-list to be put on record, which I think should always be done when an important matter is voted on, except in elections of Students, in which case there are obvious objections to the names of the voters being recorded.

At the end of a meeting, it should be settled which of the division-lists, if any, are to be entered on the minutes; and the other lists might then be destroyed.

§ 2. A list to be made of all the issues to be voted on.

This should be done before *any* vote is taken at all. The list should contain every issue which is proposed, and seconded, for entry on it. The *general negative* issue ('that there be no election,' or, 'that nothing be done') should, I think, find a place on this list (provided of course that it be proposed and seconded), and should not be voted on separately—a course sometimes adopted, but which I think I have shown, in a former paper on this subject, to be unsound.

§ 3. The first vote to be taken on all the issues collectively.

This course is suggested in the hope that it may give an absolute majority (or such a majority as may be previously declared to be binding), so as to settle the question at once.

§ 4. Failing a settlement by this method, the issues to be then voted on two at a time.

This course is suggested in the hope that by it some one issue may be discovered, which is preferred by a majority to every other taken separately. For this purpose, any two may be put up to begin with, then the winning issue along with some other, and so on. But no issue can be considered as the absolute winner, unless it has been put up along with *every* other.

§ 5. Failing a settlement by this method also, further proceedings may be then debated on.

If no settlement has been arrived at by § 3 or § 4, it will at least prove that the matter is one on which the meeting is *very evenly divided in opinion*. Such a state of things is of course very difficult to deal with, but the difficulty, though possibly not diminished, will certainly not have been increased by adopting the process I have here suggested.

5.3 A Method of Taking Votes on More Than Two Issues

Source: unpublished proof written 1876

§ 1. Proposed Rules for Conducting an Election.

I.

Each elector shall write down the issue he desires ('no Election' being reckoned as an issue) and hand in the paper folded, with his name written outside: and the Chairman, or some one appointed by him, having before him a list of the electors, shall enter these issues against their names.

II.

If the Chairman find any issue having an absolute majority of votes, he shall communicate the list to the meeting. This issue shall then be formally moved, and, if none object, the Chairman shall declare it carried.

III.

If the Chairman shall find no issue having an absolute majority of votes, he shall communicate to the meeting the list of issues only, without stating who vote for each, and shall return the papers, that each elector may add the other issues, arranged in his order of preference. The Chairman shall enter these on his list, and then communicate the whole to the meeting.

IV.

If an issue be found which has a majority over every other taken separately, it shall be formally moved as in Rule II: but if none be found, the majorities being 'cyclical', opportunity shall be given for further debate. In ascertaining which of any pair of issues is preferred to the other, any elector whose paper contains one only of the two shall be reckoned as preferring that one, and any whose paper contains neither shall be considered as not voting.

V.

If the issues cannot be all arranged in one cycle, but form a cycle and a set of issues each of which is separately beaten by each of the cycle, it shall be formally moved that this cycle be retained and all other issues struck out, and, if none object, this shall be done.

VI.

If, a formal motion having been made that a certain issue be adopted, or that a certain cycle be retained and all other issues struck out, any one object, he may move as an amendment that a division be taken between the issue he desires and the issue so to be adopted, or any one of the cycle so to be retained. If

every such amendment be lost on a division, the Chairman shall declare the original motion carried: but, if any such amendment be carried, by some voting contrary to their written papers, they shall be required to amend their papers, and the process shall begin again.

VII.

When the issues to be further debated consist of, or have been reduced to, a single cycle, the Chairman shall inform the meeting how many alternations of votes each issue requires to give it a majority over every other separately.

VIII.

If, when the majorities are found to be cyclical, any elector wish to alter his paper, he may do so: and if the cyclical majorities be thereby done away with, the voting shall proceed by former Rules: but if, when none will make any further alteration, the majorities continue cyclical, there shall be no election.

§ 2. The Legal Conditions.

In any election, when there are only *two* issues to vote on—for instance (there being only one candidate), ‘shall *A* be elected or not?’ or again (there being only two candidates, and it being understood that there is to be an election) ‘shall *A* or *B* be elected?’—and when the Chairman is able to give a casting vote, it is clear that there *must* be a majority for one or other issue, and in this case open voting is the obvious course.

But wherever there are three or more issues to vote on, any one of the following three cases may exist in the minds of the electors:—

(α) *There may be one issue desired by an absolute majority of the electors.*

(β) *There may be one issue which, when paired against every other issue separately, is preferred by a majority of electors.*

(γ) *The majorities may be ‘cyclical,’ e. g. there may be a majority for *A* over *B*, for *B* over *C*, and for *C* over *A*.*

The words of the Ordinance are **“That Candidate for whom the greatest number of votes shall have been given shall be deemed elected.”**

It seems to me that this may be complied with by either of two modes of election:—

In case (α) *If a candidate be declared elected who, when all are voted on at once, has an absolute majority of votes.*

In case (β) *If a candidate be declared elected who, when paired with every other separately, is preferred by the majority of those voting.*

But that is *not* complied with by the following mode:—

In case (γ) *If a candidate be declared elected, though it is known that there is another who, when paired with him, is preferred by the majority of those voting.*

Mode (α) needs no discussion. Failing this, it seems clear that mode (β) would be a satisfactory result, as any one who preferred some other candidate might be allowed to take a division between the two.

If modes (α) and (β) both fail, it shows that the majorities on the separate pairs are ‘cyclical,’ and if, after all possible discussion, this continues to be so, any election that may be arrived at *must* introduce mode (γ). My own opinion

is that, under these circumstances, there ought to be ‘no Election’: two other courses might be suggested, which I will now consider.

§ 3. Courses that have been suggested for the case of ‘Cyclical Majorities.’

(1) *That all candidates should be voted on at once, and the one who has the greatest number of votes should be elected.*

This might be thought to fulfil the *letter* of the law, if after the words ‘shall have been given’ we supply the words ‘in the final voting.’

Let us suppose that there are 11 electors, and 4 candidates, a, b, c, d ; and that each elector has arranged in a column the names of the candidates, in the order of his preference; and that the 11 columns stand thus:—

Fig. 1

a	a	a	b	b	b	b	c	c	c	d
d	d	b	b	c	c	d	b	b	b	c^*
c	c	d	d	a	a	c	d	d	d	d^*
b	b	c	c	d	d	a	a	a	a	a

Here the majorities are cyclical, in the order $a d c b a$, each beating the one next following.

Moreover, if we make a table of majorities in the separate pairs, in which the numerator of each fraction represents the number voting for the issue which stands at the top of that column and the denominator the number voting for the issue which stands at the end of that row, and in which every division, where the issue at the top of the column is beaten, is distinguished by placing the fraction in a parenthesis, we have

Fig. 2

	a	b	c	d
a		$\frac{7}{4}$	$\frac{7}{4}$	$\left(\frac{5}{6}\right)$
b	$\left(\frac{4}{7}\right)$		$\frac{4}{5}$	$\left(\frac{3}{8}\right)$
c	$\left(\frac{4}{7}\right)$	$\left(\frac{5}{6}\right)$		$\left(\frac{3}{8}\right)$
d	$\frac{6}{5}$	$\frac{8}{3}$	$\left(\frac{5}{6}\right)$	

Here a and d each need 4 changes of votes to win, but b and c each need one only: for instance, the interchange of the two issues which are marked * would make b win. It seems clear that a has much less claim to be elected than either b or c (observe that he is put *last* by nearly half the electors, and only needs *one* interchange of votes to cause him to be beaten by *every* other candidate separately), and yet by the above course he would win.

Again, let there be 13 electors and 4 candidates.

Fig. 3

a	a	a	a	b	b	b	c	c	c	d	d	d
b	b	b	b	d	d	d	d	a	a	b	b	b
c	c	c	c	c	c	c	a^*	b	b	c	c	c
d	d	d	d	a	a	a	b^*	d	d	a	a	a

Here the majorities are cyclical, in the order $a b c d a$; the table of majorities being:—

Fig. 4

	<i>a</i>	<i>b</i>	<i>c</i>	<i>d</i>
<i>a</i>		$\left(\frac{6}{7}\right)$	$\frac{9}{4}$	$\frac{7}{6}$
<i>b</i>	$\frac{7}{6}$		$\left(\frac{3}{10}\right)$	$\left(\frac{4}{9}\right)$
<i>c</i>	$\left(\frac{4}{9}\right)$	$\frac{10}{3}$		$\left(\frac{6}{7}\right)$
<i>d</i>	$\left(\frac{6}{7}\right)$	$\frac{9}{4}$	$\frac{7}{6}$	

Here *a*, *c*, *d* each need 4 changes of votes to win, while *b* needs only one, for instance, the interchange of the two issues marked *. Yet by the above course *a* would win—a candidate whom this single interchange would cause to be beaten by every other candidate separately.

(2) That all candidates should be voted on at once, and the one who has the smallest number of votes should be struck out, and the process repeated till only two are left.

Fig. 5

<i>a</i>	<i>a</i>	<i>a</i>	<i>a</i>	<i>b</i>	<i>b</i>	<i>b</i>	<i>b</i>	<i>c</i>	<i>c</i>	<i>c</i>
<i>b</i>	<i>b</i>	<i>c</i>	<i>c</i>	<i>c</i>	<i>c</i>	<i>c</i>	<i>c</i>	<i>b</i>	<i>a</i>	<i>a</i>
<i>c</i>	<i>c</i>	<i>b</i>	<i>b</i>	<i>a</i>	<i>a</i>	<i>a</i>	<i>a</i>	<i>a</i>	<i>b</i>	<i>b</i>

Here the majorities are cyclical, in the order *a b c a*. Moreover, *a* beates *b* (6 to 5), *b* beats *c* (6 to 5), but *c* beats *a* (7 to 4).

If any one is to be elected, it would seem that *c* has the strongest claim; but by the above method *a* would win—a candidate who is put last by nearly half the electors.

Again, let there be 15 electors and 4 candidates:—

Fig. 6

<i>a</i>	<i>a</i>	<i>a</i>	<i>a</i>	<i>b</i>	<i>b</i>	<i>b</i>	<i>b</i>	<i>c</i>	<i>c</i>	<i>c</i>	<i>c</i>	<i>d</i>	<i>d</i>	<i>d</i>
<i>d</i>	<i>d</i>	<i>d</i>	<i>d</i>	<i>c</i>	<i>c</i>	<i>c</i>	<i>c</i> *	<i>d</i>	<i>d</i>	<i>d</i>	<i>d</i>	<i>a</i>	<i>a</i>	<i>b</i>
<i>b</i>	<i>b</i>	<i>b</i>	<i>b</i>	<i>d</i>	<i>d</i>	<i>d</i>	<i>d</i> *	<i>a</i>	<i>a</i>	<i>b</i>	<i>b</i>	<i>c</i>	<i>c</i>	<i>c</i>
<i>c</i>	<i>c</i>	<i>c</i>	<i>c</i>	<i>a</i>	<i>a</i>	<i>a</i>	<i>a</i>	<i>b</i>	<i>b</i>	<i>a</i>	<i>a</i>	<i>b</i>	<i>b</i>	<i>a</i>

Here there is a cyclical majority, in the order *a b c d a*; therefore by above Rule *d* is excluded: we now have—

Fig. 7

<i>a</i>	<i>a</i>	<i>a</i>	<i>a</i>	<i>b</i>	<i>b</i>	<i>b</i>	<i>b</i>	<i>c</i>	<i>c</i>	<i>c</i>	<i>c</i>	<i>a</i>	<i>a</i>	<i>b</i>
<i>b</i>	<i>b</i>	<i>b</i>	<i>b</i>	<i>c</i>	<i>c</i>	<i>c</i>	<i>c</i>	<i>a</i>	<i>a</i>	<i>b</i>	<i>b</i>	<i>c</i>	<i>c</i>	<i>c</i>
<i>c</i>	<i>c</i>	<i>c</i>	<i>c</i>	<i>a</i>	<i>a</i>	<i>a</i>	<i>a</i>	<i>b</i>	<i>b</i>	<i>a</i>	<i>a</i>	<i>b</i>	<i>b</i>	<i>a</i>

Here there is again a cyclical majority, in the order *a b c a*; therefore *c* is excluded.

The candidates are now reduced to *a* and *b*, and *a* wins by a majority of 8 to 7.

But if we tabulate the majorities thus—

Fig. 8

	<i>a</i>	<i>b</i>	<i>c</i>	<i>d</i>
<i>a</i>		$\left(\frac{7}{8}\right)$	$\frac{9}{6}$	$\frac{11}{4}$
<i>b</i>	$\frac{8}{7}$		$\left(\frac{6}{9}\right)$	$\frac{11}{4}$
<i>c</i>	$\left(\frac{6}{9}\right)$	$\frac{9}{6}$		$\left(\frac{4}{7}\right)$
<i>d</i>	$\left(\frac{4}{11}\right)$	$\left(\frac{4}{11}\right)$	$\frac{8}{7}$	

we see that a needs 6 changes of votes to win, b 5, c 2, and d only 1. It seems clear that d ought to win; yet he is the very first to be excluded by the above course.

Lastly, let us take a case in which these two courses bring in different candidates, neither of them being the one that ought to win.

Let there be 23 electors and 4 candidates.

Fig. 9

a	a	a	a	a	a	a	b	b	b	b	b	b	c	c	c	c	c	c	d	d	d	d
b	b	c	c	c	c	d	d	d	d	d	d	d	b	b	b	b	b	b	b	b	c	c^*
d	d	b	b	b	b	b	a	a	a	a	a	a	a	a	a	a	a	a	d	a	a	b
c	c	d	d	d	d	c	c	c	c	c	c	c	d	d	d	d	d	a	c	c	a	a

Here the majorities are cyclical in the order $a d c b a$. The table of majorities is:—

Fig. 10

	a	b	c	d
a		$\frac{16}{7}$	$(\frac{8}{15})$	$(\frac{11}{12})$
b	$(\frac{7}{18})$		$\frac{12}{11}$	$(\frac{5}{13})$
c	$\frac{8}{12}$	$(\frac{11}{18})$		$\frac{13}{10}$
d	$\frac{12}{11}$	$\frac{18}{5}$	$(\frac{10}{13})$	

Now, by course (1) a wins.

By course (2) d is excluded; but we still have a cyclical majority $a c b a$; we then exclude a , and c wins.

But, if we reckon how many changes of votes each needs to win, we find that a needs 5, c needs 6, and d needs 8; whereas b needs only 1—a single interchange, such as the two marked *, would give him a clear victory.

Note also that this single interchange would cause c (who is brought in winner by course (2)) to be beaten by *every* other candidate separately.

The instances I have taken seem to show that neither of these courses can be relied on to give a satisfactory result. But there is a stronger, and as I think a fatal, objection to both; namely, that any elector, who had not consented to this course being adopted, would have a very strong ground of appeal against the election if he were able to say “ A was declared elected, and yet he had not ‘the greatest number of votes’ given for him, since he was beaten when paired against B .”

The conclusion I come to is that, in the case of persistent cyclical majorities, there ought to be ‘no Election.’

I am quite prepared to be told, with regard to the cases I have here proposed, as I have already been told with regard to others, ‘Oh, *that* is an extreme case: it could never really happen!’ Now I have observed that this answer is always given instantly, with perfect confidence, and without any examination of the details of the proposed case. It must therefore rest on some general principle: the mental process being probably something like this—‘I have formed a theory. This case contradicts my theory. *Therefore* this is an extreme case, and would never occur in practice.’

§ 4. Reasons for beginning with a vote on all issues at once.

One reason for this is that it *may* show an absolute majority for some one issue, and so save all further trouble. But another, and a stronger, reason is that, when a division is taken first of all between a certain pair of issues, there will very often be some of the electors who will not know which way to vote. I am not speaking of electors who are willing to vote contrary to their real opinion, but of electors generally.

An example or two will make this clear.

Suppose there are two vacancies, but that it is not necessary to fill both: and that a division is taken first of all on the question ‘Shall both vacancies be filled, or only one?’ An elector might reasonably say ‘I wish to elect *A* alone. If I were sure he would come in, I would vote for electing *one* only: but if *B* is preferred, then, rather than lose *A*, I would vote for electing *two*.’ And another might say ‘I wish to elect *A* and *B*, but I strongly object to *C*. If I were sure *A* and *B* would come in, I would vote for electing *two*: but if that would result in *A* and *C* coming in, then I vote for *one* only.’ How much simpler to allow the one to write down ‘*A* alone,’ and the other ‘*A* and *B*.’

Again, suppose it settled that two are to be elected, and a division to be taken between *B* and *D*. An elector might reasonably say ‘I wish to elect *A* at any rate: the other to be *B* or *C*. I do not care which: but I object to *D*. I would vote for *B*, if I were sure that *A* would be elected as the other. But if I knew that *C* would beat *A* on a division, I should wish to get *C* and *A* elected, and this *might* be effected by voting for *D*. I happen to know that *C* and *A* can each beat *D*, so that he has no real chance. My voting for him would not mean that I wish to bring him *in*, but that I wish to keep *B* *out*, and so to get *C* and *A* elected, instead of *C* and *B*.’ How much simpler to allow him to write ‘*A*, and then *B* or *C*.’

§ 5. Reasons for allowing ‘no Election’ to be reckoned among the other issues.

Evidently an elector who desires ‘no Election’ ought to have *some* opportunity of voting on the question. And if it be not reckoned as an issue, it must be voted on, as a separate question, at the beginning or the end of the proceedings.

(1) *The method of beginning with a vote on the question ‘Election or no Election?’*

This Method has the strong recommendation that if ‘no Election’ be carried, it saves all further trouble, and it *might* be a just method to adopt, provided the electors were of two kinds only—one, which prefers ‘no Election’ to *any* candidate, even the best, the other, which prefers *any* candidate, even the worst, to ‘no Election.’ But it would seldom happen that *all* the electors could be so classed: and any elector who preferred certain candidates to ‘no Election,’ but preferred ‘no Election’ to certain other candidates, would not be fairly treated by such a procedure. He might say ‘It is premature to ask me to vote on this question. If I knew that *A* or *B* would be elected, I would vote to *have* an election; but if neither *A* nor *B* can get in, I vote for having none.’

(2) *The method of ending with a vote on the question ‘Shall *X* be elected, or shall there be no Election?’*

Here again a voter who preferred certain candidates to ‘no Election,’ but preferred ‘no Election’ to certain other candidates, would not be fairly treated. He might say ‘If you had taken *A* or *B*, I would have been content, but as you have taken *C*, I vote for no Election,’ and his vote might decide the point: while the other electors might say ‘If we had only known how it would end, we would willingly have taken *A* instead of *C*.’

The conclusion I come to is that, where ‘no Election’ is allowable, the phrase should be treated exactly as if it were the name of a candidate.

§ 6. Reasons for having a preliminary voting on paper and not open voting.

Suppose *A* to be the candidate whom I wish to elect, and that a division is taken between *B* and *C*; am I bound in honour to vote for the one whom I should *really* prefer, if *A* were not in the field, or may I vote in whatever way I think most favourable to *A*’s chances? Some say ‘the former,’ some ‘the latter.’ I proceed to show that, whenever case α fails to occur, and there are among the electors a certain number who hold the latter course to be allowable, the result *must* be a case of cyclical majorities.

Let there be 3 candidates, *A*, *B*, *C*, each preferred by about one-third of the electors; and suppose that, when a division is taken between *A* and *B*, *A* wins. A division is now taken between *A* and *C*, which of course depends on the votes of the *B*-party; perhaps a majority of them *really* prefer *A*, and if they voted accordingly *A* would win under case β ; it might need only two or three to vote contrary to their real opinion to turn the division in favour of *C*. We have now got ‘*A* beats *B*, *C* beats *A*,’ and of course a division must be taken between *B* and *C*; this depends on the votes of the *A*-party, and, as before, it may only need two or three to vote contrary to their real opinion to prevent *C* winning the election. Thus we get ‘*A* beats *B*, *C* beats *A*, *B* beats *C*.’

This principle of voting makes an election more of a game of skill than a real test of the wishes of the electors, and as my own opinion is that it is better for elections to be decided according to the wish of the majority than of those who happen to have most skill in the game, I think it desirable that all should know the rule by which this game may be won. It is simply this:—‘In any division taken on a pair of issues neither of which you desire, vote against the most popular. There *may* be some one issue which, if all voted according to their real opinion, would beat every other issue when paired against it separately: but, by following this rule, you *may* succeed in getting it beaten *once*, and so prevent its having a clear victory, by introducing a cyclical majority. And this will give, to the issue you desire, a chance it would not otherwise have had.’

Now, it is impossible to prevent such votes being given: and even if a preliminary voting on paper should seem to lead to case α or β , it is impossible, when it comes to the final formal vote, to prevent votes being given contradictory to previous votes.

The advantages of having the preliminary voting taken on paper and not openly are, first, that each elector, not knowing exactly how the others are voting, has less inducement to vote contrary to his real opinion, so that a more trustworthy estimate is arrived at of the real opinion of the body of electors, and cyclical majorities are less likely to occur, than with open voting; and secondly, that if cyclical majorities do *not* occur in this process, they cannot

occur in the formal voting except by some one or more of the electors giving votes inconsistent with their written opinions, and I think it desirable that in such a case the body of electors should know who they are that have so voted—a result which this method would secure.

I do not suppose that any one would be so unwilling to have it known that he has so voted that this publicity would *prevent* an artificial cyclical majority—for I am sure that those who do so believe it to be an honourable course to take, and so have no motive for desiring concealment—but I think it would increase the sense of the responsibility incurred by those who thus exercise their right of voting, and so make its occurrence less likely.

These written lists will also be, in many cases, a great saving of time. An example will best show this. Suppose there are 2 vacancies to be filled and 3 candidates, all recommended on various grounds by the examiners, and that the electors are divided among the following 6 issues, 'A B', 'B A', 'A C', 'C A', 'B C', 'A alone.' These, taken two and two, give 15 pairs: that is, it might require 15 divisions to be taken to get the information which the written lists furnish at once.

5.4 The Purity of Election

Source: St. James's Gazette, May 4, 1881

To the EDITOR of the ST. JAMES'S GAZETTE

SIR,—Utopia is a pleasant and a well-ordered country, and enjoys many blessings to which our little island is a stranger. Some of these must, no doubt, be by us eternally despaired of (for example, no one is ever bored at a Utopian dinner-party, or overcharged by a Utopian cab-driver). Others we may hope with fitting effort to make our own; and among these attainable prizes none seems more precious than “purity of election.” Utopian electors (pardon me for mentioning so trite a fact, but we need some definite basis to begin from) are all sufficiently educated to be able to form independent opinions on the political questions of the day; and in accordance with these opinions they vote, without fear or favour. Who dares deny that this is a state of things to be wished for and striven for; and that, even though the jealous Parcæ may withhold its full fruition, still the more nearly we can attain to it the better and happier we shall be? This, then, being our goal, what are the main obstacles that beset our path—the primary well-springs of corrupt voting?

Bribery, I suppose, comes first—that subtle poison which, ever since the fatal day when Jacob sold pottage and Esau sold his birthright, has rankled in the veins of society. But every corrupt influence, which makes an elector vote on any other ground than his own unfettered judgment as to what is best for the nation, is the same in kind, if not in degree, with bribery. I say “corrupt,” for I will not assert that the uneducated elector, who is simply incompetent to form an opinion of his own, is necessarily voting corruptly. It may not be, and in my opinion it is not, for the good of the nation that such a man should vote at all; still, his motives in voting may be pure. For instance, one of the candidates may be personally known to him as an exemplary private character, and though the maxim—that a statesman “can’t be wrong when life is in the right”—may be (logically) weak, it is not (morally) corrupt. Again, he may act under the advice of some wiser friend. These are not exalted motives, and they are distinctly extra-political; but they do not produce the great evil I am now considering—corrupt voting. But there is a bribery that is not to be expressed in terms of *£ s. d.*; and many a man to whom gold might be offered in vain will strain his political convictions in order to go with the stream, and will lend his voice to swell the shout of victory rather than own his allegiance to the vanquished few.

Both forms of bribery were rampant in the days of open elections. The introduction of vote by ballot has, we may hope, largely diminished both: the rogue has less chance of getting a high price for his vote now that he cannot prove that he has earned his money; nor can he certainly, however he may wish it, be on the winning side, since in many elections no one knows till all is over where the victory lies. But, though lessened for the individual voters, this evil influence—the passion for being on the winning side—still flourishes in unabated vigour as regards constituencies; and it is to this form of it that I desire to draw attention.

No thoughtful observer of the general elections of 1874 and 1880 can have failed to be struck by the way in which, when once the stream had taken a

definite direction, it rolled on in ever-gathering volume, and seemed to carry with it, like straws tossed upon a flooded river, the elections of the later days. During the first day or two each little constituency felt itself an independent factor in the general result—it could do something real to swell or stem the stream; but long before the general election was over, the battle was virtually lost and won: the beaten Government was striking its camp; the late Opposition was exulting over the huge majority with which it would take office; and the unfortunate constituencies who returned their members in the last few days found they had a much humbler function to fulfil. The question no longer was “Which policy is best for the nation?” but “Which position is best for us—to swell the tide of victory, or to efface ourselves by adding a unit to a hopelessly beaten minority?”

But this is not all. The evil extends further than to the single constituency thus washed away in the high tide of popular passion: nay, it extends further than to a single general election; it constitutes a feature in our national history; it is darkly ominous for the future of England. So long as general elections are conducted as at present we shall be liable to oscillations of political power like those of 1874 and 1880, but of ever-increasing violence—one Parliament wholly at the mercy of one political party, the next wholly at the mercy of the other—while the Government of the hour, joyfully hastening to undo all that its predecessors have done, will wield a majority so immense that the fate of every question will be foredoomed, and debate will be a farce; in one word, we shall be a nation living from hand to mouth, and with no settled principle—an army whose only marching orders will be “Right about face!”

To those who recognise the existence of this evil, and who admit that it is desirable that every constituency should be as free in its choice of a member as those who elect on the first day of the general election, let me suggest a simple practical remedy. It is that the result of each single election should be kept secret till the general election is over. It surely would involve no real practical difficulty to provide that the boxes of voting-papers should be sealed up by a Government official and placed in such custody as would make it impossible to tamper with them; and that, when the last election had been held, they should be opened, the votes counted, and the results announced? It may be worth while to point out that, as regards the particular evil I am considering—the mischief done by announcing results before all is over—there is an exact parallelism between the single election, as it was before the Ballot Act, and the general election as it still is; “voters” in the one answering to “constituencies” in the other. My proposal is, in fact, that the benefits derived from secret voting, already conferred on single elections, shall be extended to their aggregate.

Let me, in conclusion, say one word to the possible objector to this new application of an accepted principle—who is saying, so far as audible speech goes, “This is indeed a Utopian scheme! These fine sentiments will not stand the rough wear of a practical age!” but whose secret soul is saying “I prefer the high-tide theory of a general election, because I fancy my pet party has more chance than the other party of being washed into power on the top of that tide!” “What I have here written,” I would say to such a man, “is not meant for you. You and I have no common premisses to argue from. Between us all discussion is impossible. I have written for that insignificant and unenlightened section of society who still cling to the antiquated notion that the world we live in is the work of a Personal Being, not of a Blind Force; that from that Being each of us

has received all he has of what men call power, and that to that Being each of us is finally accountable for the use he makes of the power entrusted to him.”—I am, Sir, your obedient servant,

Lewis Carroll.

5.5 Proportionate Representation

May 15, 1884

Source: St. James's Gazette, May 15, 1884

To the EDITOR of the ST. JAMES'S GAZETTE

SIR,—The system of taking votes advocated by “The Proportionate Representation Society” labours under a very serious defect in its application, to which the attention of all interested in the question should be directed. An instance will make this clear.

The system proposed is that each voter shall have one vote; that he shall hand in a list of candidates numbered 1, 2, 3, etc.; and that it shall be counted as a vote for his No. 1, unless that candidate has already received enough votes to secure his return, in which case it shall be counted for his No. 2. The difficulty is that it will often depend on *which* lists are thus transferred whether the one or the other of two candidates shall be returned. If the lists in which A stands as No. 1 are of two kinds, some having B as No. 2 and some C, and if there are more than enough to return A, it may easily happen that, if the transferred lists are of the first kind, B will be returned, but if of the other kind, C.

Take a town containing 11,999 voters, and returning two members: so that 4,000 votes are enough to return a member. Let there be three candidates, A, B, and C; and let A have 8,000 supporters, 5,000 of whom take B as their No. 2, and the other 3,000 take C. Let B have 1,400 supporters and C 2,599. It does not signify whom these voters put as their No. 2, since A's return is obvious, so that the only transferred lists are those on which he is No. 1.

Now A is returned with 4,000 votes to spare. Hence, if any teller has the opportunity of seeing the lists, he can easily arrange for the 4,000 transferred lists to contain 2,600 favourable to B, thus securing B's return; or else to contain 1,401 favourable to C, thus securing C's return.

But let us suppose all such cheating provided against, and that it is a matter of pure chance which 4,000, of the 8,000 lists headed “A,” are transferred. It is mathematically certain that the most probable event is that they will be divided between A and B in the same proportion—5 to 3—as the whole 8,000; *i. e.*, that they will contain 2,500 lists headed “A B,” and 1,500 headed “A C.” Hence B will get 3,900 votes, and C 4,099; and C will be elected by a majority of nearly 200 over B. But there are 6,400 voters who prefer B to C, and only 5,599 who prefer C to B: so that, as a matter of fact, the unsuccessful candidate B has a majority of 801 over the successful candidate C:—I am, Sir, your obedient servant,

*Charles L. Dodgson.
Ch. Ch., Oxford, May 12.*

May 19, 1884

Source: St. James's Gazette, May 19, 1884

To the EDITOR of the ST. JAMES'S GAZETTE

SIR,—Mr. Cohen may rest assured that I should never think of applying the term “absurd” to any method of voting which had his support, though I do think that its practical application may prove in some cases “unfair.” The principle of the society is, in my belief, entirely right. Where the voters are divided into two parties, and where several members are to be returned, I hold that these should be divided, as nearly as possible, in the same proportion as the voters—*e. g.*, if, in a town returning four members, rather more than five-eighths of the voters were Liberals and the rest Conservatives, the Liberals ought to return *three* of the members; if rather less than five-eighths, *two*. But this principle is not applicable where only *two* issues are possible; for then one party or the other must carry the day, and a compromise is no longer possible. And the case I proposed may easily be reduced to one of this sort.

Permit me to re-state the data, adding a new but not inconsistent hypothesis. A town containing 11,999 voters is to return two members, so that 4,000 votes are enough to return a member. There are three candidates—A, B, and C: 5,000 voters say “A B,” 3,000 “A C,” 1,400 “B A,” and 2,599 “C A.” The most probable result, if the Society’s method is adopted, is (as Mr. Cohen admits) to elect “A C.”

But this is a case where, as it appears to me, the society’s method is not fairly applicable; for there are, in fact, only *two* possible issues: the 6,400 voters, though differing as to the order in which they name the candidates, agree in wishing that A and B should be the two members returned; while the other 5,599 similarly wish to return A and C. Surely in this case, where no compromise is possible, the majority ought to have their wish, rather than the minority.

That the theory “A C ought to be elected” should commend itself with exceptional force to Mr. Arthur Cohen is not to be wondered at; but when he proposes to tell the unfortunate 6,400 voters that the reason the minority are allowed to carry all before them, and to return *both* their nominees, is that this is “the fair and proper way of giving effect to the desire of the voters,” and when Mr. Sidgwick adds his assurance that this method only claims “to give the minority their share (!),” I think the disappointed majority may be excused if they show some little coyness in accepting such doubtful consolation.—I am,
Charles L. Dodgson.

Ch. Ch., Oxford, May 17.

P.S.—Mr. Sidgwick must surly have been reading the American Naturalist? “The snakes in this country may be divided into one species—the venomous.” Or else he is inspired by the poet who sang:

I give thee all, I can no more,
 Though small thy share may be:
 Two halves, three thirds, and quarters four,
 Is all I bring to thee!

Parody on *My Heart and Lute* by Thomas Moore

May 27, 1884

Source: St. James’s Gazette, May 27, 1884

To the EDITOR of the ST. JAMES’S GAZETTE

SIR,—Having put before your readers, on the 15th and 19th of May, an instance where Sir John Lubbock’s method of taking votes fails to do justice, I propose now to state the additional rules needed to guard against such a result. Mr. Sidgwick has misunderstood me when he thinks it is my wish that the majority of a constituency shall return all the members, and that I object to giving the minority their share; and I think your readers are likely to misunderstand *him* when he says of me, “he demonstrates that this method will cause candidates to be elected who are not desired by the majority of the electors”: what I had demonstrated was something very different, namely, that it might cause one of two issues to triumph over the other, where (no compromise being possible) it had fewer supporters than the other issue; and *that* result I am sure neither Mr. Sidgwick, nor any other supporter of the method, would desire.

It may sound a paradox to say that this method enables the *minority* to return a fair share of members, and yet always gives the preference, when the question is whether one of two members shall be returned, or one of two issues (no compromise being possible) shall be adopted, to that side which has a *majority* of votes. Yet so it is. An instance will, I hope, make this clear. Take a town containing 29,999 voters, and returning five members. And let the voters be divided into two parties (call them “red” and “blue”). According to the method, 5,000 votes are enough to return a member. The reason is that each voter has only *one* vote, and that the five candidates who get the greatest numbers of votes are returned. Hence, a “red” candidate with 5,000 votes must be among the first five, for there cannot be more than four “blue” candidates who have as many votes as he: five such would require 25,000 votes, and there are only 24,999 to be had. Again, if the “reds” can muster 10,000 votes, they can return two members, by giving them 5,000 each; for there cannot be more than three “blue” candidates who have as many: four such would require 20,000 votes and there are only 19,999 to be had. Observe that, though the “reds,” being the *minority*, return two members, yet each of these has a *majority* of votes, compared with any rejected “blue” candidate.

The rules, required to complete the method, are as follows:—

(1). Divide the number of voters by the number of members to be returned, increased by one: and let n the lowest whole number greater than the quotient.

(2). If there are n lists in favour of A, A is returned: and so for B, or any other candidate.

(3). If there are n lists which suffice to return A, and which, erasing A, are in favour of no other than B; and other n lists which, erasing A, are in favour of B; B is returned: and so for A and C, or any other 2 candidates.

(4). If there are $2n$ lists, which suffice to return A and B and which, erasing A and B, are in favour of no other than C; and other n lists which, erasing A and B, are in favour of C; C is returned: and so for A, B, and D, or any other 3 candidates. Similarly for $3n$ lists, $4n$ lists, etc.

The words “no other than” are used in Rule 3, in order to meet the case of lists being handed in which contain A only. And there can be no doubt that, in thus disposing of the surplus lists, headed A, no such injustice can be done as I showed to be possible—and indeed probable—in the case examined in my former letters: for the lists, used to return A, could not, by being transferred, help any one but B; consequently the surplus lists may fairly be used in his interests.

Each rule must be applied as far as possible before taking the next. When

all are exhausted, if there are still members to be returned, some other principle must be introduced. In the example, given in my former letters, these rules serve to return A, and then cease to be applicable.—I am, Sir, your obedient servant,

Charles L. Dodgson.
Ch. Ch., Oxford, May 23.

June 5, 1884

Source: St. James's Gazette, June 5, 1884

To the EDITOR of the ST. JAMES'S GAZETTE

SIR,—In reply to the charge which I brought (on the 15th of May) against the method of voting proposed by the "Society for Proportionate Representation," that it is liable to bring in the wrong man, two pleas have been put forward: one, that the most probable result is also the most equitable; the other, that it can never be a matter of chance which of two candidates shall get in, unless they are *of the same party*.

The following instance will, I think, give the *coup de grâce* to both these pleas.

Take a town of 39,999 electors, returning three members, so that 10,000 votes will suffice to return a member; let there be four Liberal candidates, A, B, C, D, and one Conservative, Z; and let there be 21,840 lists "A B D," 10,160 "A C B," and 7,999 "Z." There can be no shadow of doubt that, as a matter of justice, A, B, C, ought to be returned. Let us see what, under the society's present rules, would be the most probable result.

The 32,000 lists headed "A" are of two kinds, bearing to each other the ratios of the numbers 273,127. Hence the most probable event is that the 10,000 lists, used in returning A, will contain 6,825 "A B D" and 3,175 "A C B." Erasing "A" from the remaining lists, we have now in hand 15,015 "B D," 6,985 "C B," and 7,999 "Z"; so that Z is returned with a majority of more than 1,000 over C. And the Liberals must derive what consolation they can from the reflection that their rejected candidate really had 2,161 more supporters than the successful Conservative!—I am, Sir, your obedient servant,

Charles L. Dodgson.

5.6 Parliamentary Elections

Source: St. James's Gazette, July 5, 1884

The question, how to arrange our Constituencies and conduct our Parliamentary Elections, so as to make the House of Commons, as far as possible, a true index of the state of opinion in the nation it professes to represent, is surely equal in importance to any that the present generation has had to settle. And the leap in the dark, which we seem about to take, in a sudden and vast extension of the Franchise, would be robbed of half its terrors could we feel assured that each political party will be duly represented in the next Parliament, so that every side of a question will get a fair hearing.

The method which, after much thought, I venture to propose, will best be explained by showing how it carries out those general principles which ought to guide us in the matter.

(1) That each Member of Parliament should represent, approximately, the *same* number of Electors is almost an axiom. The monstrous injustice of letting a Member who speaks for a few hundreds cancel the vote of one who speaks for thousands needs no proof. Equal electoral districts, each returning one Member, would seem at first sight to secure this. But they do not really do so, since the Member only represents the *majority* of the district. Suppose the Electors to consist of 5 millions of one party and 3 millions of the other (call them "blue" and "red"). Now, if these 8 millions were scattered broadcast over the land, the *most probable* proportion (*i. e.* the one more probable than any other one), in which they would fall in any district, would be 5 to 3. Such a district would return a "blue" member, as indeed any district would, even with less than 5-8ths "blue," so long as they were more than one-half. Hence a possible result of an Election would be a House—not containing, as it ought to do, 3 "red" for every 5 "blue," but wholly "blue." This extreme case is of course unlikely: but it is mathematically certain that the House would contain much too large a proportion of "blue" to fairly represent the Electors. It seems clear that each district should return several Members, so that Minorities may have a chance of returning some. But, if this be so, there is no reason why the districts should be *equal*, provided only that the number of Members returned be proportioned to the number of Electors in the district.

(2) That the Minority of the two parties into which, broadly speaking, each district may be divided, should be adequately represented, is another axiom. The common plan for electing several persons at once is to give each voter as many votes as there are vacancies to fill—and this fallacy still holds its ground, in spite of the obvious absurdity that it enables a bare majority of the Electors to fill *all* the vacancies. The plan, of giving each voter several votes, but *fewer* than there are vacancies to fill, is only a partial remedy of this injustice: *e. g.*, with 3 Members to return, and each Elector having 2 votes, it is possible for just over 3-5ths of the Electors to fill *all* the vacancies. The plan, of letting a voter give 2 or more votes to one man, simply increases the "specific gravity"—so to speak—of a vote. Give each voter 6 votes, with permission to lump them if he pleases—and in the end you will find most of the votes given in lumps of 6, and the result much the same as if each had had one vote only. So we are brought to the plan advocated by the "Proportionate Representation" Society—quite the best, I believe, that has yet been suggested—to give each Elector *one* vote only,

and to fix, for each district, the “quota” which shall suffice to return a Member. (The rule is easily seen to be to divide the total number of votes by the number of Members to be returned, increased by one, and to take the whole number next greater than the quotient.)

(3) That the waste of votes, caused by accidentally giving one candidate more than he needs, and leaving another of the same party with less than he needs, should be if possible avoided, is much more easily seen than is any practicable method for effecting this. The *packing* of votes—needing the constant supervision of a “caucus,” and also a very docile body of Electors, each willing to vote for *any* man on the “right” side—is a way, but a very clumsy one, for doing this. A much better way would be to let each man vote as he likes, and find some means of utilising surplus-votes, in order to bring in other Members of the same party. But how is this to be done? It is quite the most difficult question we have yet had to face. The P. R. Society says, “let each voter hand in an arranged list, and let his vote, if not required by his No. 1, be transferred to his No. 2, and so on.” But this involves a great difficulty, often pointed out, and never yet successfully grappled with. *Which* of the surplus-votes are we to transfer? The first thing to settle is, *where* the answer is to come from. Are we to leave it to chance? Or is some fixed rule to be made, which shall meet all such cases? Or is it to be settled arbitrarily? I must ask your readers’ patience while I discuss these three questions separately.

(3. a.) Shall we leave it to chance? “Yes,” says the P. R. Society: “and you will find that the surplus lists, headed ‘A,’ will be divided among B, C, &c., in the same proportions as the entire set of such lists; and this is surely what the voters wish, and will give an equitable result.” But this is precisely what I have shown, in my letter of June 5, will in many cases *not* give an equitable result.

(3. b.) Shall we have a fixed rule for transferring the surplus-lists? Yes, if you can find one that will, in *all* cases, work satisfactorily. None such has yet been suggested.

(3. c.) To this course we seem inevitable driven; namely, that *somebody* shall decide how to use the surplus votes. But who? The voter? That is what the P. R. Society wants: and it necessitates the arranged lists, which we have already seen cause to abandon. This power *cannot* be given to the voter: it is impracticable: the only practicable plan seems to be to let him name his one favourite, and leave to other hands the further disposal of his vote, in case it is not used for that candidate. But, what hands? The next idea that suggests itself is, the committee of the candidate. But surely the Electors would not have so much confidence in the committee as in *the man himself*. And to *him* I would refer the question, who is to have the surplus-votes. The Elector should be made to understand that, in giving his vote to A, he gives it him as his absolute property, to treat as he will—either by using it to secure his own return, or to help another candidate of whom he approves, or (if there be none such in the field) by leaving it unused. If he cannot trust the man, for whom he votes, so far as to believe that he will use the vote for the best, how comes it that he can trust him so far as to wish to return him as Member? Your readers may, no doubt, find objections to this scheme: but let them remember that what we are in search of is not a scheme *free* from objections (the quest would be hopeless) but the scheme which has the *fewest*.

(4) That the process of marking a ballot-paper should be reduced to the utmost possible simplicity, to meet the case of voters of the very narrowest

mental calibre, I should have put as an axiom, but that the above-named Society appears to ignore it. No doubt they have found many school-children able to tick off, with great readiness, lists of kings and conquerors in a supposed descending scale of merit—but try it on Hodge, fresh from the plough! Give *him* a list of half-a-dozen of the neighbouring farmers, to be arranged in their order of merit, and see if he will ever be able to make up his mind! “I knows who’s best of *two*,” he might tell you, “but blessed if I can say who’s first, and second, and third, and fourth!” This simplicity of process is secured by my method.

(5) That the process of counting votes should be as simple as possible will be admitted by all who agree (as who does not?) that the sooner the result can be announced, and the less liable it is to be set aside owing to errors of calculation, the better. This also is secured by my method.

I proceed to give a summary of rules for the method I propose. Form districts which shall return 3, 4, or more Members, in proportion to their size. Let each Elector vote for one candidate only. When the poll is closed, divide the total number of votes by the number of Members to be returned *plus* one, and take the next greater integer as “quota.” Let the returning-officer publish the list of candidates, with the votes given for each, and declare as “returned” each that has obtained the quota. If there are still Members to return, let him name a time when all the candidates shall appear before him: and each returned Member may then formally assign his surplus-votes to whomsoever of the other candidates he will; while the other candidates may in like manner assign their votes. If, by this process, any fresh candidate obtains the quota, let him be declared “returned.”

This method would enable each of the two parties in a district to return as many Members as it could muster “quotas,” no matter how the votes were distributed. If, for example, 10,000 were the quota, and the “reds” mustered 30,000 votes, they could return 3 Members: for suppose they had 4 candidates, and that A had 22,000 votes, B 4,000, C 3,000, D 1,000: A would simply have to assign 6,000 votes to B, and 6,000 to C, while D, being hopeless of success, would naturally let C have his 1,000 also. There would be no risk of a seat being left vacant through two candidates of the same party sharing a quota between them: an unwritten law would soon come to be recognised—that the one with fewest votes should give place to the other. And, with candidates of two opposite parties, this difficulty could not arise at all: one or the other could always be returned by the surplus-votes of his party.

C. L. Dodgson.

Ch. Ch. Oxford. July 4, 1884.

5.7 Notes

Source: The St. James's Gazette, August 7, 1884

A correspondent signing himself "Dynamite" sends us the following:—"Those who take the Constitutional side in this great Franchise Agitation are from time to time indebted to their opponents for some energetic expression of the truth, or some happy illustration of the fallacy of the Radical position. Mr. Bright's emphatic denunciation of all Franchise Bills which did not also deal with Redistribution deserves, and will I trust obtain, the widest publicity: the Hyde Park banners emblazoned with 'The Bill, the whole Bill, and nothing but the Bill!' was a capital thought; they ought to be bought up and used at all Conservative meetings: and the Franchise-medal, used at the Birmingham meeting on Monday, inscribed "Our Queen, our country, and our rights; the Constitution in all its fulness for the people of the United Kingdom," is exactly what Conservatives should delight to wear. And now Mr. Chamberlain presents us with a most appropriate metaphor. I quote his exact words as spoken at Birmingham:—

I have read somewhere of a patient who was ordered a shower-bath by his physician. He had never seen one before, and when he was introduced to the startling invention he stoutly declared "I will not enter that machine without an umbrella." (Laughter and cheers.) Now Lord Salisbury insists on an umbrella (laughter): he will not submit the Constitution to a bracing shower of new votes unless he can preserve it from the shock by a carefully manipulated scheme of redistribution.

We ought to be extremely obliged to Mr. Chamberlain for having hunted up a metaphor so exactly suited to the Conservative orators. He has not got the details quite right, but the correction is easily made. The patient discovered that there was only one hole at the top of the shower-bath, through which the whole of the water would have fallen *en masse* upon one shoulder only; and prudently declared 'I will not enter that machine until a proper system of holes are made, so that the water may be fairly distributed.' Every one knows that the bracing effect of a shower-bath wholly depends on this distribution. Let us return thanks to Mr. Chamberlain for so admirably illustrating a great truth."

5.8 Redistribution

October 11, 1884

Source: St. James's Gazette, October 11, 1884

Now that the Government scheme for Redistribution has been made public, it seems a fitting time for calling attention to the general principles on which Redistribution ought to be conducted.

In the article on "Parliamentary Elections,"¹ which you did me the honour to publish on July 5, I explained a method for conducting Elections which (given that the various Districts had had Members assigned to them in proper proportions) would give the most equitable result possible: in the present article I propose to explain a method of Redistribution, by which Members would be equitably assigned to the various Districts. If both parties could agree to accept some such general principles for Redistribution and the conduct of Elections, each would feel secure that, whether it comprised a majority or a minority of the Electors, it would be fairly represented in the House, and there would be no objection, on either side, to passing the Franchise Bill, with the proviso that it should not come into operation till the Redistribution Bill had also been passed.

Assuming for a moment, for the sake of simplicity, that all Electors, whatever the value of their rateable property, and whether they be in town or country, are to have equal political weight, it is plain that an ideally perfect House would be one where each Member represented the same number of Electors, where the proportion between parties in the House was exactly the same as in the whole body of Electors, and where every Elector was represented by the same fraction of a Member. Such a result is however unattainable. The nearest possible approach to it would be to make the whole Kingdom into one gigantic District, and let each Elector give one vote only: in this case, if the House consisted of 600 Members, and if means were used to prevent votes being wasted, each Member would represent 1-601th of the whole body of Electors, the proportion of parties in the House would be almost exactly the same as in the Kingdom, and only 1-601th of the whole body of Electors would be unrepresented: but it would be impossible to conduct an Election on so gigantic a scale. The other extreme would be the scheme of "equal electoral Districts, each returning one Member," which would leave nearly half of the whole body of Electors unrepresented.

Before settling a formula by which, given the number of Electors in a District, it could be calculated how many Members should be assigned to it, it would be necessary to agree what weight, if any, should be given to value of rateable property, and whether any difference should be made between town and country voters. The simplest way of giving effect to whatever were agreed on would be to have formulæ for multiplying the actual number of Electors in a District, and to use the number so obtained, instead of the actual number, in assigning Members to it: *e. g.* suppose it were agreed that the unit of rateable property should be £5 a year, and that the multiplier employed should be the square-root of the average value, then, in a District where the average value was £20 (4 times the unit), the multiplier would be '2'; and, if it were further agreed that town Electors should have 10 p. c. more weight than country Electors, then, in

¹Remark: → 5.6, p. 916

a District containing 20,000 town Electors and 30,000 country Electors, with an average value of £20 a year of rateable property, we should first add 2,000 to the number of town Electors, and then multiply the whole 52,000 by 2: that is, we should consider the District to contain, for the purpose of assigning Members, 104,000 Electors.

The question, how many Districts to make, which is the same thing as to ask how many Members to assign (on an average) to each District, and the question how many votes to allow each Elector to give, will be best considered in connection with the following Tables, which are calculated on the assumption that 6-11ths of the House are 'red' and 5-11ths 'blue.' Table I. gives the percentage, of the whole body of Electors, represented by the 'red' Members, Table II. the percentage represented by the 'blue,' and Table III. the percentage unrepresented:—

Table I.

		Number of votes each Elector can give.

Number of Members assigned to each District.	1...	49
	2...	49	32
	3...	49	39	25
	4...	49	43	32	19
	5...	49	43	37	28	16
	6...	49	45	39	32	25	14
	7...	49	45	41	36	30	21	12
	8...	...	49	47	43	38	32	27	19	10
	9...	...	49	47	43	39	36	30	25	17
	10...	49	47	45	41	38	32	28	22	16

By inspecting these Tables we see that, the fewer the Districts (*i. e.* the greater the number of Members assigned to each District) and the smaller the number of votes each Elector can give, the more equitable is the result. With less than 10 Members to a District, or with more than one vote to an Elector, it is always possible that the majority of the Electors should be 'blue,' although 6-11ths of the House are 'red.' For example, if 3 Members be assigned to each District, and each Elector have 2 votes, the 'reds' in the House represent 33 p. c. of the Electors, and the 'blues' 28 p. c., while 39 p. c. are unrepresented. It might easily happen that 25 of these 39 were 'blue' and 14 'red': in which case 53 p. c. of the Electors would be 'blue,' and only 47 p. c. 'red,' and yet the 'reds' would have a large majority in the House!

These Tables have been calculated for equal Districts, but probably the results would be much the same for unequal Districts, so long as very small Districts were as far as possible avoided.

We have now to determine a formula by which, given the number of Electors in a district (that is the *nominal* number, making due allowance for rateable property &c.) it may be calculated how many Members ought to be assigned to it. This formula should be such as to make the "quota," necessary to return a Member, as nearly as possible the same for every District. Now, if ' Q ' be this uniform quota, and if ' e ' be the (nominal) number of Electors in a District, and ' m ' the number of Members assigned to it, and if it be agreed that each Elector is to have one vote only, we know that Q must be just greater than $\frac{e}{m+1}$. Hence we set $m = \frac{e}{Q} - 1$, as the formula required. For example, if the quota were 5,000, a District containing (nominally) 30,000 Electors would have 5 Members assigned to it.

It remains to be seen how to find an equitable value for Q . Let e_1 be the (nominal) number of Electors in District No. 1, and m_1 the number of Members assigned to it, and so on: also let E be the total (nominal) number of Electors, M the total number of Members, and D the number of Districts: then we have

$$\begin{aligned}
 (m_1 + 1).Q &= e_1 \\
 (m_2 + 1).Q &= e_2 \\
 &\&c. \\
 \therefore (M + D).Q &= E; \text{ i. e. } Q = \frac{E}{M + D}.
 \end{aligned}$$

Let me say in conclusion that the object aimed at, in the methods I have

proposed for Redistribution and the conduct of Elections, is fully as much to secure that the *Majority* of the Electors shall be duly represented as that the *Minority* shall be so. The same is true of the method (a less perfect one, as I believe) proposed by “the Proportional Representation Society.” In speaking to friends about this Society, I have had such answers as this:—“I have no interest in their proposal. All I care for is that the Majority of the Electors shall be fully represented in the House: it matters little whether the Minority are represented or not.” Such people seem to think that the existing system secures what they desire. In this they are utterly mistaken: there is ample room, under the existing system, for a large Majority of the Electors to find themselves in a woeful minority in the House. The only change for the worse, that I can think of, would be the method of “equal electoral Districts each returning one Member.” Almost any other change would be a change for the better: but any system which, like the one I have here proposed, secures that the Majority of the Electors shall be duly represented, must necessarily do the same for the Minority.

To the EDITOR of the ST. JAMES'S GAZETTE

SIR,—Mr. G. A. Simcox, in discussing my proposals (of Oct. 11) for Redistribution, asks “how is the average elector to be saved from throwing away his vote on a candidate who is safe without it?” This question does not belong to the subject of “Redistribution,” but to that of “Parliamentary Elections,” under which heading I fully discussed it in my paper of July 5², and there proposed that such votes should be at the absolute disposal of the candidate for whom they were given. I also discussed, but only to reject them, the other methods suggested by Mr. Simcox.

I am embodying both papers in a small pamphlet³, which I hope to publish in a few days, and of which I shall be happy to send Mr. Simcox a copy.—I am,
Sir, your obedient servant,

C. L. Dodgson.

5.9 The Principles of Parliamentary Representation

Source: The Principles of Parliamentary Representation, first edition; including Supplement and Postscript to Supplement

Preface

Through all the dust and din of the present controversy, four things, at least, are surly clear to all thinking men:—

First, that it would be an unmitigated evil to have a General Election with the new Franchise, but without a new Distribution of Seats;

Secondly, that there would be no difficulty in avoiding all risk in such a catastrophe, *PROVIDED THAT* a clause were added to the Franchise-Bill, enacting that it “shall not be put into operation until a Redistribution-Bill has also been passed”;

Thirdly, that there would be no difficulty in both parties agreeing to such a clause, *PROVIDED THAT* each felt secure against the other party obtaining an unfair advantage in the Redistribution;

Fourthly, that there would be no difficulty in making this secure, *PROVIDED THAT* some general principles, making it impossible for either side to obtain any such advantage, could be discovered and accepted by both parties.

It is in the profound conviction that such principles exist, and that they can be as clearly formulated, and as fully proved, as the principles of any other Science, that I venture to address these pages to all interested in the matter.

Nov. 5, 1884

Chapter I. Desiderata.

The chief *desiderata* seem to be as follows:—

(1) That each Elector should have the same chance of being represented in the House. (Under *any* system, *some* Electors must be left unrepresented.)

(2) That each Elector, who is represented at all, should be represented by the same fraction of a Member. Or (which is the same thing) that each Member should represent the same number of Electors. Or (which is the same thing) that the number of Electors, needed to secure the return of a Member, should be uniform throughout the Kingdom.

(3) That the number of unrepresented Electors should be as small as possible.

(4) That the proportions of political parties in the House should be, as nearly as possible, the same as in the whole body of Electors.

(5) That the process of voting should be as simple as possible.

(6) That the process of counting the votes, and announcing the result, should be as simple as possible.

(7) That the waste of votes, caused by more votes being given for a Candidate than are needed for his return, should be as far as possible prevented.

(8) That the result of a local Election should depend as much as possible on the wishes of the Electors in that District, and as little as possible on chance.

(9) That the Electors in a District should be, as far as possible, uninfluenced by the results of Elections in other Districts.

Chapter II. Principles to be observed in forming electoral Districts, and in determining, for each District, how many Members it shall return.

§ 1. Number of Members in House.

There seems to be no sufficient reason, *a priori*, for any change in this particular. It would probably be best to take 660 as the number to be generally aimed at, though holding ourselves free to modify this as circumstances might require.

§ 2. Number of electoral Districts; whether to be equal or unequal; &c.

The two extreme cases are (1) to have as many Districts as Members, each to return one Member, in which case the Districts should of course be equal; (2) to form the whole Kingdom into one District.

In the first case (a method that has been much advocated) it is only a bare majority in each District who are represented. For it must not be supposed that all who vote for a Member are duly represented by him. If a District contains 20,001 Electors, so that 10,001 are enough to return a Member, all additional votes are absolutely wasted: hence only 10,001 Electors in that District are represented in Parliament; the other 10,000, whether they vote for the successful Candidate, or for a rival, or even if there be no contest at all, are unrepresented. This method, then, leaves nearly half the whole body of Electors unrepresented.

The injustice of this method may be illustrated from two points of view. Suppose a bare majority of the Electors to be of one party, and the rest of the opposite party; e. g. let 6-11ths be 'red' and 5-11ths 'blue.' Then, as a matter of abstract justice, about 6-11ths of the House ought to be 'red,' and 5-11ths 'blue.' But practically this would have no chance of occurring: if the 'reds' and 'blues' were evenly distributed through the Kingdom, a 'red' would be returned in every District, and the whole House would be of one party! Yet this distribution is, by the Laws of Probability, more likely than any other one distribution, and, the nearer the distribution to the most probable one, the nearer we come to this monstrous injustice.

The other way of looking at it is almost as telling. Suppose the House to have been elected, and that 6-11ths of the Members are 'red,' and 5-11ths 'blue': all we could learn from this, as to the views of the Electors, would be that 6-22ths (about 28 p. c.) are 'red,' and 5-22ths (about 23 p. c.) 'blue': as to the other 49 p. c., we should know absolutely nothing—if they were all 'red' (i. e. if 3-4ths of the Electors were 'red'), or all 'blue' (i. e. 7-10ths of the Electors 'blue'), it would make no difference in the House.

Taking this first extreme, then, as yielding the *maximum* of injustice which can be effected by arrangement of Districts, and observing that, if each District returned 2 Members, only 1-3rd of the Electors (on the assumption that each Elector has only one vote—an arrangement whose justice we shall hereafter prove) would be unrepresented, if 3 Members, only 1-4th, and so on, we see that the fewer and larger the Districts, i. e. the greater the number of Members which,

on an average, each District returns, the fairer the result: till we come to the other extreme, where the whole Kingdom is formed into one District returning 660 Members, in which case only 1-661th of the whole body of Electors would be left unrepresented. A general Election, with so gigantic a District, would of course be impracticable: and probably Districts, returning 6 Members each, would be about as large as could be conveniently dealt with: but very small Districts should be, as far as possible, avoided.

I find, in the *Standard* for October 10, 1884, a very good instance of the injustice done by sub-dividing large electoral Districts. "The Birmingham Conservatives are, a Correspondent telegraphs, keenly discussing the Government Redistribution Scheme. The clause which apportions 6 Members to Birmingham gives much dissatisfaction in Conservative circles. It is contended that, if the borough is to be divided into three electoral Districts, each District to have 2 Members, the Liberals could so manipulate the voters as to be certain of returning the whole of the 6 Members." Now, assuming that each Elector is to have one vote only, the Liberals could only do this by mustering more than two-thirds of the votes in each District; i. e. they must be 67 p. c., or more, of the whole body of Electors in Birmingham. But, if the three Districts were made one, it would need about one-seventh of the whole (i. e. 14 and 2-7ths p. c.) to return one Member. Hence 67 p. c. could only return 4 of the 6 Members: it would require 71 p. c. to return as many as 5; and they could not return all 6, unless they were 86 p. c. of the whole body.

Taking it as proved, then, that single-Member Districts should be in all cases avoided, and that all such should be grouped together, so as to form Districts returning at least 2 Members each, and, wherever it is possible, 4 or 5 or even more, we need only add, as a general remark, that, the more we equalise the Districts, the more we equalise the chance that each Elector has of being one of those represented in the House. Thus, in a District, returning 2 Members, the chance is 2-3ds; with 3 Members, it is 3-4ths; and so on.

§ 3. Formula for determining, for each District, how many Members it shall return.

A preliminary question must here be asked, viz. are we to count population, or Electors only? I do not think it matters much which, as they probably vary nearly together, i. e. a District having twice the population of another would probably have twice as many Electors. The Formula can best be determined for the number of *Electors*: but if, in using it, the number of population be substituted, it will make no important difference in the result.

The formula will of course have to be modified for each case, if it be agreed to give political weight to differences in rateable property, or to the distinction between town and country voters: and for this purpose rules would have to be laid down.

Now, taking 'e' to represent, for any one District, the number of Electors, and 'm' the number of Members to be assigned to that District, and assuming that each Elector has only one vote, we require a formula giving *m* in terms of *e*. This formula must evidently be such as will secure that every Member in the House shall, as far as possible, represent the same number of Electors.

Now, whatever be the quota of recorded votes, which is necessary and sufficient, *before the poll is closed*, to make it certain that 'A' will be returned, that

is the number of Electors whom *A* will represent in the House. He cannot represent *less*, for this number is *necessary*; and he cannot represent *more*, for it is *sufficient*, so that all additional votes are superfluous. Let us call this necessary and sufficient quota '*Q*.'

Now, in order that *Q* may be *sufficient*, it must not be possible for *m* other Candidates to obtain *Q* votes each; i. e. $(m + 1) \cdot Q$ must be greater than *e*; i. e. *Q* must be greater than $\frac{e}{m+1}$. Also, in order that *Q* may be *necessary*, it must be the whole number *next* greater than this fraction. Hence, approximately, $Q = \frac{e}{m+1}$; i. e. $m = \frac{e}{Q} - 1$.

This, then, is the formula required. An example will make it clear. Suppose the universal quota to be 6,000: then a District containing 50,000 Electors would have 7 Members assigned to it.

We have yet to find a formula for determining *Q*. Let '*e*₁' be the number of Electors in District No. 1, '*e*₂' the number in No. 2, and so on; let '*m*₁' be the number of Members assigned to District No. 1, '*m*₂' the number assigned to No. 2, and so on; also let '*E*' be the total number of Electors in the Kingdom, '*M*' the number of Members in the House, and '*D*' the number of Districts. Then we have

$$\begin{aligned} (m_1 + 1) \cdot Q &= e_1, \\ (m_2 + 1) \cdot Q &= e_2, \\ &\&c. \\ \therefore (M + D) \cdot Q &= E; \text{ i. e. } Q = \frac{E}{M + D}; \\ \therefore m &= e \cdot \frac{M + D}{E} - 1. \end{aligned}$$

§ 4. Tables calculated by the preceding Formulæ.

Let us suppose the 2,000,000 new Electors to be already enfranchised, thus making the total Electorate about 5,000,000. Let us further assume the number of electoral Districts to be 180, so that each will return, on an average, 3 and 2-3ds of a Member.

- Let *M* = No. of Members in House = 660.
- D* = No. of Districts = 180.
- e* = No. of Electors in a District.
- E* = total No. of Electors = 5,000,000.
- p* = population in a District.
- P* = total population = 36,000,000.
- Q* = universal quota, to be aimed at.
- m* = No. of Members assigned to a District.

Then $\frac{E}{M+D} = \frac{5,000,000}{840} = \text{about } 6,000;$
 $\therefore m = \frac{e}{6,000} - 1$ (a)

It will be worth while to contrast with this the 'rough and ready' method of assigning Members in proportion to the number of Electors, so that *m* : *e* :: *M* : *E*. This gives us

$m = e \cdot \frac{M}{E} = e \cdot \frac{660}{5,000,000} = \frac{e}{7,600}$ (b)

In the following Table, the second column gives the number of Members to be returned by a District, the first the number of Electors by Formula (a), and the third the same by Formula (b).

Table I.

<i>e</i> , by (<i>a</i>)	<i>m</i>	<i>e</i> , by (<i>b</i>)
9,000		4,000
	1	
15,000		11,000
	2	
21,000		19,000
	3	
27,000		27,000
	4	
33,000		34,000
	5	
39,000		42,000
	6	
45,000		49,000
	7	
51,000		57,000
	8	
57,000		65,000
	9	
63,000		72,000
	10	
69,000		80,000

The numbers, in the first and third columns, have been calculated by giving to *m*, in the preceding Formulæ, the successive values one-half, 3-halves, 5-halves, &c. Hence we see that, by Formula (*a*), a District containing between 9,000 and 15,000 Electors must have between one-half and 3-halves of a Member (i. e. must have *one* Member) assigned to it; and so on. If a District contained almost exactly 15,000, it could not fairly be determined, by this Table, whether it ought to return one Member, or two. In such a case, it would be best to change the boundaries of the District, so as to increase or diminish the number of Electors by 2,000 or so.

Comparing the results of the two Formulæ, we see that, for Districts whose population is about 27,000, it matters very little which Formula we use: but, for small Districts, Formula (*b*) assigns too many Members, and, for large Districts, too few; e. g. 13,000 Electors ought to return only one Member—Formula (*b*) gives them two; 60,000 ought to return 9—Formula (*b*) gives them 8.

We will now examine the effect of counting the population of a District, and not the Electors only.

Here, for $\frac{E}{M+D}$, we must substitute $\frac{P}{M+D}$; i. e. $\frac{36,000,000}{840}$, i. e. about 43,000.

Hence Formula (*a*) becomes

$$m = \frac{e}{43,000} - 1 \dots\dots\dots (c)$$

Also Formula (*b*) becomes

$$m = e \cdot \frac{660}{36,000,000} = \frac{e}{54,500} \dots\dots\dots (d)$$

Table II.

<i>e</i> , by (<i>c</i>)	<i>m</i>	<i>e</i> , by (<i>d</i>)
64,000		27,500
	1	
107,000		82,000
	2	
150,000		136,500
	3	
193,000		191,000
	4	
236,000		245,500
	5	
279,000		300,000
	6	
322,000		354,500
	7	
365,000		409,000
	8	
408,000		463,500
	9	
451,000		518,000
	10	
494,000		572,500

Comparing this with Table I, we see that, provided only it be true that the number of Electors in a District is always about 5-36ths of the population, the substitution of number of population for number of Electors will suffice for all practical purposes; and, seeing that there is evidently a tendency to go by population, and that it is much more easy to take the population of a District than to estimate what will be the number of its Electors when the Franchise-Bill is passed, the first column of Table II. is probably the best to employ.

Chapter III. Principles to be observed in conducting Elections.

§ 1. Number of Votes each Elector may give.

The two extreme cases are (1) to let each Elector give as many votes as there are Members to be returned by the District; (2) to let him give one vote only.

The effect of each of these methods, and of the intermediate methods which lie between them, will be best understood by considering the following Tables of percentages.

We will first find general formulæ for determining what number of Electors, in a given District, is necessary and sufficient to secure the return of one Candidate, of 2, of 3, &c.

- Let e = No. of Electors in the District,
- m = Members assigned to it,
- v = votes each Elector can give,
- s = seats it is desired to fill,
- x = Electors required.

Also let it be assumed that an Elector may not give 2 votes to the same

Candidate. (N.B. 'cumulative' voting is discussed at p. 934.)

Now, in order that x may be *sufficient* to fill s seats, it must be large enough to make it impossible for the other $(e - x)$ Electors to fill $(m + 1 - s)$ seats; since the two events are incompatible, so that, if the latter were possible, the former would be impossible. To effect this, each of the s Candidates must have more votes than it is possible to give to each of $(m + 1 - s)$ rival Candidates.

In order that x may be *necessary*, it must be only *just* large enough for the purpose.

It will be necessary to consider the following 4 cases separately. Observe that $>$ means 'greater than,' $\not>$ means 'not greater than,' and \therefore means 'therefore'.

Case (a) v is $\not>$ s , and also $\not>$ $(m + 1 - s)$;

Case (b) $\dots > s$, but $\not>$ $(m + 1 - s)$;

Case (c) $\dots \not> s$, but $>$ $(m + 1 - s)$;

Case (d) $\dots > s$, and also $>$ $(m + 1 - s)$.

In case (a) the x Electors can give vx votes, which divided among s Candidates, supply them with $\frac{vx}{s}$ votes apiece. Similarly, the $(e - x)$ Electors can give $v.(e - x)$ votes, which, divided among $(m + 1 - s)$ Candidates, supply them with $\frac{v.(e-x)}{m+1-s}$ votes apiece. Hence we must have

$$\frac{vx}{s} > \frac{v.(e-x)}{m+1-s},$$

where v divides out;

$$\therefore x.(m+1-s) > se - sx;$$

$$\therefore x.(m+1) > se,$$

$$\therefore x > \frac{se}{m+1}.$$

In case (b), each of the x Electors can only use s of his v votes, since he can only give *one* to each Candidate: hence the x Electors can only give sx votes, thus supplying s Candidates with x votes apiece. But the $(e - x)$ Electors can, as in case (a), supply $(m + 1 - s)$ Candidates with $\frac{v.(e-x)}{m+1-s}$ votes apiece. Hence we must have

$$x > \frac{v.(e-x)}{m+1-s};$$

$$\therefore x.(m+1-s) > ve - vx;$$

$$\therefore x.(m+1-s+v) > ve;$$

$$\therefore x > \frac{ve}{m+1-s+v}.$$

In case (c), the x Electors can, as in case (a), supply s Candidates with $\frac{vx}{s}$ votes apiece. But each of the $(e - x)$ Electors can only use $(m + 1 - s)$ of his votes: hence the $(e - x)$ Electors can only give $(m + 1 - s).(e - x)$ votes, thus supplying $(m + 1 - s)$ Candidates with $(e - x)$ votes apiece. Hence we must have

$$\frac{vx}{s} > e - x;$$

$$\therefore vx > se - sx;$$

$$\therefore x.(s+v) > se;$$

$$\therefore x > \frac{se}{s+v}.$$

In case (d), the x Electors can, as in case (b), supply s Candidates with x votes apiece. And the $(e - x)$ Electors can, as in case (c), supply $(m + 1 - s)$ Candidates with $(e - x)$ votes apiece. Hence we must have

$$\begin{aligned} x &> e - x; \\ \therefore 2x &> e; \\ \therefore x &> \frac{e}{2}. \end{aligned}$$

Tabulating these results, we have the following formulæ.

	<i>Data.</i>	<i>Formulæ.</i>
(a)	$v \not> s$ $\not> m + 1 - s$	$x > \frac{se}{m+1}$
(b)	$v > s$ $\not> m + 1 - s$	$x > \frac{ve}{m+1-s+v}$
(c)	$v \not> s$ $> m + 1 - s$	$x > \frac{se}{s+v}$
(d)	$v > s$ $> m + 1 - s$	$x > \frac{e}{2}$

By these formulæ the following Table is calculated. It shows, for a given District, what percentage of the Electors is necessary and sufficient to secure the return of *one* Candidate, of 2, of 3, &c.

The 2nd line in the 3d section represents the well-known “three-cornered constituency.” Observe (by comparing it with the next line) that it makes it too hard for a minority to fill *one* seat, and too easy for a majority to fill *all*.

Table III.

No. of Members ret. by District.	No. of votes each Elector can give.	No. of Seats it is desired to fill.					
		1	2	3	4	5	6
1	1	51					
2	2	51	51				
	1	34	67				
3	3	51	51	51			
	2	41	51	61			
	1	26	51	76			
4	4	51	51	51	51		
	3	43	51	51	58		
	2	34	41	61	67		
	1	21	41	61	81		
5	5	51	51	51	51	51	
	4	45	51	51	51	56	
	3	38	43	51	58	63	
	2	29	34	51	67	72	
	1	17	34	51	67	84	
6	6	51	51	51	51	51	51
	5	46	51	51	51	51	55
	4	41	45	51	51	56	61
	3	31	38	43	58	63	67
	2	26	29	43	58	72	76
	1	15	29	43	58	72	86

In examining this Table, we notice, first, the uniformity of the *upper* line in each section (i. e. the percentages required when each Elector can give as many votes as there are seats to fill). Here, in every case, more than half the Electors must agree, in order to fill one single seat: but, when once this number have mustered, they have it in their power to fill *all* the seats! ‘*C’est le premier pas qui coûte.*’

This absurdity diminishes gradually, from line to line, as we look down each section; the lowest line (i. e. the percentages required when each Elector can give one vote only) being always the most reasonable. One of the most startling anomalies is the 4th line of the 6th section. Here we see that, out of 100 Electors, we must muster 34 in order to fill *one* seat: with four more Electors, we can fill the second seat: with five more, the third: but ‘then comes the tug of war’; to win the fourth seat, we actually need *fifteen* more Electors!

Quoted from *The Rivals Queens* by Nathaniel Lee

Lastly, comparing together the lowest lines of the several sections, we notice that they gradually improve as we move down from section to section, requiring a smaller percentage to fill *one* seat, thus giving a minority a better chance of being represented, and a larger percentage to fill *all*, thus leaving a smaller number unrepresented. This last figure (the right-hand end of each lowest row) represents the percentage of the Electors in the Kingdom who would be represented in the House, supposing all the Districts similar to the one under consideration: and this percentage we find to rise, from 51 in the case of single-Member

Districts, to 86 in the case of six-Member Districts.

The obvious conclusion is—let the Districts be as *large* as possible, and let each Elector give *one* vote only.

The effect, on the composition of the House, will be yet more clearly seen by considering the following three Tables, which are calculated on the assumption that, in any District, all proportions, between ‘red’ and ‘blue,’ are equally probable, and that 6-11ths of the House are ‘red’ and 5-11ths ‘blue.’ Table IV. gives the percentage of the whole body of Electors represented by the ‘red’ Members, Table V. the percentage represented by the ‘blue,’ and Table VI. the percentage unrepresented:—

Table IV.

Number of Members assigned to each District.	Number of votes each Elector can give.					
	6.	5.	4.	3.	2.	1.
1.	28
2.	28	37
3.	28	36	42
4.	28	35	40	44
5.	...	28	33	39	43	46
6.	28	32	36	40	44	48

Table V.

Number of Members assigned to each District.	Number of votes each Elector can give.					
	6.	5.	4.	3.	2.	1.
1.	23
2.	23	31
3.	23	30	34
4.	23	29	34	37
5.	...	23	28	32	36	38
6.	23	27	30	34	37	38

Table VI.

Number of Members assigned to each District.	Number of votes each Elector can give.					
	6.	5.	4.	3.	2.	1.
1.	49
2.	49	32
3.	49	34	24
4.	49	36	26	19
5.	...	49	39	29	21	16
6.	49	41	34	26	19	14

By inspecting these Tables, we see two things:—

First, that the fewer and larger the Districts, i. e. the greater the number of Members returned (on an average) by each District, the more equitable the

result. This conclusion we have already arrived at, from general considerations. (See p. 925, line 44.) We observe, further, that the advantage, in fairness of result, increases rapidly at first and more slowly afterwards. For instance, in Table VI, if each Elector be allowed one vote only, the change from single-Member to two-Member Districts changes the percentage of unrepresented Electors from 49 to 32 (i. e. deducts about 1-3rd); whereas the change, from 5-Member to 6-Member Districts, only changes the percentage from 16 to 14 (i. e. deducts only 1-8th). The conclusion is that *the* important point is to have as few single-Member, and even as few 2-Member Districts as possible; but that, when we have got as far as to Districts returning 4 or 5 Members each, it is hardly worth while to go further.

Secondly, we see that the fewer the number of votes (down to the least possible, viz. 'one') that each Elector is allowed to give, the more equitable the result. We observe, further, that the advantage, in fairness of result, increases slowly at first and more rapidly afterwards. For instance, in Table VI, if 6 Members be assigned to a District, the change from 6 votes to 5 only changes the percentage of unrepresented Electors from 49 to 41 (i. e. deducts less than 1-6th); whereas the change from 2 votes to one changes it from 19 to 14 (i. e. deducts more than 1-4th). We observe, further, that the system of allowing each Elector as many votes as there are seats to fill produces, in *every* case, the same result, (the most inequitable that it is possible to produce by any variation in these data,) viz. that it leaves about 49 p. c. of the Electors unrepresented. The system (already discussed at p. 925) of "equal electoral Districts, each returning one Member" is only a particular instance of this general law.

The method of 'cumulative voting' (where an Elector can give two or more votes to the same Candidate) will usually have no other effect than to increase the 'specific gravity'—so to speak—of a vote. Let each Elector have 4 votes, with permission to 'lump' them if he chooses, and in the end you will find most of the votes given in lumps of 4, and the result much the same as if each Elector had had *one* vote only.

The conclusion is that *the* important point is to let each Elector give *one* vote only.

§ 2. Formula for determining, after the poll is closed, the quota of Votes needed to return a Member.

By a process, exactly similar to that employed at p. 927, we may prove that, if '*r*' be the number of recorded votes, and '*m*' the number of Members to be returned, the quota must be just greater than $\frac{r}{m+1}$. For example, if 55,000 votes had been given, and the District had to return 6 Members, the quota needed to return one Member would be just greater than 7,857 and 1-7th: i. e., a Member, having 7,858 votes, would be returned. Similarly, anything just greater than 15,714 and 2-7ths would be enough (if the votes could be reckoned *en masse*) to return 2 Members: i. e., if 2 Members of the same party had 15,715 votes between them, both could be returned. We shall prove, further on, that such reckoning of votes is equitable and ought to be provided for.

This quota must be carefully distinguished from the one discussed at p. 927. If a District, returning one Member, contains 10,001 Electors, the quota needed, *before the poll is closed*, to make it certain that '*A*' will be returned, is 5,001; but, if only 8,001 vote, the quota needed, *after the poll is closed*, to return him,

is only 4,001. For the purpose of *assigning Members to a District*, it is fair to proceed as if *all* the Electors were sure to vote; but, for the purpose of *returning Members*, we can count only the votes that are actually recorded.

§ 3. Method for preventing waste of Votes.

Assuming it to be agreed that each District is to return 2 or more Members, and that each Elector is to give one vote only, we have now to consider what is to be done when 2 or more Candidates of the same party have got, among them, enough votes to be returned, but when some have got more than the quota, and others less. It is obviously not fair that the party should fail in bringing in their rightful number of Members, merely by an accidental disarrangement of votes; but how to make an equitable transfer of the superfluous votes is by no means so obvious.

Various methods have been proposed for this: of which I will consider two:—

(1) “The Proportional Representation Society” proposes to let each Elector hand in a list of Candidates, marked in the order of his preference; and that his vote, if not required for his No. 1, should be transferred to his No. 2, and, if not required for him, then to No. 3, and so on. One great objection to this method is the confusion it would cause in the mind of an ignorant Elector, who, though quite able to name his favourite Candidate, would be utterly puzzled if told to arrange 5 or 6 names in order of merit. But a much stronger objection is the difficulty of deciding to *which* of the remaining Candidates the surplus votes shall go: e. g. if 8,000 be the quota needed to return a Member, and if 6,000 lists be headed ‘*A B*,’ and 4,000 ‘*A C*,’ *which* 2,000 are to be transferred? Mr. J. Parker Smith, in a Pamphlet entitled “Preferential Voting,” says (at p. 2), “The course which is exactly fair to *B* and *C* is that the votes which are transferred should be divided between them in the same proportion as that in which the opinions of the whole number of *A*’s supporters is divided.” (This would require, in the above instance, that 3-5ths of the 2,000, i. e. 1,200, should be taken from the ‘*A B*’ lists, and 2-5ths, i. e. 800, from the ‘*A C*’ lists.) He adds, “This principle avoids all uncertainty, and is indisputably fair.” He then proceeds to show that if, instead of counting and arranging the surplus votes, they be taken “in a random order,” the chances are very great that they will come out nearly in this proportion. And he further adds (at p. 4), that “the element of chance will not be of importance as between the different parties, but only as between different individual Candidates of the same party.” Now all this rests on the assertion that this mode of dividing the surplus votes, whether effected by counting or left to chance, is “indisputably fair:” and this assertion I entirely deny. The following instance will serve the two purposes, of showing that this method may easily lead to gross injustice, and of showing that the difficulty may easily arise between candidates of opposite parties.

Take a town of 39,999 Electors, returning 3 Members, so that 10,000 votes will suffice to return a Member; let there be 4 ‘red’ Candidates, *A*, *B*, *C*, *D*, and one ‘blue,’ *Z*; and let there be 21,840 lists “*A B D*,” 10,160 “*A C B*,” and 7,999 “*Z*.” There can be no shadow of doubt that, as a matter of justice, *A*, *B*, *C* ought to be returned, since there are more than two full quotas who put ‘*A B*’ first, and, over and above these, more than one quota who put ‘*A C*’ first. Let us see what, under the Society’s present rules, would be the most probable result.

The 32,000 lists headed "A" are of two kinds, bearing to each other the ratios of the numbers 273, 127. Hence the certain event, if the lists are divided by rule, and the most probable event, if they are divided at random is that the 10,000 lists, used in returning A, will contain 6,825 "A B D" and 3,175 "A C B." Erasing "A" from the remaining lists, we have now in hand 15,015 "B D," 6,985 "C B," and 7,999 "Z"; so that B is returned. Erasing "B" from the remaining lists, we now have 5,015 "D," 6,985 "C," and 7,999 "Z"; so that Z is returned with a majority of more than 1,000 over C. And the 'reds' must derive what consolation they can from the reflection that their rejected Candidate really had 2,161 more supporters than the successful 'blue'!

While fully agreeing, then, with the Proportional Representation Society as to the propriety of allowing only one vote to each Elector, I think I have sufficiently proved the fallacy of its method for disposing of surplus votes.

(2) A mechanical method of recording votes was suggested, in a letter signed "F. R. C.," in the *St. James' Gazette* for Aug. 1. Each Elector is to pass (unseen) through one of a set of turnstiles, (each Candidate having a separate turnstile), which will mechanically record his vote. The records are to be periodically examined, and the results placarded outside, in order that Electors, on seeing that a Candidate has already got votes enough to secure his return, may cease to vote for him. Several objections, each by itself fatal, may be made to this method. One is that, if the periods were short enough to prevent waste of votes, the inspection would destroy the secrecy of the ballot, as it would be known who had just voted, and the result of his voting would be at once placarded; whereas, if the periods were long enough to avoid this, time would be allowed for large waste of votes. Another is that, as the quota, necessary to return a Candidate, could not be fixed till the poll had closed, it would be impossible to know, during the Election, whether a Candidate had or had not received votes enough to secure his return. Another is that, if part of the machinery went wrong, so as (for instance) to record a total of votes greater than the number of Electors, the mistake could not (as it can with voting-papers) be rectified, but the Election would have to be held over again.

Having proved, then, that the method of arranged lists will not serve fairly to dispose of surplus votes, and yet that we cannot prevent such votes being given, we have now to find, if possible, a fair method for disposing of them. Clearly *somebody* must have authority to dispose of them: it cannot be the Elector (as we have proved); it will never do to refer it to a Committee. There remains *the Candidate himself, for whom the votes have been given*. This seems to solve the whole difficulty. The Elector must understand that, in giving his vote to A, he gives it him as his absolute property, to use for himself, or to transfer to other Candidates, or to leave unused. If he cannot trust the man, for whom he votes, so far as to believe that he will use the vote for the best, how comes it that he can trust him so far as to wish to return him as Member?

§ 4. Method for preventing the Electors in one District from being influenced by the results of Elections in other Districts.

That Electors are liable to such influences may be proved both *a priori* and *a posteriori*. On the one hand, it is a tendency of human nature, too well-known to need proving, to surrender one's own judgment in order to be on the winning side. In the words of the immortal Mr. Pickwick, "it's always best on

Quoted from *The Pickwick Papers* by Charles Dickens

these occasions to do what the mob do." "But suppose there are two mobs?" suggested Mr. Snodgrass. "Shout with the largest," replied Mr. Pickwick. On the other hand, no one, who has ever watched the progress of a General Election, can need to be reminded how obviously the local Elections of the later days have 'followed suit,' under the irresistible influence of those of the earlier days. "The secret of success," it has been well said, "is to succeed:" and there can be little doubt that the party, which fails in carrying a majority of the local Elections at first, is heavily handicapped during the rest of the contest.

Supposing it admitted that such an influence does exist in General Elections as now managed, and that it is an influence to be avoided, the remedy is not far to seek: let the local Elections be so arranged that all, or nearly all, the results may be announced at the same time.

This arrangement would no doubt be unwelcome to certain 'pluralists,' who are now able to vote in several different Districts. Possibly, in such exceptional cases, voting-papers might be allowed. But, even if no remedy could be found, the justice of allowing one Elector to vote as if he were, "like Cerberus, three gentlemen at once," seems so doubtful that the objection hardly deserves serious consideration.

Quoted from *The Rivals* by Richard Brinsley Sheridan

§ 5. Conduct of Elections.

The practical working of the principles, which have now been demonstrated, would be as follows:—When the poll is closed, let the total number of votes recorded be divided by the number of Members to be returned increased by one, and let the returning-officer announce the whole number next greater than the quotient as the quota needed to return *one* Member. Similarly, the whole number next greater than twice the quotient will be the quota needed to return *two*, and so on.

Let him further announce the number of votes given for each Candidate, and also announce as "returned" any Candidate who has received the quota needed to return *one*. If there are still Members to return, let him appoint a time and place for all the Candidates to appear before him; and any two or more Candidates may then formally signify that they wish their votes to be clubbed together, and may nominate so many of themselves as can be returned by the votes so clubbed. They must of course include in their nomination any of themselves who have been already declared to be returned. Let the returning-officer add together the votes of these Candidates, and, if the amount be not less than the necessary quota, let him declare to be duly returned the Candidates so nominated.

As an example, suppose that a District is to return 5 Members, and that there are 4 'red' Candidates, *A*, *B*, *C*, *D*, and 3 'blue,' *X*, *Y*, *Z*. Then the returning-officer might announce as follows:—

Votes given for	
<i>C</i>	15,000
<i>X</i>	9,000
<i>D</i>	8,001
<i>Z</i>	8,000
<i>B</i>	7,500
<i>A</i>	6,500
<i>Y</i>	6,000
	<hr style="width: 100%;"/> 6 60,001 10,000 and 1-6th.
Quota needed to return	
1 Member ...	10,001
2 Members ..	20,001
3 Members ..	30,001
4 Members ..	40,001
5 Members ..	50,001
I hereby declare <i>C</i> to be duly returned.	
Four vacancies remain to be filled.	
(Signed) _____	

The Candidates might then appear before the returning-officer, and *B*, *C*, *D* might formally declare that they wished to club their votes; and, as the sum total of their votes is 30,501, they would be declared to be “returned”: similarly, *X*, *Y*, *Z* might club their votes, naming *X* and *Z* as the Candidates to be returned; and, as the sum total of their votes is 23,000, *X* and *Z* would be declared to be “returned.”

Such Candidates would have to sign some such paper as the following:—

We, the undersigned, for whom the recorded votes, as stated below, amount to _____, which is not less than _____, the quota announced as needed to return ____ Candidates, hereby declare that we desire the said votes to be clubbed together. And we nominate, as Candidates whom we desire to be returned by the said votes, in addition to _____, who have been already declared to be duly returned,

	<i>Names.</i>	<i>Votes.</i>
Signed,		
	Sum total of votes	

This method would enable each of the parties in a District to return as many Members as it could muster the proper quota for, no matter how the votes were distributed. There would be no risk of a seat being left vacant through rivalry between two Candidates of the same party: an unwritten law

would soon come to be recognised—that the one with fewest votes should give way. With Candidates of two opposite parties, such a difficulty could not arise at all: one or other of them could always be returned by the surplus votes of his own party. The only exception to this would be the occurrence (a very rare one) of an exact balance of votes. This might happen, even in the case of a single-Member constituency, if each of 2 Candidates got exactly half the votes. Of course, in such a case, somebody must give a casting-vote.

Chapter IV. Final Summary.

The main points, which I claim to have made good in this little treatise, are as follows:—

- (1) That electoral Districts should be so large as to return, on an average, 3 or more Members each: and that single-Member Districts should be, as far as possible, done away with.
- (2) That Members should be assigned to the several Districts in such numbers that the quota, needed to return a Member, should be tolerably uniform throughout the Kingdom.
- (3) That each Elector should give one vote only.
- (4) That all votes given should be at the absolute disposal of the Candidate for whom they are given, whether to use for himself, or to transfer to other Candidates, or to leave unused.
- (5) That the Elections in the several Districts should terminate, as nearly as possible, at the same time.

As a practical conclusion to this treatise, I venture to suggest the following ideal Schedule of General Resolutions, such as might fairly be agreed on by all parties, and thus tend to the peaceful termination of this deplorable controversy.

[N.B. The *numbers* here suggested are merely tentative, and capable of being modified *ad libitum*.]

General Resolutions.

1. The House shall consist of 660 Members.
2. There shall be 180 electoral Districts.
3. No District shall contain less than a population of 60,000, or more than 500,000.
4. A District, whose population is between 60,000 and 105,000, shall have one Member assigned to it; between 105,000 and 150,000, two Members; and so on, in accordance with the following Table:—

Population.	Members.
60,000	1
105,000	2
150,000	3
195,000	4
240,000	5
280,000	6
320,000	7
365,000	8
410,000	9
455,000	10
500,000	

5. If the population of a District be very near to one of the above-named numbers, its boundaries shall be altered so as to increase, or diminish, the population, by not less than 10,000.

6. If it be agreed to give political weight to differences in rateable property, or to the difference between town and country voters, this shall be done by modifying the number of Members assigned by the above Table.

7. The procedure at a local Election shall be as follows:—Each Elector shall give one vote only. When the poll is closed, the number of recorded votes shall be divided by the number of Members to be returned increased by one, and the returning-officer shall announce the whole number, next greater than the quotient, as the quota needed to return one Member; the whole number, next greater than twice the quotient, as the quota needed to return two Members; and so on. He shall also announce the number of votes recorded for each Candidate, and shall declare to be duly returned any Candidate who has obtained the quota. If any vacancies remain to be filled, he shall appoint a time when the Candidates shall appear before him, and any two or more of them may then formally signify their desire to club their votes, and may nominate, as Candidates to be returned by those votes, so many of themselves as the votes suffice for: provided always that they include, in such nomination, any of themselves who have been already declared to be returned. And, if the sum total of the votes so clubbed be not less than the quota needed to return the Candidates so nominated, the returning-officer shall declare to be duly returned all of them who have not been already so declared.

8. The local Elections shall be so arranged that their results may be announced, as nearly as possible, at the same time.

Supplement

Now that the public are beginning to realise the justice of the demand for “proportional representation,” the day cannot be far off when they will understand the gross injustice (so clearly proved by Lord Salisbury in the *National Review* for October) of the “single-member” districts, and will recognise as true the main contention of the Society for Proportional Representation, that each district should return several Members, and that each elector should have *one* vote only.

May I, as one who has given much thought to this subject, point out a serious mistake which the Society is making in the details of its method, and which is in my belief greatly damaging its cause?

It is fairly obvious, and by this time pretty generally known, that, to obtain the quota of votes necessary and sufficient to return a candidate, when each elector has one vote only, we must divide the total number of votes by the number of members to be returned plus one, and that the whole number, next above the quotient, is the required quota: e. g. if the district returns 3 members, and 4000 votes are recorded, we divide by 4, and the quota is 1001.

It is also obvious that it will often happen to a candidate to poll more votes than he needs, and the question arises, how are the spare votes to be utilised? The answer of the Society is “Let the voter mark on his paper his second-best man, his third-best, and so on: and, if his first man is already returned, let his vote be used for his second, and so on.” This method is complicated and likely to puzzle voters: but such an objection might well be set aside, if only it were just.

But a second question arises. Suppose that *A* has votes to spare, and that some of the papers, headed *A*, have *B* as second-man, while others have *C*: which papers are we to transfer? To this the Society replies “The absolutely just method would be to count how many papers have *B* as second-man, and how many have *C*, and to maintain this proportion in the transferred votes: e. g. if 3-4ths of the whole set of papers, headed *A*, have *B* as second-man, then *B* ought to have 3-4ths of the transferred votes. But, if the votes are simply shuffled and drawn at random, the probability is that this proportion will be almost exactly secured: so that the above calculation may be dispensed with.”

Thus the Society is in effect making two assertions, both of which are demonstrably incorrect: one, that it is only when an elector’s first-man is already returned that his vote would be used for his second-man; the other, that the Society’s method for transferring spare votes would always secure a just result.

Let a constituency have to return 3 Members, and let 5 candidates stand, 3 Liberals, 1 Independent Liberal, and 1 Conservative.

Let 11999 voting-papers be filled up follows:—

CHAMBERLAIN	4	4	2	1	4	—
GLADSTONE	1	2	1	2	2	—
GOSCHEN	3	3	4	4	1	—
HARTINGTON	2	1	3	3	3	—
NORTHCOTE	—	—	—	—	—	1
Nos. of papers	3030	2980	2020	1100	790	2079

Here the necessary ‘quota’ is 3000, since, if 3 candidates get 3000 each, a fourth can only get 2999.

Also it is clear that, as a matter of justice, Gladstone, Hartington, and

Chamberlain ought to be returned, since there are 6010 electors who put Gladstone and Hartington as their first two favorites, and, over and above these, 3120 who put Gladstone and Chamberlain as their first two.

The First Count would give:—

Gladstone	5050
Hartington	2980
Northcote	2079
Chamberlain	1100
Goschen	790

Thus Gladstone is returned, with 2050 votes to spare, which must be divided between Hartington and Chamberlain in the proportion of 3030 to 2020, i. e. of 3 to 2; i. e. Hartington must have 1230 of them, and Chamberlain 820.

The Second Count would give:—

Gladstone	3000
Hartington	4210
Northcote	2079
Chamberlain	1920
Goschen	790

Thus Hartington is returned, with 1210 votes to spare, the whole of which must go to Goschen.

The Third Count would give:—

Gladstone	3000
Hartington	3000
Northcote	2079
Goschen	2000
Chamberlain	1920

What is to be done now? There is one seat yet to be filled, and no one has the necessary quota. Merely counting votes as they now stand would bring in Northcote, which we know would be unfair. The method of the Society in such a case would be (they tell me) to transfer to Goschen so many of Chamberlain's votes as would give him the necessary quota. But this also would bring in the wrong man.

Thus the Society's method not only excludes Chamberlain, who most undoubtedly ought to be returned; but it actually uses, for the purpose of returning Goschen, the votes of 1000 electors who prefer Chamberlain!

May I, in conclusion, point out that the method advocated in my pamphlet (where each elector names one candidate only, and the candidates themselves can, after the numbers are announced, club their votes, so as to bring in others besides those already announced as returned) would be at once perfectly simple and perfectly equitable in its result?

In the above instance, the returning-officer would announce as follows:—

“Gladstone ..	5050
Hartington .	2980
Northcote ..	2079
Chamberlain	1100
Goschen	790
4	11999
	2999 and 3-4ths ¹ .

Quota needed to return 1 Member is 3000.

26000.

39000.

I hereby declare Mr. Gladstone to be duly returned.

Two seats remain to be filled.”

Gladstone, Hartington, and Chamberlain would then club their votes, making 9130 votes, which would suffice to return all three.

*C. L. Dodgson.
Ch. Ch., Oxford,
Feb. 1885.*

Postscript to Supplement

Objection has been taken to my statement on page 941 (“it is clear that, as a matter of justice, Gladstone, Hartington, and Chamberlain ought to be returned”) on the ground that, of the 9920 Liberal electors, there are 6800 who prefer Goschen to Chamberlain, while there are only 3120 who prefer Chamberlain to Goschen. And it has been pressed upon me that, after all, Goschen is the right man to return, so that the Society’s method does *not* break down in this instance.

Now, first, we might almost on *a priori* considerations reject such a test as manifestly unfair. For does it not involve the using an elector’s voting-power *more than once*? We first let an elector exhaust his full voting-power in helping to return (say) Gladstone; and, after that, we allow his opinion to have weight in deciding between two other candidates. Is not this to abandon the principle, adopted by the Society, that each elector shall have *one* vote only?

But, secondly, this test may be easily proved to be valueless, by a simple *reductio ad absurdum*.

Let the 11999 voting-papers be filled up as follows:—

CHAMBERLAIN	4	4	2	1	4	—
GLADSTONE	1	2	1	2	2	—
GOSCHEN	3	3	4	4	1	—
HARTINGTON	2	1	3	3	3	—
NORTHCOTE	—	—	—	—	—	1
Nos. of papers	1826	1712	1826	1712	1910	3013

The First Count would give:—

Gladstone	3652
Northcote	3013
Goschen	1910
Chamberlain	1712
Hartington	1712

¹Corrected from “1-4th” according to Erratum

Thus Gladstone and Northcote are returned, and Gladstone's 652 spare votes must be equally divided between Chamberlain and Hartington.

The Second Count would give:—

Northcote	3013
Gladstone	3000
Chamberlain	2038
Hartington	2038
Goschen	1910

What is to be done now? There is one seat yet to be filled, and no one has the necessary quota.

Let us try the new test. And first, of course, we apply it to Chamberlain and Hartington. We find that

5448 prefer Chamberlain to Hartington;

3538 prefer Hartington to Chamberlain;

so that Chamberlain is clearly the victor.

Let us next apply it to Chamberlain and Goschen. We find that

3538 prefer Chamberlain to Goschen;

5448 prefer Goschen to Chamberlain;

so that Goschen is clearly the victor, and we might perhaps rest satisfied that he is the right man to be returned.

Let us, however, in order to make assurance doubly sure, apply the test to Goschen and Hartington. We find that

1910 prefer Goschen to Hartington;

7076 prefer Hartington to Goschen!

This lands us in a hopeless circle: and the logical conclusion I believe to be that the proposed test is absolutely valueless.

The statement, thus objected to, may be more fully expressed as follows:—

The 6010 electors, who put Gladstone and Hartington as their first two favorites, have a clear *moral* right to return these two, as they muster more than two full quotas, and it is a mere accident (which they would have avoided had they known how the voting was going on) that they did not divide themselves so as to *secure* this result.

Now suppose them to have exercised this right, and that Gladstone and Hartington are returned. Then the 3120, who put Gladstone and Chamberlain as their first two favorites, would undoubtedly (Gladstone being now safe) all vote for Chamberlain. *He* therefore has also a *moral* right to be returned.

5.10 Election Gains and Losses

Source: The St. James's Gazette, December 4, 1885

To the EDITOR of the ST. JAMES'S GAZETTE

SIR,—Will you allow me to present, to such of your readers as may be suffering from the present epidemic of *febris electoralis*, a simple formula for calculating the relative gains and losses of the several contending parties—a formula which will take account of a rather perplexing item in the *data*, viz. the change in the number of seats assigned to a constituency.

This change will not affect the *relative* gains and losses in any constituency where the seats are shared in the same relative proportions as before: *e. g.* If a town, which returned 4 Liberals and 2 Conservatives to the last Parliament, now returns 2 Liberals and 1 Conservative, there are no relative gains or losses. But if a town, which formerly returned 5 Liberals, 2 Conservatives, and 1 Independent, has lost 2 of its 8 seats, and now returns 4 Liberals, 1 Conservative, and 1 Independent, it might puzzle some of your readers to estimate the relative gains and losses. They might have a vague consciousness that the Independents, who did hold 1 seat in 8, and now hold 1 in 6, are rather better off, but *how much* they might be unable to say.

The formula is this. Let S_1 be the number of seats formerly assigned to the town, and S_2 the new number. Similarly let L_1 be the number of seats formerly held by Liberals, and so on. Then the Liberal gain is $(L_2S_1 - L_1S_2)$ divided by S_1 . If this comes out *negative*, it is really a *loss*.

Thus, in the above example, the old set of numbers, S_1, L_1, C_1, I_1 are 8, 5, 2, 1, and the new set are 6, 4, 1, 1. Hence the Liberal “gain” is $(4 \times 8 - 5 \times 6)$ divided by 8, *i. e.* one-fourth; the Conservative “gain” is $(1 \times 8 - 2 \times 6)$ divided by 8, *i. e.* minus one-half; and the Independent “gain” is $(1 \times 8 - 1 \times 6)$ divided by 8, *i. e.* one-fourth.

Thus the Conservatives have lost half a seat, which has been shared equally between the Liberals and the Independents.—I am, Sir, your obedient servant,

Lewis Carroll.

Part 6

Logical Texts

6.1 First Paper on Logic

Source: printed 1886

I. State each of the following in 3 equivalent forms:—

- (1) There are no perfect men.
- (2) Some apples are unripe.
- (3) No pigs can fly.

II. Taking $x =$ 'good riddles,' and $y =$ 'hard,' interpret:—

- (1)

	0
--	---

. (2)

1	0
---	---

.
- (3)

1	1
---	---

. (4)

0	0
---	---

.

III.

Break up each of the following into its 2 component propositions:—

- (1) All judges are just.
- (2) All good children are happy.
- (3) All old and sickly men are fretful and troublesome.

IV.

Taking $x =$ 'cakes,' and $y =$ 'wholesome,' represent, with diagrams like those in Qu. II, the following propositions:—

- (1) Some cakes are unwholesome.
- (2) There are no wholesome cakes.
- (3) There are no cakes in existence.
- (4) All cakes are wholesome.

V.

Taking x = 'diligent students,' and y = 'successful,' represent in like manner:—

- (1) No diligent students are unsuccessful.
- (2) All diligent students are successful.
- (3) There are some diligent students.
- (4) There are some diligent, but unsuccessful, students.

6.2 Fourth Paper on Logic

Source: printed 1886

Examples. Pairs of Premises

1. No exciting books suit feverish patients;
Unexciting books make one drowsy.
2. Some, who deserve the fair, get their deserts;
None but the brave deserve the fair.
3. No children are patient;
No impatient person can sit still.
4. All pigs are fat;
No skeletons are fat.
5. No monkeys are soldiers;
All monkeys are mischievous.
6. None of my cousins are just;
No judges are unjust.
7. Some days are rainy;
Rainy days are tiresome.
8. All medicine is nasty;
Senna is a medicine.
9. Some Jews are rich;
All Kamschatgans are Gentiles.
10. All teetotalers like sugar;
No nightingale drinks wine.
11. No muffins are wholesome;
All buns are unwholesome.
12. No fat creatures run well;
Some greyhounds run well.
13. All soldiers march;
Some youths are not soldiers.
14. Sugar is sweet;
Salt is not sweet.
15. Some eggs are hard-boiled;
No eggs are uncrackable.
16. There are no Jews in the house;
There are no Gentiles in the garden.
17. All battles are noisy;
What makes no noise may escape notice.
18. No Jews are mad;
All Rabbis are Jews.
19. There are no fish that cannot swim;

Other version:
→ 6.3, p. 975

- Some skates are fish.
20. All passionate people are unreasonable;
Some orators are passionate.
21. Pain is wearisome;
No pain is eagerly wished for.
22. No bald person needs a hair-brush;
No lizards have hair.
23. All thoughtless people do mischief;
No thoughtful person forgets a promise.
24. I do not like John;
Some of my friends like John.
25. No potatoes are pine-apples;
All pine-apples are nice.
26. No pins are ambitious;
No needles are pins.
27. All my friends have colds;
No one can sing who has a cold.
28. All these dishes are well-cooked;
Some dishes are unwholesome if not well-cooked.
29. No medicine is nice;
Senna is a medicine.
30. Some oysters are silent;
No silent creatures are amusing.
31. All wise men walk on their feet;
All unwise men walk on their hands.
32. "Mind your own business;
This quarrel is no business of yours."
33. No bridges are made of sugar;
Some bridges are picturesque.
34. No riddles interest me that can be solved;
All these riddles are insoluble.
35. John is industrious;
All industrious people are happy.
36. No frogs write books;
Some people use ink in writing books.
37. No poker are soft;
All pillows are soft.
38. No antelope is ungraceful;
Graceful animals delight the eye.
39. Some uncles are ungenerous;
All merchants are generous.
40. No unhappy people chuckle;
No happy people groan.

Other version:
→ 6.3, p. 990

41. Audible music causes vibration in the air;
Inaudible music is not worth paying for.
42. He gave me five pounds;
I was delighted.
43. No old Jews are fat millers;
All my friends are old millers.
44. Flour is good for food;
Oatmeal is a kind of flour.
45. Some dreams are terrible;
No lambs are terrible.
46. No rich man begs in the street;
All who are not rich should keep accounts.
47. No thieves are honest;
Some dishonest people are found out
48. All wasps are unfriendly;
All puppies are friendly.
49. All improbable stories are doubted;
None of these stories are probable.
50. "He told me you had gone away."
"He never says one word of truth."

6.3 The Game of Logic

Source: The Game of Logic (edition from 1886 with minor differences as noted)

Colours for Counters.

See, the Sun is overhead,
Shining on us, FULL and
RED!

Now the Sun is gone away,
And the EMPTY sky is
GREY!

Chapter I. New Lamps for Old.

“Light come, light go.”

Quoted from proverb

§ 1. Propositions.

“Some new Cakes are nice.”

“No new Cakes are nice.”
⌊“All new cakes are nice.”¹

There are three ‘*Propositions*’ for you—the only three kinds we are going to use in this Game: and the first thing to be done is to learn how to express them on the Board.

Let us begin with

“Some new Cakes are nice.”

But, before doing so, a remark has to be made—one that is rather important, and by no means easy to understand all in a moment: so please to read this *very* carefully.

The world contains many *Things* (such as “Buns”, “Babies”, “Beetles”, “Battledores”, &c.); and these Things possess many *Attributes* (such as “baked”, “beautiful”, “black”, “broken”, &c.: in fact, whatever can be “attributed to”, that is “said to belong to”, any Thing, is an Attribute). Whenever we wish to mention a Thing, we use a *Substantive*: when we wish to mention an Attribute, we use an *Adjective*. People have asked the question “Can a Thing exist without any Attributes belonging to it?” It is a very puzzling question, and I’m not going to try to answer it: let us turn up our noses, and treat it with contemptuous silence, as if it really wasn’t worth noticing. But, if they put it the other way, and ask “Can an Attribute exist without any Thing for it to belong to?”, we may say at once “No: no more than a Baby could go a railway-journey with no one to take care of it!” You never saw “beautiful” floating about in the air, or littered about on the floor, without any Thing to *be* beautiful, now did you?

And now what am I driving at, in all this long rigmarole? It is this. You may put “is” or “are” between the names of two *Things* (for example, “some Pigs are fat Animals”), or between the names of two *Attributes* (for example, “pink is light-red”), and in each case it will make good sense. But, if you put “is” or “are” between the name of a *Thing* and the name of an *Attribute* (for example, “some Pigs are pink”), you do *not* make good sense (for how can a Thing *be* an Attribute?) unless you have an understanding with the person to whom you are speaking. And the simplest understanding would, I think, be this—that the Substantive shall be supposed to be repeated at the end of the sentence, so that the sentence, if written out in full, would be “some Pigs are pink (Pigs)”. And now the word “are” makes quite good sense.

Thus, in order to make good sense of the Proposition “some new Cakes are nice”, we must suppose it to be written out in full, in the form “some new Cakes are nice (Cakes)”. Now this contains two ‘*Terms*’—“new Cakes” being one of them, and “nice (Cakes)” the other. “New Cakes,” being the one we are talking about, is called the ‘*Subject*’ of the Proposition, and “nice (Cakes)” the ‘*Predicate*’. Also this Proposition is said to be a ‘*Particular*’ one, since it does not speak of the *whole* of its Subject, but only of a *part* of it. The other

¹In the 1886 edition:

“Some red Apples are ripe.”
“No red Apples are ripe.”
“All red Apples are ripe.”

The same changes apply to the whole chapter, i. e. every “new” was “red” (including “redness” for “newness”), every “Cake” was “Apple” and every “nice” was “ripe” (including “ripeness” for “niceness”, and “unripe” for “not-nice”). Only other changes are noted explicitly.

two kinds are said to be ‘*Universal*’, because they speak of the *whole* of their Subjects—the one denying niceness, and the other asserting it, of the *whole* class of “new Cakes”. Lastly, if you would like to have a definition of the word ‘*Proposition*’ itself, you may take this:—“a sentence stating that some, or none, or all, of the Things belonging to a certain class, called its ‘Subject’, are also Things belonging to a certain other class, called its ‘Predicate’.”

You will find these seven words—*Proposition, Attribute, Term, Subject, Predicate, Particular, Universal*—charmingly useful, if any friend should happen to ask if you have ever studied Logic. Mind you bring all seven words into your answer, and your friend will go away deeply impressed—‘a sadder and a wiser man’.

Quoted from *The Rime of the Ancient Mariner* by Samuel Taylor Coleridge

Now please to look at the smaller Diagram on the Board, and suppose it to be a cupboard, intended for all the Cakes in the world (it would have to be a good large one, of course). And let us suppose all the new ones to be put into the upper half (marked ‘*x*’), and all the rest (that is, the *not-new* ones) into the lower half (marked ‘*x'*’). Thus the lower half would contain *elderly Cakes, aged Cakes, ante-diluvian Cakes*²—if there are any: I haven’t seen many, myself—and so on. Let us also suppose all the nice Cakes to be put into the left-hand half (marked ‘*y*’), and all the rest (that is, the *not-nice* ones) into the right-hand half (marked ‘*y'*’). At present, then, we must understand *x* to mean “new”, *x'* “not-new”, *y* “nice”, and *y'* “not-nice”.

And now what kind of Cakes would you expect to find in compartment No. 5?

It is part of the upper half, you see; so that, if it has any Cakes in it, they must be *new*: and it is part of the left-hand half; so that they must be *nice*. Hence, if there are any Cakes in this compartment, they must have the double ‘*Attribute*’ “new and nice”: or, if we use letters, they must be “*x y*”.

Observe that the letters *x, y* are written on two of the edges of this compartment. This you will find a very convenient rule for knowing what Attributes belong to the Things in any compartment. Take No. 7, for instance. If there are any Cakes there, they must be “*x' y*”, that is, they must be “not-new and nice”.

Now let us make another agreement—that a red counter in a compartment shall mean that it is ‘*occupied*’, that is, that there are *some* Cakes in it. (The word ‘some,’ in Logic, means ‘one or more’: so that a single Cake in a compartment would be quite enough reason for saying “there are *some* Cakes here”). Also let us agree that a grey counter in a compartment shall mean that it is ‘*empty*’, that is, that there are *no* Cakes in it. In the following Diagrams, I shall put ‘1’ (meaning ‘one or more’) where you are to put a *red* counter, and ‘0’ (meaning ‘none’) where you are to put a *grey* one.

As the Subject of our Proposition is to be “new Cakes”, we are only concerned, at present, with the *upper* half of the cupboard, where all the Cakes have the attribute *x*, that is, “new.”

Now, fixing our attention on this upper half, suppose we found it marked like this,

that is, with a red counter in No. 5. What would this tell us, with regard to the

²yellow Apples, blue Apples, mauve-coloured Apples

class of “new Cakes”?

Would it not tell us that there are *some* of them in the *xy*-compartment? That is, that some of them (besides having the Attribute *x*, which belongs to both compartments) have the Attribute *y* (that is, “nice”). This we might express by saying “some *x*-Cakes are *y*-(Cakes)”, or, putting words instead of letters,

“Some new Cakes are nice (Cakes)”,

or, in a shorter form,

“Some new Cakes are nice”.

At last we have found out how to represent the first Proposition of this Section. If you have not *clearly* understood all I have said, go no further, but read it over and over again, till you *do* understand it. After that is once mastered, you will find all the rest quite easy.

It will save a little trouble, in doing the other Propositions, if we agree to leave out the word “Cakes” altogether. I find it convenient to call the whole class of Things, for which the cupboard is intended, the ‘*Universe*.’ Thus we might have begun this business by saying “Let us take a Universe of Cakes.” (Sounds nice, doesn’t it?)

Of course any other Things would have done just as well as Cakes. We might make Propositions about “a Universe of Lizards”, or even “a Universe of Hornets”. (Wouldn’t *that* be a charming Universe to live in?)

So far, then, we have learned that

1	
---	--

means “some *x* are *y*,” i. e. “some new are nice.”

I think you will see, without further explanation, that

	1
--	---

means “some *x* are *y*’,” i. e. “some new are not-nice.”

Now let us put a *grey* counter into No. 5, and ask ourselves the meaning of

0	
---	--

This tells us that the *xy*-compartment is *empty*, which we may express by “no *x* are *y*”, or, “no new Cakes are nice”.³ This is the second of the three Propositions at the head of this Section.

In the same way,

	0
--	---

would mean “no *x* are *y*’,” or, “no new Cakes are not-nice.”⁴

What would you make of this, I wonder?

1	1
---	---

³no red are ripe

⁴no red are unripe

I hope you will not have much trouble in making out that this represents a *double* Proposition: namely, “some x are y , and some are y' ,” i. e. “some new are nice, and some are not-nice.”

The following is a little harder, perhaps:—

This means “no x are y , and none are y' ,” i. e. “no new are nice, and none are not-nice”: which leads to the rather curious result that “no new \lrcorner exist,” i. e. “no Cakes are new.”⁵ This is because⁶ “nice” and “not-nice”⁷ make what we call an ‘*exhaustive*’ division of the class “new Cakes”: i. e., between them, they *exhaust* the whole class, so that all the new Cakes, that exist, must be found in one or the other of them.

And now suppose you had⁸ to represent, with counters, the contradictory to “no Cakes are new”, which would be “some Cakes are new”,⁹ or, putting letters for words, “some Cakes are x ”,¹⁰ how would you do it?

This will puzzle you a little, I expect. Evidently you must put a red counter *somewhere* in the x -half of the cupboard, since you know there are *some* new Cakes. But you must not put it into the *left-hand* compartment, since you do not know them to be *nice*: nor may you put into the *right-hand* one, since you do not know them to be *not-nice*.

What, then, are you to do? I think the best way out of the difficulty is to place the red counter *on the division-line* between the xy -compartment and the xy' -compartment. This I shall represent (as I always put ‘1’ where *you* are to put a red counter) by the diagram

Our ingenious American cousins have invented a phrase to express the position of a man who wants to join one or other of two parties——such as their two parties ‘Democrats’ and ‘Republicans’——but ca’n’t make up his mind *which*. Such a man is said to be “sitting on the fence.” Now that is exactly the position of the red counter you have just placed on the division-line. He likes the look of No. 5, and he likes the look of No. 6, and he doesn’t know *which* to jump down into. So there he sits astride, silly fellow, dangling his legs, one on each side of the fence!

Now I am going to give you a much harder one to make out. What does this mean?

This is clearly a *double* Proposition. It tells us, not only that “some x are y ,” but also that “no x are *not* y .” Hence the result is “*all* x are y ,” i. e. “all new Cakes are nice”,¹¹ which is the last of the three Propositions at the head of this Section.

We see, then, that the Universal Proposition

⁵exist *at all*”.

⁶follows from the fact that

⁷not ripe

⁸I were to ask you

⁹“no red exist at all”, that is, “some red exist”

¹⁰some x exist

¹¹all red are ripe

“All new Cakes are nice”

consists of *two* Propositions taken together, namely,

“Some new Cakes are nice,”
and “No new Cakes are not-nice.”

In the same way

0	1
---	---

would mean “all x are y ”, that is,

“All new Cakes are not-nice.”

Now what would you make of such a Proposition as “The Cake you have given me is nice”? Is it Particular, or Universal?

“Particular, of course,” you readily reply. “One single Cake is hardly worth calling ‘some,’ even.”

No, my dear impulsive Reader, it is ‘Universal’. Remember that, few as they are (and I grant you they couldn’t well be fewer), they are (or rather ‘it is’) *all* that you have given me! Thus, if (leaving ‘red’ out of the question) I divide my Universe of Cakes into two classes—the Cakes you have given me (to which I assign the upper half of the cupboard), and those you *haven’t* given me (which are to go below)—I find the lower half fairly full, and the upper one as nearly as possible empty. And then, when I am told to put an upright division into each half, keeping the *nice* Cakes to the left, and the *not-nice* ones to the right, I begin by carefully collecting *all* the Cakes you have given me (saying to myself, from time to time, “Generous creature! How shall I ever repay such kindness?”), and piling them up in the left-hand compartment. *And it doesn’t take long to do it!*

Here is another Universal Proposition for you. “Barzillai Beckalegg is an honest man.” That means “*All* the Barzillai Beckaleggs, that I am now considering, are honest men.” (You think I invented that name, now don’t you? But I didn’t. It’s on a carrier’s cart, somewhere down in Cornwall.)

This kind of Universal Proposition (where the Subject is \lrcorner a single Thing¹²) \lrcorner is¹³ called an “*Individual*” Proposition.

Now let us take “*nice* Cakes” as the Subject of our Proposition: that is, let us fix our thoughts on the *left-hand* half of the cupboard, where all the Cakes have the attribute y , that is, “*nice*”.

Suppose we find it marked like this:—

1

What would that tell us?

I hope that it is not necessary, after explaining the *horizontal* oblong so fully, to spend much time over the *upright* one. I hope you will see, for yourself, that this means “some y are x ”, that is,

“Some nice Cakes are new.”

¹²one single thing

¹³is sometimes

“But,” you will say, “we have had this case before. You put a red counter into No. 5, and you told us it meant ‘some new Cakes are nice’; and *now* you tell us that it means ‘some *nice* Cakes are *new*’! Can it mean *both*?”

The question is a very thoughtful one, and does you *great* credit, dear Reader! It *does* mean both. If you choose to take x (that is, “new Cakes”) as your Subject, and to regard No. 5 as part of a *horizontal* oblong, you may read it “some x are y ”, that is, “some new Cakes are nice”: but, if you choose to take y (that is, “nice Cakes”) as your Subject, and to regard No. 5 as part of an *upright* oblong, *then* you may read it “some y are x ”, that is, “some nice Cakes are new”. They are merely two different ways of expressing the very same truth.

Without more words, I will simply set down the other ways in which this upright oblong might be marked, adding the meaning in each case. By comparing them with the various cases of the horizontal oblong, you will, I hope, be able to understand them clearly.

Symbols.	Meanings.
<div style="border: 1px solid black; width: 20px; height: 20px; margin: 0 auto; display: flex; align-items: center; justify-content: center;"> <div style="border: 1px solid black; width: 10px; height: 10px; margin: 0 auto; display: flex; align-items: center; justify-content: center;">1</div> </div>	Some y are x' ; i. e. <div style="border: 1px solid black; width: 20px; height: 20px; margin: 0 auto; display: flex; align-items: center; justify-content: center;"> <div style="border: 1px solid black; width: 10px; height: 10px; margin: 0 auto; display: flex; align-items: center; justify-content: center;">0</div> </div>	All y are x' ; i. e. All nice are not-new.
<div style="border: 1px solid black; width: 20px; height: 20px; margin: 0 auto; display: flex; align-items: center; justify-content: center;"> <div style="border: 1px solid black; width: 10px; height: 10px; margin: 0 auto; display: flex; align-items: center; justify-content: center;">1</div> </div>	

You will find it a good plan to examine yourself on this table, by covering up first one column and then the other, and ‘dodging about’, as the children say.

Also you will do well to write out for yourself two other tables—one for the *lower* half of the cupboard, and the other for its *right-hand* half.

And now I think we have said all we need to say about the smaller Diagram, and may go on to the larger one.

This may be taken to be a cupboard divided in the same way as the last, but *also* divided into two portions, for the Attribute m . Let us give to m the meaning “wholesome”: and let us suppose that all *wholesome* Cakes are placed *inside* the central Square, and all the *unwholesome* ones *outside* it, that is, in one or other of the four queer-shaped *outer* compartments.

We see that, just as, in the smaller Diagram, the Cakes in each compartment had *two* Attributes, so, here, the Cakes in each compartment have *three* Attributes: and, just as the letters, representing the *two* Attributes, were written on the *edges* of the compartment, so, here, they are written at the *corners*. (Observe that m' is supposed to be written at each of the four outer corners.) So that we can tell in a moment, by looking at a compartment, what three Attributes belong to the Things in it. For instance, take No. 12. Here we find x, y', m , at the corners: so we know that the Cakes in it, if there are any, have the triple Attribute ‘ $xy'm$ ’, that is, “new, not-nice, and wholesome.” Again, take No. 16. Here we find, at the corners, x', y', m' : so the Cakes in it are “not-new, not-nice, and unwholesome.” (Remarkably untempting Cakes!)

It would take far too long to go through all the Propositions, containing x and y, x and m , and y and m , which can be represented on this diagram (there are ninety-six altogether, so I am sure you will excuse me!), and I must content myself with doing two or three, as specimens. You will do well to work out a lot more for yourself.

Taking the upper half by itself, so that our Subject is “new Cakes”, how are we to represent “no new Cakes are wholesome”?

This is, writing letters for words, “no x are m .” Now this tells us that none of the Cakes, belonging to the upper half of the cupboard, are to be found *inside* the central Square: that is, the two compartments, No. 11 and No. 12, are *empty*. And this, of course, is represented by

And now how are we to represent the contradictory Proposition “*some* x are m ”? This is a difficulty I have already considered. I think the best way is to place a red counter *on the division-line* between No. 11 and No. 12, and to understand this to mean that *one* of the two compartments is ‘occupied,’ but that we do not at present know *which*. This I shall represent thus:—

Now let us express “all x are m .”

This consists, we know, of *two* Propositions,

“Some x are m ,”
and “No x are m' .”

Let us express the negative part first. This tells us that none of the Cakes, belonging to the upper half of the cupboard, are to be found *outside* the central

Square: that is, the two compartments, No. 9 and No. 10, are *empty*. This, of course, is represented by

But we have yet to represent “Some x are m .” This tells us that there are *some* Cakes in the oblong consisting of No. 11 and No. 12: so we place our red counter, as in the previous example, on the division-line between No. 11 and No. 12, and the result is

Now let us try one or two interpretations.

What are we to make of this, with regard to x and y ?

This tells us, with regard to the xy' -Square, that it is wholly ‘empty’, since *both* compartments are so marked. With regard to the xy -Square, it tells us that it is ‘occupied’. True, it is only *one* compartment of it that is so marked; but that is quite enough, whether the *other*¹⁵ be ‘occupied’ or ‘empty’, to settle the fact that there is *something* in the Square.

If, then, we transfer our marks to the smaller Diagram, so as to get rid of the m -subdivisions, we have a right to mark it

which means, you know, “all x are y .”

The result would have been exactly the same, if the given oblong had been marked thus:—

Once more: how shall we interpret this, with regard to x and y ?

This tells us, as to the xy -Square, that *one* of its compartments is ‘empty’. But this information is quite useless, as there is no mark in the *other* compartment. If the other compartment happened to be ‘empty’ too, the Square would be ‘empty’: and, if it happened to be ‘occupied’, the Square would be ‘occupied’. So, as we do not know *which* is the case, we can say nothing about *this* Square.

The other Square, the xy' -Square, we know (as in the previous example) to be ‘occupied’.

¹⁵other compartment

If, then, we transfer our marks to the smaller Diagram, we get merely this:—

which means, you know, “some x are y ’.”

These principles may be applied to all the other oblongs. For instance, to represent “all y are m ” we should mark the *right-hand upright oblong* (the one that has the attribute y) thus:—

and, if we were told to interpret the lower half of the cupboard, marked as follows, with regard to x and y ,

we should transfer it to the smaller Diagram thus,

and read it “all x are y ”.

Two more remarks about Propositions need to be made.¹⁶

One is that, in every Proposition beginning with “some” or “all”, the *actual existence* of the ‘Subject’ is asserted. If, for instance, I say “all misers are selfish,” I mean that misers *actually exist*. If I wished to avoid making this assertion, and merely to state the *law* that miserliness necessarily involves selfishness, I should say “no misers are unselfish” which does not assert that any misers exist at all, but merely that, if any *did* exist, they *would* be selfish.¹⁷

The other is that, when a Proposition begins¹⁸ with “some” or “no”, and contains¹⁹ more than two Attributes, these Attributes may be re-arranged, and shifted from one Term to the other, *ad libitum*. For example, “some abc are def ” may be re-arranged as “some bf are $acde$ ” each being equivalent to “some Things are $abcdef$ ”.²⁰ Again, “No wise old men are rash and reckless gamblers” may be re-arranged as “No rash old gamblers are wise and reckless,” each being equivalent to “No men are wise old rash reckless gamblers.”²¹

§ 2. Syllogisms.

Now suppose we divide our Universe of Things in three ways, with regard to three different Attributes. Out of these three Attributes, we may make up three

¹⁶missing in 1886 edition

¹⁷paragraph missing in 1886 edition

¹⁸One more remark about Propositions should be made. When they begin

¹⁹contain

²⁰some $abcdef$ exist

²¹missing in 1886 edition

different couples (for instance, if they were a, b, c , we might make up the three couples ab, ac, bc). Also suppose we have two Propositions given us, containing two of these three couples, and that from them we can prove a third Proposition containing the third couple. (For example, if we divide our Universe for m, x , and y ; and if we have the two Propositions given us, “no m are x ” and “all m' are y ”, containing the two couples mx and my , it might be possible to prove from them a third Proposition, containing x and y .)

In such a case we call the given Propositions ‘*the Premisses*’, the third one ‘*the Conclusion*’, and the whole set ‘*a Syllogism*’.

Evidently, one of the Attributes must occur in both Premisses; or else one must occur in *one* Premiss, and its *contradictory* in the other.

In the first case (when, for example, the Premisses are “some m are x ” and “no m are y ”) the Term, which occurs twice, is called “*the Middle Term*”, because it serves as a sort of link between the other two Terms.

In the second case (when, for example, the Premisses are “no m are x ” and “all m' are y ”) the two Terms, which contain these contradictory Attributes, may be called “*the Middle Terms*”.

Thus, in the first case, the class of “ m -Things” is the Middle Term; and, in the second case, the two classes of “ m -Things” and “ m' -Things” are the Middle Terms.

The Attribute, which occurs in the Middle Term or Terms, disappears in the Conclusion, and is said to be “eliminated”, which literally means “turned out of doors”.

Now let us try to draw a Conclusion from the two Premisses—

“Some new Cakes are unwholesome; }
 No nice Cakes are unwholesome.” }

In order to express them with counters, we need to divide Cakes in *three* different ways, with regard to newness, to niceness, and to wholesomeness. For this we must use the larger Diagram, making x mean “new”, y “nice”, and m “wholesome”. (Everything *inside* the central Square is supposed to have the attribute m , and everything *outside* it the attribute m' , i. e. “*not-m*”.)

You had better adopt the rule \perp to make²² m mean the Attribute which occurs in the *Middle* Term or Terms. (I have chosen m as the symbol, because ‘middle’ begins with ‘m’.)

Now, in representing the two Premisses, I prefer to begin with the *negative* one (the one beginning with “no”), because *grey* counters can always be placed with *certainty*, and will then help to fix the position of the red counters, which are sometimes a little uncertain where they will be most welcome.

Let us express, then, “no nice Cakes are unwholesome (Cakes)”, i. e. “no y -Cakes are m' -(Cakes)”. This tells us that none of the Cakes belonging to the y -half of the cupboard are in its m' -compartments (i. e. the ones *outside* the central Square). Hence the two compartments, No. 9 and No. 15, are both

²²of making

‘empty’; and we must place a grey counter in *each* of them, thus:—

We have now to express the other Premiss, namely, “some new Cakes are unwholesome (Cakes)”, i. e. “some x -Cakes are m' -(Cakes)”. This tells us that some of the Cakes in the x -half of the cupboard are in its m' -compartments. Hence *one* of the two compartments, No. 9 and No. 10, is ‘occupied’: and, as we are not told in *which* of these two compartments to place the red counter, the usual rule would be to lay it on the division-line between them: but, in this case, the other Premiss has settled the matter for us, by declaring No. 9 to be *empty*. Hence the red counter has no choice, and *must* go into No. 10, thus:—

And now what counters will²³ this information enable us to place in the *smaller* Diagram, so as to get some Proposition involving x and y only, leaving out m ? Let us take its four compartments, one by one.

First, No. 5. All we know about *this* is that its *outer* portion is empty: but we know nothing about its *inner* portion. Thus the Square *may* be empty, or it *may* have something in it. Who can tell? So we dare not place *any* counter in this Square.

Secondly, what of No. 6? Here we are a little better off. We know that there is *something* in it, for there is a red counter in its outer portion. It is true we do not know whether its inner portion is empty or occupied: but what does *that* matter? One solitary Cake, in one corner of the Square, is quite sufficient excuse for saying “*this Square is occupied*”, and for marking it with a red counter.

As to No. 7, we are in the same condition as with No. 5—we find it *partly* ‘empty’, but we do not know whether the other part is empty or occupied: so we dare not mark this Square.

And as to No. 8, we have simply no information *at all*.

The result is

Our ‘Conclusion’, then, must be got out of the rather meagre piece of information that there is a red counter in the xy' -Square. Hence our Conclusion is “some x are y' ”, i. e. “some new Cakes are not-nice (Cakes)”: or, if you prefer to take y' as your Subject, “some not-nice Cakes are new (Cakes)”; but the other looks neatest.²⁴

²³will all

²⁴is neatest, I think

We will now write out the whole Syllogism, putting the symbol \therefore for “therefore”, and omitting “Cakes”, for the sake of brevity, at the end of each Proposition.

“Some new Cakes are unwholesome; }
 No nice Cakes are unwholesome, }
 \therefore Some new Cakes are not-nice.”

And you have now worked out, successfully, your first ‘*Syllogism*’. Permit me to congratulate you, and to express the hope that it is but the beginning of a long and glorious series of similar victories!

We will work out one other Syllogism—a rather harder one than the last—and then, I think, you may be safely left to play the Game by yourself, or (better) with any friend whom you can find, that is able and willing to take a share in the sport.

Let us see what we can make of the two Premises—

“All Dragons are uncanny; }
 All Scotchmen are canny.” }

Remember, I don’t guarantee the Premises to be *facts*. In the first place, I never even saw a Dragon: and, in the second place, it isn’t of the slightest consequence to us, as *Logicians*, whether our Premises are true or false: all *we* have to do is to make out whether they *lead logically to the Conclusion*, so that, if *they* were true, *it* would be true also.

You see, we must give up the “Cakes” now, or our cupboards will be of no use to us. We must take, as our ‘Universe’, some class of things which will include Dragons and Scotchmen: shall we say ‘Animals’? And, as “canny” is evidently the Attribute belonging to the ‘Middle’ Terms, we will let *m* stand for “canny”, *x* for “Dragons”, and *y* for “Scotchmen”. So that our two Premises are, in full,

“All Dragon-Animals are uncanny (Animals); }
 All Scotchman-Animals are canny (Animals).” }

And these may be expressed, using letters for words, thus:—

“All *x* are *m*’; }
 All *y* are *m*.” }

The first Premiss consists, as you already know, of two parts:—

“Some *x* are *m*’,”
 and “No *x* are *m*.”

And the second also consists of two parts:—

“Some *y* are *m*,”
 and “No *y* are *m*’.”

Let us take the negative portions first.

We have, then, to mark, on the larger Diagram, first, “no *x* are *m*”, and secondly, “no *y* are *m*’”. I think you will see, without further explanation, that

the two results, separately, are

and that these two, when combined, give us

We have now to mark the two positive portions, “some x are m ” and “some y are m ”.

The only two compartments, available for Things which are xm' are No. 9 and No. 10. Of these, No. 9 is already marked as ‘empty’; so our red counter *must* go into No. 10.

Similarly, the only two, available for ym , are No. 11 and No. 13. Of these, No. 11 is already marked as ‘empty’; so our red counter *must* go into No. 13.

The final result is

And now how much of this information can usefully be transferred to the smaller Diagram?

Let us take its four compartments, one by one.

As to No. 5? This, we see, is wholly ‘empty’. (So mark it with a grey counter.)

As to No. 6? This, we see, is ‘occupied’. (So mark it with a red counter.)

As to No. 7? Ditto, ditto.

As to No. 8? No information.

The smaller Diagram is now pretty liberally marked:—

And now what Conclusion can we read off from this? Well, it is impossible to pack such abundant information into *one* Proposition: we shall have to indulge in *two*, this time.

First, by taking x as Subject, we get “all x are y ”, that is,

“All Dragons are not-Scotchmen”:

secondly, by taking y as Subject, we get “all y are x ”, that is,

“All Scotchmen are not-Dragons”.

Let us now write out, all together, our two Premisses and our brace of Conclusions.

“All Dragons are uncanny; }
All Scotchmen are canny. }
∴ { All Dragons are not-Scotchmen;
All Scotchmen are not-Dragons.”

Let me mention, in conclusion, that you may perhaps meet with logical treatises in which it is not assumed that any Thing *exists* at all, but “some x are y ” is understood to mean “the Attributes x , y are *compatible*, so that a Thing can have both at once”, and “no x are y ” to mean “the Attributes x , y are *incompatible*, so that nothing can have both at once”.

In such treatises, Propositions have quite different meanings from what they have in our ‘Game of Logic’, and it will be well to understand exactly what the difference is.

First take “some x are y ”. Here *we* understand “are” to mean “are, as an actual *fact*”—which of course implies that some x -Things *exist*. But *they* (the writers of these other treatises) only understand “are” to mean “*can be*”, which does not at all imply that any *exist*. So they mean *less* than we do: our meaning includes theirs (for of course “some x are y ” includes “some x can be y ”), but theirs does *not* include ours. For example, “some Welsh hippopotami are heavy” would be *true*, according to these writers (since the Attributes “Welsh” and “heavy” are quite *compatible* in a hippopotamus), but it would be *false* in our Game (since there are no Welsh hippopotami to *be* heavy).

Secondly, take “no x are y ”. Here *we* only understand “are” to mean “are, as an actual *fact*”—which does not at all imply that \lrcorner no x can be y .²⁵ But *they* understand the Proposition to mean, not only that none *are* y , but that none *can possibly* be y . So they mean *more* than we do: their meaning includes ours (for of course “no x can be y ” includes “no x are y ”), but ours does *not* include theirs. For example, “no Policemen are eight feet high” would be *true* in our Game (since, as an actual fact, no such splendid specimens \lrcorner are ever²⁶ found), but it would be *false*, according to these writers (since the Attributes “belonging to the Police Force” and “eight feet high” are quite *compatible*: there is nothing to *prevent* a Policeman from growing to that height, if sufficiently rubbed with Rowland’s Macassar Oil—which is said to make *hair* grow, when rubbed on hair, and so of course will make a *Policeman* grow, when rubbed on a Policeman).

Thirdly, take “all x are y ”, which consists of the two partial Propositions “some x are y ” and “no x are y ”. Here, of course, the treatises mean *less* than we do in the *first* part, and *more* than we do in the *second*. But the two operations don’t balance each other—any more than you can console a man, for having knocked down one of his chimneys, by giving him an extra door-step.

If you meet with Syllogisms of this kind, you may work them, quite easily, by the system I have given you: you have only to make ‘are’ mean ‘are *capable of being*’, and all will go smoothly. For “some x are y ” will become “some \lrcorner x ²⁷ are

²⁵they *cannot* be y

²⁶can be

²⁷ x -Things

capable of being y^{28} , that is, “the Attributes x, y are *compatible*”. And “no x are y ” will become “no x^{29} are capable of being y^{30} ”, that is, “the Attributes x, y are *incompatible*”. And, of course, “all x are y ” will become “some x^{31} are capable of being y^{32} , and none are capable of being y^{33} ”, that is, “the Attributes x, y are *compatible*, and the Attributes³⁴ x, y' are *incompatible*.” In using the Diagrams for this system, you must understand a red counter to mean “there may *possibly* be something in this compartment,” and a grey one to mean “there cannot *possibly* be anything in this compartment.”

§ 3. Fallacies.

And so you think, do you, that the chief use of Logic, in real life, is to deduce Conclusions from workable Premisses, and to satisfy yourself that the Conclusions, deduced by other people, are correct? I only wish it were! Society would be much less liable to panics and other delusions, and *political* life, especially, would be a totally different thing, if even a majority of the arguments, that are scattered broadcast over the world, were correct! But it is all the other way, I fear. For *one* workable Pair of Premisses (I mean a Pair that lead to a logical Conclusion) that you meet with in reading your newspaper or magazine, you will probably find *five* that lead to no Conclusion at all: and, even when the Premisses *are* workable, for *one* instance, where the writer draws a correct Conclusion, there are probably *ten* where he draws an incorrect one.

In the first case, you may say “the *Premisses* are fallacious”: in the second, “the *Conclusion* is fallacious.”

The chief use you will find, in such Logical skill as this Game may teach you, will be in detecting ‘*Fallacies*’ of these two kinds.

The first kind of Fallacy——‘Fallacious Premisses’——you will detect when, after marking them on the larger Diagram, you try to transfer the marks to the smaller. You will take its four compartments, one by one, and ask, for each in turn, “What mark can I place *here*?”; and in *every* one the answer will be “No information!”, showing that there is *no Conclusion at all*. For instance,

“All soldiers are brave; }

 Some Englishmen are brave. }

 ∴ Some Englishmen are soldiers.”

looks uncommonly *like* a Syllogism, and might easily take in a less experienced Logician. But *you* are not to be caught by such a trick! You would simply set out the Premisses, and would then calmly remark “Fallacious *Premisses!*”: you wouldn’t condescend to ask what *Conclusion* the writer professed to draw——knowing that, *whatever* it is, it *must* be wrong. You would be just as safe as that wise mother was, who said “Mary, just go up to the nursery, and see what Baby’s doing, *and tell him not to do it!*”

²⁸ y -(Things)

²⁹ x -(Things)

³⁰ y -(Things)

³¹ x -(Things)

³² y -(Things)

³³ y' -(Things)

³⁴missing in the 1886 edition

The other kind of Fallacy——‘Fallacious Conclusion’ ——you will not detect till you have marked *both* Diagrams, and have read off the correct Conclusion, and have compared it with the Conclusion which the writer has drawn.

But mind, you mustn’t say “*Fallacious Conclusion*,” simply because it is not *identical* with the correct one: it may be a *part* of the correct Conclusion, and so be quite correct, *as far as it goes*. In this case you would merely remark, with a pitying smile, “*Defective Conclusion!*” Suppose, for example, you were to meet with this Syllogism:—

$$\left. \begin{array}{l} \text{“All unselfish people are generous; } \\ \text{No misers are generous.} \end{array} \right\} \\ \therefore \text{No misers are unselfish,}”$$

the Premisses of which might be thus expressed in letters:—

$$\left. \begin{array}{l} \text{“All } x' \text{ are } m; \\ \text{No } y \text{ are } m.”} \end{array} \right\}$$

Here the correct Conclusion would be “All x' are y' ” (that is, “All unselfish people are not misers”), while the Conclusion, drawn by the writer, is “No y are x' ,” (which is the same as “No x' are y ,” and so is *part* of “All x' are y' .”) Here you would simply say “*Defective Conclusion!*” The same thing would happen, if you were in a confectioner’s shop, and if a little boy were to come in, put down twopence, and march off triumphantly with a single penny-bun. You would shake your head mournfully, and would remark “*Defective Conclusion! Poor little chap!*” And perhaps you would ask the young lady behind the counter whether she would let *you* eat the bun, which the little boy had paid for and left behind him: and perhaps *she* would reply “*Sha’n’t!*”

But if, in the above example, the writer had drawn the Conclusion “All misers are selfish” (that is, “All y are x' ”), this would be going *beyond* his legitimate rights (since it would assert the *existence* of y , which is not contained in the Premisses), and you would very properly say “*Fallacious Conclusion!*”

Now, when you read other treatises on Logic, you will meet with various kinds of (so-called) ‘Fallacies’, which are by no means *always* so. For example, if you were to put before one of these Logicians the Pair of Premisses

$$\left. \begin{array}{l} \text{“No honest men cheat; } \\ \text{No dishonest men are trustworthy.”} \end{array} \right\}$$

and were to ask him what Conclusion followed, he would probably say “None at all! Your Premisses offend against *two* distinct Rules, and are as fallacious as they can well be!” Then suppose you were bold enough to say “The Conclusion is ‘No men who cheat are trustworthy,’” I fear your Logical friend would turn away hastily——perhaps angry, perhaps only scornful: in any case, the result would be unpleasant. *I advise you not to try the experiment!*

“But why is this?” you will say. “Do you mean to tell us that all these Logicians are wrong?” Far from it, dear Reader! From *their* point of view, they are perfectly right. But they do not include, in their system, anything like *all* the possible forms of Syllogism.

They have a sort of nervous dread of Attributes beginning with a negative particle. For example, such Propositions as “All not- x are y ,” “No x are not- y ,” are quite outside their system. And thus, having (from sheer nervousness)

excluded a quantity of very useful forms, they have made rules which, though quite applicable to the few forms which they allow of, are no use at all when you consider all possible forms.

Let us not quarrel with them, dear Reader! There is room enough in the world for both of us. Let us quietly take our broader system: and, if they choose to shut their eyes to all these useful forms, and to say “They are not Syllogisms at all!” we can but stand aside, and let them Rush upon their Fate! There is scarcely anything of yours, upon which it is so dangerous to Rush, as your Fate. You may Rush upon your Potato-beds, or your Strawberry-beds, without doing much harm: you may even Rush upon your Balcony (unless it is a new house, built by contract, and with no clerk of the works) and may survive the foolhardy enterprise: but if you once Rush upon your *Fate*—why, you must take the consequences!

Chapter II. Cross Questions.

*“The Man in the Wilderness asked of me
‘How many strawberries grow in the sea?’”*

Quoted from nursery rhyme

§ 1. Elementary.

1. What is an ‘Attribute’? Give examples.
2. When is it good sense to put “is” or “are” between two names? Give examples.
3. When is it *not* good sense? Give examples.
4. When it is *not* good sense, what is the simplest agreement to make, in order to make good sense?
5. Explain ‘Proposition’, ‘Term’, ‘Subject’, and ‘Predicate’. Give examples.
6. What are ‘Particular’ and ‘Universal’ Propositions? Give examples.
7. Give a rule for knowing, when we look at the smaller Diagram, what Attributes belong to the things in each compartment.
8. What does “some” mean in Logic?³⁵
9. In what sense do we use the word ‘Universe’ in this Game?
10. What is a ‘Double’ Proposition? Give examples.
11. When is a class of Things said to be ‘exhaustively’ divided? Give examples.
12. Explain the phrase “sitting on the fence.”
13. What two partial Propositions make up, when taken together, “all x are y ”?
14. What are ‘Individual’ Propositions? Give examples.
15. What kinds of Propositions imply, in this Game, the *existence* of their Subjects?
16. When a Proposition contains more than two Attributes, these Attributes may in some cases be re-arranged, and shifted from one Term to the other. In what cases may this be done? Give examples.

Break up each of the following into two *partial* Propositions:

17. All tigers are fierce.

³⁵Remark: At the end of each page there is a reference on which pages the solutions are found. This has not been reproduced here, and is not in the 1886 edition.

18. All hard-boiled eggs are unwholesome.
19. I am happy.
20. John is not at home.

21. Give a rule for knowing, when we look at the larger Diagram, what Attributes belong to the Things contained in each compartment.
22. Explain 'Premisses', 'Conclusion', and 'Syllogism'. Give examples.
23. Explain the phrases "Middle Term" and "Middle Terms".
24. In marking a pair of Premisses on the larger Diagram, why is it best to mark *negative* Propositions before *affirmative* ones?
25. Why is it of no consequence to us, as Logicians, whether the Premisses are true or false?
26. How can we work Syllogisms in which we are told that "some x are y " is to be understood to mean "the Attributes x, y are *compatible*", and "no x are y " to mean "the Attributes x, y are *incompatible*"?
27. What are the two kinds of 'Fallacies'?
28. How may we detect 'Fallacious Premisses'?
29. How may we detect a 'Fallacious Conclusion'?
30. Sometimes the Conclusion, offered to us, is not identical with the correct Conclusion, and yet cannot be fairly called 'Fallacious'. When does this happen? And what name may we give to such a Conclusion?

§ 2. Half of Smaller Diagram. Propositions to be represented.

1. Some x are not- y .
2. All x are not- y .
3. Some x are y , and some are not- y .
4. No x exist.
5. \neg Some x exist.³⁶
6. No x are not- y .
7. Some x are not- y , and some x exist.

Taking x = "judges"; y = "just";

8. No judges are just.
9. Some judges are unjust.
10. All judges are just.

Taking x = "plums";³⁷ y = "wholesome";

³⁶Questions 5 to 7 are missing in the 1886 edition, the following questions have different numbers.

³⁷"cakes", also in the following questions

11. Some plums are wholesome.
12. There are no wholesome plums.
13. Plums are some of them wholesome, and some not.
14. All plums are unwholesome.

Taking y = “diligent students”; x = “successful”;

15. No diligent students are unsuccessful,
16. All diligent students are successful.
17. No students are diligent.
18. There are some diligent, but unsuccessful, students.
19. \lrcorner Some students are diligent.³⁸

 Some orators are passionate. }

Chapter III. Crooked Answers.

*"I answered him, as I thought good,
 'As many as red-herrings grow in the wood'."*

Quoted from nursery
 rhyme

§ 1. Elementary.

1. Whatever can be "attributed to", that is "said to belong to", a Thing, is called an 'Attribute'. For example, "baked", which can (frequently) be attributed to "Buns", and "beautiful", which can (seldom) be attributed to "Babies".

2. When they are the Names of two Things (for example, "these Pigs are fat Animals"), or of two Attributes (for example, "pink is light red").

3. When one is the Name of a Thing, and the other the Name of an Attribute (for example, "these Pigs are pink"), since a Thing cannot actually *be* an Attribute.

4. That the Substantive shall be supposed to be repeated at the end of the sentence (for example, "these Pigs are pink (Pigs)").

5. A 'Proposition' is a sentence stating that some, or none, or all, of the Things belonging to a certain class, called the 'Subject', are also Things belonging to a certain other class, called the 'Predicate'. For example, "some new Cakes⁴³ are not nice", that is (written in full) "some new Cakes are not nice Cakes"; where the class "new Cakes" is the Subject, and the class "not-nice Cakes" is the Predicate.⁴⁴

6. A Proposition, stating that *some* of the Things belonging to its Subject are so-and-so, is called 'Particular'. For example, "some new Cakes are nice", "some new Cakes are not nice."

⁴³The remarks in chapter I apply here and in the following questions, too.

⁴⁴Remark: At the end of each page there is a reference on which pages the questions are found. This has not been reproduced here, and is not in the 1886 edition.

A Proposition, stating that *none* of the Things belonging to its Subject, or that *all* of them, are so-and-so, is called 'Universal'. For example, "no new Cakes are nice", "all new Cakes are not nice".

7. The Things in each compartment possess *two* Attributes, whose symbols will be found written on two of the *edges* of that compartment.

8. "One or more."

9. As a name of the class of Things to which the whole Diagram is assigned.

10. A Proposition containing two statements. For example, "some new Cakes are nice and some are not-nice."

11. When the whole class, thus divided, is "exhausted" among the sets into which it is divided, there being no member of it which does not belong to some one of them. For example, the class "new Cakes" is "exhaustively" divided into "nice" and "not-nice", since *every* new Cake must be one or the other.

12. When a man cannot make up his mind which of two parties he will join, he is said to be "sitting on the fence"—not being able to decide on which side he will jump down.

13. "Some *x* are *y*" and "no *x* are *y*".

14. A Proposition, whose Subject is $\lrcorner a$ ⁴⁵ single Thing, is called 'Individual'. For example, "I am happy", "John is not at home". These are Universal Propositions, being the same as "all the I's that exist are happy", "*all* the Johns, that I am now considering, are not at home".

15. \lrcorner Propositions beginning with "some" or "all".⁴⁶

16. When they begin with "some" or "no". For example, "some *abc* are *def*" may be re-arranged as "some *bf* are *acde*", each being equivalent to "some *abcdef* exist".

17. Some tigers are fierce,

No tigers are not-fierce.

18. Some hard-boiled eggs are unwholesome,

No hard-boiled eggs are wholesome.

19. Some I's are happy,

No I's are unhappy.

20. Some Johns are not at home,

No Johns are at home.

21. The Things, in each compartment of the larger Diagram, possess *three* Attributes, whose symbols will be found written at three of the *corners* of the compartment (except in the case of *m'*, which is not actually inserted in the Diagram, but is *supposed* to stand at each of its four outer corners).

22. If the Universe of Things be divided with regard to three different Attributes; and if two Propositions be given, containing two different couples of these Attributes; and if from these we can prove a third Proposition, containing the two Attributes that have not yet occurred together; the given Propositions are called 'the Premisses', the third one 'the Conclusion', and the whole set 'a Syllogism'. For example, the Premisses might be "no *m* are *x*" and "all *m'* are *y*"; and it might be possible to prove from them a Conclusion containing *x* and *y*.

23. If an Attribute occurs in both Premisses, the Term containing it is called 'the Middle Term'. For example, if the Premisses are "some *m* are *x*" and "no

⁴⁵one

⁴⁶'Particular' and 'Universal' Propositions.

m are y' ”, the class of “ m -Things” is the Middle Term.

If an Attribute occurs in one Premiss, and its contradictory in the other, the Terms containing them may be called ‘the Middle Terms’. For example, if the Premisses are “no m are x' ” and “all m' are y ”, the two classes of “ m -Things” and “ m' -Things” may be called ‘the Middle Terms’.

24. Because they can be marked with *certainty*: whereas *affirmative* Propositions (that is, those that begin with “some” or “all”) sometimes require us to place a red counter ‘sitting on a fence’.

25. Because the only question we are concerned with is whether the Conclusion *follows logically* from the Premisses, so that, if *they* were true, *it* also would be true.

26. By understanding a red counter to mean “this compartment *can be* occupied”, and a grey one to mean “this compartment *cannot be* occupied” or “this compartment *must be* empty”.

27. ‘Fallacious Premisses’ and ‘Fallacious Conclusion’.

28. By finding, when we try to transfer marks from the larger Diagram to the smaller, that there is ‘no information’ for any of its four compartments.

29. By finding the correct Conclusion, and then observing that the Conclusion, offered to us, is neither identical with it nor a part of it.

30. When the offered Conclusion is part of the correct Conclusion. In this case, we may call it a ‘Defective Conclusion’.

§ 2. Half of Smaller Diagram. Propositions represented.

It might be thought that the proper Diagram would be

—	1
---	---

, in order to express “some x exist”: but this is really contained in “some x are y' .” To put a red counter on the division-line would only tell us “*one of the* compartments is occupied”, which we know already, in knowing that *one* is occupied.⁴⁸

19. All m are x , } i. e.
 All m are y }

20. We had better take “persons” as Universe. We may choose “myself” as ‘Middle Term’, in which case the Premisses will take the form

I am a-person-who-sent-him-to-bring-a-kitten. }
 I am a-person-to-whom-he-brought-a-kettle-by-mistake. }

Or we may choose “he” as ‘Middle Term’, in which case the Premisses will take the form

He is a-person-whom-I-sent-to-bring-me-a-kitten. }
 He is a-person-who-brought-me-a-kettle-by-mistake. }

The latter form seems best, as the interest of the anecdote clearly depends on *his* stupidity—not on what happened to *me*. Let us then make m = “he”; x = “persons whom I sent, &c.”; and y = “persons who brought, &c.”

Hence,

All m are x , }
 All m are y , } and the required Diagram is

§ 7. Both Diagrams employed.

1.

0	
1	

 i. e. All y are x' .
2.

	1

 i. e. Some x are y' ; or, Some y' are x .
3.

1	

 i. e. Some y are x' ; or, Some x' are y .
4.

	0

 i. e. No x' are y' ; or, No y' are x' .
5.

0	
1	

 i. e. All y are x' . i. e. All black rabbits are young.
6.

1	

 i. e. Some y are x' . i. e. Some black rabbits are young.

7.

1	0

 i. e. All x are y . i. e. All well-fed birds are happy.
8.

	1

 i. e. Some x' are y' . i. e. Some birds, that are not well-fed, are unhappy; or, Some unhappy birds are not well-fed.
9.

1	0

 i. e. All x are y . i. e. John has got a tooth-ache.
10.

0	

 i. e. No x' are y . i. e. No one, but John, has got a tooth-ache.
11.

1	

 i. e. Some x are y . i. e. Some one, who has taken a walk, feels better.
12.

1	

 i. e. Some x are y . i. e. Some one, whom I sent to bring me a kitten, brought me a kettle by mistake.
13.

Let “books” be Universe; m = “exciting”; x = “that suit feverish patients”; y = “that make one drowsy”.

No m are x ,
All m' are y . } \therefore No y' are x .

i. e. No books suit feverish patients, except such as make one drowsy.

14.

	1	0
		0

1	

Let “persons” be Universe; m = “that deserve the fair”; x = “that get their deserts”; y = “brave”.

Some m are x ,
No y' are m . } \therefore Some y are x .

i. e. Some brave persons get their deserts.

15.

0		
	0	0
0		

0	

Let “persons” be Universe; m = “patient”; x = “children”; y = “that can sit still”.

No x are m , }
 No m' are y . } \therefore No x are y .

i. e. No children can sit still.

Let “things” be Universe; m = “fat”; x = “pigs”; y = “skeletons”.

All x are m , }
 No y are m . } \therefore All x are y' .

i. e. All pigs are not-skeletons.

Let “creatures” be Universe; m = “monkeys”; x = “soldiers”; y = “mischievous”.

No m are x , }
 All m are y . } \therefore Some y are x' .

i. e. Some mischievous creatures are not soldiers.

Let “persons” be Universe; m = “just”; x = “my cousins”; y = “judges”.

No x are m , }
 No y are m' . } \therefore No x are y .

i. e. None of my cousins are judges.

Let “periods”⁵⁵ be Universe; m = “days”; x = “rainy”; y = “tiresome”.

⁵⁵things

Some m are x ,
 All xm are y . } \therefore Some x are y .

i. e. Some rainy periods⁵⁶ are tiresome.

N.B. These are not legitimate Premisses, since⁵⁷ the Conclusion is really part of the second Premiss, so that⁵⁸ the first Premiss is superfluous. This may be shown, in letters, thus:—

“All xm are y ” contains “Some xm are y ”, which contains “Some x are y ”. Or, in words, “All rainy days are tiresome” contains “Some rainy days are tiresome”, which contains “Some rainy periods⁵⁹ are tiresome”.

Moreover, the first Premiss, besides being superfluous, is actually contained in the second; since it is equivalent to “Some rainy days exist”, which, as we know, is implied in the Proposition “All rainy days are tiresome”.

Altogether, a *most* unsatisfactory Pair of Premisses!

Let “things” be Universe; m = “medicine”; x = “nasty”; y = “senna”.

All m are x ,
 All y are m . } \therefore All y are x .

i. e. Senna is nasty.

Let “persons” be Universe, m = “Jews”; x = “rich”; y = “Patagonians”.⁶⁰

Some m are x ,
 All y are m' . } \therefore Some x are y' .

i. e. Some rich persons are not Patagonians.⁶¹

Let “creatures” be Universe; m = “teetotalers”; x = “that like sugar”; y = “nightingales”.

⁵⁶things

⁵⁷since x and y both enter into the second Premiss; so that

⁵⁸and

⁵⁹things

⁶⁰Kamschatgans

⁶¹Kamschatgans

All m are x ,
 No y are m' . } \therefore No y are x' .

i. e. No nightingales dislike sugar.

Let “food” be Universe; m = “wholesome”; x = “muffins”; y = “buns”.

No x are m ,
 All y are m' . }

There is ‘no information’ for the smaller Diagram; so no Conclusion can be drawn.

Let “creatures” be Universe; m = “that run well”; x = “fat”; y = “greyhounds”.

No x are m ,
 Some y are m . } \therefore Some y are x' .

i. e. Some greyhounds are not fat.

Let “persons” be Universe; m = “soldiers”; x = “that march”; y = “youths”.

All m are x ,
 Some y are m' . }

There is ‘no information’ for the smaller Diagram; so no Conclusion can be drawn.

Let “food” be Universe; m = “sweet”; x = “sugar”; y = “salt”.

All x are m ,
 All y are m' . } \therefore { All x are y' .
 All y are x' .

i. e. $\left\{ \begin{array}{l} \text{Sugar is not salt.} \\ \text{Salt is not sugar.} \end{array} \right.$

Let “things” be Universe; m = “eggs”; x = “hard-boiled”; y = “crackable”.

$\left. \begin{array}{l} \text{Some } m \text{ are } x, \\ \text{No } m \text{ are } y'. \end{array} \right\} \therefore \text{Some } x \text{ are } y.$

i. e. Some hard-boiled things can be cracked.

Let “persons” be Universe; m = “Jews”; x = “that are in the house”; y = “that are in the garden”.

$\left. \begin{array}{l} \text{No } m \text{ are } x, \\ \text{No } m' \text{ are } y. \end{array} \right\} \therefore \text{No } x \text{ are } y.$

i. e. No persons, that are in the house, are also in the garden.

Let “things” be Universe; m = “noisy”; x = “battles”; y = “that may escape notice”.

$\left. \begin{array}{l} \text{All } x \text{ are } m, \\ \text{All } m' \text{ are } y. \end{array} \right\} \therefore \text{Some } x' \text{ are } y.$

i. e. Some things, that are not battles, may escape notice.

Let “persons” be Universe; m = “Jews”; x = “mad”; y as “Rabbis”.

$\left. \begin{array}{l} \text{No } m \text{ are } x, \\ \text{All } y \text{ are } m. \end{array} \right\} \therefore \text{All } y \text{ are } x'.$

i. e. All Rabbits are sane.

31.

Let “things” be Universe; m = “fish”; x = “that can swim”; y = “skates”.

No m are x' ,
Some y are m . } \therefore Some y are x .

i. e. Some skates can swim.

32.

Let “people” be Universe; m = “passionate”; x = “reasonable”; y = “orators”.

All m are x' ,
Some y are m . } \therefore Some y are x' .

i. e. Some orators are unreasonable.

Chapter IV. Hit or Miss.

*“Thou canst not hit it, hit it, hit it,
Thou canst not hit it, my good man.”*

Quoted from *Love’s Labour’s Lost* by William Shakespeare

What is lawful may be done without fear. }
43. No fossils can be crossed in love; }
An oyster may be crossed in love. }
44. “This is beyond endurance!” }
“Well, nothing beyond endurance has ever happened to *me*.” }
45. All uneducated men are shallow; }
All these students are educated. }
46. All my cousins are unjust; }
No judges are unjust. }
47. No country, that has been explored, is infested by dragons; }
Unexplored countries are fascinating. }
48. No misers are generous; }
Some old men are not generous. }
49. A prudent man shuns hyænas; }
No banker is imprudent. }
50. Some poetry is original; }
No original work is producible at will. }
51. No misers are unselfish; }
None but misers save egg-shells. }

52. All pale people are phlegmatic; }
 No one, who is not pale, looks poetical. }
53. All spiders spin webs; }
 Some creatures, that do not spin webs, are savage. }
54. None of my cousins are just; }
 All judges are just. }
55. John is industrious; }
 No industrious people are unhappy. }
56. Umbrellas are useful on a journey; }
 What is useless on a journey should be left behind. }
57. Some pillows are soft; }
 No poker are soft. }
58. I am old and lame; }
 No old merchant is a lame gambler. }
59. No eventful journey is ever forgotten; }
 Uneventful journeys are not worth writing a book about. }
60. Sugar is sweet; }
 Some sweet things are liked by children. }
61. Richard is out of temper; }
 No one but Richard can ride that horse. }
62. All jokes are meant to amuse; }
 No Act of Parliament is a joke. }
63. "I saw it in a newspaper." }
 "All newspapers tell lies." }
64. No nightmare is pleasant; }
 Unpleasant experiences are not anxiously desired. }
65. Prudent travellers carry plenty of small change; }
 Imprudent travellers lose their luggage. }
66. All wasps are unfriendly; }
 No puppies are unfriendly. }
67. He called here yesterday; }
 He is no friend of mine. }
68. No quadrupeds can whistle; }
 Some cats are quadrupeds. }
69. No cooked meat is sold by butchers; }
 No uncooked meat is served at dinner. }
70. Gold is heavy; }
 Nothing but gold will silence him. }
71. Some pigs are wild; }
 There are no pigs that are not fat. }
72. No emperors are dentists; }
 All dentists are dreaded by children. }
73. All, who are not old, like walking; }

- Neither you nor I are old.
74. All blades are sharp; }
Some grasses are blades. }
75. No dictatorial person is popular; }
She is dictatorial. }
76. Some sweet things are unwholesome; }
No muffins are sweet. }
77. No military men write poetry; }
No generals are civilians. }
78. Boredoms are dreaded; }
A bore is never begged to prolong his visit. }
79. All owls are satisfactory; }
Some excuses are unsatisfactory. }
80. All my cousins are unjust; }
All judges are just. }
81. Some buns are rich; }
All buns are nice. }
82. No medicine is nice; }
No pills are unmedicinal. }
83. Some lessons are difficult; }
What is difficult needs attention. }
84. No unexpected pleasure annoys me; }
Your visit is an unexpected pleasure. }
- 85.⁶² Caterpillars are not eloquent; }
Jones is eloquent. }
86. Some bald people wear wigs; }
All your children have hair. }
87. All wasps are unfriendly; }
Unfriendly creatures are always unwelcome. }
88. No bankrupts are rich; }
Some merchants are not bankrupts. }
- 89.⁶³ Weasels sometimes sleep; }
All animals sometimes sleep. }
90. Ill-managed concerns are unprofitable; }
Railways are never ill-managed. }
91. Everybody has seen a pig; }
Nobody admires a pig. }

Extract a Pair of Premises out of each of the following: and deduce the Conclusion, if there is one:—

⁶²Missing in the 1886 edition.

⁶³Missing in the 1886 edition.

92.⁶⁴ “The Lion, as any one can tell you who has been chased by them as often as *I* have, is a very savage animal: and there are *certain*⁶⁵ individuals among them, though I will not guarantee it as a general law, who do not drink coffee.”

93. “It was most absurd of you to offer it! You might have known, if you had had any sense, that no old sailors ever like gruel!”

“But I thought, as he was an uncle of yours—”

“An uncle of mine, indeed! Stuff!”

“*You*⁶⁶ may call it stuff, if you like. All I know is, *my* uncles are all old men: and they like gruel like anything!”

“Well, then *your* uncles are—”

94. “Do come away! I can’t stand this squeezing any more. No crowded shops are comfortable, you know very well.”

“Well, who expects to be comfortable, out shopping?”

“Why, *I* do, of course! And I’m sure there are some shops, further down the street, that are not crowded. So—”

95. “They say *no*⁶⁷ doctors are *metaphysical*⁶⁸ organists: and that lets me into a little fact about *you*, you know.”

“Why, how do you make *that* out? You never heard me play the organ.”

“No, *doctor*,⁶⁹ but I’ve heard you talk about Browning’s poetry: and that showed me that you’re *metaphysical*,⁷⁰ at any rate. So—”

Extract a Syllogism out of each of the following: and test its correctness:—

96. “Don’t talk to me! I’ve known more rich merchants than you have: and I can tell you not *one* of them was ever an old miser since the world began!”

“And what has that got to do with old Mr. Brown?”

“Why, isn’t he very rich?”

“Yes, of course he is. And what then?”

“Why, don’t you see that it’s absurd to call him a miserly merchant? Either he’s not a merchant, or he’s not a miser!”

97. “*It is* so kind of you to enquire! I’m really feeling a great deal better to-day.”

“And is it Nature, or Art, *that is*⁷¹ to have the credit of this happy change?”

“Art, I think. The Doctor has given me some of that patent medicine of his.”

“Well, I’ll never call him a humbug again. There’s *somebody*, at any rate, that feels better after taking his medicine!”

⁶⁴The 1886 edition has additionally:

91. “Good morning, dear Mrs. Jones! I’ve just seen the most extraordinary people you ever met! You never saw such bonnets!”

“Oh, I know who you mean. They lodge just opposite.”

“Do they? Well, I do wonder who they are!”

“So do I.”

⁶⁵certainly

⁶⁶Well, you

⁶⁷missing in 1886 edition

⁶⁸never enthusiastic

⁶⁹missing in 1886 edition

⁷⁰*enthusiastic*

⁷¹that’s

98. “No, I don’t like you one bit. And I’ll go and play with my doll. *Dolls* are never unkind.”

“So you like a doll better than a cousin? Oh you little silly!”

“Of course I do! *Cousins* are never kind—at least no cousins *I’ve* ever seen.”

“Well, and what does *that* prove, I’d like to know! If you mean that cousins aren’t dolls, who ever said they were?”

99.⁷² “What are you talking about geraniums for? You can’t tell one flower from another, at this distance! I grant you they’re all *red* flowers: it doesn’t need a telescope to know *that*.”

“Well, some geraniums are red, aren’t they?”

“I don’t deny it. And what then? I suppose you’ll be telling me some of those flowers are geraniums!”

“Of course that’s what I should tell you, if you’d the sense to follow an argument! But what’s the good of proving anything to *you*, I should like to know?”

100. “Boys, you’ve passed a fairly good examination, all things considered. Now let me give you a word of advice before I go. Remember that all, who are really anxious to learn, work *hard*.”

“I thank you, Sir, in the name of my scholars! And proud am I to think there are *some* of them, at least, that belong to that are⁷³ really *anxious* to learn.”

“Very glad to hear it: and how do you make it out to be so?”

“Why, Sir, *I* know how hard they work—some of them, that is. Who should know better?”

Extract from the following speech a series of Syllogisms, or arguments having the form of Syllogisms: and test their correctness.

It is supposed to be spoken by a fond mother, in answer to a friend’s cautious suggestion that she is perhaps a *little* overdoing it, in the way of lessons, with her children.

101. “Well, they’ve got their own way to make in the world. *We* can’t leave them a fortune apiece! And money’s not to be had, as *you* know, without money’s worth: they must *work* if they want to live. And how are they to work, if they don’t know anything? Take my word for it, there’s no place for ignorance in *these* times! And all authorities agree that the time to learn is when you’re young. One’s got no memory afterwards, worth speaking of. A child will learn more in an hour than a grown man in five. So those, that have to learn, must learn when they’re young, if ever they’re to learn at all. Of course that doesn’t do unless children are *healthy*: I quite allow *that*. Well, the doctor tells me no children are healthy unless they’ve got a good colour in their cheeks. And only just look at my darlings! Why, their cheeks bloom like peonies! Well, now, they

⁷²The 1886 edition has additionally:

99. “You’re as greedy as a pig!”

“*That* doesn’t prove much, unless you mean to say that every pig, as ever is, is greedy.”

“Then that’s just what I do mean to say.”

“Well, I’ll tell you another interesting fact about pigs. Not one of them can fly!”

“I knew that before, Mister Impertinence! So *something*, that’s greedy, can’t fly: and I think its *you*!”

⁷³that category!”

“What category, might I ask?”

“The category, Sir, of them as—I mean of boys that are

tell me that, to keep children in health, you should never give them more than six hours altogether at lessons in the day, and at least two half-holidays in the week. And that's *exactly* our plan, I can assure you! We never go beyond six hours, and every Wednesday and Saturday, as ever is, not one syllable of lessons do they do after their one o'clock dinner! So how you can imagine I'm running any risk in the education of my precious pets is more than *I* can understand, I promise you!"

6.4 Fifth Paper on Logic

Source: printed 1887

Examples. Sets of Premisses

1. No ducks waltz;
All officers waltz;
All my poultry are ducks.
2. All puddings are nice;
All these dishes are puddings;
No nice things are wholesome.
3. No fat old men are active;
All wise men are old;
No unwise lawyers are fat.
4. All novels are exciting;
I have no books but novels;
Nothing exciting belongs to me.
5. All pencils are made of lead;
No rubbish is useful;
All lead-pencils are useful.
6. No buns are unwholesome;
No puffy currant buns are stale;
All new puffy food is unwholesome.
7. All rich noblemen are well-dressed;
All my friends are rich;
No well-dressed persons sweep chimnies.
8. All eels wriggle;
No eels wear boots;
Nothing, that wriggles and wears no boots, can act Shakespeare.
9. No unkind advice is welcome;
No welcome letters, that I have had to-day, are unanswered;
None of to-day's letters, that I have answered, are kind.
10. No cats can sing well;
None of my household get any cream, unless they can sing well;
All cats get cream.
11. All boots are leather;
Anything made of buttered toast is good to eat;
No leather boots are good to eat.
12. There are no Jews in the street;
No Gentiles say "shpoonj";
All my servants are in the street.

Other version:
→ 6.24, p. 1119

Other version:
→ 6.18, p. 1032

13. No hoofed animal has scales;
No pigs are destitute of hoofs;
No pigs, without scales, have wings.
14. Nothing, that is meant to hold fluids, is worth taking care of
when broken;
All jugs are meant to hold fluids;
All useful things are worth taking care of.
15. All English sailors are light-hearted;
All sailors are enterprising;
None but Englishmen are enterprising.
16. All unripe fruit is unwholesome;
All these apples are wholesome;
No fruit, grown in the shade, is ripe.
17. No frogs are dignified;
All fat things in this garden eat greedily;
Nothing that eats greedily is fat, except a frog.
18. All bilious boys refuse buns;
All greedy boys are bilious;
No healthy boys refuse buns.
19. No pins of mine, that will bend, are useful;
Nothing made of steel will bend;
All my useless pins are made of steel.
20. All rolling stones are restless;
All stones are heavy;
All restless things, that gather moss, are light.
21. All respectable umbrellas are meant to open;
Useful old things should be preserved;
Things that are meant to open but will not do it, need not be
preserved;
All new umbrellas will open;
What is old is always respectable.
22. No young crabs are melancholy;
All healthy policemen are sane;
No discontented judges are chickens;
All rich bakers are fat;
Some rich healthy young judges are unmarried.
23. Ungraceful creatures are thoughtful when left alone;
No elephants are graceful;
When one is disliked, one is left alone;
Thoughtful elephants are universally liked;
Ungraceful creatures, who are not fond of apples, are disliked.
24. All, who have lost their way and have not learned to dance, are
unfriendly;
No gypsies, who have learned to dance, are wild;
All wild people, who have not lost their way, are uncivil;
All my nephews have lost their way;

- All uncivil people, who are not nephews of mine, have learned to dance.
25. No invalids are unromantic civilians;
 All architects are dreamy enthusiasts;
 No lovers are hopeless;
 No military men are dreamy;
 All romantic enthusiasts are in love;
 All who live on muffins are hopeless invalids.
26. All short-hand-writers are fit to be printers;
 Salmon, that can read small print, have good eyesight;
 No young folk need be pitied, unless they are short-hand-writers;
 Those who have good eyesight do not wear spectacles;
 Young folk, who have bad eyesight and cannot read small print,
 are not fit to be printers.
 Those who cannot read small print are to be pitied.
27. No savage animals are trustworthy sentinels;
 Mastiffs are domesticated wolves;
 All warm-blooded domesticated carnivora have claws;
 All quadrupeds are warm-blooded animals;
 My property consists of savage quadrupeds;
 A wolf, that wags its tail, may be trusted, even if it has claws;
 There is nothing in this house but my dogs;
 All dogs are carnivorous sentinels.
28. All the gay and hopeful are Germans;
 All old gorilla-keepers are good-tempered;
 All young captains are gay;
 Those who are good-tempered need not take snuff;
 No young Germans are experienced;
 Melancholy old folk ought to take snuff;
 People of experience do not keep gorillas, unless they feel out of spirits;
 Young people never despair.
29. Ball-guests, who are caricatured, are sulky;
 A conceited ball-guest is ridiculous;
 A man who is pleased, and yet sulky, is a paradox;
 Ridiculous ball-guests are caricatured;
 Conceited people, if entertaining, are not avoided;
 Frogs, who are never invited to balls, are unpopular;
 People, who are sulky and ridiculous, are avoided;
 A ball-guest, who is a paradox, is entertaining;
 Popular people are pleased when they are caricatured.
30. All English aldermen are well-fed;
 All the military men in my family are Hussars;
 People with toothache are unhappy, even if well-fed;
 All the English, who are not members of my family, are babies;
 All the aldermen in my family are fat;
 No well-fed gluttons are discontented;
 No discontented foreigners are happy;

All active babies are aldermen;
No Hussars are lazy gluttons;
All happy babies are well-fed;
All lazy civilians are aldermen;
None of my family are ill-fed, except the babies.

[May, 1887.]

6.5 Sixth Paper on Logic

Source: printed 1887

Examples. Sets of Premises

1. (1) Despised and silent gluttons are discontented, but are not quarrelsome;
(2) All ugly lady-birds are shy, silent, and sulky;
(3) Shy discontented creatures, that are hated, are always quarrelsome;
(4) A crocodile is an ugly lazy glutton;
(5) All creatures, that are lazy and sulky, are hated and despised.
2. (1) No wise old friends of mine are happy;
(2) No rich friends of mine are unhealthy youths;
(3) No dishonest friends of mine are old fools;
(4) No friends of mine are talkative young paupers;
(5) No honest old friends of mine are foolish;
(6) No young friends of mine are rich and healthy;
(7) No friends of mine are unhappy old sages;
(8) No poor young friends of mine are silent.
3. (1) All old monkeys are docile;
(2) All affectionate cats purr;
(3) All healthy dogs bark;
(4) All my fat pets are in this basket;
(5) No small pigs are affectionate;
(6) Black cats can be easily carried about;
(7) No cross active creatures jump, except monkeys;
(8) I make pets of all affectionate docile creatures;
(9) A healthy monkey, if electrified, becomes a pig;
(10) The large creatures in this basket are all cats;
(11) Old dogs are always cross;
(12) No fat creatures bark, except when electrified;
(13) All affectionate old creatures jump;
(14) All the creatures in this basket, that purr, are black;
(15) Large dogs cannot be easily carried about;
(16) Creatures, that are cross and destitute of affection, are always lazy;
(17) Unhealthy creatures are either large or thin.
4. (1) A quarrelsome man does not deserve blame if he is not in his right mind;
(2) Men, who are objects of terror, are always avoided;
(3) The popular candidates in this election are Liberals;
(4) Captains always tell long yarns;
(5) A man of slim figure, who is constantly quoted as a model citizen, is always conceited;
(6) Any man of genial manners may safely go through the town to-day, except Mr. Brown;

- (7) No good man of business, who is cautious as to what he states, ever says he has seen the sea-serpent;
 - (8) A thoughtless man is a constant cause of mischief;
 - (9) A popular man, who is fat, is always out of breath;
 - (10) A man, who tells long yarns and has no geniality of manner, is an object of terror;
 - (11) Mr. Brown is a candidate in this election;
 - (12) A man, who is ready to make amends for any harm he has done, is always a humble man;
 - (13) No man, who tells long yarns without giving names or dates, is readily believed;
 - (14) No quarrelsome man would be safe in the streets to-day, unless he were a candidate in this election;
 - (15) A good business-man, who is not quarrelsome, is cautious as to everything he states;
 - (16) No man ever tells long yarns, when running to catch a train and out of breath;
 - (17) A man, who has caused mischief and is not ready to make amends for the harm he has done, cannot be in his right mind;
 - (18) No man, who gives names and dates, is avoided, unless he is in his second childhood;
 - (19) The Liberal candidates in this election are all running to catch the train;
 - (20) Any man, who gives names and dates, is a good man of business;
 - (21) No quarrelsome man is an object of terror if he is in his second childhood;
 - (22) A man deserves blame if he is not ready to make amends for any harm he has done;
 - (23) A man who tells long yarns is always popular;
 - (24) A man of genial manners, who is ready to make amends for any harm he has done, is constantly quoted as a model citizen.
5. (1) Fortunate men, who are lawyers' clerks, are always hungry;
- (2) All the basket-makers are out of work;
 - (3) A man without self-restraint is helped five times to plum-pudding;
 - (4) No one but Whittington ever heard bells speak;
 - (5) A bore, who has self-restraint, gets rich;
 - (6) No lean and slippered pantaloon is respected;
 - (7) A man, who is helped five times to plum-pudding, is a glutton;
 - (8) Those who complain always get listened to;
 - (9) A rich man, who has never heard bells speak, is always lean;
 - (10) None but lawyers' clerks have self-restraint;
 - (11) A pantomime-actor, who wears slippers, is a pantaloon;
 - (12) The famous Whittington was elected Lord Mayor;
 - (13) A fat man, who talks without cessation when any one will listen to him, is a bore;
 - (14) All lean persons, who are self-restrained, act in pantomimes;
 - (15) Those who never complain get underpaid;

- (16) Egoists are intolerable;
 - (17) Any one, who has heard bells speak, is fortunate;
 - (18) No hungry lawyer's clerk was ever elected Lord Mayor;
 - (19) All letter-carriers, who do not live in this village, complain if underpaid;
 - (20) Any one, who is listened to, will talk without cessation;
 - (21) Pantaloons, employed in pantomimes, are respected if rich;
 - (22) All, who have not heard bells speak, are egoists;
 - (23) A bore is endurable, provided he does not wear slippers;
 - (24) All hungry men, who complain, become famous;
 - (25) The people in this village are all basket-makers.
6. (1) All Jews wear beards;
- (2) No learned traveller cares for pitch-and-toss;
 - (3) All Frenchmen walk fast;
 - (4) One who squints is graceful if he is good-humoured;
 - (5) There is no one in the house but Ebenezer;
 - (6) Those who can see always avoid pigs;
 - (7) No discontented person, who has not travelled much, is interesting;
 - (8) People with heads on their shoulders are not irritating, so long as they are not talkative;
 - (9) A squinting Gentile, who is easily taken in, ought not to buy a horse;
 - (10) All old people are discontented invalids;
 - (11) No one of learning, who is very remarkable, travels much;
 - (12) Any one, who has not been educated by a pig, will take to smoking, unless he is threatened with a blunderbuss;
 - (13) All, who are not in the house, have heads on their shoulders;
 - (14) Nothing but a pig can be made into bacon;
 - (15) Those who are learned are always interesting;
 - (16) No Jews are fond of pigs;
 - (17) Bearded persons, who look shy, are in failing health;
 - (18) Ebenezer has a head on his shoulders so long as he is alive;
 - (19) All invalids are fretful and troublesome;
 - (20) When a cab-driver retires from business, he always takes to farming;
 - (21) None but Frenchmen are fat and yet graceful;
 - (22) Gentiles are easily taken in;
 - (23) Those who wear beards always retire from business when their health fails;
 - (24) All fretful creatures that grunt can be made into bacon;
 - (25) A dull person is not troublesome, so long as he has some sense in his head;
 - (26) Fat people, who wish to ride, are always good-humoured;
 - (27) An unlearned person, who avoids pigs, has some sense in his head;
 - (28) Any one, who does not care for pitch-and-toss and is willing to be painted green, is very remarkable;
 - (29) A talkative cab-driver is never a bore;

- (30) All farmers, who wear beards, are fond of pigs;
- (31) A Jew that squints always looks shy;
- (32) No fat pigs walk fast;
- (33) Any one, who looks anxious, is an irritating bore;
- (34) Creatures, that are not pigs but have been educated by pigs, always grunt;
- (35) If Ebenezer took to smoking, it would kill him;
- (36) All unlearned persons are dull;
- (37) Those who have heads on their shoulders always look anxious;
- (38) A blind person, who is easily taken in, may buy a horse, provided he does not wish to ride;
- (39) All pigs are fat.

[June, 1887.]

Solutions:

1. All lady-birds are not crocodiles, and all crocodiles are not lady-birds.
2. I don't have any friends.
3. Old dogs are thin or lazy.
4. No captain, who says he has seen the sea-serpent, is readily believed.
5. No letter-carrier with work is not a glutton.
6. No old, but alive, squinting cab-driver, who is not threatened with a blunderbuss, is willing to be painted green. [At least I think that this is correct.]

6.6 Questions in Logic

Source: printed 1887 in two editions, first with more compact layout and table of assigned marks missing; all questions are printed in the left column, with space in the right column for answers, for blocks IV, V, and VI empty diagrams are provided as in the examples, this has not been reproduced here

N.B. The marks, assigned to this paper, are as follows:—

Quest.	Mark.	II. ...	5	IV. (2)	4	VI. (2)	6
I. ...	3	(1)	2	(3)	4	(3)	6
(1)	1	(2)	2	V. (2)	5	(4)	6
(2)	1	(3)	2	(3)	5	(5)	6
(3)	1	III. (1)	3	(4)	5	(6)	6
		(2)	3	(5)	5	(7)	6
		(3)	3	(6)	5	(8)	6

Thus the *maximum* attainable is 101.

I.

Explain the words 'Subject' and 'Predicate.'

Name the Subject, and the Predicate, of each of the following Propostions:—

- (1) No wise man is headstrong and passionate.
- (2) Happy is the man who is content.
- (3) My brothers are all in France.

II.

Explain the words 'Converse' and 'Contradictory.'

Name the Converse, and the Contradictory, of each of the following Propostions:—

- (1) No wise man is headstrong and passionate.
- (2) Some dogs do not bark.
- (3) All beautiful pictures are valuable.

III.

State the Contradictory of each of the following double Propostions:—

- (1) Some of his sons are soldiers and some are not.
- (2) He is deceiving us, or is deceived.
- (3) This book is neither instructive nor amusing.

IV.

Taking the first of the following examples as a model, mark the remaining diagrams.

- (1) All m are x' .

- (2) No y' are m .

- (3) All x' are m' .

V.

Taking the first of the following examples as a model, mark the given Premises on the large diagram: then mark the smaller according to the information given by the larger: then state the conclusion, if any.

- (1) All m are x' ; }
 All m' are y . }

hence

i. e. "No x are y' ."

- (2) No x are m ; }
 No m' are y . }

- (3) No m are x ; }
 All m are y . }

- (4) Some x are m ; }
 All y are m' . }

- (5) All m are x ; }
 Some y are m' . }

- (6) All x' are m ; }
 All y' are m' . }

VI.

Taking the first of the following examples as a model, find the conclusion, if any, of each of the following Pairs of Premises.

- (1) No birds have hoofs; }
 All canaries are birds. }

Let m = birds.

x = hoofed.

y = canaries.

No m are x ; }
 All y are m . }

0	
0	0
1	
0	

hence

0	
1	

\therefore All y are x' .

i. e. All canaries are hoofless.

(2) This book is not interesting; }
 An interesting book makes time go quickly. }

(3) No pigs can dance; }
 All Frenchmen can dance. }

(4) All unhappy grocers frown; }
 My grocer is happy. }

(5) No dictionaries are interesting; }
 Some novels are uninteresting. }

(6) I am tired; }
 Nobody likes dancing a hornpipe when he is tired. }

(7) He called here yesterday; }
 He is no friend of mine. }

(8) John is proud; }
 James is not proud. }

6.7 A Challenge to Logicians

Source: printed 1892

Other versions:

→ 6.8, p. 1010

→ 6.24, p. 1167

Given

1. If some a are b and some not, some c are not d ;
2. If some e are f , and if some g are h , some j are k ;
3. If all l are m , no n are p ;
4. If some c are d and some not, some g are h ;
5. If no e are f , and if some n are p , some j are not k ;
6. If some e are not f , and if some g are not h , some n are p ;
7. If some c are not d , and if some j are k , no e are f ;
8. If some g are not h , and if some j are not k , some l are m ;
9. If some e are not f , and if some n are p , some a are not b ;
10. If some a are b , and if some c are d , some g are not h ;
11. If some c are not d , and if some l are not m , some e are f ;

To Prove

If some a are b , and if some e are not f , no c are d .

*C. L. Dodgson.
Ch. Ch., Oxford,
Oct. 1892*

[N.B. Copies of this paper may be had by applying to Messrs. PARKER,
Broad Street.]

6.8 Eighth Paper on Logic

Source: printed 1892 in two variants, first with minor differences as noted

Examples. Sets of Premisses

1. (1) If all a are b , no c are d ;
 (2) If some a are not b , some c are not d .
 Prove that, if all c are d , no a are b .
2. (1) If some a are b and some not, some c are not d ;
 (2) If some c are d , either some a are b , or some e are not f .
 Prove that, if all c are d , and if all e are f , all a are b .
3. (1) If all a are b , no c are d ;
 (2) If no a are b , and if some c are not d , some e are not f ;
 (3) If some a are b and some not, and if some g are h , no e are f .
 Prove that, if some c are d and some not, and if all e are f ,
 no g are h .
4. (1) If some a are b and some not, some c are not d ;
 (2) If some e are f , and if some g are h , some k are l ;
 (3) If all m are n , no p are q ;
 (4) If some c are d and some not, some g are h ;
 (5) If no e are f , and if some p are q , some k are not l ;
 (6) If some e are not f , and if some g are not h , some p are q ;
 (7) If some c are not d , and if some k are l , no e are f ;
 (8) If some g are not h , and if some k are not l , some m are n ;
 (9) If some e are not f , and if some p are q , some a are not b ;
 (10) If some a are b , and if some c are d , some g are not h ;
 (11) If some c are not d , and if some m are not n , some e are f .
 Prove that, if some a are b , and if some e are not f , no c are
 d .
5. (1) If all a are b , and if some e are f and some not, some c are d ;
 (2) If all e are f , and if some g are h , some a are not b ;
 (3) \sqcup If¹ some c are d and some not, and if some e are not f , \sqcup no
 a are b ;²
 \sqcup (4)³ If some a are not b , and if some e are f , no g are h ;
 (5) If some c are d , and if some g are h , some c are not d .
 Prove that, if some a are b , and if all g are h , no e are f .

Other versions:

→ 6.7, p. 1009

→ 6.24, p. 1167

- \sqcup 6.⁷⁴ Six friends, A, B, C, D, E, F , and their six wives, all walk out daily, in parties of various size and composition, under the following conditions:—

Other version:

→ 6.24, p. 1171

¹If some a are b , and if

²some g are h

³(4) and (5) are swapped in the first version.

⁴

6. (1) Six friends, A, B, C, D, E, F , and their wives, walk out daily, in large or small parties at pleasure.
- (2) When A, B, C take their wives, E accompanies (i. e. is in the same party with) F 's wife;
- (3) When D, E, F take their wives, A accompanies B 's wife;

- (1) When A is with (i. e. is in the same party with) his wife, and B with his, and E with F 's, C is with D 's;
- (2) When A is with his wife, and F with his, and when B is with C 's wife, D is not with E 's;
- (3) When C and D and their wives are in the same party, and when A is not with B 's wife, E is not with F 's;
- (4) When A is with his wife, and D with his, and when B is not with C 's, E is with F 's;
- (5) When E is with his wife, and F with his, and C with D 's, A is not with B 's;
- (6) When B and C and their wives are in the same party, and when E is not with F 's wife, D is with E 's.

Prove that there is, every day, at least *one* couple who are not in the same party.

7. (1) All active old Jews are healthy;
- (2) All indolent magistrates are \neg popular;⁵
- (3) All rich snuff-takers are unhealthy;
- (4) All unpopular magistrates are Jews;
- (5) All young snuff-takers are poor;
- (6) \neg All rich old men,⁶ who are unhealthy, are unpopular;
- (7) All magistrates, who are not Jews, are \neg studious;⁷
- (8) \neg All rich magistrates are talented;⁸
- (9) All talented and popular \neg students⁹ are rich;
- (10) \neg All poor snuff-takers are unpopular;¹⁰
- (11) \neg All unpopular magistrates abstain from snuff;¹¹
- (12) All talented Jews, who are active, are rich.

Prove that no magistrates take snuff.

[Dec. 1892.]¹²

(4) When A , F take their wives, and when B accompanies C 's wife, D accompanies E 's wife;

(5) When A , D take their wives, and when E accompanies F 's wife, B accompanies C 's wife;

(6) When C , F take their wives, and when D accompanies E 's wife, A does *not* accompany B 's wife.

Prove that there is, every day, at least *one* man who does not take his wife.

⁵popular

⁶All old military men

⁷military men

⁸All healthy snuff-takers are early risers

⁹soldiers

¹⁰All young men, who rise late, abstain from snuff

¹¹All magistrates, who are not military men, are active

¹²[Nov., 1892]

6.9 Ninth Paper on Logic

Source: printed 1892

Examples. Sets of Premises

1. (1) There is always sunshine when the wind is in the East;
(2) When it is cold and foggy, my neighbour practises the flute;
(3) When my fire smokes, I set the door open;
(4) When it is cold and I feel rheumatic, I light my fire;
(5) When the wind is in the East and comes in gusts, my fire smokes;
(6) When I keep the door open, I am free from headache;
(7) Even when the sun is shining and it is not cold, I keep my window shut if it is foggy;
(8) When the wind does not come in gusts, and when I have a fire and keep the door shut, I do not feel rheumatic;
(9) Sunshine always brings on fog;
(10) When my neighbour practises the flute, I shut the door, even if I have no headache;
(11) When there is a fog and the wind is in the East, I feel rheumatic.

Prove that, when the wind is in the East, I keep my window shut.

2. A certain Railway-Company has appointed a Committee of Shareholders, under the following conditions:—Directors are *ex-officio* members of it; Bondholders also are admissible; all others are inadmissible.

It is given that:—

- (1) All admissible Shareholders, who are on the Committee and are lame Directors, live in town;
- (2) All short-sighted elderly Shareholders, who are admissible but are not Directors, are on the Committee;
- (3) All elderly Shareholders, living out of town, who are neither Directors nor Members of the Committee, are admissible;
- (4) All lame short-sighted Shareholders, who are admissible and are on the Committee, are Directors.

Prove that no lame elderly Shareholders, who live out of town, are short-sighted.

3. Prove that, if A is greater than B , and if B is greater than C , A is greater than C .
4. (1) All, whom I have taught, except any own sons, know something;
(2) A contented barber is a welcome visitor;
(3) All, except those who are in this house, are scholars;
(4) All the fat men, who have been plucked, are grinning;
(5) Any one, who admires a bald head, is either a brother of mine or is in good spirits;

- (6) Inattentive people know nothing;
- (7) Nobody with a headache likes beating a gong;
- (8) Any one in this house, who makes foolish remarks, is a son of mine;
- (9) None but the young like toffy;
- (10) All barbers wear white aprons;
- (11) A fanciful man, who does not read hard, is always complaining;
- (12) Peter is a candidate for Matriculation;
- (13) All, who do little, except my sons, are contented;
- (14) The candidates for Responsions, who have not been plucked, are all in good spirits;
- (15) No son of mine, who is in good health, is fat;
- (16) All attentive scholars, who are not boys, are boastful;
- (17) My brothers are all barbers;
- (18) Any one, who wears a white apron and can endure a hurdy-gurdy, is worthy of respect;
- (19) No boys dance jigs when at lessons;
- (20) Those of my sons, who are always complaining, are ambitious;
- (21) All the hard-reading men, who have been plucked, are fat;
- (22) All respectable barbers dance jigs;
- (23) Any one, who has a headache, is either attentive or else is one of my old pupils;
- (24) Boastful persons do little;
- (25) All the young, when not at lessons, like beating a gong;
- (26) All, except scholars, make foolish remarks;
- (27) Boys are mischievous;
- (28) All my sons, except Peter, are candidates for Responsions;
- (29) All grinning barbers are in good health;
- (30) All, who are ambitious, read hard;
- (31) A man in good spirits, who does not like beating a gong, cannot endure a hurdy-gurdy;
- (32) All the candidates for Matriculation have been plucked;
- (33) No boaster is a welcome visitor;
- (34) All mischievous persons, except my sons, like toffy;
- (35) Any one, who does not admire a bald head, is a barber;
- (36) All invalids are fanciful.

Prove that no invalid with a headache can endure a hurdy-gurdy.

- 5. (1) One seldom finds a man who is neither a speculator nor bad to lend money to;
- (2) All my friends, who are members of this club, are would-be celebrities;
- (3) A wise man demands a receipt when he pays a bill;
- (4) No handsome man, outside this town, is sure to get into hot water;
- (5) No dancing-master is sought after, if very fat;
- (6) No passionate man is popular, unless he is generous;

- (7) A foolish speculator is on the road to ruin;
- (8) A generous man gets testimonials, if he blows his own trumpet;
- (9) All wise enthusiasts are poetical;
- (10) A man, who dresses in sheep-skins and lives on whale-blubber, is an Arctic voyager;
- (11) A generous man, who is not a dandy, retails other people's jokes;
- (12) A passionate man, who is above taking advice, is sure to get into hot water;
- (13) An ugly man, who gets on badly, is not an eligible suitor;
- (14) All foolish dandies are old;
- (15) All British merchants are economical;
- (16) A man, who has not dreamy eyes, is despised by ladies, unless he is intimate with the Royal Family;
- (17) A man, who blows his own trumpet, is noticed by society;
- (18) All wise noblemen are rich;
- (19) A man does not demand receipts when he pays bills, unless he is getting on badly;
- (20) All the firemen in this town are ugly;
- (21) All uncommon men, who are not would-be celebrities, are members of this club;
- (22) A man, who is noticed by society and gets testimonials, is no fool;
- (23) No economical man is bad to lend money to, unless he lives on whale-blubber;
- (24) No influential man is sought after, unless he is a dancing-master;
- (25) Commoners are eligible suitors, if intimate with the Royal Family;
- (26) All wise dreamy-eyed men are fond of barley-sugar;
- (27) A man without enthusiasm loves walking by moonlight;
- (28) An overbearing man is influential, if he is generous;
- (29) Arctic voyagers, who dress in sheep-skins, are wise;
- (30) No one is economical, unless he is a merchant;
- (31) All would-be celebrities, who retail other people's jokes, blow their own trumpets;
- (32) All the wise men in this town are firemen;
- (33) A man, who is despised by ladies, is sought after, provided he loves walking by moonlight;
- (34) Old dandies retail other people's jokes;
- (35) Men, who pay no bills, get on badly;
- (36) All foolish members of this club are friends of mine;
- (37) No one, who is above taking advice, has influence if he is overbearing;
- (38) A speculator, who is on the road to ruin, is a bad man to lend money to;
- (39) Men with dreamy eyes, who are fond of barley-sugar, are despised by ladies;
- (40) All wise dancing-masters are very fat;
- (41) Rich noblemen are eligible suitors;

- (42) All men, who live on whale-blubber and are above taking advice, dress in sheep-skins;
- (43) All poetical enthusiasts love walking by moonlight;
- (44) All foreign merchants are wise.
- Prove that no passionate overbearing man is popular.

[Nov., 1892.]

6.10 Eighth and Ninth Paper on Logic. Notes

Source: printed 1892

In attempting any of these Problems, the reader is requested to bear in mind the following assumptions, which I have made throughout:—

(1) That the proposition “all x are y ” is the sum total of the *two* propositions “some x are y ” and “no x are not y ”.

(2) That the proposition “no x exist” is the sum total of the *two* propositions “no x are y ” and “no x are not y ”.

(3) That, in setting a Problem, I hold myself free to demand proof of a *less* conclusion than might be logically deduced from the premisses: e. g. if the full logical conclusion were “all x are y ”, I should hold myself free to set, as the Problem, “prove that some x are y ”; or, if the full logical conclusion were “no x exist”, I should hold myself free to set, as the Problem, “prove that no x are y ”. Thus, in Paper 8, Problem 7, if it were possible to prove, from the premisses, that “no magistrates exist”, I should hold myself free to set, as the Problem, “prove that no magistrates take snuff”.

(4) That, in setting a Problem of the form adopted in the first four of Paper 8, where the premisses and the conclusion assert certain *sequences* among certain sub-propositions, but neither assert nor deny any such sub-proposition taken by itself, I hold myself free to demand proof of a *less* result than might be logically deduced from the premisses: e. g. if the full logical conclusion were “if all a are b , and if some c are d , all x are y ”, I should hold myself free to set, as the Problem, “prove that, if all a are b , and if some c are d , some x are y ”; or, if the full logical conclusion were “if all a are b , and if some c are d , no x exist”, I should hold myself free to set, as the Problem, “prove that, if all a are b , and if some c are d , no x are y ”.

[It may be worth while to remark, in reference to the case last mentioned, that it would not be correct to say that the Problem, whose full conclusion is “if all a are b , and if some c are d , no x exist”, is only soluble, (i. e. that its conclusion is only true), if one of the terms be non-existent; for this conclusion merely asserts a *sequence* among the three sub-propositions, “all a are b ”, “some c are d ”, “no x exist”, and the *validity of this sequence* is entirely independent of the truth or falsehood of these sub-propositions taken by themselves. Thus, it would be quite logical, in the case contemplated, to give an additional premiss, viz. “some x exist”, without making the Problem at all less soluble.

Supposing that this additional premiss were given, the *full* reply to this Problem, if set in the form “prove that, if all a are b , and if some c are d , no x exist”, would be “from the given premisses, omitting the last, we have proved the required sequence, viz. “if all a are b , and if some c are d , no x exist”: but it is also given that “some x exist”: hence, if the two propositions, “all a are b ” and “some c are d ”, were simultaneously true, the two propositions, “no x exist” and “some x exist”, would be simultaneously true; which is absurd: hence the two propositions, “all a are b ” and “some c are d ”, cannot be simultaneously true”.

And the *full* reply to this same Problem, if set in the form “prove that, if all a are b , and if some c are d , no x are y ”, would be “from the given premisses, omitting the last, we have proved the sequence “if all a are b , and if some c are d , no x exist”, which contains, as a portion of itself, the required sequence “if all a are b , and if some c are d , no x are y ”: but it is also given that “some x exist”:

hence two results follow:—first, combining the two propositions, “no x are y ” and “some x exist”, into the single proposition “all x are not y ”, we prove the sequence “if all a are b , and if some c are d , all x are not y ”; secondly, we see that, if the two propositions, “all a are b ” and “some c are d ”, were simultaneously true, the two propositions, “no x exist” and “some x exist”, would be simultaneously true; which is absurd: hence the two propositions, “all a are b ” and “some c are d ”, cannot be simultaneously true”.

To make my meaning yet more clear, let me add a “concrete” illustration. Supposing I had set a Problem, having, as its premisses, the rules enacted by an eccentric school-master as to the daily dinner, and, as its conclusion, “prove that, when there is beef and spinach, there are no potatoes”; and supposing it were found that some of the rules led to the conclusion “when there is beef, there are no boiled potatoes”, and that the others led to the conclusion “when there is spinach, there are no unboiled potatoes”, so that the whole set of rules led to the conclusion “when there is beef and spinach, there are no potatoes”: it would not be correct to say that this Problem is only soluble (i. e. that its conclusion is only true) if potatoes never appear on the table: for this conclusion merely asserts a *sequence* among the three propositions, “there is beef”, “there is spinach”, “there are no potatoes”: and, if we were told “there always *are* potatoes on the table”, this fact would not in the least affect *the validity of this sequence*, but would merely prove that the dinner never includes both beef and spinach, but that one or the other of them must always be absent.]

(5) That the proposition “ A is true or B is true” is to be regarded as the contradictory of “ A is false and B is false,” and that this is the *only* state of things which it is meant to *exclude*. Hence it is to be regarded as compatible with any one of the other three possible states of things, viz.:—

- (a) “ A is true and B is false”;
- (b) “ A is false and B is true”;
- (c) “Both are true”.

(6) That two phrases, which merely differ slightly in form, are to be regarded as identical: e. g. “sun-shine always brings on fog” is to be regarded as identical with “when the sun shines it is foggy”: similarly, “I light my fire” and “I have a fire” are to be regarded as identical.

(7) That predicates, one of which denies the other, are to be regarded as contradictory, and as constituting an exhaustive division of the things of which they are predicated: e. g. in using the predicates, “popular” and “unpopular”, of men, I assume that every man is one or the other, so that the two classes, “popular men” and “unpopular men”, constitute an exhaustive division of “men”.

(8) That the proposition “ B is greater than C ” must be assumed to mean that the *magnitude*, residing in B , is greater than that residing in C , and would continue so to be, even if it resided in something other than B . Hence it must be assumed to be equivalent to “every thing, that is not less than B , is greater than C ”.

[N.B. If this assumption be *not* made; i. e. if it be assumed that the proposition “ B is greater than C ” predicates the quality “greater than the magnitude residing in C ”, of the magnitude residing in B , *merely when so residing*, and does *not* predicate any quality of it, when residing in something *other* than B ; it does not seem possible to prove the required conclusion from the data.]

[Nov. 1892.]

6.11 A Disputed Point in Logic (April 1894)

Source: printed 1894, text (especially those parts by “Nemo”) by John Cook Wilson

There are two Propositions, A and B .
Let it be granted that
 If A is true, B is true. (i)
Let there be another Proposition C , such that
 If C is true, then if A is true B is not true. (ii)

NEMO and OUTIS differ about the truth of C .
NEMO says C cannot be true: OUTIS says it may be.

NEMO's Argument

Number (ii) amounts to this:—
 If C is true, then (i) is not true.
But, *ex hypothesi*, (i) is true.
∴ C cannot be true; for the assumption of C involves an absurdity.

OUTIS's Reply

NEMO's two assertions, “if C is true, then (i) is not true” and “the assumption of C involves an absurdity”, are erroneous.

The assumption of C does *not* involve any absurdity; since the two propositions, “if A is true, B is true” and “if A is true, B is not true”, are compatible.

But the assumption of C and A together *does* involve an absurdity; since the two propositions, “ B is true” and “ B is not true”, *are* incompatible.

Hence it follows, not that C is untrue, but that C and A cannot be true together.

NEMO's Rejoinder

OUTIS has wrongly divided protasis and apodosis in (ii).

The absurdity is not the last clause of (ii), “ B is not true”, but *all* that follows the word “then”, i. e. the Hypothetical “If A is true B is not true”; and, by (ii), it is the assumption of C only which causes this absurdity.

In fact, OUTIS has made (ii) equivalent to “If C is true [and if A is true] then if A is true B is not true”. This is erroneous: the words in the brackets in the compound protasis are superfluous, and the remainder is the true protasis which conditions the absurd apodosis, as is evident from the form of (ii) originally given.

[April, 1894.]

6.12 A Disputed Point in Logic. A Concrete Example.

Source: manuscript written 1894

Another manuscript with the same title dated April 11, 1894 is not reproduced here, as it is an early variant of the printed version with Allen, Brown, and Carr.

16/4/94

This island consists of a Northern and a Southern Division; but I am not sure where the boundary-line is.

The Northern Division is Brown's estate: the Southern is mine.

Brown is selling his estate to me; but I do not know whether the sale is completed.

The following propositions are true.

- I. If this field is Brown's, it must be in the Northern Division (for otherwise it would be part of *my* estate).
- II. If the sale is completed, then, if this field is Brown's, it cannot be in the Northern Division (for otherwise it would be *mine* by purchase).

Now let "A is true" = "this field is Brown's"

"B is true" = "this field is in the Northern Division"

"C is true" = "the sale is completed"

Then Propositions I, II, are equivalent to (i), (ii), and the question "can C be true?" is equivalent to "is it possible that the sale is completed?"

Here the 2 Propositions, "if A is true B is true" and "if A is true B is not true," both of them contain a logical sequence. Also they are *compatible*; their combined effect being "A is not true."

Hence, if C is true, A is not true; and *vice versa*, if A is true, C is not true: i. e. A and C cannot be true together.

But there is nothing to prevent C *alone* being true; i. e. it is possible, consistently with I and II, that the sale *may* have been completed.

6.13 A Disputed Point in Logic (May 1894)

Source: printed 1894

There are three men in a house, Allen, Brown, and Carr, who may go in and out, provided that (1) they never go out all at once, and that (2) Allen never goes out without Brown.

Can Carr ever go out?

NEMO and OUTIS differ on this point.

NEMO says he cannot: OUTIS says he can.

The rules, by which the men are bound, may be expressed thus:—

- (1) If Carr goes out, then if Allen goes out Brown does not go out.
- (2) If Allen goes out, Brown goes out.

NEMO's Argument

Number (1) amounts to this:—

If Carr goes out, then (2) is not true.

But, *ex hypothesi*, (2) is true.

∴ Carr cannot go out; for the assumption that he goes out involves an absurdity.

OUTIS's Reply

NEMO's two assertions, "if Carr goes out, then (2) is not true" and "the assumption that Carr goes out involves an absurdity", are erroneous.

The assumption, that Carr goes out, does *not* involve any absurdity; since the two propositions, "if Allen goes out Brown does not go out" and "if Allen goes out Brown goes out", are *compatible*.

But the assumption, that Carr and Allen go out both at once, *does* involve an absurdity; since the two propositions, "Brown does not go out" and "Brown goes out", are *incompatible*.

Hence it follows, not that Carr cannot go out, but that Carr and Allan cannot go out both at once.

NEMO's Rejoinder

OUTIS has wrongly divided protasis and apodosis in (1).

The absurdity is not the last clause of (1), "Brown does not go out", but *all* that follows the word "then", i. e. the Hypothetical "If Allen goes out Brown does not go out"; and, by (1), it is the assumption, that Carr goes out, which causes this absurdity.

In fact, OUTIS has made (1) equivalent to "If Carr goes out [and if Allen goes out] then if Allen goes out Brown does not go out". This is erroneous: the words in the brackets in the compound protasis are superfluous, and the remainder is the true protasis which conditions the absurd apodosis, as is evident from the form of (1) originally given.

[May 1, 1894.]

6.14 A Theorem in Logic

Source: printed 1894

There are three Propositions, A , B , and C .

It is given that

“If A is true, B is true. (i)

If C is true, then if A is true B is not true. (ii)

Number (ii) amounts to this:—

If C is true, then (i) is not true.

But, *ex hypothesi*, (i) is true.

∴ C cannot be true; for the assumption of C involves an absurdity.

This Theorem in Hypotheticals—that the Propositions, numbered (i) and (ii), together prove that C cannot be true—may be illustrated by the following algebraical example:—

Let $ax + (a - b)y + z = 5$; (1)

$bx + z = 6$ (2)

Equation (1) may be stated as a Hypothetical, thus:—

“If ax , $(a - b)y$, and z be added together, the number ‘5’ is obtained”.

Let ‘ A ’ mean “ ax , $(a - b)y$, and z are added together”;

‘ B ’ ” “the number ‘5’ is obtained”;

‘ C ’ ” “ $a = b$ ”.

Then we have

“If A is true B is true”.

Assume that C is true; i. e. that $a = b$.

Then $(ax + (a - b)y + z)$ becomes $(bx + z)$, which, by Equation (2), must *always* = 6.

Hence

“If C is true, then if A is true B is not true”.

Therefore C cannot be true;

i. e. ‘ a ’ cannot = ‘ b ’.

6.15 A Logical Paradox

Source: Mind, July 1894

By Lewis Carroll

“What, *nothing* to do?” said Uncle Jim. “Then come along with me down to Allen’s. And you can just take a turn while I get myself shaved.”

“All right,” said Uncle Joe. “And the Cub had better come too, I suppose?”

The “Cub” was *me*, as the reader will perhaps have guessed for himself. I’m turned *fifteen*—more than three months ago; but there’s no sort of use in mentioning *that* to Uncle Joe; he’d only say “Go to your cubbicle, little boy!” or “Then I suppose you can do cubbic equations?” or some equally vile pun. He asked me yesterday to give him an instance of a Proposition in *A*. And I said “All uncles make vile puns”. And I don’t think he liked it. However, that’s neither here nor there. I was glad enough to go. I *do* love hearing those uncles of mine “chop logic,” as they call it; and they’re desperate hands at it, *I* can tell you!

“That is not a logical inference from my remark,” said Uncle Jim.

“Never said it was,” said Uncle Joe: “it’s a *Reductio ad Absurdum*”.

“An *Illicit Process of the Minor!*” chuckled Uncle Jim.

That’s the sort of way they always go on, whenever *I’m* with them. As if there was any fun in calling me a Minor!

After a bit, Uncle Jim began again, just as we came in sight of the barber’s. “I only hope *Carr* will be at home,” he said. “Brown’s so clumsy. And Allen’s hand has been shaky ever since he had that fever.”

“Carr’s *certain* to be in,” said Uncle Joe.

“I’ll bet you sixpence he *isn’t!*” said I.

“Keep your bets for your betters,” said Uncle Joe. “I mean”—he hurried on, seeing by the grin on my face what a slip he’d made—“I mean that I can *prove* it, logically. It isn’t a matter of *chance*.”

“Prove it *logically!*” sneered Uncle Jim. “Fire away, then! I defy you to do it!”

“For the sake of argument,” Uncle Joe began, “let us assume Carr to be *out*. And let us see what that assumption would lead to. I’m going to do this by *Reductio ad Absurdum*.”

“Of course you are!” growled Uncle Jim. “Never knew any argument of *yours* that didn’t end in some absurdity or other!”

“Unprovoked by your unmanly taunts,” said Uncle Joe in a lofty tone, “I proceed. Carr being out, you will grant that, if Allen is *also* out, *Brown* must be at home?”

“What’s the good of *his* being at home?” said Uncle Jim. “I don’t want *Brown* to shave me! He’s too clumsy.”

“Patience is one of those inestimable qualities——” Uncle Joe was beginning; but Uncle Jim cut him off short.

“*Argue!*” he said. “Don’t *moralise!*”

“Well, but *do* you grant it?” Uncle Joe persisted. “Do you grant me that, if Carr is out, it follows that if Allen is out *Brown must* be in?”

“Of course he must,” said Uncle Jim; “or there’d be nobody to mind the shop.”

“We see, then, that the absence of Carr brings into play a certain Hypothetical, whose *protasis* is ‘Allen is out,’ and whose *apodosis* is ‘Brown is in’. And we see that, so long as Carr remains out, this Hypothetical remains in force?”

“Well, suppose it does. What then?” said Uncle Jim.

“You will also grant me that the truth of a Hypothetical—I mean its *validity* as a logical *sequence*—does not in the least depend on its *protasis* being actually *true*, nor even on its being *possible*. The Hypothetical ‘If you were to run from here to London in five minutes you would surprise people,’ remains true as a *sequence*, whether you can do it or not.”

“I *ca’n’t* do it,” said Uncle Jim.

“We have now to consider *another* Hypothetical. What was that you told me yesterday about Allen?”

“I told you,” said Uncle Jim, “that ever since he had that fever he’s been so nervous about going out alone, he always takes Brown with him.”

“Just so,” said Uncle Joe. “Then the Hypothetical ‘if Allen is out Brown is out’ is *always* in force, isn’t it?”

“I suppose so,” said Uncle Jim. (He seemed to be getting a little nervous, himself, now.)

“Then, if Carr is out, we have *two* Hypotheticals, ‘if Allen is out Brown is *in*’ and ‘If Allen is out Brown is *out*,’ in force at once. And two *incompatible* Hypotheticals, mark you! They *ca’n’t possibly* be true together!”

“*Ca’n’t* they?” said Uncle Jim.

“How *can* they?” said Uncle Joe. “How *can* one and the same *protasis* prove two contradictory *apodoses*? You grant that the two *apodoses*, ‘Brown is *in*’ and ‘Brown is *out*,’ are contradictory, I suppose?”

“Yes, I grant *that*,” said Uncle Jim.

“Then I may sum up,” said Uncle Joe. “If Carr is out, these two Hypotheticals are true together. And we know that they *cannot* be true together. Which is absurd. Therefore Carr *cannot* be out. There’s a nice *Reductio ad Absurdum* for you!”

Uncle Jim looked thoroughly puzzled; but after a bit he plucked up courage, and began again. “I don’t feel at all clear about that *incompatibility*. Why shouldn’t those two Hypotheticals be true together? It seems to me that would simply prove ‘Allen is in’. Of course, it’s clear that the *apodoses* of those two Hypotheticals are incompatible—‘Brown is in’ and ‘Brown is out’. But why shouldn’t we put it like this? If Allen is out Brown is *out*. If Carr and Allen are *both* out, Brown is *in*. Which is absurd. Therefore Carr and Allen *ca’n’t* be *both* of them out. But, so long as Allen is *in*, I don’t see what’s to hinder Carr from going *out*.”

“My dear, but most illogical, brother!” said Uncle Joe. (Whenever Uncle Joe begins to “dear” you, you may make pretty sure he’s got you in a cleft stick!) “Don’t you see that you are wrongly dividing the *protasis* and the *apodosis* of that Hypothetical? Its *protasis* is simply ‘Carr is out’; and its *apodosis* is a sort of sub-Hypothetical, ‘If Allen is out, Brown is *in*’. And a most absurd *apodosis* it is, being hopelessly incompatible with that other Hypothetical, that we know is *always* true, ‘If Allen is out, Brown is *out*’. And it’s simply the assumption ‘Carr is out’ that has caused this absurdity. So there’s only *one* possible conclusion. *Carr is in!*”

How long this argument *might* have lasted, I haven’t the least idea. I believe *either* of them could argue for six hours at a stretch. But, just at this moment,

we arrived at the barber's shop; and, on going inside, we found——

Note

The paradox, of which the foregoing paper is an ornamental presentment, is, I have reason to believe, a very real difficulty in the Theory of Hypotheticals. The disputed point has been for some time under discussion by several practised logicians, to whom I have submitted it; and the various and conflicting opinions, which my correspondence with them has elicited, convince me that the subject needs further consideration, in order that logical teachers and writers may come to some agreement as to what Hypotheticals *are*, and how they ought to be treated.

The original dispute, which arose, more than a year ago, between two students of Logic, may be symbolically represented as follows:—

There are two Propositions, *A* and *B*.

It is given that

- (1) If *C* is true, then, if *A* is true, *B* is not true;
- (2) If *A* is true, *B* is true.

The question is, can *C* be true?

The reader will see that if, in these two Propositions, we replace the letters, *A*, *B*, *C* by the names Allen, Brown, Carr, and the words “true” and “not true” by the words “out” and “in” we get

- (1) If Carr is out, then, if Allen is out, Brown is in;
- (2) If Allen is out, Brown is out.

These are the very two Propositions on which “Uncle Joe” builds his argument.

Several very interesting questions suggest themselves in connexion with this point, such as

Can a Hypothetical, whose protasis is false, be regarded as legitimate?

Are two Hypotheticals, of the forms “If *A* then *B*” and “If *A* then not-*B*,” compatible?

What difference in meaning, if any, exists between the following Propositions?

- (1) *A*, *B*, *C*, cannot be all true at once;
- (2) If *C* and *A* are true, *B* is not true;
- (3) If *C* is true, then, if *A* is true, *B* is not true;
- (4) If *A* is true, then, if *C* is true, *B* is not true.

The following concrete form of the paradox has just been sent me, and may perhaps, as embodying *necessary* truth, throw fresh light on the question.

Let there be three lines, *KL*, *LM*, *MN*, forming, at *L* and *M*, equal acute angles on the same side of *LM*.

Let “*A*” mean “The points *K* and *N* coincide, so that the three lines form a triangle”.

Let “*B*” mean “The triangle has equal base-angles”.

Let “*C*” mean “The lines *KL* and *MN* are unequal”.

Then we have

- (1) If *C* is true, then, if *A* is true, *B* is not true;
- (2) If *A* is true, *B* is true.

The second of these Propositions needs no proof; and the first is proved in Euc., i, 6, though of course it may be questioned whether it fairly represents Euclid's meaning.

I greatly hope that some of the readers of MIND who take an interest in logic will assist in clearing up these curious difficulties.

6.16 A Logical Puzzle

Source: printed 1894

There are three Propositions, A , B , and C .

It is given that

- “If A is true, B is true. (i)
- If C is true, then if A is true B is not true. (ii)

NEMO and OUTIS differ about the truth of C .

NEMO says C cannot be true: OUTIS says it may be.

NEMO’s Argument

Number (ii) amounts to this:—

If C is true, then (i) is not true.

But, *ex hypothesi*, (i) is true.

∴ C cannot be true; for the assumption of C involves an absurdity.

OUTIS’s Reply

NEMO’s two assertions, “if C is true, then (i) is not true” and “the assumption of C involves an absurdity”, are erroneous.

The assumption of C alone does *not* involve any absurdity, since the two Hypotheticals, “if A is true, B is true” and “if A is true, B is not true”, are *compatible*; i. e. they can be true together, in which case A cannot be true.

But the assumption of C and A together does involve an absurdity; since the two Propositions, “ B is true” and “ B is not true”, are *incompatible*.

Hence it follows, not that C , taken by itself, cannot be true, but that C and A cannot be true together.

NEMO’s Rejoinder

OUTIS has wrongly divided Protasis and Apodosis in (ii).

The absurdity is not the last clause of (ii), “ B is not true”, but *all* that follows the word “then”, i. e. the Hypothetical “If A is true B is not true”; and, by (ii), it is the assumption of C only which causes this absurdity.

In fact, OUTIS has made (ii) equivalent to “If C is true [and if A is true] then if A is true B is not true”. This is erroneous: the words in the brackets in the compound Protasis are superfluous, and the remainder is the true Protasis which conditions the absurd Apodosis, as is evident from the form of (ii) originally given.

This Theorem in Hypotheticals—that the Propositions, numbered (i) and (ii), together prove that C cannot be true—may be illustrated by the following algebraical example:—

$$\text{Let } ax + (a - b)y + z = 5; \dots\dots\dots (1)$$

$$bx + z = 6 \dots\dots\dots (2)$$

Equation (1) may be stated as a Hypothetical, thus:—

“If ax , $(a - b)y$, and z be added together, the number ‘5’ is obtained”.

Let ‘ A ’ mean “ ax , $(a - b)y$, and z are added together”;

‘ B ’ ” “the number ‘5’ is obtained”;

‘ C ’ ” “ $a = b$ ”.

Then we have

“If A is true B is true”.

Assume that C is true; i. e. that $a = b$.

Then $(ax + (a - b)y + z)$ becomes $(bx + z)$, which, by Equation (2), must *always* = 6.

Hence

“If C is true, then if A is true B is not true”.

Therefore C cannot be true;

i. e. ‘ a ’ cannot = ‘ b ’.

OUTIS’s Second Reply

This reply will include (α) a proof that “NEMO’s Argument” is self-destructive; (β) a proof that his algebraical example fails, owing to its not correctly representing the data; (γ) a proof that, when corrected, it illustrates OUTIS’s contention, viz. that Hypotheticals (i) and (ii) prove, not that C , *taken by itself*, cannot be true, but that C and A cannot be true *together*; (δ) a simple proof of the *true* outcome of these two Hypotheticals.

(α)

Let us consider the Trio of Hypotheticals (which we will call (K), (L), and (M))

(K) “If X is true, Y is not true”.

(L) “If X is true, Y is true”.

(M) “If X is not true, Y is true”

It will not be disputed that (L) and (M), taken together, are equivalent to the Categorical (which we will call ‘ N ’) “ Y is true.” Hence the above Trio of Hypotheticals is equivalent to the Hypothetical and Categorical

(K) “If X is true, Y is not true”.

(N) “ Y is true”.

For this Trio (or its equivalent Pair) two different interpretations might be proposed, viz.

“(K) and (L) cannot be true together. Hence, (K), (L), and (M) cannot be true together.”

“(K) and (N) can be true together; that is, (K), (L), and (M) can be true together.”

These interpretations are *incompatible*.

Now, when NEMO says “the assumption of C involves an absurdity”, the “absurdity”, to which he alludes, is the *simultaneous truth* of the two Propositions “If A is true B is true” and “If A is true B is not true”.

These two Propositions are Hypotheticals of the forms (L) and (K): and, in declaring that the assumption of their simultaneous truth involves an absurdity, NEMO virtually declares that they *cannot be true together*.

Here, then, he adopts the *first* interpretation of the Trio of Hypotheticals, (K), (L), and (M).

Again, when he says “ $\therefore C$ cannot be true”, the premisses, from which he deduces this conclusion, are the two Propositions “If C is true, then (i) is not true. But, *ex hypothesi*, (i) is true”.

These two Propositions are a Hypothetical and a Categorical of the forms (*K*) and (*N*): and, in deducing a conclusion from them, regarded as premisses, NEMO virtually declares that they *can be true together*.

Here, then, he adopts the *second* interpretation of the Trio of Hypotheticals, (*K*), (*L*), and (*M*).

Thus, he has adopted, in the course of one and the same argument, *two incompatible* interpretations of this Trio.

Hence, “NEMO’s Argument” is self-destructive.

(β)

Let us now examine NEMO’s algebraical example.

He gives us Equations (1) and (2) as *always true*.

Hence Equation (1) remains true, even when $a = b$.

Hence his second Hypothetical is incomplete: it ought to be “If *C* is true, then if *A* is true *B* is (by Equation 1) true, but (by Equation 2) not true.”

Hence his algebraical example fails, owing to its not correctly representing the data.

(γ)

The two Hypotheticals, when *fully* stated, run thus:—

“If *A* is true, *B* is (by Equation 1) true”;

“If *C* is true, then if *A* is true *B* is (by Equation 1) true, but (by Equation 2) not true.”

These two may be stated as *three* Hypotheticals, viz.

“If *A* is true, *B* is (by Equation 1) true”;

“If *C* is true, then if *A* is true *B* is (by Equation 1) true;

“If *C* is true, then if *A* is true *B* is (by Equation 2) not true.”

The second of these we may omit, as it leads to no result. The other two may be more briefly stated thus:—

“If *A* and (1) are true, *B* is true;

If *C* and *A* and (2) are true, *B* is not true”.

And the correct conclusion is, not that *C*, *taken by itself*, cannot be true, but that *C*, *A*, (1), and (2) cannot all be true *together*.

But *A* is *always possible*; so that we may, if we like, assume it is *always true*, and not mention it.

The two Hypotheticals may now be written thus:—

“If (1) is true, *B* is true;

If *C* and (2) are true, *B* is not true”.

Therefore *C* and (1) and (2) cannot all be true *together*, though any *two* of them may be true *by themselves*.

Thus, if *C* and (1) are true, then (2) cannot be true: that is, if $a = b$ (so that Equation (1) becomes “ $bx + z = 5$ ”), and if Equation 1 is true, and if $bx + z = 6$, then it cannot be true that

$$ax + (a - b)y + z = 5.$$

Thirdly, if (1) and (2) are true, then C cannot be true: that is, if *both* the given Equations are true, then a cannot $= b$.

This algebraical example might easily mislead an unwary reader, from the fact that its Conclusion, " C cannot be true," is (on the assumption that Equations 1 and 2 are always true) a true one. The fallacy lies in prefixing the word "Therefore," and thereby asserting that this Conclusion *follows from the two Hypotheticals*. This is *not* the case: the *real* reason, why C cannot be true, is that *it is incompatible with Equations 1 and 2* (by subtraction we get $(a-b)(x+y) = -1$, whence it follows that $(a-b)$ cannot $= 0$; i. e. that a cannot $= b$: the two Hypotheticals, by themselves, do *not* prove it.

(δ)

The *true* outcome, of the original Hypotheticals numbered (i) and (ii), may be very simply exhibited as follows:—

Let ' t ' stand for "true", and ' f ' for "false".

There are 8 conceivable combinations of A , B , and C , with regard to truth and falsity: these are as follows:—

	1.	2.	3.	4.	5.	6.	7.	8.
$A.$	t	t	t	t	f	f	f	f
$B.$	t	t	f	f	t	t	f	f
$C.$	t	f	t	f	t	f	t	f

Of these, Nos. 3 and 4 are forbidden by (i), and No. 1 is forbidden by (ii).

The other 5 combinations are *possible*; and *two* of them, viz. Nos. 5 and 7, contain the condition " C is true", which NEMO believes to be *impossible*.

6.17 Questions for Solution: 14122

Source: The Educational Times, February 1899

A solution by H. W. Curjel was published in September 1899, see

<https://archive.org/details/educationaltimes52educ/page/386>, by H. MacColl
in June 1900, see

<https://archive.org/details/educationaltimes53educ/page/258>

14122. (The late “LEWIS CARROLL.”)—It is given that (1), if C is true, then, if A is true, B is not true; and (2), if A is true, B is true. Can C be true? What difference in meaning, if any, exists between the following propositions?—
(1) A, B, C cannot be all true at once; (2) if C and A are true, B is not true;
(3) if C is true, then, if A is true, B is not true.

6.18 Symbolic Logic. Specimen-Syllogisms. Premises

Source: printed 1894 in two editions, first with minor differences as noted

1. Nothing intelligible ever puzzles *me*;
Logic puzzles me.
2. Nothing, that is nice, need be shunned;
Some kinds of jam are nice.
3. Warmth relieves pain;
Nothing, that does *not* relieve pain, is useful in toothache.
4. No birds, except peacocks, are proud of their tails;
Some birds, that are proud of their tails, cannot sing.
5. All those bonbons are chocolate-creams;
All these bonbons are delicious.
6. No one, when exercising self-control, fails to keep his temper;
Some persons, when contradicted, keep their tempers.
7. Nothing in this book interest me;
This book consists entirely of easy riddles.
8. All clever people are popular;
All good-tempered people are popular.
9. No portrait of a lady, that makes her simper or scowl, is satisfactory.
No photograph of a lady ever fails to make her simper or scowl.
10. Those, who are fully occupied, never talk about their grievances;
Discontented people are always talking about their grievances.
11. No tall men have woolly hair;
All niggers have woolly hair.
12. Your course is always honest;
Your course is always the best policy.
13. All is not gold that glitters;
Glittering things dazzle the eyes.
14. I don't believe *everything* he tells me;
I believe he is planning to go abroad.
- 15.¹ All dogs of mine, that are not black, are valuable;
Some of my greyhounds have won prizes.
16. (1) No cats sing well;
(2) None of my household get any cream, unless they sing well;
(3) All cats get cream.
17. (1) All boots are leather;

Other version:
→ 6.4, p. 998

¹This is missing in the first edition, the following have numbers 15 to 17.

- (2) Anything made of buttered toast is good to eat;
 - (3) No leather boots are good to eat.
18. (1) No pins of mine, that will bend, are useful;
- (2) Nothing made of steel will bend;
 - (3) All my useless pins are made of steel.⁷²
19. (1) Ungraceful creatures are thoughtful when left alone;
- (2) No elephants are graceful;
 - (3) When one is disliked, one is left alone;
 - (4) Thoughtful elephants are universally liked;
 - (5) Ungraceful creatures, who are not fond of apples, are disliked.
20. (1) No invalids are unromantic civilians;
- (2) All architects are dreamy enthusiasts;
 - (3) No lovers are unhappy;
 - (4) No military men are dreamy;
 - (5) All romantic enthusiasts are in love;
 - (6) All who live on muffins are unhappy invalids.

[Feb., 1894]

²In the first edition followed by:

18. (1) All rolling stones are restless;
- (2) All stones are heavy;
 - (3) All restless things, that gather moss, are light.

6.19 Symbolic Logic. Specimen-Syllogisms. (2nd Ed.) Conclusions

Source: printed 1894

1. Logic is unitelligible.
2. Some kinds of jam need not be shunned.
3. [*No conclusion.*]
4. Some peacocks cannot sing.
5. Some chocolate-creams are delicious.
6. [*No conclusion.*]
7. Easy riddles do not interest me.¹
8. [*No conclusion.*]
9. No photograph of a lady is satisfactory.
10. Those, who are fully occupied, are contented; and discontented people are not fully occupied.
11. All niggers are short.
12. Honesty is sometimes the best policy.
13. Some things, that dazzle the eyes, are not gold.
14. The assertion “the only thing he has told me is that he is planning to go abroad” is false.
15. The assertion “I have no black dogs that have won prizes and no valuable greyhounds” is false.
16. Cats are forbidden in my house.
17. Boots are not made of buttered toast; and things made of buttered toast are not boots.
18. All my pins are unbendable.
19. Ungraceful creatures, who are not fond of apples, are not elephants.²
20. Architects do not live on muffins; and those, who live on muffins, are not architects.

[Feb., 1894]

¹This should be: Some easy riddles do not interest me.

²This should be: Elephants are fond of apples; and creatures, who are not fond of apples, are not elephants.

6.20 Symbolic Logic. Questions. I

Source: printed 1894

1. Explain the words "Logic" and "Proof".
2. Why do we need Logic?
3. Explain "Proposition". State the 3 ordinary forms, using x and y . And give an example of each kind, of your own invention.
4. Explain "Division", and "Exhaustive Division".
5. Break up each of the following Propositions under the 4 headings "Sign of Quantity", "Subject", "Copula", "Predicate".

- (a) Some of us cannot understand Logic.
- (b) I don't like Logic!
- (c) No cheap goods last long.

6. In Diagram $\begin{array}{|c|c|} \hline x & y \\ \hline y & x \\ \hline \end{array}$, what Propositions would be represented by $\begin{array}{|c|c|} \hline 0 & \\ \hline \end{array}$, $\begin{array}{|c|c|} \hline & 1 \\ \hline \end{array}$, $\begin{array}{|c|c|} \hline 0 & 1 \\ \hline \end{array}$, $\begin{array}{|c|c|} \hline 0 & 0 \\ \hline \end{array}$?

7. Represent (drawing a diagram for each),

- (a) No x are not- y .
- (b) All x are y .
- (c) Some x exist.
- (d) Some books are bound and some are not. (x = "books"; y = "bound books".)
- (e) All my friends are unkind. (x = "my friends"; y = "kind friends".)
- (f) I have no friends.

8. State the Contradictories of (a), (c), (f), in Question 7.

[Feb., 1894]

6.21 Symbolic Logic. Questions. II

Source: printed 1894

1. Describe the 3 ways in which we get knowledge.
2. Which of the following Divisions are 'Cross', 'Exhaustive', 'Incomplete', 'Dichotomy'.

- (1) Dividing the girls in a certain School into 'over 10', '10', 'under 10'.
- (2) Dividing them into 'those whose names are one syllable', 'those whose names are two syllables'.
- (3) Dividing them into 'those who learn Arithmetic', 'those who learn History'.
- (4) Dividing them into 'not more than 5 feet high', 'not less than 5 feet high'.
- (5) Dividing them into 'those who are in this room', 'those who are not in this room'.
- (6) Dividing them into 'those who can sing and dance', 'those who can sing but cannot dance', 'those who can dance but cannot sing', 'those who can neither sing nor dance'.

3. State the following as Logical Propositions:—

- (a) Over-eating injures the health.
- (b) Some friends called here yesterday.
- (c) Nobody likes to be contradicted.

4. Name the 'Sign of Quantity', and the 'Predicate' of (a), the 'Copula' of (b), and the 'Subject' of (c).

5. In the lower Diagram on the card, what Propositions are represented by

6. Represent (drawing a diagram for each):—

- (a) Some things are neither x nor y .
- (b) All not- x are y .
- (c) No not- y exist.
- (d) Mary is ill. (Univ. = 'people'; x = "Mary"; y = "ill".)
- (e) There is nothing nice for dinner. (Univ. = "food"; x = "provided for dinner"; y = "nice".)
- (f) There is nothing for dinner!

7. Break up each of the Double Propositions, (d) and (f), into two single ones.

[Feb., 1894]

6.22 What the Tortoise Said to Achilles

Source: Mind, April 1895

By Lewis Carroll

Achilles had overtaken the Tortoise, and had seated himself comfortably on its back.

“So you’ve got to the end of our race-course?” said the Tortoise. “Even though it *does* consist of an infinite series of distances? I thought some wiseacre or other had proved that the thing couldn’t be done?”

“It *can* be done,” said Achilles. “It *has* been done! *Solvitur ambulando*. You see the distances were constantly *diminishing*; and so—”

“But if they had been constantly *increasing*?” the Tortoise interrupted. “How then?”

“Then I shouldn’t be *here*,” Achilles modestly replied; “and *you* would have got several times round the world, by this time!”

“You flatter me—*flatten*, I mean,” said the Tortoise; “for you *are* a heavy weight, and *no* mistake! Well now, would you like to hear of a race-course, that most people fancy they can get to the end of in two or three steps, while it *really* consists of an infinite number of distances, each one longer than the previous one?”

“Very much indeed!” said the Grecian warrior, as he drew from his helmet (few Grecian warriors possessed *pockets* in those days) an enormous note-book and a pencil. “Proceed! And speak *slowly*, please! *Short-hand* isn’t invented yet!”

“That beautiful First Proposition of Euclid!” the Tortoise murmured dreamily. “You admire Euclid?”

“Passionately! So far, at least, as one *can* admire a treatise that wo’n’t be published for some centuries to come!”

“Well, now, let’s take a little bit of the argument in that First Proposition—just *two* steps, and the conclusion drawn from them. Kindly enter them in your note-book. And, in order to refer to them conveniently, let’s call them *A*, *B*, and *Z*:—

- (A) Things that are equal to the same are equal to each other.
- (B) The two sides of this Triangle are things that are equal to the same.
- (Z) The two sides of this Triangle are equal to each other.

“Readers of Euclid will grant, I suppose, that *Z* follows logically from *A* and *B*, so that any one who accepts *A* and *B* as true, *must* accept *Z* as true?”

“Undoubtedly! The youngest child in a High School—as soon as High Schools are invented, which will not be till some two thousand years later—will grant *that*.”

“And if some reader had *not* yet accepted *A* and *B* as true, he might still accept the *sequence* as a *valid* one, I suppose?”

“No doubt such a reader might exist. He might say ‘I accept as true the Hypothetical Proposition that, *if* *A* and *B* be true, *Z* must be true; but I *don’t* accept *A* and *B* as true.’ Such a reader would do wisely in abandoning Euclid, and taking to football.”

“And might there not *also* be some reader who would say ‘I accept *A* and *B* as true, but I *don’t* accept the Hypothetical’?”

“Certainly there might. *He*, also, had better take to football.”

“And *neither* of these readers,” the Tortoise continued, “is *as yet* under any logical necessity to accept *Z* as true?”

“Quite so,” Achilles assented.

“Well, now, I want you to consider *me* as a reader of the *second* kind, and to force me, logically, to accept *Z* as true.”

“A tortoise playing football would be—” Achilles was beginning

“—an anomaly, of course,” the Tortoise hastily interrupted. “Don’t wander from the point. Let’s have *Z* first, and football afterwards!”

“I’m to force you to accept *Z*, am I?” Achilles said musingly. “And your present position is that you accept *A* and *B*, but you *don’t* accept the Hypothetical—”

“Let’s call it *C*,” said the Tortoise.

“—but you *don’t* accept

(*C*) If *A* and *B* are true, *Z* must be true.”

“That is my present position,” said the Tortoise.

“Then I must ask you to accept *C*.”

“I’ll do so,” said the Tortoise, “as soon as you’ve entered it in that note-book of yours. What else have you got in it?”

“Only a few memoranda,” said Achilles, nervously fluttering the leaves: “a few memoranda of—of the battles in which I have distinguished myself!”

“Plenty of blank leaves, I see!” the Tortoise cheerily remarked. “We shall need them *all!*” (Achilles shuddered.) “Now write as I dictate:—

(*A*) Things that are equal to the same are equal to each other.

(*B*) The two sides of this Triangle are things that are equal to the same.

(*C*) If *A* and *B* are true, *Z* must be true.

(*Z*) The two sides of this Triangle are equal to each other.”

“You should call it *D*, not *Z*,” said Achilles. “It comes *next* to the other three. If you accept *A* and *B* and *C*, you *must* accept *Z*.”

“And why *must* I?”

“Because it follows *logically* from them. If *A* and *B* and *C* are true, *Z* *must* be true. You don’t dispute *that*, I imagine?”

“If *A* and *B* and *C* are true, *Z* *must* be true,” the Tortoise thoughtfully repeated. “That’s *another* Hypothetical, isn’t it? And, if I failed to see its truth, I might accept *A* and *B* and *C*, and *still* not accept *Z*, mightn’t I?”

“You might,” the candid hero admitted; “though such obtuseness would certainly be phenomenal. Still, the event is *possible*. So I must ask you to grant *one* more Hypothetical.”

“Very good. I’m quite willing to grant it, as soon as you’ve written it down. We will call it

(*D*) If *A* and *B* and *C* are true, then *Z* must be true.

Have you entered that in your note-book?”

“I *have!*” Achilles joyfully exclaimed, as he ran the pencil into its sheath. “And at last we’ve got to the end of this ideal race-course! Now that you accept *A* and *B* and *C* and *D*, *of course* you accept *Z*.”

“Do I?” said the Tortoise innocently. “Let’s make that quite clear. I accept *A* and *B* and *C* and *D*. Suppose I *still* refused to accept *Z*?”

“Then Logic would take you by the throat, and *force* you to do it!” Achilles triumphantly replied. “Logic would tell you ‘You ca’n’t help yourself. Now that you’ve accepted *A* and *B* and *C* and *D*, you *must* accept *Z!*’ So you’ve no choice, you see.”

“Whatever *Logic* is good enough to tell me is worth *writing down*,” said the Tortoise. “So enter it in your book, please. We will call it

(*E*) If *A* and *B* and *C* and *D* are true, *Z* must be true. Until I’ve granted *that*, of course I needn’t grant *Z*. So it’s quite a *necessary* step, you see?”

“I see,” said Achilles; and there was a touch of sadness in his tone.

Here the narrator, having pressing business at the Bank, was obliged to leave the happy pair, and did not again pass the spot until some months afterwards. When he did so, Achilles was still seated on the back of the much-enduring Tortoise, and was writing in his note-book, which appeared to be nearly full. The Tortoise was saying “Have you got that last step written down? Unless I’ve lost count, that makes a thousand and one. There are several millions more to come. And *would* you mind, as a personal favour, considering what a lot of instruction this colloquy of ours will provide for the Logicians of the Nineteenth Century—*would* you mind adopting a pun that my cousin the Mock-Turtle will then make, and allowing yourself to be re-named *Taught-U*s?”

“As you please!” replied the weary warrior, in the hollow tones of despair, as he buried his face in his hands. “Provided that *you*, for *your* part, will adopt a pun the Mock-Turtle never made, and allow yourself to be re-named *A Kill-Ease*!”

6.23 Logical Nomenclature

Source: printed 1895, in two variants

Desiderata

Variant I

In each of the following sets of words, printed in italics and enclosed in brackets, the Reader is requested to score the one which he thinks most appropriate, or to insert one of his own invention, if he can think of one better than any of them.

(1)

The name “soldier” represents, equally well, each of a number of different objects of thought; and, when we hear it used, we are not certain what particular object of thought the speaker refers to. Such a name may be called [*collective, common, general, indefinite, etc.*]

(2)

The name “London”, or the name “soldiers” (when used in the sense of “*all soldiers*”, as in the Proposition “Soldiers are men”), represents only *one* object of thought; and, when we hear it used, we are certain what particular object of thought the speaker refers to. Such a name may be called [*definite, individual, particular, singular, etc.*]

(3)

Suppose that a certain valid argument has “No *A* are *B*” for its Conclusion; but that this Conclusion is *false*, one of the Premisses also being *false*.

(1) We may say

“The Conclusion “No *A* are *B*” is [*consequent, correct, lawful, legal, legitimate, logical, right, valid, etc.*] but *false*’.

(2) Again, we may say

“The Conclusion “Some *A* are *B*” is [*inconsequent, incorrect, unlawful, illegal, illegitimate, illogical, wrong, invalid, etc.*] though *true*’.

(4)

Suppose that a certain valid argument has the double Proposition “No *A* are *B*, and no *C* are *D*” for its Conclusion.

(3) We may say

“The Conclusion “No *A* are *B*, and no *C* are *D*” is [*consequent, etc.*] and [*complete, full, perfect, etc.*]’.

(4) Again, we may say

“The Conclusion “No *A* are *B*” is [*consequent, etc.*] but [*incomplete, imperfect, deficient, defective, etc.*]’.

For each of the following Fallacies a short and expressive Name is desired.

(1)

“Schoolboys are numerous;
My sons are not numerous.
∴ My sons are not schoolboy.”

(2)

“Books in my bookcase are books in my room. Hence, to diminish the number of books in my bookcase is to diminish the number of books in my room.”

(3)

“He who is most hungry eats most;
He who eats most is least hungry.
∴ He who is most hungry is least hungry.”

(4)

“So your picture is No. 1 in the Catalogue, is it? Well, *that* doesn’t prove it to be the best in the Exhibition!” [This *insinuates*, without actually saying it, that the artist had assumed that the mark ‘No. 1’ *did* prove his picture to be the best. It might perhaps be called ‘*The Fallacy of denying what has not been asserted*’.]

June, 1895

Variant II

In each of the following sets of words, printed in italics and enclosed in brackets, the Reader is requested to score the one which he thinks most appropriate, or to insert one of his own invention, if he can think of one better than any of them.

(1)

A name, which represents, equally well, each of a number of different objects of thought (e. g. “soldier”), may be called [*collective, common, general, indefinite, etc.*]

(2)

A name, which represents only *one* object of thought (e. g. “the sun”), may be called [*definite, individual, particular, singular, etc.*]

(3)

Under which category would you place the following names, “our soldiers”, “our army”, “Frenchmen”, “manhood”?

(4)

The Conclusion of a valid argument may be called [*consequent, correct, lawful, legal, legitimate, logical, right, valid, etc.*]

(5)

Would you prefix the adverb “*formally*”?

(6)

A Proposition, offered as the Conclusion of an invalid argument, may be called [*inconsequent, incorrect, unlawful, illegal, illegitimate, illogical, wrong, invalid, etc.*]

(7)

When a Proposition, offered as the Conclusion of a valid argument, contains the *whole* of its Conclusion, it may be called [*complete, full, perfect, etc.*]

(8)

When it contains only a *portion* of its Conclusion, it may be called [*incomplete, imperfect, deficient, defective, etc.*]

June, 1895.

6.24 Symbolic Logic. Part I: Elementary

Source: Symbolic Logic. Part I: Elementary; fourth edition (one chapter currently not included)

Many syllogisms from Book VIII, Chapter I, § 5 and § 7 are reprinted from earlier works (especially *The Game of Logic*, Chapter IV, and *Symbolic Logic. Specimen-Syllogisms*), but in a new order, so linking the other version is not possible.

A Syllogism worked out.

That story of yours, about your once meeting the sea-serpent, always sets me off yawning;
I never yawn, unless when I'm listening to something totally devoid of interest.

The Premises, separately.

The Premises, combined.

The Conclusion.

That story, of yours, about your once meeting the sea-serpent, is totally devoid of interest.

Book I. Things and Their Attributes.

Chapter I. Introductory.

The Universe contains 'Things.'

[For example, "I," "London," "roses," "redness," "old English books," "the letter which I received yesterday."]

Things have 'Attributes.'

[For example, "large," "red," "old," "which I received yesterday."]

One Thing may have many Attributes; and one Attribute may belong to many Things.

[Thus, the Thing "a rose" may have the Attributes "red," "scented," "full-blown," &c.; and the Attribute "red" may belong to the Things "a rose," "a brick," "a ribbon," &c.]

Any Attribute, or any Set of Attributes, may be called an 'Adjunct.'

[This word is introduced in order to avoid the constant repetition of the phrase "Attribute or Set of Attributes."]

Thus, we may say that a rose has the Attribute “red” (or the Adjunct “red,” whichever we prefer); or we may say that it has the Adjunct “red, scented and full-blown.”]

Chapter II. Classification.

‘Classification,’ or the formation of Classes, is a Mental Process, in which we imagine that we have put together, in a group, certain Things. Such a group is called a ‘**Class**.’

This Process may be performed in three different ways, as follows:—

(1) We may imagine that we have put together all Things. The Class so formed (i. e. the Class “Things”) contains the whole Universe.

(2) We may think of the Class “Things,” and may imagine that we have picked out from it all the Things which possess a certain Adjunct *not* possessed by the whole Class. This Adjunct is said to be ‘**peculiar**’ to the Class so formed. In this case, the Class “Things” is called a ‘**Genus**’ with regard to the Class so formed: the Class, so formed, is called a ‘**Species**’ of the Class “Things”: and its peculiar Adjunct is called its ‘**Differentia**’.

As this Process is entirely *Mental*, we can perform it whether there *is*, or *is not*, an *existing* Thing which possesses that Adjunct. If there *is*, the Class is said to be ‘**Real**’; if not, it is said to be ‘**Unreal**’, or ‘**Imaginary**.’

[For example, we may imagine that we have picked out, from the Class “Things,” all the Things which possess the Adjunct “material, artificial, consisting of houses and streets”; and we may thus form the Real Class “towns.” Here we may regard “Things” as a *Genus*, “Towns” as a *Species* of Things, and “material, artificial, consisting of houses and streets” as its *Differentia*.

Again, we may imagine that we have picked out all the Things which possess the Adjunct “weighing a ton, easily lifted by a baby”; and we may thus form the *Imaginary* Class “Things that weigh a ton and are easily lifted by a baby.”]

(3) We may think of a certain Class, *not* the Class “Things,” and may imagine that we have picked out from it all the Members of it which possess a certain Adjunct *not* possessed by the whole Class. This Adjunct is said to be ‘**peculiar**’ to the smaller Class so formed. In this case, the Class thought of is called a ‘**Genus**’ with regard to the smaller Class picked out from it: the smaller Class is called a ‘**Species**’ of the larger: and its peculiar Adjunct is called its ‘**Differentia**’.

[For example, we may think of the Class “towns,” and imagine that we have picked out from it all the towns which possess the Attribute “lit with gas”; and we may thus form the Real Class “towns lit with gas.” Here we may regard “Towns” as a *Genus*, “Towns lit with gas” as a *Species* of Towns, and “lit with gas” as its *Differentia*.

If, in the above example, we were to alter “lit with gas” into “paved with gold,” we should get the *Imaginary* Class “towns paved with gold.”]

A Class, containing only *one* Member is called an ‘**Individual**.’

[For example, the Class “towns having four million inhabitants,” which Class contains only *one* Member, viz. “London.”]

Hence, any single Thing, which we can name so as to distinguish it from all other Things, may be regarded as a one-Member Class.

[Thus “London” may be regarded as the one-Member Class, picked out from the Class “towns,” which has, as its *Differentia*, “having four million inhabitants.”]

A Class, containing two or more Members, is sometimes regarded as *one single Thing*. When so regarded, it may possess an Adjunct which is *not* possessed

by any Member of it taken separately.

[Thus, the Class "The soldiers of the Tenth Regiment," when regarded as *one single Thing*, may possess the Attribute "formed in square," which is *not* possessed by any Member of it taken separately.]

Chapter III. Division.

§ 1. Introductory. 'Division' is a Mental Process, in which we think of a certain Class of Things, and imagine that we have divided it into two or more smaller Classes.

[Thus, we might think of the Class "books," and imagine that we had divided it into the two smaller Classes "bound books" and "unbound books," or into the three Classes, "books priced at less than a shilling," "shilling-books," "books priced at more than a shilling," or into the twenty-six Classes, "books whose names begin with A," "books whose names begin with B," &c.]

A Class, that has been obtained by a certain Division, is said to be 'codivisional' with every Class obtained by that Division.

[Thus, the Class "bound books" is codivisional with each of the two Classes, "bound books" and "unbound books."

Similarly, the Battle of Waterloo may be said to have been "contemporary" with every event that happened in 1815.]

Hence a Class, obtained by Division, is codivisional with itself.

[Thus, the Class "bound books" is codivisional with itself.

Similarly, the Battle of Waterloo may be said to have been "contemporary" with itself.]

§ 2. Dichotomy. If we think of a certain Class, and imagine that we have picked out from it a certain smaller Class, it is evident that the *Remainder* of the large Class does *not* possess the Differentia of that smaller Class. Hence it may be regarded as *another* smaller Class, whose Differentia may be formed, from that of the Class first picked out, by prefixing the word "not"; and we may imagine that we have *divided* the Class first thought of into *two* smaller Classes, whose Differentiæ are *contradictory*. This kind of Division is called '**Dichotomy**'.

[For example, we may divide "books" into the two Classes whose Differentiæ are "old" and "not-old."]

In performing this Process, we may sometimes find that the Attributes we have chosen are used so loosely, in ordinary conversation, that it is not easy to decide *which* of the Things belong to the one Class and *which* to the other. In such a case, it would be necessary to lay down some arbitrary *rule*, as to *where* the one Class should end and the other begin.

[Thus, in dividing "books" into "old" and "not-old," we may say "Let all books printed before A.D. 1801, be regarded as 'old,' and all others as 'not-old'."]

Henceforward let it be understood that, if a Class of Things be divided into two Classes, whose Differentiæ have contrary meanings, each Differentia is to be regarded as equivalent to the other with the word "not" prefixed.

[Thus, if "books" be divided into "old" and "new" the Attribute "old" is to be regarded as equivalent to "not-new," and the Attribute "new" as equivalent to "not-old."]

After dividing a Class, by the Process of *Dichotomy*, into two smaller Classes, we may sub-divide each of these into two still smaller Classes; and this Process may be repeated over and over again, the number of Classes being doubled at each repetition.

[For example, we may divide “books” into “old” and “new” (i. e. “*not*-old”): we may then sub-divide each of these into “English” and “foreign” (i. e. “*not*-English”), thus getting *four* Classes, viz.

- (1) old English;
- (2) old foreign;
- (3) new English;
- (4) new foreign.

If we had begun by dividing into “English” and “foreign,” and had then sub-divided into “old” and “new,” the four Classes would have been

- (1) English old;
- (2) English new;
- (3) foreign old;
- (4) foreign new.

The Reader will easily see that these are the very same four Classes which we had before.]

Chapter IV. Names.

The word “Thing”, which conveys the idea of a Thing, *without* any idea of an Adjunct, represents *any* single Thing. Any other word (or phrase), which conveys the idea of a Thing, *with* the idea of an Adjunct represents *any* Thing which possesses that Adjunct; i. e., it represents any Member of the Class to which that Adjunct is *peculiar*.

Such a word (or phrase) is called a ‘**Name**’; and, if there be an existing Thing which it represents, it is said to be a Name of that Thing.

[For example, the words “Thing,” “Treasure,” “Town,” and the phrases “valuable Thing,” “material artificial Thing consisting of houses and streets,” “Town lit with gas,” “Town paved with gold,” “old English Book.”]

Just as a Class is said to be *Real*, or *Unreal*, according as there *is*, or *is not*, an existing Thing in it, so also a Name is said to be *Real*, or *Unreal*, according as there *is*, or *is not*, an existing Thing represented by it.

[Thus, “Town lit with gas” is a *Real* Name: “Town paved with gold” is an *Unreal* Name.]

Every Name is either a Substantive only, or else a phrase consisting of a Substantive and one or more Adjectives (or phrases used as Adjectives).

Every Name, except “Thing”, may usually be expressed in three different forms:—

- (a) The Substantive “Thing”, and one or more Adjectives (or phrases used as Adjectives) conveying the ideas of the Attributes;
- (b) A Substantive, conveying the idea of a Thing with the ideas of *some* of the Attributes, and one or more Adjectives (or phrases used as Adjectives) conveying the ideas of the *other* Attributes;
- (c) A Substantive conveying the idea of a Thing with the ideas of *all* the Attributes.

[Thus, the phrase “material living Thing, belonging to the Animal Kingdom, having two hands and two feet” is a Name expressed in Form (a).

If we choose to roll up together the Substantive "Thing" and the Adjectives "material, living, belonging to the Animal Kingdom," so as to make the new Substantive "Animal," we get the phrase "Animal having two hands and two feet," which is a Name (representing the same Thing as before) expressed in Form (*b*).

And, if we choose to roll up the whole phrase into one word, so as to make the new Substantive "Man," we get a Name (still representing the very same Thing) expressed in Form (*c*).]

A Name, whose Substantive is in the *plural* number, may be used to represent either

- (1) Members of a Class, *regarded as separate Things*;
- or (2) a whole Class, *regarded as one single Thing*.

[Thus, when I say "Some soldiers of the Tenth Regiment are tall," or "The soldiers of the Tenth Regiment are brave," I am using the Name "soldiers of the Tenth Regiment" in the *first* sense; and it is just the same as if I were to point to each of them *separately*, and to say "*This* soldier of the Tenth Regiment is tall," "*That* soldier of the Tenth Regiment is tall," and so on.

But, when I say "The soldiers of the Tenth Regiment are formed in square," I am using the phrase in the *second* sense; and it is just the same as if I were to say "The *Tenth Regiment* is formed in square.]"

Chapter V. Definitions.

It is evident that every Member of a *Species* is *also* a Member of the *Genus* out of which that *Species* has been picked, and that it possesses the *Differentia* of that *Species*. Hence it may be represented by a Name consisting of two parts, one being a Name representing any Member of the *Genus*, and the other being the *Differentia* of that *Species*. Such a Name is called a '**Definition**' of any Member of that *Species*, and to give it such a Name is to '**define**' it.

[Thus, we may define a "Treasure" as a "valuable Thing." In this case we regard "Things" as the *Genus*, and "valuable" as the *Differentia*.]

The following Examples, of this Process, may be taken as models for working others.

[Note that, in each Definition, the Substantive, representing a Member (or Members) of the *Genus*, is printed in Capitals.]

1. Define "a Treasure."
Ans. "a valuable THING."
2. Define "Treasures."
Ans. "valuable THINGS."
3. Define "a Town."
Ans. "a material artificial THING, consisting of houses and streets."
4. Define "Men."
Ans. "material, living THINGS, belonging to the Animal Kingdom, having two hands and two feet";
or else
"ANIMALS having two hands and two feet."
5. Define "London."

Ans. “the material artificial THING, which consists of houses and streets, and has four million inhabitants”;

or else

“the TOWN which has four million inhabitants.”

[Note that we here use the article “the” instead of “a”, because we happen to know that there is only *one* such Thing.

The Reader can set himself any number of Examples of this Process, by simply choosing the Name of any common Thing (such as “house,” “tree,” “knife”), making a Definition for it, and then testing his answer by referring to any English Dictionary.]

Book II. Propositions.

Chapter I. Propositions Generally.

§ 1. **Introductory.** Note that the word “some” is to be regarded, henceforward, as meaning “one or more.”

The word ‘Proposition,’ as used in ordinary conversation, may be applied to *any* word, or phrase, which conveys any information whatever.

[Thus the words “yes” and “no” are Propositions in the ordinary sense of the word; and so are the phrases “you owe me five farthings” and “I don’t!”

Such words as “oh!” or “never!”, and such phrases as “fetch me that book!” “which book do you mean?” do not seem, at first sight, to convey any *information*; but they can easily be turned into equivalent forms which do so, viz. “I am surprised,” “I will never consent to it,” “I order you to fetch me that book,” “I want to know which book you mean.”]

But a ‘**Proposition**,’ as used in this First Part of “Symbolic Logic,” has a peculiar form, which may be called its ‘**Normal form**’; and if any Proposition, which we wish to use in an argument, is not in normal form, we must reduce it to such a form, before we can use it.

A ‘**Proposition**,’ when in normal form, asserts, as to certain two Classes, which are called its ‘**Subject**’ and ‘**Predicate**,’ either

- (1) that *some* Members of its Subject are Members of its Predicate;
- or (2) that *no* Members of its Subject are Members of its Predicate;
- or (3) that *all* Members of its Subject are Members of its Predicate.

The Subject and the Predicate of a Proposition are called its ‘**Terms**.’

Two Propositions, which convey the *same* information, are said to be ‘**equivalent**’.

[Thus, the two Propositions, “I see John” and “John is seen by me,” are equivalent.]

§ 2. **Normal form of a Proposition.** A Proposition, in normal form, consists of four parts, viz.—

- (1) The word “some,” or “no,” or “all.” (This word, which tells us *how many* Members of the Subject are also Members of the Predicate, is called the ‘**Sign of Quantity**.’)
- (2) Name of Subject.
- (3) The verb “are” (or “is”). (This is called the ‘**Copula**.’)
- (4) Name of Predicate.

§ 3. Various kinds of Propositions. A Proposition, that begins with “Some”, is said to be ‘**Particular.**’ It is also called ‘a Proposition **in I.**’

[Note, that it is called ‘Particular,’ because it refers to a *part* only of the Subject.]

A Proposition, that begins with “No”, is said to be ‘**Universal Negative.**’ It is also called ‘a Proposition **in E.**’

A Proposition, that begins with “All”, is said to be ‘**Universal Affirmative.**’ It is also called ‘a Proposition **in A.**’

[Note, that they are called ‘Universal’, because they refer to the *whole* of the Subject.]

A Proposition, whose Subject is an *Individual*, is to be regarded as *Universal*.

[Let us take, as an example, the Proposition “John is not well”. This of course implies that there is an *Individual*, to whom the speaker refers when he mentions “John”, and whom the listener *knows* to be referred to. Hence the Class “men referred to by the speaker when he mentions ‘John’” is a one-Member Class, and the Proposition is equivalent to “*All* the men, who are referred to by the speaker when he mentions ‘John’, are not well.”]

Propositions are of two kinds, ‘Propositions of Existence’ and ‘Propositions of Relation.’

These shall be discussed separately.

Chapter II. Propositions of Existence.

A ‘**Proposition of Existence**’, when in normal form, has, for its *Subject*, the Class “existing Things”.

Its Sign of Quantity is “Some” or “No”.

[Note that, though its Sign of Quantity tells us *how many* existing Things are Members of its Predicate, it does *not* tell us the *exact* number: in fact, it only deals with *two* numbers, which are, in ascending order, “0” and “1 or more.”]

It is called “a Proposition of Existence” because its effect is to assert the *Reality* (i. e. the real *existence*), or else the *Imaginariness*, of its Predicate.

[Thus, the Proposition “Some existing Things are honest men” asserts that the Class “honest men” is *Real*.

This is the *normal* form; but it may also be expressed in any one of the following forms:—

- (1) “Honest men exist”;
- (2) “Some honest men exist”;
- (3) “The Class ‘honest men’ exists”;
- (4) “There are honest men”;
- (5) “There are some honest men”.

Similarly, the Proposition “No existing Things are men fifty feet high” asserts that the Class “men 50 feet high” is *Imaginary*.

This is the *normal* form; but it may also be expressed in any one of the following forms:—

- (1) “Men 50 feet high do not exist”;
- (2) “No men 50 feet high exist”;
- (3) “The Class ‘men 50 feet high’ does not exist”;
- (4) “There are not any men 50 feet high”;
- (5) “There are no men 50 feet high.”]

Chapter III. Propositions of Relation.

§ 1. Introductory. A **Proposition of Relation**, of the kind to be here discussed, has, for its Terms, two Specieses of the same Genus, such that each of the two Names conveys the idea of some Attribute *not* conveyed by the other.

[Thus, the Proposition “Some merchants are misers” is of the right kind, since “merchants” and “misers” are Specieses of the same Genus “men”; and since the Name “merchants” conveys the idea of the Attribute “mercantile”, and the name “misers” the idea of the Attribute “miserly”, each of which ideas is *not* conveyed by the other Name.

But the Proposition “Some dogs are setters” is *not* of the right kind, since, although it is true that “dogs” and “setters” are Specieses of the same Genus “animals”, it is *not* true that the Name “dogs” conveys the idea of any Attribute not conveyed by the Name “setters”. Such Propositions will be discussed in Part II.]

The Genus, of which the two Terms are Specieses, is called the ‘**Universe of Discourse**,’ or (more briefly) the ‘**Univ.**’

The Sign of Quantity is “Some” or “No” or “All”.

[Note that, though its Sign of Quantity tells us *how many* Members of its Subject are *also* Members of its Predicate, it does not tell us the *exact* number: in fact, it only deals with *three* numbers, which are, in ascending order, “0”, “1 or more”, “the total number of Members of the Subject”.]

It is called “a Proposition of Relation” because its effect is to assert that a certain *relationship* exists between its Terms.

§ 2. Reduction of a Proposition of Relation to Normal form. The Rules, for doing this, are as follows:—

(1) Ascertain what is the *Subject* (i. e., ascertain what Class we are *talking about*);

(2) If the verb, governed by the Subject, is *not* the verb “are” (or “is”), substitute for it a phrase beginning with “are” (or “is”);

(3) Ascertain what is the *Predicate* (i. e., ascertain what Class it is, which is asserted to contain *some*, or *none*, or *all*, of the Members of the Subject);

(4) If the Name of each Term is *completely expressed* (i. e. if it contains a Substantive), there is no need to determine the ‘Univ.’; but, if either Name is *incompletely expressed*, and contains *Attributes* only, it is then necessary to determine a ‘Univ.’, in order to insert its Name as the Substantive.

(5) Ascertain the *Sign of Quantity*;

(6) Arrange in the following order:—

Sign of Quantity,
Subject,
Copula,
Predicate.

[Let us work a few Examples, to illustrate these Rules.

(1)

“Some apples are not ripe.”

(1) The Subject is “apples.”

(2) The Verb is “are.”

(3) The Predicate is “not-ripe * * *.” (As no Substantive is expressed, and we have not yet settled what the Univ. is to be, we are forced to leave a blank.)

(4) Let Univ. be “fruit.”

- (5) The Sign of Quantity is “some.”
- (6) The Proposition now becomes
“Some | apples | are | not-ripe fruit.”

(2)

“None of my speculations have brought me as much as 5 per cent.”

- (1) The Subject is “my speculations.”
- (2) The Verb is “have brought,” for which we substitute the phrase “are * * * that have brought”.
- (3) The Predicate is “* * * that have brought &c.”
- (4) Let Univ. be “transactions.”
- (5) The Sign of Quantity is “none of.”
- (6) The Proposition now becomes
“None of | my speculations | are | transactions that have brought me as much as 5 per cent.”

(3)

“None but the brave deserve the fair.”

To begin with, we note that the phrase “none but the brave” is equivalent to “no *not-brave*.”

- (1) The Subject has for its *Attribute* “not-brave.” But no *Substantive* is supplied. So we express the Subject as “not-brave * * *.”
- (2) The Verb is “deserve,” for which we substitute the phrase “are deserving of”.
- (3) The Predicate is “* * * deserving of the fair.”
- (4) Let Univ. be “persons.”
- (5) The Sign of Quantity is “no.”
- (6) The Proposition now becomes
“No | not-brave persons | are | persons deserving of the fair.”

(4)

“A lame puppy would not say “thank you” if you offered to lend it a skipping-rope.”

- (1) The Subject is evidently “lame puppies,” and all the rest of the sentence must somehow be packed into the Predicate.
- (2) The Verb is “would not say,” &c., for which we may substitute the phrase “are not grateful for.”
- (3) The Predicate may be expressed as “* * * not grateful for the loan of a skipping-rope.”
- (4) Let Univ. be “puppies.”
- (5) The Sign of Quantity is “all.”
- (6) The Proposition now becomes
“All | lame puppies | are | puppies not grateful for the loan of a skipping-rope.”

(5)

“No one takes in the *Times*, unless he is well-educated.”

- (1) The Subject is evidently persons who are not well-educated (“no *one*” evidently means “no *person*”).
- (2) The Verb is “takes in,” for which we may substitute the phrase “are persons taking in.”
- (3) The Predicate is “persons taking in the *Times*.”
- (4) Let Univ. be “persons.”
- (5) The Sign of Quantity is “no.”
- (6) The Proposition now becomes
“No | persons who are not well-educated | are | persons taking in the *Times*.”

(6)

“My carriage will meet you at the station.”

(1) The Subject is “my carriage.” This, being an ‘Individual,’ is equivalent to the Class “my carriages.” (Note that this Class contains only *one* Member.)

(2) The Verb is “will meet”, for which we may substitute the phrase “are * * * that will meet.”

(3) The Predicate is “* * * that will meet you at the station.”

(4) Let Univ. be “things.”

(5) The Sign of Quantity is “all.”

(6) The Proposition now becomes

“All | my carriages | are | things that will meet you at the station.”

(7)

“Happy is the man who does not know what ‘toothache’ means!”

(1) The Subject is evidently “the man &c.” (Note that in this sentence, the *Predicate* comes first.) At first sight, the Subject seems to be an ‘*Individual*’; but on further consideration, we see that the article “the” does *not* imply that there is only *one* such man. Hence the phrase “the man who” is equivalent to “all men who”.

(2) The Verb is “are.”

(3) The Predicate is “happy * * *.”

(4) Let Univ. be “men.”

(5) The Sign of Quantity is “all.”

(6) The Proposition now becomes

“All | men who do not know what ‘toothache’ means | are | happy men.”

(8)

“Some farmers always grumble at the weather, whatever it may be.”

(1) The Subject is “farmers.”

(2) The Verb is “grumble,” for which we substitute the phrase “are * * * who grumble.”

(3) The Predicate is “* * * who always grumble &c.”

(4) Let Univ. be “persons.”

(5) The Sign of Quantity is “some.”

(6) The Proposition now becomes

“Some | farmers | are | persons who always grumble at the weather, whatever it may be.”

(9)

“No lambs are accustomed to smoke cigars.”

(1) The Subject is “lambs.”

(2) The Verb is “are.”

(3) The Predicate is “* * * accustomed &c.”

(4) Let Univ. be “animals.”

(5) The Sign of Quantity is “no.”

(6) The Proposition now becomes

“No | lambs | are | animals accustomed to smoke cigars.”

(10)

“I ca’n’t understand examples that are not arranged in regular order, like those I am used to.”

(1) The Subject is “examples that,” &c.

(2) The Verb is “I ca’n’t understand,” which we must alter, so as to have “examples,” instead of “I,” as the nominative case. It may be expressed as “are not understood by me.”

(3) The Predicate is “* * * not understood by me.”

- (4) Let Univ. be “examples.”
- (5) The Sign of Quantity is “all.”
- (6) The Proposition now becomes

“All | examples that are not arranged in regular order like those I am used to | are | examples not understood by me.”]

§ 3. A Proposition of Relation, beginning with “All”, is a Double Proposition. A Proposition of Relation, beginning with “All”, asserts (as we already know) that “*All* Members of the Subject are Members of the Predicate”. This evidently contains, as a *part* of what it tells us, the smaller Proposition “*Some* Members of the Subject are Members of the Predicate”.

[Thus, the Proposition “*All* bankers are rich men” evidently contains the smaller Proposition “*Some* bankers are rich men”.]

The question now arises “What is the *rest* of the information which this Proposition gives us?”

In order to answer this question, let us begin with the smaller Proposition, “*Some* Members of the Subject are Members of the Predicate,” and suppose that this is *all* we have been told; and let us proceed to inquire what *else* we need to be told, in order to know that “*All* Members of the Subject are Members of the Predicate”.

[Thus, we may suppose that the Proposition “*Some* bankers are rich men” is all the information we possess; and we may proceed to inquire what *other* Proposition needs to be added to it, in order to make up the entire Proposition “*All* bankers are rich men”.]

Let us also suppose that the ‘Univ.’ (i. e. the Genus, of which both the Subject and the Predicate are Specieses) has been divided (by the Process of *Dichotomy*) into two smaller Classes, viz.

- (1) the Predicate;
- (2) the Class whose Differentia is *contradictory* to that of the Predicate.

[Thus, we may suppose that the Genus “men,” (of which both “bankers” and “rich men” are Specieses) has been divided into the two smaller Classes, “rich men”, “poor men”.]

Now we know that *every* Member of the Subject is (as shown at p. 1047) a Member of the Univ. Hence *every* Member of the Subject is either in Class (1) or else in Class (2).

[Thus, we know that *every* banker is a Member of the Genus “men”. Hence, *every* banker is either in the Class “rich men”, or else in the Class “poor men”.]

Also we have been told that, in the case we are discussing, *some* Members of the Subject are in Class (1). What *else* do we need to be told, in order to know that *all* of them are there? Evidently we need to be told that *none* of them are in Class (2); i. e. that *none* of them are Members of the Class whose Differentia is *contradictory* to that of the Predicate.

[Thus, we may suppose we have been told that *some* bankers are in the Class “rich men”. What *else* do we need to be told, in order to know that *all* of them are there? Evidently we need to be told that *none* of them are in the Class “poor men”.]

Hence a Proposition of Relation, beginning with “All”, is a *Double* Proposition, and is ‘**equivalent**’ to (i. e. gives the same information as) the *two* Propositions

- (1) “*Some* Members of the Subject are Members of the Predicate”;
- (2) “*No* Members of the Subject are Members of the Class whose Differentia is *contradictory* to that of the Predicate”.

[Thus, the Proposition “*All* bankers are rich men” is a *Double* Proposition, and is equivalent to the *two* Propositions

- (1) “*Some* bankers are rich men”;
- (2) “*No* bankers are *poor* men”.]

§ 4. What is implied, in a Proposition of Relation, as to the Reality of its Terms? Note that the rules, here laid down, are *arbitrary*, and only apply to Part I of my “Symbolic Logic.”

A Proposition of Relation, beginning with “Some”, is henceforward to be understood as asserting that there are *some existing Things*, which, being Members of the Subject, are also Members of the Predicate; i. e. that *some existing Things* are Members of *both* Terms at once. Hence it is to be understood as implying that *each* Term, taken by itself, is *Real*.

[Thus, the Proposition “Some rich men are invalids” is to be understood as asserting that *some existing Things* are “rich invalids”. Hence it implies that *each* of the two Classes, “rich men” and “invalids”, taken by itself, is *Real*.]

A Proposition of Relation, beginning with “No”, is henceforward to be understood as asserting that there are *no existing Things* which, being Members of the Subject, are also Members of the Predicate; i. e. that *no existing Things* are Members of *both* Terms at once. But this implies nothing as to the *Reality* of either Term taken by itself.

[Thus, the Proposition “No mermaids are milliners” is to be understood as asserting that *no existing Things* are “mermaid-milliners”. But this implies nothing as to the *Reality*, or the *Unreality*, of either of the two Classes, “mermaids” and “milliners”, taken by itself. In this case as it happens, the Subject is *Imaginary*, and the Predicate *Real*.]

A Proposition of Relation, beginning with “All”, contains (see § 3) a similar Proposition beginning with “Some”. Hence it is to be understood as implying that *each* Term, taken by itself, is *Real*.

[Thus, the Proposition “All hyænas are savage animals” contains the Proposition “Some hyænas are savage animals”. Hence it implies that *each* of the two Classes, “hyænas” and “savage animals”, taken by itself, is *Real*.]

§ 5. Translation of a Proposition of Relation into one or more Propositions of Existence. We have seen that a Proposition of Relation, beginning with “Some,” asserts that *some existing Things*, being Members of its Subject, are *also* Members of its Predicate. Hence, it asserts that some existing Things are Members of *both*; i. e. it asserts that some existing Things are Members of the Class of Things which have *all* the Attributes of the Subject and the Predicate.

Hence, to translate it into a Proposition of Existence, we take “existing Things” as the new *Subject*, and Things, which have *all* the Attributes of the Subject and the Predicate, as the new Predicate.

Similarly for a Proposition of Relation beginning with “No”.

A Proposition of Relation, beginning with “All”, is (as shown in § 3) equivalent to *two* Propositions, one beginning with “Some” and the other with “No”, each of which we now know how to translate.

[Let us work a few Examples, to illustrate these Rules.

(1)

“Some apples are not ripe.”

Here we arrange thus:—

“Some” *Sign of Quantity.*

“existing Things” *Subject.*

“are” *Copula.*

“not-ripe apples” *Predicate.*

or thus:—

“Some | existing Things | are | not-ripe apples.”

(2)

“Some farmers always grumble at the weather, whatever it may be.”

Here we arrange thus:—

“Some | existing Things | are | farmers who always grumble at the weather,
whatever it may be.”

(3)

“No lambs are accustomed to smoke cigars.”

Here we arrange thus:—

“No | existing Things | are | lambs accustomed to smoke cigars.”

(4)

“None of my speculations have brought me as much as 5 per cent.”

Here we arrange thus:—

“No | existing Things | are | speculations of mine, which have brought me as
much as 5 per cent.”

(5)

“None but the brave deserve the fair.”

Here we note, to begin with, that the phrase “none but the brave” is equivalent to
“no not-brave men.” We then arrange thus:—

“No | existing Things | are | not-brave men deserving of the fair.”

(6)

“All bankers are rich men.”

This is equivalent to the two Propositions “Some bankers are rich men” and “No
bankers are poor men.”

Here we arrange thus:—

“Some | existing Things | are | rich bankers”;

and

“No | existing Things | are | poor bankers.”]

[Work Examples § 1, 1-4 (p. 1100).]

Book III. The Biliteral Diagram.

xy	xy'
$x'y$	$x'y'$

Chapter I. Symbols and Cells.

First, let us suppose that the above Diagram is an enclosure assigned to a certain Class of Things, which we have selected as our 'Universe of Discourse.' or, more briefly, as our 'Univ'.

[For example, we might say "Let Univ. be 'books'"; and we might imagine the Diagram to be a large table, assigned to all "books."]

[The Reader is strongly advised, in reading this Chapter, *not* to refer to the above Diagram, but to draw a large one for himself, *without any letters*, and to have it by him while he reads, and keep his finger on that particular *part* of it, about which he is reading.]

Secondly, let us suppose that we have selected a certain Adjunct, which we may call " x ," and have divided the large Class, to which we have assigned the whole Diagram, into the two smaller Classes whose Differentiæ are " x " and "not- x " (which we may call " x' "), and that we have assigned the *North* Half of the Diagram to the one (which we may call "the Class of x -Things," or "the x -Class"), and the *South* Half to the other (which we may call "the Class of x' -Things," or "the x' -Class").

[For example, we might say "Let x mean 'old,' so that x' will mean 'new,'" and we might suppose that we had divided books into the two Classes whose Differentiæ are "old" and "new," and had assigned the *North* Half of the table to "*old* books" and the *South* Half to "*new* books."]

Thirdly, let us suppose that we have selected another Adjunct, which we may call " y ," and have subdivided the x -Class into the two Classes whose Differentiæ are " y " and " y' ," and that we have assigned the *North-West* Cell to the one (which we may call "the xy -Class"), and the *North-East* Cell to the other (which we may call "the xy' -Class").

[For example, we might say "Let y mean 'English,' so that y' will mean 'foreign'," and we might suppose that we had subdivided "old books" into the two Classes whose Differentiæ are "English" and "foreign", and had assigned the *North-West* Cell to "old *English* books", and the *North-East* Cell to "old *foreign* books."]

Fourthly, let us suppose that we have subdivided the x' -Class in the same manner, and have assigned the *South-West* Cell to the $x'y$ -Class, and the *South-East* Cell to the $x'y'$ -Class.

[For example, we might suppose that we had subdivided "new books" into the two Classes "new *English* books" and "new *foreign* books", and had assigned the *South-West* Cell to the one, and the *South-East* Cell to the other.]

It is evident that, if we had begun by dividing for y and y' , and had then subdivided for x and x' , we should have got the *same* four Classes. Hence we see that we have assigned the *West* Half to the y -Class, and the *East* Half to the y' -Class.

[Thus, in the above Example, we should find that we had assigned the *West* Half of the table to "*English* books" and the *East* Half to "*foreign* books."]

We have, in fact, assigned the four Quarters of the table to four different Classes of books, as here shown.]

old English books	old foreign books
new English books	new foreign books

The Reader should carefully remember that, in such a phrase as “the x -Things,” the word “Things” means that particular *kind* of Things, to which the whole Diagram has been assigned.

[Thus, if we say “Let Univ. be ‘books’,” we mean that we have assigned the whole Diagram to “books.” In that case, if we took “ x ” to mean “old”, the phrase “the x -Things” would mean “the old books.”]

The Reader should not go on to the next Chapter until he is *quite familiar* with the *blank* Diagram I have advised him to draw.

He ought to be able to name, *instantly*, the *Adjunct* assigned to any *Compartment* named in the right-hand column of the following Table.

Table I

<i>Adjuncts of Classes.</i>	<i>Compartments, or Cells, assigned to them.</i>	
x	North	Half.
x'	South	”
y	West	”
y'	East	”
xy	North-	West Cell.
xy'	”	East ”
$x'y$	South-	West ”
$x'y'$	”	East ”

Also he ought to be able to name, *instantly*, the *Compartment* assigned to any *Adjunct* named in the left-hand column.

To make sure of this, he had better put the book into the hands of some genial friend, while he himself has nothing but the blank Diagram, and get that genial friend to question him on this Table, *dodging* about as much as possible. The Questions and Answers should be something like this:—

- Q. “Adjunct for West Half?”
A. “ y .”
Q. “Compartment for xy' ?”
A. “North-East Cell.”
Q. “Adjunct for South-West Cell?”
A. “ $x'y$.”
&c., &c.

After a little practice, he will find himself able to do without the blank Diagram, and will be able to see it *mentally* (“in my mind’s eye, Horatio!”) while answering the questions of his genial friend. When *this* result has been reached, he may safely go on to the next Chapter.

Quoted from *Hamlet*
by William
Shakespeare

Chapter II. Counters.

Let us agree that a *Red Counter*, placed within a Cell, shall mean “This Cell is *occupied*” (i. e. “There is at least *one* Thing in it”).

Let us also agree that a *Red Counter*, placed on the partition between two Cells, shall mean “The Compartment, made up of these two Cells, is *occupied*; but it is not known *whereabouts*, in it, its occupants are.” Hence it may be understood to mean “At least *one* of these two Cells is occupied: possibly *both* are.”

Our ingenious American cousins have invented a phrase to describe the condition of a man who has not yet made up his mind *which* of two political parties he will join: such a man is said to be “**sitting on the fence**.” This phrase exactly describes the condition of the Red Counter.

Let us also agree that a *Grey Counter*, placed within a Cell, shall mean “This Cell is *empty*” (i. e. “There is *nothing* in it”).

[The Reader had better provide himself with 4 Red Counters and 5 Grey ones.]

Chapter III. Representation of Propositions.

§ 1. Introductory. Henceforwards, in stating such Propositions as “Some *x*-Things exist” or “No *x*-Things are *y*-Things”, I shall omit the word “Things”, which the Reader can supply for himself, and shall write them as “Some *x* exist” or “No *x* are *y*”.

[Note that the word “Things” is here used with a special meaning, as explained at p. 1057.]

A Proposition, containing only *one* of the Letters used as Symbols for Attributes, is said to be ‘**Unilateral**’.

[For example, “Some *x* exist”, “No *y*’ exist”, &c.]

A Proposition, containing *two* Letters, is said to be ‘**Bilateral**’.

[For example, “Some *xy*’ exist”, “No *x*’ are *y*”, &c.]

A Proposition is said to be ‘**in terms of**’ the Letters it contains, whether with or without accents.

[Thus, “Some *xy*’ exist”, “No *x*’ are *y*”, &c., are said to be *in terms of x* and *y*.]

§ 2. Representation of Propositions of Existence. Let us take, first, the Proposition “Some *x* exist”.

[Note that this Proposition is (as explained at p. 1049) equivalent to “Some existing Things are *x*-Things.”]

This tells us that there is at least *one* Thing in the North Half; that is, that the North Half is *occupied*. And this we can evidently represent by placing a *Red Counter* (here represented by a *dotted circle*) on the partition which divides the North Half.

[In the “books” example, this Proposition would be “Some old books exist”.]

Similarly we may represent the three similar Propositions “Some *x*’ exist”, “Some *y* exist”, and “Some *y*’ exist”.

[The Reader should make out all these for himself. In the “books” example, these Propositions would be “Some new books exist”, &c.]

Let us take, next, the Proposition “No *x* exist”.

This tells us that there is *nothing* in the North Half; that is, that the North Half is *empty*; that is, that the North-West Cell and the North-East Cell are

both of them *empty*. And this we can represent by placing *two Grey Counters* in the North Half, one in each Cell.

[The Reader may perhaps think that it would be enough to place a *Grey Counter* on the partition in the North Half, and that, just as a *Red Counter*, so placed, would mean “This Half is *occupied*”, so a *Grey* one would mean “This Half is *empty*”.

This, however, would be a mistake. We have seen that a *Red Counter*, so placed, would mean “At least *one* of these two Cells is occupied: possibly *both* are.” Hence a *Grey* one would merely mean “At least *one* of these two Cells is empty: possibly *both* are”. But what we have to represent is, that both Cells are *certainly* empty: and this can only be done by placing a *Grey Counter* in *each* of them.

In the “books” example, this Proposition would be “No old books exist”.]

Similarly we may represent the three similar Propositions “No x' exist”, “No y' exist”, and “No $y'x'$ exist”.

[The Reader should make out all these for himself. In the “books” example, these three Propositions would be “No new books exist”, &c.]

Let us take, next, the Proposition “Some xy exist”.

This tells us that there is at least *one* Thing in the North-West Cell; that is, that the North-West Cell is *occupied*. And this we can represent by placing a *Red Counter* in it.

[In the “books” example, this Proposition would be “Some old English books exist”.]

Similarly we may represent the three similar Propositions “Some xy' exist”, “Some $x'y$ exist”, and “Some $x'y'$ exist”.

[The Reader should make out all these for himself. In the “books” example, these three Propositions would be “Some old foreign books exist”, &c.]

Let us take, next, the Proposition “No xy exist”.

This tells us that there is *nothing* in the North-West Cell; that is, that the North-West Cell is *empty*. And this we can represent by placing a *Grey Counter* in it.

[In the “books” example, this Proposition would be “No old English books exist”.]

Similarly we may represent the three similar Propositions “No xy' exist”, “No $x'y$ exist”, and “No $x'y'$ exist”.

[The Reader should make out all these for himself. In the “books” example, these three Propositions would be “No old foreign books exist”, &c.]

We have seen that the Proposition “No x exist” may be represented by placing *two Grey Counters* in the North Half, one in each Cell.

We have also seen that these two *Grey Counters*, taken *separately*, represent the two Propositions “No xy exist” and “No xy' exist”.

Hence we see that the Proposition “No x exist” is a *Double Proposition*, and is equivalent to the *two* Propositions “No xy exist” and “No xy' exist”.

[In the “books” example, this Proposition would be “No old books exist”.

Hence this is a *Double Proposition*, and is equivalent to the *two* Propositions “No old *English* books exist” and “No old *foreign* books exist”.]

§ 3. Representation of Propositions of Relation. Let us take, first, the Proposition “Some x are y ”.

This tells us that at least *one* Thing, in the *North* Half, is also in the *West* Half. Hence it must be in the space *common* to them, that is, in the *North-West Cell*. Hence the North-West Cell is *occupied*. And this we can represent by placing a *Red Counter* in it.

[Note that the *Subject* of the Proposition settles which *Half* we are to use; and that the *Predicate* settles in which *portion* of it we are to place the Red Counter.]

In the “books” example, this Proposition would be “Some old books are English”.]

Similarly we may represent the three similar Propositions “Some x are y ”, “Some x' are y ”, and “Some x' are y' ”.

[The Reader should make out all these for himself. In the “books” example, these three Propositions would be “Some old books are foreign”, &c.]

Let us take, next, the Proposition “Some y are x ”.

This tells us that at least *one* Thing, in the *West* Half, is also in the *North* Half. Hence it must be in the space *common* to them, that is, in the *North-West Cell*. Hence the North-West Cell is *occupied*. And this we can represent by placing a *Red Counter* in it.

[In the “books” example, this Proposition would be “Some English books are old”.]

Similarly we may represent the three similar Propositions “Some y are x ”, “Some y' are x ”, and “Some y' are x' ”.

[The Reader should make out all these for himself. In the “books” example, these three Propositions would be “Some English books are new”, &c.]

We see that this *one* Diagram has now served to represent no less than *three* Propositions, viz.

- (1) “Some xy exist;
- (2) Some x are y ;
- (3) Some y are x ”.

Hence these three Propositions are equivalent.

[In the “books” example, these Propositions would be

- (1) “Some old English books exist;
- (2) Some old books are English;
- (3) Some English books are old”.]

The two equivalent Propositions, “Some x are y ” and “Some y are x ”, are said to be ‘**Converse**’ to each other; and the Process, of changing one into the other, is called ‘**Converting**’, or ‘**Conversion**’.

[For example, if we were told to convert the Proposition

“Some apples are not ripe,”

we should first choose our Univ. (say “fruit”), and then complete the Proposition, by supplying the Substantive “fruit” in the Predicate, so that it would be

“Some apples are not-ripe fruit”;

and we should then convert it by interchanging its Terms, so that it would be

“Some not-ripe fruit are apples”.]

Similarly we may represent the three similar Trios of equivalent Propositions; the whole Set of *four* Trios being as follows:—

- (1) "Some xy exist" = "Some x are y " = "Some y are x ".
- (2) "Some xy' exist" = "Some x are y' " = "Some y' are x ".
- (3) "Some $x'y$ exist" = "Some x' are y " = "Some y are x' ".
- (4) "Some $x'y'$ exist" = "Some x' are y' " = "Some y' are x' ".

Let us take, next, the Proposition "No x are y ".

This tells us that no Thing, in the *North* Half, is also in the *West* Half. Hence there is *nothing* in the space *common* to them, that is, in the *North-West Cell*. Hence the North-West Cell is *empty*. And this we can represent by placing a *Grey Counter* in it.

[In the "books" example, this Proposition would be "No old books are English".]

Similarly we may represent the three similar Propositions "No x are y ", and "No x' are y ", and "No x' are y' ".

[The Reader should make out all these for himself. In the "books" example, these three Propositions would be "No old books are foreign", &c.]

Let us take, next, the Proposition "No y are x ".

This tells us that no Thing, in the *West* Half, is also in the *North* Half. Hence there is *nothing* in the space *common* to them, that is, in the *North-West Cell*. That is, the North-West Cell is *empty*. And this we can represent by placing a *Grey Counter* in it.

[In the "books" example, this Proposition would be "No English books are old".]

Similarly we may represent the three similar Propositions "No y are x ", "No y' are x ", and "No y' are x' ".

[The Reader should make out all these for himself. In the "books" example, these three Propositions would be "No English books are new", &c.]

We see that this *one* Diagram has now served to present no less than *three* Propositions, viz.

- (1) "No xy exist;
- (2) No x are y ;
- (3) No y are x ."

Hence these three Propositions are equivalent.

[In the "books" example, these Propositions would be

- (1) "No old English books exist;
- (2) No old books are English;
- (3) No English books are old".]

The two equivalent Propositions, "No x are y " and "No y are x ", are said to be 'Converse' to each other.

[For example, if we were told to convert the Proposition

"No porcupines are talkative",

we should first choose our Univ. (say "animals"), and then complete the Proposition, by supplying the Substantive "animals" in the Predicate, so that it would be

"No porcupines are talkative animals",

and we should then convert it, by interchanging its Terms, so that it would be

"No talkative animals are porcupines".]

Similarly we may represent the three similar Trios of equivalent Propositions; the whole Set of *four* Trios being as follows:—

- (1) "No xy exist" = "No x are y " = "No y are x ".
- (2) "No xy' exist" = "No x are y' " = "No y' are x ".
- (3) "No $x'y$ exist" = "No x' are y " = "No y are x' ".
- (4) "No $x'y'$ exist" = "No x' are y' " = "No y' are x' ".

Let us take, next, the Proposition "All x are y ".

We know (see p. 1053) that this is a *Double* Proposition, and equivalent to the *two* Propositions "Some x are y " and "No x are y' ", each of which we already know how to represent.

[Note that the *Subject* of the given Proposition settles which *Half* we are to use; and that its *Predicate* settles in which *portion* of that *Half* we are to place the Red Counter.]

Table II

Some x exist		No x exist	
Some x' exist		No x' exist	
Some y exist		No y exist	
Some y' exist		No y' exist	

Similarly we may represent the seven similar Propositions "All x are y' ", "All x' are y ", "All x' are y' ", "All y are x ", "All y are x' ", "All y' are x ", and "All y' are x' ".

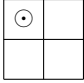

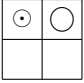

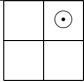

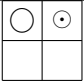

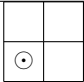

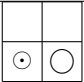

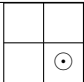

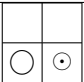

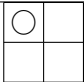

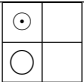

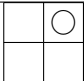

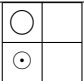

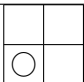

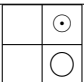

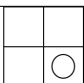

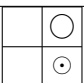

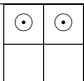

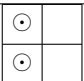

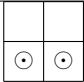

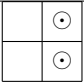

Let us take, lastly, the Double Proposition "Some x are y and some are y' ", each part of which we already know how to represent.

Similarly we may represent the three similar Propositions, "Some x' are y and some are y' ", "Some y are x and some are x' ", "Some y' are x and some are x' ".

The Reader should now get his genial friend to question him, severely, on these two Tables. The *Inquisitor* should have the Tables before him: but the *Victim* should have nothing but a blank Diagram, and the Counters with which he is to represent the various Propositions named by his friend, e. g. "Some y exist", "No y' are x ", "All x are y ", &c. &c.

Table III

Some xy exist = Some x are y = Some y are x		All x are y	
Some xy' exist = Some x are y' = Some y' are x		All x are y'	
Some $x'y$ exist = Some x' are y = Some y are x'		All x' are y	
Some $x'y'$ exist = Some x' are y' = Some y' are x'		All x' are y'	
No xy exist = No x are y = No y are x		All y are x	
No xy' exist = No x are y' = No y' are x		All y are x'	
No $x'y$ exist = No x' are y = No y are x'		All y' are x	
No $x'y'$ exist = No x' are y' = No y' are x'		All y' are x'	
Some x are y , and some are y'		Some y are x and some are x'	
Some x' are y , and some are y'		Some y' are x and some are x'	

Chapter IV. Interpretation of Biliteral Diagram When Marked With Counters.

The Diagram is supposed to be set before us, with certain Counters placed upon it; and the problem is to find out what Proposition, or Propositions, the Counters represent.

As the process is simply the reverse of that discussed in the previous Chapter, we can avail ourselves of the results there obtained, as far as they go.

First, let us suppose that we find a *Red* Counter placed in the North-West Cell.

We know that this represents each of the Trio of equivalent Propositions

“Some xy exist” = “Some x are y ” = “Some y are x ”.

Similarly we may interpret a *Red* Counter, when placed in the North-East, or South-West, or South-East Cell.

Next, let us suppose that we find a *Grey* Counter placed in the North-West Cell.

We know that this represents each of the Trio of equivalent Propositions

“No xy exist” = “No x are y ” = “No y are x ”.

Similarly we may interpret a *Grey* Counter, when placed in the North-East, or South-West, or South-East Cell.

Next, let us suppose that we find a *Red* Counter placed on the partition which divides the North Half.

We know that this represents the Proposition “Some x exist.”

Similarly we may interpret a *Red* Counter, when placed on the partition which divides the South, or West, or East Half.

Next, let us suppose that we find *two Red* Counters placed in the North Half, one in each Cell.

We know that this represents the *Double* Proposition “Some x are y and some are y ”.

Similarly we may interpret *two Red* Counters, when placed in the South, or West, or East Half.

Next, let us suppose that we find *two Grey* Counters placed in the North Half, one in each Cell.

We know that this represents the Proposition “No x exist”.

Similarly we may interpret *two Grey* Counters, when placed in the South, or West, or East Half.

Lastly, let us suppose that we find a *Red* and a *Grey* Counter placed in the North Half, the *Red* in the North-*West* Cell, and the *Grey* in the North-*East* Cell.

We know that this represents the Proposition, “All x are y ”.

[Note that the *Half*, occupied by the two Counters, settles what is to be the *Subject* of the Proposition, and that the *Cell*, occupied by the *Red* Counter, settles what is to be its *Predicate*.]

Similarly we may interpret a *Red* and a *Grey* counter, when placed in any one of the seven similar positions

Red in North-East, Grey in North-West;
Red in South-West, Grey in South-East;

Red in South-East, Grey in South-West;
 Red in North-West, Grey in South-West;
 Red in South-West, Grey in North-West;
 Red in North-East, Grey in South-East;
 Red in South-East, Grey in North-East.

Once more the genial friend must be appealed to, and requested to examine the Reader on Tables II and III, and to make him not only *represent* Propositions, but also *interpret* Diagrams when marked with Counters.

The Questions and Answers should be like this:—

- Q. Represent “No x' are y' .”
 A. Grey Counter in S.E. Cell.
 Q. Interpret Red Counter on E. partition.
 A. “Some y' exist.”
 Q. Represent “All y' are x .”
 A. Red in N.E. Cell; Grey in S.E.
 Q. Interpret Grey Counter in S.W. Cell.
 A. “No $x'y$ exist” = “No x' are y ” = “No y are x' ”.
 &c., &c.

At first the Examinee will need to have the Board and Counters before him; but he will soon learn to dispense with these, and to answer with his eyes shut or gazing into vacancy.

[Work Examples § 1, 5–8 (p. 1100).]

Book IV. The Trilateral Diagram.

Chapter I. Symbols and Cells.

First, let us suppose that the above *left-hand* Diagram is the Biliteral Diagram that we have been using in Book III., and that we change it into a *Trilateral* Diagram by drawing an *Inner Square*, so as to divide each of its 4 Cells into 2 portions, thus making 8 Cells altogether. The *right-hand* Diagram shows the result.

[The Reader is strongly advised, in reading this Chapter, *not* to refer to the above Diagrams, but to make a large copy of the right-hand one for himself, *without any letters*, and to have it by him while he reads, and keep his finger on that particular *part* of it, about which he is reading.]

Secondly, let us suppose that we have selected a certain Adjunct, which we may call “ m ”, and have subdivided the xy -Class into the two Classes whose Differentiæ are m and m' , and that we have assigned the N.W. *Inner* Cell to the one (which we may call “the Class of xym -Things”, or “the xym -Class”), and the N.W. *Outer* Cell to the other (which we may call “the Class of xym' -Things”, or “the xym' -Class”).

[Thus, in the “books” example, we might say “Let m mean ‘bound’, so that m' will mean ‘unbound’”, and we might suppose that we had subdivided the Class “old English books” into the two Classes, “old English bound books” and “old English unbound books”, and had assigned the N.W. *Inner* Cell to the one, and the N.W. *Outer* Cell to the other.]

Thirdly, let us suppose that we have subdivided the xy' -Class, the $x'y$ -Class, and the $x'y'$ -Class in the same manner, and have, in each case, assigned the *Inner* Cell to the Class possessing the Attribute m , and the *Outer* Cell to the Class possessing the Attribute m' .

[Thus, in the “books” example, we might suppose that we had subdivided the “new English books” into the two Classes, “new English bound books” and “new English unbound books”, and had assigned the S.W. *Inner* Cell to the one, and the S.W. *Outer* Cell to the other.]

It is evident that we have now assigned the *Inner Square* to the m -Class, and the *Outer Border* to the m' -Class.

[Thus, in the “books” example, we have assigned the *Inner Square* to “bound books” and the *Outer Border* to “unbound books”.]

When the Reader has made himself familiar with this Diagram, he ought to be able to find, in a moment, the Compartment assigned to a particular *pair* of Attributes, or the Cell assigned to a particular *trio* of Attributes. The following Rules will help him in doing this:—

- (1) Arrange the Attributes in the order x, y, m .
- (2) Take the *first* of them and find the Compartment assigned to it.
- (3) Then take the *second*, and find what *portion* of that compartment is assigned to it.
- (4) Treat the *third*, if there is one, in the same way.

[For example, suppose we have to find the Compartment assigned to ym . We say to ourselves “ y has the *West* Half; and m has the *Inner* portion of that West Half.”

Again, suppose we have to find the Cell assigned to $x'ym'$. We say to ourselves “ x' has the *South* Half; y has the *West* portion of that South Half, i. e. has the *South-West Quarter*; and m' has the *Outer* portion of that South-West Quarter.”]

The Reader should now get his genial friend to question him on the Table given on the next page, in the style of the following specimen-Dialogue.

- Q. Adjunct for South Half, Inner Portion?
A. $x'm$.
Q. Compartment for m' ?
A. The Outer Border.
Q. Adjunct for North-East Quarter, Outer Portion?
A. $xy'm'$.
Q. Compartment for ym ?
A. West Half, Inner Portion.
Q. Adjunct for South Half?

- A. x' .
- Q. Compartment for $x'y'm$?
- A. South-East Quarter, Inner Portion.
- &c. &c.

Table IV.

<i>Adjunct of Classes.</i>	<i>Compartments, or Cells, assigned to them.</i>				
x	North	Half.			
x'	South	"			
y	West	"			
y'	East	"			
m	Inner	Square.			
m'	Outer	Border.			
xy	North-	West	Quarter.		
xy'	"	East	"		
$x'y$	South-	West	"		
$x'y'$	"	East	"		
xm	North	Half,	Inner	Portion.	
xm'	"	"	Outer	"	
$x'm$	South	"	Inner	"	
$x'm'$	"	"	Outer	"	
ym	West	"	Inner	"	
ym'	"	"	Outer	"	
$y'm$	East	"	Inner	"	
$y'm'$	"	"	Outer	"	
xym	North-	West	Quarter,	Inner	Portion.
xym'	"	"	"	Outer	"
$xy'm$	"	East	"	Inner	"
$xy'm'$	"	"	"	Outer	"
$x'ym$	South-	West	"	Inner	"
$x'ym'$	"	"	"	Outer	"
$x'y'm$	"	East	"	Inner	"
$x'y'm'$	"	"	"	Outer	"

Chapter II. Representation of Propositions in Terms of x and m , or of y and m .

§ 1. Representation of Propositions of Existence in terms of x and m , or of y and m . Let us take, first, the Proposition "Some xm exist".

[Note that the *full* meaning of this Proposition is (as explained at p. 1049) "Some existing Things are xm -Things".]

This tells us that there is at least *one* Thing in the Inner portion of the North Half; that is, that this Compartment is *occupied*. And this we can evidently represent by placing a *Red Counter* on the partition which divides it.

[In the "books" example, this Proposition would mean "Some old bound books exist" (or "There are some old bound books").]

Similarly we may represent the seven similar Propositions, "Some xm' exist", "Some $x'm$ exist", "Some $x'm'$ exist", "Some ym exist", "Some ym' exist", "Some $y'm$ exist", and "Some $y'm'$ exist".

Let us take, next, the Proposition “No xm exist”.

This tells us that there is *nothing* in the Inner portion of the North Half; that is, that this Compartment is *empty*. And this we can represent by placing *two Grey Counters* in it, one in each Cell.

Similarly we may represent the seven similar Propositions, in terms of x and m , or of y and m , viz. “No xm' exist”, “No $x'm$ exist”, &c.

These sixteen Propositions of Existence are the only ones that we shall have to represent on this Diagram.

§ 2. Representation of Propositions of Relation in terms of x and m , or of y and m . Let us take, first, the Pair of Converse Propositions

“Some x are m ” = “Some m are x .”

We know that each of these is equivalent to the Proposition of Existence “Some xm exist”, which we already know how to represent.

Similarly for the seven similar Pairs, in terms of x and m , or of y and m .

Let us take, next, the Pair of Converse Propositions

“No x are m ” = “No m are x .”

We know that each of these is equivalent to the Proposition of Existence “No xm exist”, which we already know how to represent.

Similarly for the seven similar Pairs, in terms of x and m , or of y and m .

Let us take, next, the Proposition “All x are m .”

We know (see p. 1053) that this is a *Double Proposition*, and equivalent to the *two* Propositions “Some x are m ” and “No x are m' ”, each of which we already know how to represent.

Similarly for the fifteen similar Propositions, in terms of x and m , or of y and m .

These thirty-two Propositions of Relation are the only ones that we shall have to represent on this Diagram.

The Reader should now get his genial friend to question him on the following four Tables.

The Victim should have nothing before him but a blank Trilateral Diagram, a Red Counter, and 2 Grey ones, with which he is to represent the various Propositions named by the Inquisitor, *e. g.* “No y' are m ”, “Some xm' exist”, &c., &c.

Table V.

	<p>Some xm exist = Some x are m = Some m are x</p>	<p>No xm exist = No x are m = No m are x</p>	
	<p>Some xm' exist = Some x are m' = Some m' are x</p>	<p>No xm' exist = No x are m' = No m' are x</p>	
	<p>Some $x'm$ exist = Some x' are m = Some m are x'</p>	<p>No $x'm$ exist = No x' are m = No m are x'</p>	
	<p>Some $x'm'$ exist = Some x' are m' = Some m' are x'</p>	<p>No $x'm'$ exist = No x' are m' = No m' are x'</p>	

Table VI.

	<p>Some ym exist = Some y are m = Some m are y</p>	<p>No ym exist = No y are m = No m are y</p>	
	<p>Some ym' exist = Some y are m' = Some m' are y</p>	<p>No ym' exist = No y are m' = No m' are y</p>	
	<p>Some $y'm$ exist = Some y' are m = Some m are y'</p>	<p>No $y'm$ exist = No y' are m = No m are y'</p>	
	<p>Some $y'm'$ exist = Some y' are m' = Some m' are y'</p>	<p>No $y'm'$ exist = No y' are m' = No m' are y'</p>	

Table VII.

	All x are m	All x are m'	
	All x' are m	All x' are m'	
	All m are x	All m are x'	
	All m' are x	All m' are x'	

Table VIII.

	All y are m	All y are m'	
	All y' are m	All y' are m'	
	All m are y	All m are y'	
	All m' are y	All m' are y'	

Chapter III. Representation of Two Propositions of Relation, One in Terms of x and m , and the Other in Terms of y and m , on the Same Diagram.

The Reader had better now begin to draw little Diagrams for himself, and to mark them with the Digits “I” and “O”, instead of using the Board and Counters: he may put a “I” to represent a *Red* Counter (this may be interpreted to mean “There is at least *one* Thing here”), and a “O” to represent a *Grey* Counter (this may be interpreted to mean “There is *nothing* here”).

The Pair of Propositions, that we shall have to represent, will always be, one in terms of x and m , and the other in terms of y and m .

When we have to represent a Proposition beginning with “All”, we break it up into the *two* Propositions to which it is equivalent.

When we have to represent, on the same Diagram, Propositions, of which some begin with “Some” and others with “No”, we represent the *negative* ones *first*. This will sometimes save us from having to put a “I” “on a fence” and afterwards having to shift it into a Cell.

[Let us work a few examples.

(1)

“No x are m' ;
No y' are m ”.

Let us first represent “No x are m' ”. This gives us Diagram *a*.

Then, representing “No y' are m ” on the same Diagram, we get Diagram *b*.

(2)

“Some m are x ;
No m are y ”.

If, neglecting the Rule, we were begin with “Some m are x ”, we should get Diagram *a*.

And if we were then to take “No m are y ”, which tells us that the Inner N.W. Cell is *empty*, we should be obliged to take the “I” off the fence (as it no longer has the choice of *two* Cells), and to put it into the Inner N.E. Cell, as in Diagram *c*.

This trouble may be saved by beginning with “No m are y ”, as in Diagram *b*.

And *now*, when we take “Some m are x ”, there is no fence to sit on! The “I” has to go, at once, into the N.E. Cell, as in Diagram *c*.

(3)

“No x' are m' ;
All m are y ”.

Here we begin by breaking up the Second into the two Propositions to which it is equivalent. Thus we have *three* Propositions to represent, viz.—

- (1) “No x' are m' ;
- (2) Some m are y ;
- (3) No m are y' ”.

These we will take in the order 1, 3, 2.

First we take No. (1), viz. “No x' are m' ”. This gives us Diagram *a*.

Adding to this, No. (3), viz. “No m are y' ”, we get Diagram *b*.

This time the “I”, representing No. (2), viz. “Some m are y ,” has to sit on the fence, as there is no “O” to order it off! This gives us Diagram *c*.

(4)

“All m are x ;
All y are m ”.

Here we break up *both* Propositions, and thus get *four* to represent, viz.—

- (1) “Some m are x ;
- (2) No m are x' ;
- (3) Some y are m ;
- (4) No y are m' ”.

These we will take in the order 2, 4, 1, 3.

First we take No. (2), viz. “No m are x' ”. This gives us Diagram *a*.

To this we add No. (4), viz. “No y are m' ”, and thus get Diagram *b*.

If we were to add to this No. (1), viz. “Some m are x ”, we should have to put the “I” on a fence: so let us try No. (3) instead, viz. “Some y are m ”. This gives us Diagram *c*.

And now there is no need to trouble about No. (1), as it would not add anything to our information to put a “I” on the fence. The Diagram *already* tells us that “Some m are x ”.]

[Work Examples § 1, 9–12 (p. 1100); § 2, 1–20 (p. 1100).]

Chapter IV. Interpretation, in Terms of x and y , of Trilateral Diagram, When Marked With Counters or Digits.

The problem before us is, given a marked Trilateral Diagram, to ascertain *what* Propositions of Relation, in terms of x and y , are represented on it.

The best plan, for a *beginner*, is to draw a *Bilateral* Diagram alongside of it, and to transfer, from the one to the other, all the information he can. He

can then read off, from the Biliteral Diagram, the required Propositions. After a little practice, he will be able to dispense with the Biliteral Diagram, and to read off the result from the Trilateral Diagram itself.

To *transfer* the information, observe the following Rules:—

- (1) Examine the N.W. Quarter of the Trilateral Diagram.
- (2) If it contains a “T”, in *either* Cell, it is certainly *occupied*, and you may mark the N.W. Quarter of the Biliteral Diagram with a “T”.
- (3) If it contains *two* “O”s, one in *each* Cell, it is certainly *empty*, and you may mark the N.W. Quarter of the Biliteral Diagram with a “O”.
- (4) Deal in the same way with the N.E., the S.W., and the S.E. Quarter.

[Let us take, as examples, the results of the four Examples worked in the previous Chapters.

(1)

In the N.W. Quarter, only *one* of the two Cells is marked as *empty*: so we do not know whether the N.W. Quarter of the Biliteral Diagram is *occupied* or *empty*: so we cannot mark it.

In the N.E. Quarter, we find *two* “O”s: so *this* Quarter is certainly *empty*; and we mark it so on the Biliteral Diagram.

In the S.W. Quarter, we have no information *at all*.

In the S.E. Quarter, we have not enough to use.

We may read off the result as “No x are y ”, or “No y' are x ,” whichever we prefer.

(2)

In the N.W. Quarter, we have not enough information to use.

In the N.E. Quarter, we find a “I”. This shows us that it is *occupied*: so we may mark the N.E. Quarter on the Biliteral Diagram with a “I”.

In the S.W. Quarter, we have not enough information to use.

In the S.E. Quarter, we have none at all.

We may read off the result as “Some x are y ”, or “Some y' are x ”, whichever we prefer.

(3)

In the N.W. Quarter, we have *no* information. (The “I”, sitting on the fence, is of no use to us until we know on *which* side he means to jump down!)

In the N.E. Quarter, we have not enough information to use.

Neither have we in the S.W. Quarter.

The S.E. Quarter is the only one that yields enough information to use. It is certainly *empty*: so we mark it as such on the Biliteral Diagram.

We may read off the results as “No x' are y' ”, or “No y' are x' ”, whichever we prefer.

(4)

The N.W. Quarter is *occupied*, in spite of the “O” in the Outer Cell. So we mark it with a “I” on the Biliteral Diagram.

The N.E. Quarter yields no information.

The S.W. Quarter is certainly *empty*. So we mark it as such on the Biliteral Diagram.

The S.E. Quarter does not yield enough information to use.

We read off the result as “All y are x .”]

[Review Tables V, VI (pp. 1069, 1070). Work Examples § 1, 13–16 (p. 1100); § 2, 21–32 (p. 1101); § 3, 1–20 (p. 1102).]

Book V. Syllogisms.

Chapter I. Introductory

When a Trio of Biliteral Propositions of Relation is such that

- (1) all their six Terms are Species of the same Genus,
- (2) every two of them contain between them a Pair of codivisional Classes,
- (3) the three Propositions are so related that, if the first two were true, the third would be true,

the Trio is called a ‘**Syllogism**’; the Genus, of which each of the six Terms is a Species, is called its ‘**Universe of Discourse**’, or, more briefly, its ‘**Univ.**’; the first two Propositions are called its ‘**Premisses**’, and the third its ‘**Conclusion**’; also the Pair of codivisional Terms in the Premisses are called its ‘**Eliminands**’, and the other two its ‘**Retinends**’.

The Conclusion of a Syllogism is said to be ‘**consequent**’ from its Premisses: hence it is usual to prefix to it the word “Therefore” (or the Symbol “ \therefore ”).

[Note that the ‘Eliminands’ are so called because they are *eliminated*, and do not appear in the Conclusion; and that the ‘Retinends’ are so called because they are *retained*, and *do* appear in the Conclusion.

Note also that the question, whether the Conclusion is or is not *consequent* from the Premisses, is not affected by the *actual* truth or falsity of any of the Trio, but depends entirely on their *relationship to each other*.

As a specimen-Syllogism, let us take the Trio

“No x -Things are m -Things;
 No y -Things are m' -Things.
 No x -Things are y -Things.”

which we may write, as explained at p. 1058, thus:—

“No x are m ;
 No y are m' .
 No x are y ”.

Here the first and second contain the Pair of codivisional Classes m and m' ; the first and third contain the Pair x and x ; and the second and third contain the Pair y and y .

Also the three Propositions are (as we shall see hereafter) so related that, if the first two were true, the third would also be true.

Hence the Trio is a *Syllogism*; the two Propositions, “No x are m ” and “No y are m' ”, are its *Premisses*; the Proposition “No x are y ” is its *Conclusion*; the Terms m and m' are its *Eliminands*; and the Terms x and y are its *Retinends*.

Hence we may write it thus:—

“No x are m ;
 No y are m' .
 ∴ No x are y ”.

As a second specimen, let us take the Trio

“All cats understand French;
 Some chickens are cats.
 Some chickens understand French”.

These, put into normal form, are

“All cats are creatures understanding French;
 Some chickens are cats.
 Some chickens are creatures understanding French”.

Here all the six Terms are Species of the Genus “creatures.”

Also the first and second Propositions contain the Pair of codivisional Classes “cats” and “cats”; the first and third contain the Pair “creatures understanding French” and “creatures understanding French”; and the second and third contain the Pair “chickens” and “chickens”.

Also the three Propositions are (as we shall see at p. 1081) so related that, if the first two were true, the third would be true. (The first two are, as it happens, *not* strictly true in *our* planet. But there is nothing to hinder them from being true in some *other* planet, say *Mars* or *Jupiter*—in which case the third would *also* be true in that planet, and its inhabitants would probably engage chickens as nursery-governesses. They would thus secure a singular *contingent* privilege, unknown in England, namely, that they would be able, at any time when provisions ran short, to utilise the nursery-governess for the nursery-dinner!)

Hence the Trio is a *Syllogism*; the Genus “creatures” is its ‘Univ.’; the two Propositions, “All cats understand French” and “Some chickens are cats”, are its *Premisses*, the Proposition “Some chickens understand French” is its *Conclusion*; the Terms “cats”

and “cats” are its *Eliminands*; and the Terms, “creatures understanding French” and “chickens”, are its *Retinends*.

Hence we may write it thus:—

“All cats understand French;
Some chickens are cats;
∴ Some chickens understand French.”]

Chapter II. Problems in Syllogisms.

§ 1. Introductory. When the Terms of a Proposition are represented by *words*, it is said to be ‘**concrete**’; when by *letters*, ‘**abstract**.’

To translate a Proposition from concrete into abstract form, we fix on a Univ., and regard each Term as a *Species* of it, and we choose a letter to represent its *Differentia*.

[For example, suppose we wish to translate “Some soldiers are brave” into abstract form. We may take “men” as Univ., and regard “soldiers” and “brave men” as *Species* of the *Genus* “men”; and we may choose x to represent the peculiar Attribute (say “military”) of “soldiers,” and y to represent “brave.” Then the Proposition may be written “Some military men are brave men”; *i. e.* “Some x -men are y -men”; *i. e.* (omitting “men,” as explained at p. 1058) “Some x are y .”

In practice, we should merely say “Let Univ. be “men”, x = soldiers, y = brave”, and at once translate “Some soldiers are brave” into “Some x are y .”]

The Problems we shall have to solve are of two kinds, viz.

(1) “Given a Pair of Propositions of Relation, which contain between them a pair of codivisional Classes, and which are proposed as Premisses: to ascertain what Conclusion, if any, is consequent from them.”

(2) “Given a Trio of Propositions of Relation, of which every two contain a pair of codivisional Classes, and which are proposed as a Syllogism: to ascertain whether the proposed Conclusion is consequent from the proposed Premisses, and, if so, whether it is *complete*.”

These Problems we will discuss separately.

§ 2. Given a Pair of Propositions of Relation, which contain between them a pair of codivisional Classes, and which are proposed as Premisses: to ascertain what Conclusion, if any, is consequent from them.

The Rules, for doing this, are as follows:—

- (1) Determine the ‘Universe of Discourse’.
- (2) Construct a Dictionary, making m and m (or m and m') represent the pair of codivisional Classes, and x (or x') and y (or y') the other two.
- (3) Translate the proposed Premisses into abstract form.
- (4) Represent them, together, on a Trilateral Diagram.
- (5) Ascertain what Proposition, if any, in terms of x and y , is *also* represented on it.
- (6) Translate this into concrete form.

It is evident that, if the proposed Premisses were true, this other Proposition would *also* be true. Hence it is a *Conclusion* consequent from the proposed Premisses.

[Let us work some examples.

(1)

“No son of mine is dishonest;
 People always treat an honest man with respect”.

Taking “men” as Univ., we may write these as follows:—

“No sons of mine are dishonest men;
 All honest men are men treated with respect”.

We can now construct¹ our Dictionary, viz. m = honest; x = sons of mine; y = treated with respect.

(Note that the expression “ x = sons of mine” is an abbreviated form of “ x = the Differentia of ‘sons of mine’, when regarded as a Species of ‘men’”.)

The next thing is to translate the proposed Premisses into abstract form, as follows:—

“No x are m' ;
 All m are y ”.

Next, by the process described at p. 1072, we represent these on a Trilateral Diagram, thus:—

Next, by the process described at p. 1073, we transfer to a Biliteral Diagram all the information we can.

The result we read as “No x are y' ” or as “No y' are x ,” whichever we prefer. So we refer to our Dictionary, to see which will look best; and we choose

“No x are y' ”,

which, translated into concrete form, is

“No son of mine fails to be treated with respect”.

(2)

“All cats understand French;
 Some chickens are cats”.

Taking “creatures” as Univ., we write these as follows:—

“All cats are creatures understanding French;
 Some chickens are cats”.

We can now construct our Dictionary, viz. m = cats; x = understanding French; y = chickens.

The proposed Premisses, translated into abstract form, are

“All m are x ;
 Some y are m ”.

In order to represent these on a Trilateral Diagram, we break up the first into the two Propositions to which it is equivalent, and thus get the *three* Propositions

¹accidentally “construct”

- (1) "Some m are x ;
- (2) No m are x' ;
- (3) Some y are m ".

The Rule, given at p. 1072, would make us take these in the order 2, 1, 3.
This, however, would produce the result

So it would be better to take them in the order 2, 3, 1. Nos. (2) and (3) give us the result here shown; and now we need not trouble about No. (1), as the Proposition "Some m are x " is *already* represented on the Diagram.

Transferring our information to a Biliteral Diagram, we get

This result we can read either as "Some x are y " or "Some y are x ".
After consulting our Dictionary, we choose

"Some y are x ",

which, translated into concrete form, is

"Some chickens understand French."

(3)

"All diligent students are successful;
All ignorant students are unsuccessful".

Let Univ. be "students"; m = successful; x = diligent; y = ignorant.
These Premises, in abstract form, are

"All x are m ;
All y are m' ".

These, broken up, give us the four Propositions

- (1) "Some x are m ;
- (2) No x are m' ;
- (3) Some y are m' ;
- (4) No y are m ".

which we will take in the order 2, 4, 1, 3.

Representing these on a Trilateral Diagram, we get

And this information, transferred to a Biliteral Diagram, is

Here we get *two* Conclusions, viz.

“All x are y' ;
All y are x' .”

And these, translated into concrete form, are

“All diligent students are (not-ignorant, i. e.) learned;
All ignorant students are (not-diligent, i. e.) idle”. (See p. 1045.)

(4)

“Of the prisoners who were put on their trial at the last Assizes, all, against whom the verdict ‘guilty’ was returned, were sentenced to imprisonment;
Some, who were sentenced to imprisonment, were also sentenced to hard labour”.

Let Univ. be “the prisoners who were put on their trial at the last Assizes”; m = who were sentenced to imprisonment; x = against whom the verdict ‘guilty’ was returned; y = who were sentenced to hard labour.

The Premises, translated into abstract form, are

“All x are m ;
Some m are y ”.

Breaking up the first, we get the three

- (1) “Some x are m ;
- (2) No x are m' ;
- (3) Some m are y ”.

Representing these, in the order 2, 1, 3, on a Trilateral Diagram, we get

Here we get no Conclusion at all.

You would very likely have guessed, if you had seen *only* the Premises, that the Conclusion would be

“Some, against whom the verdict ‘guilty’ was returned, were sentenced to hard labour”.

But this Conclusion is not even *true*, with regard to the Assizes I have here invented.

“Not *true!*” you exclaim. “Then who *were* they, who were sentenced to imprisonment and were also sentenced to hard labour? They *must* have had the verdict ‘guilty’ returned against them, or how could they be sentenced?”

Well, it happened like *this*, you see. They were three ruffians, who had committed highway-robbery. When they were put on their trial, they *pleaded* ‘guilty’. So no *verdict* was returned at all; and they were sentenced at once.]

I will now work out, in their briefest form, as models for the Reader to imitate in working examples, the above four concrete Problems.

(1) [see p. 1077]

“No son of mine is dishonest;
People always treat an honest man with respect.”

Univ. "men"; m = honest; x = my sons; y = treated with respect.

"No x are m' ;
All m are y ."

\therefore "No x are y' ."

i. e. "No son of mine ever fails to be treated with respect."

(2) [see p. 1078]

"All cats understand French;
Some chickens are cats".

Univ. "creatures"; m = cats; x = understanding French; y = chickens.

"All m are x ;
Some y are m ."

\therefore "Some y are x ."

i. e. "Some chickens understand French."

(3) [see p. 1079]

"All diligent students are successful;
All ignorant students are unsuccessful".

Univ. "students"; m = successful; x = diligent; y = ignorant.

"All x are m ;
All y are m' ."

\therefore "All x are y' ; All y are x' ."

i. e. "All diligent students are learned; and all ignorant students are idle".

(4) [see p. 1080]

"Of the prisoners who were put on their trial at the last Assizes, all,
against whom the verdict 'guilty' was returned, were sentenced
to imprisonment;
Some, who were sentenced to imprisonment, were also sentenced to
hard labour".

Univ. "prisoners who were put on their trial at the last Assizes", m = sentenced to imprisonment; x = against whom the verdict 'guilty' was returned; y = sentenced to hard labour.

“All x are m ;
Some m are y .”

There is no Conclusion.

[Review Tables VII, VIII (p. 1071). Work Examples § 1, 17–21 (p. 1100); § 4, 1–6 (p. 1105); § 5, 1–6 (p. 1107).]

§ 3. Given a Trio of Propositions of Relation, of which every two contain a Pair of codivisional Classes, and which are proposed as a Syllogism; to ascertain whether the proposed Conclusion is consequent from the proposed Premisses, and, if so, whether it is complete.
The Rules, for doing this, are as follows:—

- (1) Take the proposed Premisses, and ascertain, by the process described at p. 1077, what Conclusion, if any, is consequent from them.
- (2) If there be *no* Conclusion, say so.
- (3) If there be a Conclusion, compare it with the proposed Conclusion, and pronounce accordingly.

I will now work out, in their briefest form, as models for the Reader to imitate in working examples, six Problems.

(1)

“All soldiers are strong;
All soldiers are brave.
Some strong men are brave.”

Univ. “men”; m = soldiers; x = strong; y = brave.

“All m are x ;
All m are y .
Some x are y .”

∴ “Some x are y .”

Hence proposed Conclusion is right.

(2)

“I admire these pictures;
When I admire anything I wish to examine it thoroughly.
I wish to examine some of these pictures thoroughly.”

Univ. “things”; m = admired by me; x = these pictures; y = things which I wish to examine thoroughly.

“All x are m ;
 All m are y .
 Some x are y .”

∴ “All x are y .”

Hence proposed Conclusion is *incomplete*, the *complete* one being “I wish to examine *all* these pictures thoroughly”.

(3)

“None but the brave deserve the fair;
 Some braggarts are cowards.
 Some braggarts do not deserve the fair.”

Univ. “persons”; m = brave; x = deserving of the fair; y = braggarts.

“No m' are x ;
 Some y are m' .
 Some y are x' .”

∴ “Some y are x' .”

Hence proposed Conclusion is right.

(4)

“All soldiers can march;
 Some babies are not soldiers.
 Some babies cannot march”.

Univ. “persons”; m = soldiers; x = able to march; y = babies.

“All m are x ;
 Some y are m' .
 Some y are x' .”

There is no Conclusion.

(5)

“All selfish men are unpopular;
 All obliging men are popular.
 All obliging men are unselfish”.

Univ. “men”; m = popular; x = selfish; y = obliging.

“All x are m' ;
 All y are m .
 All y are x' .”

∴ “All x are y' ; All y are x' .”

Hence proposed Conclusion is *incomplete*, the *complete* one containing, in addition, “All selfish men are disobliging”.

(6)

”No one, who means to go by the train and cannot get a conveyance, and has not enough time to walk to the station, can do without running;

This party of tourists mean to go by the train and cannot get a conveyance, but they have plenty of time to walk to the station.

This party of tourists need not run.”

Univ. “persons meaning to go by the train, and unable to get a conveyance”; m = having enough time to walk to the station; x = needing to run; y = these tourists.

“No m' are x' ;
All y are m .
All y are x' .”

There is no Conclusion.

[Here is *another* opportunity, gentle Reader, for playing a trick on your innocent friend. Put the proposed Syllogism before him, and ask him what he thinks of the Conclusion.

He will reply “Why, it’s perfectly correct, of course! And if your precious Logic-book tells you it *isn’t*, don’t believe it! You don’t mean to tell me those tourists *need* to run? If I were one of them, and knew the *Premisses* to be true, I should be *quite* clear that I *needn’t* run—and I *should walk!*”

And *you* will reply “But suppose there was a mad bull behind you?”

And then your innocent friend will say “Hum! Ha! I must think that over a bit!”

You may then explain to him, as a convenient *test* of the soundness of a Syllogism, that, if circumstances can be invented which, without interfering with the truth of the *Premisses*, would make the *Conclusion* false, the Syllogism *must* be unsound.]

[Review Tables V–VIII (pp. 1069–1071). Work Examples § 4, 7–12 (p. 1105); § 5, 7–12 (p. 1107); § 6, 1–10 (p. 1111); § 7, 1–6 (p. 1112).]

Book VI. The Method of Subscripts.

Chapter I. Introductory.

Let us agree that “ x_1 ” shall mean “Some existing Things have the Attribute x ”, i. e. (more briefly) “Some x exist”; also that “ xy_1 ” shall mean “Some xy exist”, and so on. Such a Proposition may be called an ‘**Entity**.’

[Note that, when there are *two* letters in the expression, it does not in the least matter which stands *first*: “ xy_1 ” and “ yx_1 ” mean exactly the same.]

Also that “ x_0 ” shall mean “No existing Things have the Attribute x ”, i. e. (more briefly) “No x exist”; also that “ xy_0 ” shall mean “No xy exist”, and so on. Such a Proposition may be called a ‘**Nullity**’.

Also that “†” shall mean “and”.

[Thus “ $ab_1 \dagger cd_0$ ” means “Some ab exist and no cd exist”.]

Also that “P” shall mean “would, if true, prove”.

[Thus, “ $x_0 \text{ P } xy_0$ ” means “The Proposition ‘No x exist’ would, if true, prove the Proposition ‘No xy exist’.”]

When two Letters are both of them accented, or both *not* accented, they are said to have ‘**Like Signs**’, or to be ‘**Like**’: when one is accented, and the other not, they are said to have ‘**Unlike Signs**’, or to be ‘**Unlike**’.

Chapter II. Representation of Propositions of Relation.

Let us take, first, the Proposition “Some x are y ”.

This, we know, is equivalent to the Proposition of Existence “Some xy exist”. (See p. 1060.) Hence it may be represented by the expression “ xy_1 ”.

The Converse Proposition “Some y are x ” may of course be represented by the *same* expression, viz. “ xy_1 ”.

Similarly we may represent the three similar Pairs of Converse Propositions, viz.—

$$\begin{aligned} \text{“Some } x \text{ are } y\text{”} &= \text{“Some } y' \text{ are } x\text{”}, \\ \text{“Some } x' \text{ are } y\text{”} &= \text{“Some } y \text{ are } x'\text{”}, \\ \text{“Some } x' \text{ are } y'\text{”} &= \text{“Some } y' \text{ are } x'\text{”}. \end{aligned}$$

Let us take, next, the Proposition “No x are y ”.

This, we know, is equivalent to the Proposition of Existence “No xy exist”. (See p. 1061.) Hence it may be represented by the expression “ xy_0 ”.

The Converse Proposition “No y are x ” may of course be represented by the *same* expression, viz. “ xy_0 ”.

Similarly we may represent the three similar Pairs of Converse Propositions, viz.—

$$\begin{aligned} \text{“No } x \text{ are } y'\text{”} &= \text{“No } y' \text{ are } x\text{”}, \\ \text{“No } x' \text{ are } y\text{”} &= \text{“No } y \text{ are } x'\text{”}, \\ \text{“No } x' \text{ are } y'\text{”} &= \text{“No } y' \text{ are } x'\text{”}. \end{aligned}$$

Let us take, next, the Proposition “All x are y ”.

Now it is evident that the Double Proposition of Existence “Some x exist and no xy' exist” tells us that *some* x -Things exist, but that *none* of them have the Attribute y' : that is, it tells us that *all* of them have the Attribute y : that is, it tells us that “All x are y ”.

Also it is evident that the expression “ $x_1 \dagger xy'_0$ ” represents this Double Proposition.

Hence it also represents the Proposition “All x are y ”.

[The Reader will perhaps be puzzled by the statement that the Proposition “All x are y ” is equivalent to the Double Proposition “Some x exist and no xy' exist,” remembering that it was stated, at p. 1062, to be equivalent to the Double Proposition “Some x are y and no x are y' ” (i. e. “Some xy exist and no xy' exist”). The explanation is that the Proposition “Some xy exist” contains *superfluous information*. “Some x exist” is enough for our purpose.]

This expression may be written in a shorter form, viz. “ $x_1y'_0$ ”, since *each* Subscript takes effect back to the *beginning* of the expression.

Similarly we may represent the seven similar Propositions “All x are y' ”, “All x' are y ”, “All x' are y' ”, “All y are x ”, “All y are x' ”, “All y' are x ”, and “All y' are x' ”.

[The Reader should make out all these for himself.]

It will be convenient to remember that, in translating a Proposition, beginning with “All”, from abstract form into subscript form, or *vice versâ*, the Predicate *changes sign* (that is, changes from positive to negative, or else from negative to positive).

[Thus, the Proposition “All y are x ” becomes “ $y_1 x_0$ ”, where the Predicate changes from x' to x .

Again, the expression “ $x'_1 y'_0$ ” becomes “All x' are y ”, where the Predicate changes for y' to y .]

Chapter III. Syllogisms.

§ 1. Representation of Syllogisms. We already know how to represent each of the three Propositions of a Syllogism in subscript form. When that is done, all we need, besides, is to write the three expressions in a row, with “†” between the Premisses, and “P” before the Conclusion.

[Thus the Syllogism

“No x are m' ;
All m are y .
∴ No x are y' .”

may be represented thus:—

$$x m'_0 \dagger m_1 y'_0 \text{ P } x y'_0$$

When a Proposition has to be translated from concrete form into subscript form, the Reader will find it convenient, just at first, to translate it into *abstract* form, and *thence* into subscript form. But, after a little practice, he will find it quite easy to go straight from concrete form to subscript form.]

§ 2. Formulæ for solving Problems in Syllogisms. When once we have found, by Diagrams, the Conclusion to a given Pair of Premisses, and have represented the Syllogism in subscript form, we have a *Formula*, by which we can at once find, without having to use Diagrams again, the Conclusion to any *other* Pair of Premisses having the *same* subscript forms.

[Thus, the expression

$$x m_0 \dagger y m'_0 \text{ P } x y_0$$

is a Formula, by which we can find the Conclusion to any Pair of Premisses whose subscript forms are

$$x m_0 \dagger y m'_0$$

For example, suppose we had the Pair of Propositions

“No gluttons are healthy;
No unhealthy men are strong”.

proposed as Premisses. Taking “men” as our ‘Universe’, and making m = healthy; x = gluttons; y = strong; we might translate the Pair into abstract form, thus:—

“No x are m ;
No m' are y ”.

These, in subscript form, would be

$$x m_0 \dagger m' y_0$$

which are identical with those in our *Formula*. Hence we at once know the Conclusion to be

$$xy_0$$

that is, in abstract form,

“No x are y ”;

that is, in concrete form,

“No gluttons are strong”.]

I shall now take three different forms of Pairs of Premises, and work out their Conclusions, once for all, by Diagrams; and thus obtain some useful Formulæ. I shall call them “Fig. I”, “Fig. II”, and “Fig. III”.

Fig. I.

This includes any Pair of Premises which are both of them Nullities, and which contain Unlike Eliminands.

The simplest case is

$$xm_0 \dagger ym'_0$$

$\therefore xy_0$

In this case we see that the Conclusion is a Nullity, and that the Retinends have kept their Signs.

And we should find this Rule to hold good with *any* Pair of Premises which fulfil the given conditions.

[The Reader had better satisfy himself of this, by working out, on Diagrams, several varieties, such as

$$\begin{aligned} & m_1x_0 \dagger ym'_0 \text{ (which } \mathbb{P}xy_0) \\ & xm'_0 \dagger m_1y_0 \text{ (which } \mathbb{P}xy_0) \\ & x'm_0 \dagger ym'_0 \text{ (which } \mathbb{P}x'y_0) \\ & m'_1x'_0 \dagger m_1y'_0 \text{ (which } \mathbb{P}x'y'_0).] \end{aligned}$$

If either Retinend is asserted in the *Premises* to exist, of course it may be so asserted in the *Conclusion*.

Hence we get two *Variants* of Fig. I, viz.

- (α) where *one* Retinend is so asserted;
- (β) where *both* are so asserted.

[The Reader had better work out, on Diagrams, examples of these two Variants, such as

$$\begin{aligned} & m_1x_0 \dagger y_1m'_0 \text{ (which proves } y_1x_0) \\ & x_1m'_0 \dagger m_1y_0 \text{ (which proves } x_1y_0) \\ & x'_1m_0 \dagger y_1m'_0 \text{ (which proves } x'_1y_0 \dagger y_1x'_0).] \end{aligned}$$

The Formula, to be remembered, is

$$xm_0 \dagger ym'_0 \mathbb{P} xy_0$$

with the following two Rules:—

- (1) *Two Nullities, with Unlike Eliminands, yield a Nullity, in which both Retinends keep their Signs.*
- (2) *A Retinend, asserted in the Premisses to exist, may be so asserted in the Conclusion.*

[Note that Rule (1) is merely the Formula expressed in words.]

Fig. II.

This includes any Pair of Premisses, of which one is a Nullity and the other an Entity, and which contain Like Eliminands.

The simplest case is

$$xm_0 \dagger ym_1$$

$\therefore x'y_1$

In this case we see that the Conclusion is an Entity, and that the Nullity-Retinend has changed its Sign.

And we should find this Rule to hold good with *any* Pair of Premisses which fulfil the given conditions.

[The Reader had better satisfy himself of this, by working out, on Diagrams, several varieties, such as

- $x'm_0 \dagger ym_1$ (which $\mathbb{P}xy_1$)
- $x_1m'_0 \dagger y'm'_1$ (which $\mathbb{P}x'y'_1$)
- $m_1x_0 \dagger y'm_1$ (which $\mathbb{P}x'y'_1$).]

The Formula, to be remembered, is,

$$xm_0 \dagger ym_1 \mathbb{P} x'y_1$$

with the following Rule:—

A Nullity and an Entity, with Like Eliminands, yield an Entity, in which the Nullity-Retinend changes its Sign.

[Note that this Rule is merely the Formula expressed in words.]

Fig. III.

This includes any Pair of Premisses which are both of them Nullities, and which contain Like Eliminands asserted to exist.

The simplest case is

$$xm_0 \dagger ym_0 \dagger m_1$$

[Note that “ m_1 ” is here stated *separately*, because it does not matter in which of the two Premisses it occurs: so that this includes the *three* forms “ $m_1x_0 \dagger ym_0$ ”, “ $xm_0 \dagger m_1y_0$ ”, and “ $m_1x_0 \dagger m_1y_0$ ”.]

$\therefore x'y'_1$

In this case we see that the Conclusion is an Entity, and that *both* Retinends have changed their Signs.

And we should find this Rule to hold good with *any* Pair of Premisses which fulfil the given conditions.

[The Reader had better satisfy himself of this, by working out, on Diagrams, several varieties, such as

$x'm_0 \dagger m_1y_0$ (which $\mathbb{P}xy'_1$)
 $m'_1x_0 \dagger m'y'_0$ (which $\mathbb{P}x'y_1$)
 $m_1x'_0 \dagger m_1y'_0$ (which $\mathbb{P}xy_1$).]

The Formula, to be remembered, is

$$xm_0 \dagger ym_0 \dagger m_1 \mathbb{P} x'y'_1$$

with the following Rule (which is merely the Formula expressed in words):—

Two Nullities, with Like Eliminands asserted to exist, yield an Entity, in which both Retinends change their Signs.

In order to help the Reader to remember the peculiarities and Formulæ of these three Figures, I will put them all together in one Table.

Table IX

<p>Fig. I. $xm_0 \dagger ym'_0 \mathbb{P} xy_0$ Two Nullities, with Unlike Eliminands, yield a Nullity, in which both Retinends keep their Signs. A Retinend, asserted in the Premisses to exist, may be so asserted in the Conclusion.</p>
<p>Fig. II. $xm_0 \dagger ym_1 \mathbb{P} x'y_1$ A Nullity and an Entity, with Like Eliminands, yield an Entity, in which the Nullity-Retinend changes its Sign.</p>
<p>Fig. III. $xm_0 \dagger ym_0 \dagger m_1 \mathbb{P} x'y'_1$ Two Nullities, with Like Eliminands asserted to exist, yield an Entity, in which both Retinends change their Signs.</p>

I will now work out, by these Formulæ, as models for the Reader to imitate, some Problems in Syllogisms which have been already worked, by Diagrams, in Book V., Chap. II.

(1) [see p. 1080]

“No son of mine is dishonest;
 People always treat an honest man with respect.”

Univ. “men”; m = honest; x = my sons; y = treated with respect.

$$xm'_0 \dagger m_1y'_0 \mathbb{P} xy'_0 \quad \text{[Fig. I.]}$$

i. e. “No son of mine ever fails to be treated with respect.”

(2) [see p. 1081]

“All cats understand French;
Some chickens are cats.”

Univ. “creatures”; m = cats; x = understanding French; y = chickens.

$$m_1x'_0 \dagger ym_1 \mathbb{P} xy_1 \quad [\text{Fig. II.}]$$

i. e. “Some chickens understand French.”

(3) [see p. 1081]

“All diligent students are successful;
All ignorant students are unsuccessful.”

Univ. “students”; m = successful; x = diligent; y = ignorant.

$$x_1m'_0 \dagger y_1m_0 \mathbb{P} x_1y_0 \dagger y_1x_0 \quad [\text{Fig. I } (\beta).]$$

i. e. “All diligent students are learned; and all ignorant students are idle.”

(4) [see p. 1082]

“All soldiers are strong;
All soldiers are brave.
Some strong men are brave.”

Univ. “men”; m = soldiers; x = strong; y = brave.

$$m_1x'_0 \dagger m_1y'_0 \mathbb{P} xy_1 \quad [\text{Fig. III.}]$$

Hence proposed Conclusion is right.

(5) [see p. 1082]

“I admire these pictures;
When I admire anything, I wish to examine it thoroughly.
I wish to examine some of these pictures thoroughly.”

Univ. “things”; m = admired by me; x = these; y = things which I wish to examine thoroughly.

$$x_1m'_0 \dagger m_1y'_0 \mathbb{P} x_1y'_0 \quad [\text{Fig. I } (\alpha).]$$

Hence proposed Conclusion, xy_1 , is *incomplete*, the *complete* one being “I wish to examine *all* these pictures thoroughly.”

(6) [see p. 1083]

“None but the brave deserve the fair;
Some braggarts are cowards.
Some braggarts do not deserve the fair.”

Univ. “persons”; m = brave; x = deserving of the fair; y = braggarts.

$$m'x_0 \dagger ym'_1 \mathbb{P} x'y_1 \quad [\text{Fig. II.}]$$

Hence proposed Conclusion is right.

(7) [see p. 1084]

”No one, who means to go by the train and cannot get a conveyance, and has not enough time to walk to the station, can do without running;

This party of tourists mean to go by the train and cannot get a conveyance, but they have plenty of time to walk to the station. This party of tourists need not run.”

Univ. “persons meaning to go by the train, and unable to get a conveyance”; m = having enough time to walk to the station; x = needing to run; y = these tourists.

$m'x_0 \dagger y_1 m'_0$ do not come under any of the three Figures. Hence it is necessary to return to the Method of Diagrams, as shown at p. 1084.

Hence there is no Conclusion.

[Work Examples § 4, 12–20 (p. 1105); § 5, 13–24 (p. 1107); § 6, 1–6 (p. 1111); § 7, 1–3 (p. 1112). Also read Note (A), at p. 1145.]

§ 3. Fallacies. Any argument which *deceives* us, by seeming to prove what it does not really prove, may be called a ‘**Fallacy**’ (derived from the Latin verb *fallo* “I deceive”): but the particular kind, to be now discussed, consists of a Pair of Propositions, which are proposed as the Premisses of a Syllogism, but yield no Conclusion.

When each of the proposed Premisses is a Proposition in *I*, or *E*, or *A*, (the only kinds with which we are now concerned,) the Fallacy may be detected by the ‘Method of Diagrams,’ by simply setting them out on a Trilateral Diagram, and observing that they yield no information which can be transferred to the Biliteral Diagram.

But suppose we were working by the ‘Method of *Subscripts*,’ and had to deal with a Pair of proposed Premisses, which happened to be a ‘Fallacy,’ how could we be certain that they would not yield any Conclusion?

Our best plan is, I think, to deal with *Fallacies* in the same way as we have already dealt with *Syllogisms*: that is, to take certain forms of Pairs of Propositions, and to work them out, once for all, on the Trilateral Diagram, and ascertain that they yield *no* Conclusion; and then to record them, for future use, as *Formulæ for Fallacies*, just as we have already recorded our three *Formulæ for Syllogisms*.

Now, if we were to record the two Sets of Formulæ in the *same* shape, viz. by the Method of Subscripts, there would be considerable risk of confusing the two kinds. Hence, in order to keep them distinct, I propose to record the Formulæ for *Fallacies* in *words*, and to call them “Forms” instead of “Formulæ.”

Let us now proceed to find, by the Method of Diagrams, three “Forms of Fallacies,” which we will then put on record for future use. They are as follows:—

- (1) Fallacy of Like Eliminands not asserted to exist.
- (2) Fallacy of Unlike Eliminands with an Entity-Premiss.
- (3) Fallacy of two Entity-Premisses.

These shall be discussed separately, and it will be seen that each fails to yield a Conclusion.

(1) Fallacy of Like Eliminands not asserted to exist.

It is evident that neither of the given Propositions can be an *Entity*, since that kind asserts the *existence* of both of its Terms (see p. 1054). Hence they must both be *Nullities*.

Hence the given Pair may be represented by $(xm_0 \dagger ym_0)$, with or without x_1, y_1 .

These, set out on Trilateral Diagrams, are

(2) Fallacy of Unlike Eliminands with an Entity-Premiss.

Here the given Pair may be represented by $(xm_0 \dagger ym'_1)$ with or without x_1 or m_1 .

These, set out on Trilateral Diagrams, are

(3) Fallacy of two Entity-Premisses.

Here the given Pair may be represented by either $(xm_1 \dagger ym_1)$ or $(xm_1 \dagger ym'_1)$.

These, set out on Trilateral Diagrams, are

§ 4. Method of proceeding with a given Pair of Propositions. Let us suppose that we have before us a Pair of Propositions of Relation, which contain between them a Pair of codivisional Classes, and that we wish to ascertain what Conclusion, if any, is consequent from them. We translate them, if necessary, into subscript-form, and then proceed as follows:—

(1) We examine their Subscripts, in order to see whether they are

(a) a Pair of Nullities;

or (b) a Nullity and an Entity;
or (c) a Pair of Entities.

(2) If they are a Pair of Nullities, we examine their Eliminands, in order to see whether they are Unlike or Like.

If their Eliminands are *Unlike*, it is a case of Fig. I. We then examine their Retinends, to see whether one or both of them are asserted to *exist*. If one Retinend is so asserted, it is a case of Fig. I (α); if both, it is a case of Fig. I (β).

If their Eliminands are Like, we examine them, in order to see whether either of them is asserted to exist. If so, it is a case of Fig. III.; if not, it is a case of "Fallacy of Like Eliminands not asserted to exist."

(3) If they are a Nullity and an Entity, we examine their Eliminands, in order to see whether they are Like or Unlike.

If their Eliminands are Like, it is a case of Fig. II.; if *Unlike*, it is a case of "Fallacy of Unlike Eliminands with an Entity-Premiss."

(4) If they are a Pair of Entities, it is a case of "Fallacy of two Entity-Premisses."

[Work Examples § 4, 1–11 (p. 1105); § 5, 1–12 (p. 1107); § 6, 7–12 (p. 1111); § 7, 7–12 (p. 1113).]

Book VII. Sorites

Chapter I. Introductory.

When a Set of three or more Biliteral Propositions are such that all their Terms are Species of the same Genus, and are also so related that two of them, taken together, yield a Conclusion, which, taken with another of them, yields another Conclusion, and so on, until all have been taken, it is evident that, if the original Set were true, the last Conclusion would *also* be true.

Such a Set, with the last Conclusion tacked on, is called a '**Sorites**'; the original Set of Propositions is called its '**Premisses**'; each of the intermediate Conclusions is called a '**Partial Conclusion**' of the Sorites; the last Conclusion is called its '**Complete Conclusion**,' or, more briefly, its '**Conclusion**'; the Genus, of which all the Terms are Species, is called its '**Universe of Discourse**', or, more briefly, its '**Univ.**'; the Terms, used as Eliminands in the Syllogisms, are called its '**Eliminands**'; and the two Terms, which are retained, and therefore appear in the Conclusion, are called its '**Retinends**'.

[Note that each *Partial* Conclusion contains one or two *Eliminands*; but that the *Complete* Conclusion contains *Retinends* only.]

The Conclusion is said to be '**consequent**' from the Premisses; for which reason it is usual to prefix to it the word "Therefore" (or the symbol "∴").

[Note that the question, whether the Conclusion is or is not *consequent* from the Premisses, is not affected by the *actual* truth or falsity of any one of the Propositions which make up the Sorites, but depends entirely on their *relationship to one another*.

As a specimen-Sorites, let us take the following Set of 5 Propositions:—

- (1) "No *a* are *b*';
- (2) All *b* are *c*;
- (3) All *c* are *d*;
- (4) No *e*' are *a*';
- (5) All *h* are *e*'".

Here the first and second, taken together, yield "No a are c' ".

This, taken along with the third, yields "No a are d' ".

This, taken along with the fourth, yields "No d' are e' ".

And this, taken along with the fifth, yields "All h are d' ".

Hence, if the original Set were true, this would *also* be true.

Hence the original Set, with this tacked on, is a *Sorites*; the original Set is its *Premisses*; the Proposition "All h are d' " is its *Conclusion*; the Terms a , b , c , e are its *Eliminands*; and the Terms d and h are its *Retinends*.

Hence we may write the whole Sorites thus:—

"No a are b' ;
All b are c ;
All c are d ;
No e' are a' ;
All h are e' .
∴ All h are d' ."

In the above Sorites, the 3 Partial Conclusions are the Positions "No a are e' ", "No a are d' ", "No d' are e' "; but, if the Premisses were arranged in other ways, other Partial Conclusions might be obtained. Thus, the order 41523 yields the Partial Conclusions "No c' are b' ", "All h are b' ", "All h are c' ". There are altogether *nine* Partial Conclusions to this Sorites, which the Reader will find it an interesting task to make out for himself.]

Chapter II. Problems in Soriteses.

§ 1. **Introductory.** The Problems we shall have to solve are of the following form:—

"Given three or more Propositions of Relation, which are proposed as Premisses: to ascertain what Conclusion, if any, is consequent from them."

We will limit ourselves, at present, to Problems which can be worked by the Formulæ of Fig. I. (See p. 1087.) Those, that require *other* Formulæ, are rather too hard for beginners.

Such Problems may be solved by either of two Methods, viz.

- (1) The Method of Separate Syllogisms;
- (2) The Method of Underscoring.

These shall be discussed separately.

§ 2. **Solution by Method of Separate Syllogisms.** The Rules, for doing this, are as follows:—

- (1) Name the 'Universe of Discourse'.
- (2) Construct a Dictionary, making a , b , c , &c. represent the Terms.
- (3) Put the Proposed Premisses into subscript form. (4) Select two which, containing between them a pair of codivisional Classes, can be used as the Premisses of a Syllogism.
- (5) Find their Conclusion by Formula.
- (6) Find a third Premiss which, along with this Conclusion, can be used as the Premisses of a second Syllogism.
- (7) Find a second Conclusion by Formula.
- (8) Proceed thus, until all the proposed Premisses have been used.

- (9) Put the last Conclusion, which is the Complete Conclusion of the Sorites, into concrete form.

[As an example of this process, let us take, as the proposed Set of Premisses,

- (1) "All the policemen on this beat sup with our cook;
- (2) No man with long hair can fail to be a poet;
- (3) Amos Judd has never been in prison;
- (4) Our cook's 'cousins' all love cold mutton;
- (5) None but policemen on this beat are poets;
- (6) None but her 'cousins' ever sup with our cook;
- (7) Men with short hair have all been in prison."

Univ. "men"; a = Amos Judd; b = cousins of our cook; c = having been in prison; d = long-haired; e = loving cold mutton; h = poets; k = policemen on this beat; l = supping with our cook.

We now have to put the proposed Premisses into *subscript* form. Let us begin by putting them into *abstract* form. The result is

- (1) "All k are l ;
- (2) No d are h' ;
- (3) All a are c' ;
- (4) All b are e ;
- (5) No k' are h ;
- (6) No b' are l ;
- (7) All d' are c ."

And it is now easy to put them into *subscript* form, as follows:—

- (1) $k_1 l'_0$
- (2) dh'_0
- (3) $a_1 c_0$
- (4) $b_1 e'_0$
- (5) $k' h_0$
- (6) $b' l_0$
- (7) $d'_1 c'_0$

We now have to find a pair of Premisses which will yield a Conclusion. Let us begin with No. (1), and look down the list, till we come to one which we can take along with it, so as to form Premisses belonging to Fig. I. We find that No. (5) will do, since we can take k as our Eliminand. So our first syllogism is

- (1) $k_1 l'_0$
 - (5) $k' h_0$
- $\therefore l' h_0 \dots$ (8)

We must now begin again with $l' h_0$ and find a Premiss to go along with it. We find that No. (2) will do, h being our Eliminand. So our next Syllogism is

- (8) $l' h_0$
 - (2) dh'_0
- $\therefore l' d_0 \dots$ (9)

We have now used up Nos. (1), (5), and (2), and must search among the others for a partner for $l' d_0$. We find that No. (6) will do. So we write

- (9) $l' d_0$
 - (6) $b' l_0$
- $\therefore db'_0 \dots$ (10)

Now what can we take along with db'_0 ? No. (4) will do.

$$\begin{array}{l}
(10) db'_0 \\
(4) b_1e'_0 \\
\therefore de'_0 \dots (11)
\end{array}$$

Along with *this* we may take No. (7).

$$\begin{array}{l}
(11) de'_0 \\
(7) d'_1c'_0 \\
\therefore c'e'_0 \dots (12)
\end{array}$$

And along with *this* we may take No. (3).

$$\begin{array}{l}
(12) c'e'_0 \\
(3) a_1c_0 \\
\therefore a_1e'_0
\end{array}$$

This Complete Conclusion, translated into *abstract* form, is

“All *a* are *e*”;

and this, translated into *concrete* form, is

“Amos Judd loves cold mutton.”

In actually *working* this Problem, the above explanations would, of course, be omitted, and all, that would appear on paper, would be as follows:—

$$\begin{array}{l}
(1) k_1l'_0 \\
(2) dh'_0 \\
(3) a_1c_0 \\
(4) b_1e'_0 \\
(5) k'h_0 \\
(6) b'l_0 \\
(7) d'_1c'_0 \\
(1) k_1l'_0 \\
(5) k'h_0 \\
\therefore l'h_0 \dots (8)
\end{array}$$

$$\begin{array}{l}
(8) l'h_0 \\
(2) dh'_0 \\
\therefore l'd_0 \dots (9)
\end{array}$$

$$\begin{array}{l}
(9) l'd_0 \\
(6) b'l_0 \\
\therefore db'_0 \dots (10)
\end{array}$$

$$\begin{array}{l}
(10) db'_0 \\
(4) b_1e'_0 \\
\therefore de'_0 \dots (11)
\end{array}$$

$$\begin{array}{l}
(11) de'_0 \\
(7) d'_1c'_0 \\
\therefore c'e'_0 \dots (12)
\end{array}$$

$$\begin{array}{l}
(12) c'e'_0 \\
(3) a_1c_0 \\
\therefore a_1e'_0
\end{array}$$

Note that, in working a Sorites by this Process, we may begin with *any* Premiss we choose.]

§ 3. Solution by Method of Underscoring. Consider the Pair of Premisses

$$xm_0 \dagger ym'_0$$

which yield the Conclusion xy_0

We see that, in order to get this Conclusion, we must eliminate m and m' , and write x and y together in one expression.

Now, if we agree to *mark* m and m' as eliminated, and to read the two expressions together, as if they were written in one, the two Premisses will then exactly represent the *Conclusion*, and we need not write it out separately.

Let us agree to mark the eliminated letters by *underscoring* them, putting a *single* score under the *first*, and a *double* one under the *second*.

The two Premisses now become

$$xm_0 \dagger y\underline{m}'_0$$

which we read as " xy_0 ".

In copying out the Premisses for underscoring, it will be convenient to *omit all subscripts*. As to the "0's" we may always *suppose* them written, and, as to the "1's", we are not concerned to know *which* Terms are asserted to *exist*, except those which appear in the *Complete Conclusion*; and for *them* it will be easy enough to refer to the original list.

[I will now go through the process of solving, by this method, the example worked in § 2.

The Data are

$$\begin{array}{ccccccc} 1 & 2 & 3 & 4 & 5 & 6 & 7 \\ k_1l'_0 \dagger & dh'_0 \dagger & a_1c_0 \dagger & b_1e'_0 \dagger & k'h_0 \dagger & b'l_0 \dagger & d'_1c'_0 \end{array}$$

The Reader should take a piece of paper, and write out this solution for himself. The first line will consist of the above Data; the second must be composed, bit by bit, according to the following directions.

We begin by writing down the first Premiss, with its numeral over it, but omitting the subscripts.

We have now to find a Premiss which can be combined with this, *i. e.*, a Premiss containing either k' or l . The first we find is No. 5; and this we tack on, with a \dagger .

To get the *Conclusion* from these, k and k' must be eliminated, and what remains must be taken as one expression. So we *underscore* them, putting a *single* score under k , and a *double* one under k' . The result we read as $l'h$.

We must now find a Premiss containing either l or h' . Looking along the row, we fix on No. 2, and tack it on.

Now these 3 Nullities are really equivalent to $(l'h \dagger dh')$, in which h and h' must be eliminated, and what remains taken as one expression. So we *underscore* them. The result reads as $l'd$.

We now want a Premiss containing l or d' . No. 6 will do.

These 4 Nullities are really equivalent to $(l'd \dagger b'l)$. So we underscore l' and l . The result reads as db' .

We now want a Premiss containing d' or b . No. 4 will do.

Here we underscore b' and b . The result reads as de' .

We now want a Premiss containing d' or e . No. 7 will do.

Here we underscore d and d' . The result reads as $c'e'$.

We now want a Premiss containing c or e . No. 3 will do—in fact *must* do, as it is the only one left.

Here we underscore c' and c ; and, as the whole thing now reads as $e'a$, we tack on $e'a_0$ as the *Conclusion*, with a \mathbb{P} .

We now look along the row of Data, to see whether e' or a has been given as *existent*. We find that a has been so given in No. 3. So we add this fact to the Conclusion, which now stands as $\mathbb{P}e'a_0 \dagger a_1$, *i. e.* $\mathbb{P}a_1e'_0$; *i. e.* "All a are e ."

If the Reader has faithfully obeyed the above directions, his written solution will now stand as follows:—

$$\begin{array}{ccccccc} 1 & 2 & 3 & 4 & 5 & 6 & 7 \\ k_1l'_0 & \dagger & dh'_0 & \dagger & a_1c_0 & \dagger & b_1e'_0 & \dagger & k'h_0 & \dagger & b'l_0 & \dagger & d'_1c'_0 \end{array}$$

$$\begin{array}{ccccccc} 1 & 5 & 2 & 6 & 4 & 7 & 3 \\ \underline{k'l'} & \dagger & \underline{k'h} & \dagger & \underline{dh'} & \dagger & \underline{b'l} & \dagger & \underline{b'e'} & \dagger & \underline{d'c'} & \dagger & \underline{ac} & \mathbb{P}e'a_0 \dagger a_1i.e. \mathbb{P}a_1e'_0; \end{array}$$

i. e. “All *a* are *e*.”

The Reader should now take a second piece of paper, and copy the Data only, and try to work out the solution for himself, beginning with some other Premiss.

If he fails to bring out the Conclusion $a_1e'_0$, I would advise him to take a third piece of paper, and *begin again!*

I will now work out, in its briefest form, a Sorites of 5 Premisses, to serve as a model for the Reader to imitate in working examples.

- (1) "I greatly value everything that John gives me;
- (2) Nothing but this bone will satisfy my dog;
- (3) I take particular care of everything that I greatly value;
- (4) This bone was a present from John;
- (5) The things, of which I take particular care, are things I do *not* give to my dog".

Univ. “things”; *a* = given by John to me; *b* = given by me to my dog; *c* = greatly valued by me; *d* = satisfactory to my dog; *e* = taken particular care of by me; *h* = this bone.

$$\begin{array}{ccccccc} 1 & 2 & 3 & 4 & 5 \\ a_1c'_0 & \dagger & h'd_0 & \dagger & c_1e'_0 & \dagger & h_1a'_0 & \dagger & e_1b_0 \end{array}$$

$$\begin{array}{ccccccc} 1 & 3 & 4 & 2 & 5 \\ \underline{ac'} & \dagger & \underline{ce'} & \dagger & \underline{ha'} & \dagger & \underline{hd} & \dagger & \underline{eb} & \mathbb{P}db_0 \end{array}$$

i. e. “Nothing, that I give my dog, satisfies him,” or, “My dog is not satisfied with *anything* that I give him!”

[Note that, in working a Sorites by this process, we may begin with *any* Premiss we choose. For instance, we might begin with No. 5, and the result would then be

$$\begin{array}{ccccccc} 5 & 3 & 1 & 4 & 2 \\ \underline{eb} & \dagger & \underline{ce'} & \dagger & \underline{ac'} & \dagger & \underline{ha'} & \dagger & \underline{hd} & \mathbb{P}bd_0 \end{array}$$

]

[Work Examples § 4, 25–30 (p. 1106); § 5, 25–30 (p. 1108); § 6, 13–15 (p. 1112); § 7, 13–15 (p. 1113); § 8, 1–4, 13, 14, 19, 24 (p. 1115); § 9, 1–4, 26, 27, 40, 48 (p. 1120).]

The Reader, who has successfully grappled with all the Examples hitherto set, and who thirsts, like Alexander the Great, for “more worlds to conquer,” may employ his spare energies on the following 17 Examination-Papers. He is recommended not to attempt more than *one* Paper on any one day. The answers to the questions about words and phrases may be found by referring to the Index at p. 197.

- I. § 4, 31 (p. 100); § 5, 31–34 (p. 102); § 6, 16, 17 (p. 106); § 7, 16 (p. 108); § 8, 5, 6 (p. 110); § 9, 5, 22, 42 (pp. 112, 115, 119).
What is ‘Classification’? And what is a ‘Class’?
- II. § 4, 32 (p. 100); § 5, 35–38 (pp. 102, 103); § 6, 18 (p. 107); § 7, 17, 18 (p. 108); § 8, 7, 8 (p. 110); § 9, 6, 23, 43 (pp. 112, 115, 119). What are ‘Genus’, ‘Species’, and ‘Differentia’?
- III. § 4, 33 (p. 100); § 5, 39–42 (p. 103); § 6, 19, 20 (p. 107); § 7, 19 (p. 109); § 8, 9, 10 (p. 111); § 9, 7, 24, 44 (pp. 113, 116, 120).
What are ‘Real’ and ‘Imaginary’ Classes?
- IV. § 4, 34 (p. 100); § 5, 43–46 (p. 103); § 6, 21 (p. 107); § 7, 20, 21 (p. 109); § 8, 11, 12 (p. 111); § 9, 8, 25, 45 (pp. 113, 116, 120).
What is ‘Division’? When are Classes said to be ‘Codivisional’?
- V. § 4, 35 (p. 100); § 5, 47–50 (p. 103); § 6, 22, 23 (p. 107); § 7, 22 (p. 109); § 8, 15, 16 (p. 111); § 9, 9, 28, 46 (pp. 113, 116, 120).
What is ‘Dichotomy’? What arbitrary rule does \lceil it² sometimes require?
- VI. § 4, 36 (p. 100); § 5, 51–54 (p. 103); § 6, 24 (p. 107); § 7, 23, 24 (p. 109); § 8, 17 (p. 111); § 9, 10, 29, 47 (pp. 113, 117, 120).
What is a ‘Definition’?
- VII. § 4, 37 (p. 100); § 5, 55–58 (pp. 103, 104); § 6, 25, 26 (p. 107); § 7, 25 (p. 109); § 8, 18 (p. 111); § 9, 11, 30, 49 (pp. 113, 117, 121).
What are the ‘Subject’ and the ‘Predicate’ of a Proposition?
What is its ‘Normal’ form?
- VIII. § 4, 38 (p. 100); § 5, 59–62 (p. 104); § 6, 27 (p. 107); § 7, 26, 27 (p. 109); § 8, 20 (p. 111); § 9, 12, 31, 50 (pp. 113, 117, 121).
What is a Proposition ‘in *I*’? ‘In *E*’? And ‘in *A*’?
- IX. § 4, 39 (p. 100); § 5, 63–66 (p. 104); § 6, 28, 29 (p. 107); § 7, 28 (p. 109); § 8, 21 (p. 111); § 9, 13, 32, 51 (pp. 114, 117, 121).
What is the ‘Normal’ form of a Proposition of Existence?
- X. § 4, 40 (p. 100); § 5, 67–70 (p. 104); § 6, 30 (p. 107); § 7, 29, 30 (p. 109); § 8, 22 (p. 111); § 9, 14, 33, 52 (pp. 114, 117, 122).
What is the ‘Universe of Discourse’?
- XI. § 4, 41 (p. 100); § 5, 71–74 (p. 104); § 6, 31, 32 (p. 107); § 7, 31 (p. 109); § 8, 23 (p. 111); § 9, 15, 34, 53 (pp. 114, 118, 122).
What is implied, in a Proposition of Relation, as to the Reality of its Terms?
- XII. § 4, 42 (p. 100); § 5, 75–78 (p. 105); § 6, 33 (p. 107); § 7, 32, 33 (pp. 109, 110); § 8, 25 (p. 111); § 9, 16, 35, 54 (pp. 114, 118, 122). Explain the phrase “sitting on the fence”.
- XIII. § 5, 79–83 (p. 105); § 6, 34, 35 (p. 107); § 7, 34 (p. 110); § 8, 26 (p. 111); § 9, 17, 36, 55 (pp. 114, 118, 122). What are ‘Converse’ Propositions?
- XIV. § 5, 84–88 (p. 105); § 6, 36 (p. 107); § 7, 35, 36 (p. 110); § 8, 27 (p. 111); § 9, 18, 37, 56 (pp. 114, 118, 123). What are ‘Concrete’ and ‘Abstract’ Propositions?
- XV. § 5, 89–93 (p. 105); § 6, 37, 38 (p. 107); § 7, 37 (p. 110); § 8, 28 (p. 111); § 9, 19, 38, 57 (pp. 115, 118, 123). What is a ‘Syllogism’? And what are its ‘Premisses’ and its ‘Conclusion’?

²accidentally missing

- XVI. § 5, 94–97 (p. 106); § 6, 39 (p. 107); § 7, 38, 39 (p. 110); § 8, 29 (p. 111); § 9, 20, 39, 58 (pp. 115, 119, 123). What is a ‘Sorites’? And what are its ‘Premisses’, its ‘Partial Conclusions’, and its ‘Complete Conclusion’?
- XVII. § 5, 98–101 (p. 106); § 6, 40 (p. 107); § 7, 40 (p. 110); § 8, 30 (p. 111); § 9, 21, 41, 59, 60 (pp. 115, 119, 124). What are the ‘Universe of Discourse’, the ‘Eliminands’, and the ‘Retinends’, of a Syllogism? And of a Sorites?

Book VIII. Examples, Answers, and Solutions.

[N.B. Reference tags for Examples, Answers & Solutions will be found in the right margin.]³

Chapter I. Examples.

§ 1. Propositions of Relation, to be reduced to normal form.

1. I have been out for a walk.
2. I am feeling better.
3. No one has read the letter but John.
4. Neither you nor I are old.
5. No fat creatures run well.
6. None but the brave deserve the fair.
7. No one looks poetical unless he is pale.
8. Some judges lose their tempers.
9. I never neglect important business.
10. What is difficult needs attention.
11. What is unwholesome should be avoided.
12. All the laws passed last week relate to excise.
13. Logic puzzles me.
14. There are no Jews in the house.
15. Some dishes are unwholesome if not well-cooked.
16. Unexciting books make one drowsy.
17. When a man knows what he’s about, he can detect a sharper.
18. You and I know what we’re about.
19. Some bald people wear wigs.
20. Those who are fully occupied never talk about their grievances.
21. No riddles interest me if they can be solved.

§ 2. Pairs of Abstract Propositions, one in terms of x and m , and the other in terms of y and m , to be represented on the same Trilateral Diagram.

1. No x are m ;
No m' are y .
2. No x' are m' ;
All m' are y .
3. Some x' are m ;

³Remark: This has not been reproduced here.

- No m are y .
4. All m are x ;
All m' are y' .
 5. All m' are x ;
All m' are y' .
 6. All x' are m' ;
No y' are m .
 7. All x are m ;
All y' are m' .
 8. Some m' are x' ;
No m are y .
 9. All m are x' ;
No m are y .
 10. No m are x' ;
No y are m' .
 11. No x' are m' ;
No m are y .
 12. Some x are m ;
All y' are m .
 13. All x' are m ;
No m are y .
 14. Some x are m' ;
All m are y .
 15. No m' are x' ;
All y are m .
 16. All x are m' ;
No y are m .
 17. Some m' are x ;
No m' are y' .
 18. All x are m' ;
Some m' are y' .
 19. All m are x ;
Some m are y' .
 20. No x' are m ;
Some y are m .
 21. Some x' are m' ;
All y' are m .
 22. No m are x ;
Some m are y .
 23. No m' are x ;
All y are m' .
 24. All m are x ;
No y' are m' .

25. Some m are x ;
No y' are m .
26. All m' are x' ;
Some y are m' .
27. Some m are x' ;
No y' are m' .
28. No x are m' ;
All m are y' .
29. No x' are m ;
No m are y' .
30. No x are m ;
Some y' are m' .
31. Some m' are x ;
All y' are m ;
32. All x are m' ;
All y are m .

§ 3. Marked Trilateral Diagrams, to be interpreted in terms of x and y .

§ 4. Pairs of Abstract Propositions, proposed as Premisses: Conclusions to be found.

1. No m are x' ;
All m' are y .
2. No m' are x ;
Some m' are y' .
3. All m' are x ;
All m' are y' .
4. No x' are m' ;
All y' are m .
5. Some m are x' ;
No y are m .
6. No x' are m ;
No m are y .
7. No m are x' ;
Some y' are m .
8. All m' are x' ;
No m' are y .
9. Some x' are m' ;
No m are y' .
10. All x are m ;
All y' are m' .
11. No m are x ;
All y' are m' .
12. No x are m ;
All y are m .
13. All m' are x ;
No y are m .
14. All m are x ;
All m' are y .
15. No x are m ;
No m' are y .
16. All x are m' ;
All y are m .
17. No x are m ;
All m' are y .
18. No x are m' ;
No m are y .
19. All m are x ;
All m are y' .
20. No m are x ;
All m' are y .
21. All x are m ;

- Some m' are y .
22. Some x are m ;
All y are m .
 23. All m are x ;
Some y are m .
 24. No x are m ;
All y are m .
 25. Some m are x' ;
All y' are m' .
 26. No m are x' ;
All y are m .
 27. All x are m' ;
All y' are m .
 28. All m are x' ;
Some m are y .
 29. No m are x ;
All y are m' .
 30. All x are m' ;
Some y are m .
 31. All x are m ;
All y are m .
 32. No x are m' ;
All m are y .
 33. No m are x ;
No m are y .
 34. No m are x' ;
Some y are m .
 35. No m are x ;
All y are m .
 36. All m are x' ;
Some y are m .
 37. All m are x ;
No y are m .
 38. No m are x ;
No m' are y .
 39. Some m are x' ;
No m are y .
 40. No x' are m ;
All y' are m .
 41. All x are m' ;
No y are m' .
 42. No m' are x ;
No y are m .

§ 5. Pairs of Concrete Propositions, proposed as Premisses: Conclusions to be found.

1. I have been out for a walk;
I am feeling better.
2. No one has read the letter but John;
No one, who has *not* read it, knows what it is about.
3. Those who are not old like walking;
You and I are young.
4. Your course is always honest;
Your course is always the best policy.
5. No fat creatures run well;
Some greyhounds run well.
6. Some, who deserve the fair, get their deserts;
None but the brave deserve the fair.
7. Some Jews are rich;
All Esquimaux are Gentiles.
8. Sugar-plums are sweet;
Some sweet things are liked by children.
9. John is in the house;
Everybody in the house is ill.
10. Umbrellas are useful on a journey;
What is useless on a journey should be left behind.
11. Audible music causes vibration in the air;
Inaudible music is not worth paying for.
12. Some holidays are rainy;
Rainy days are tiresome.
13. No Frenchmen like plumpudding;
All Englishmen like plumpudding.
14. No portrait of a lady, that makes her simper or scowl, is satisfactory;
No photograph of a lady ever fails to make her simper or scowl.
15. All pale people are phlegmatic;
No one looks poetical unless he is pale.
16. No old misers are cheerful;
Some old misers are thin.
17. No one, who exercises self-control, fails to keep his temper;
Some judges lose their tempers.
18. All pigs are fat;
Nothing that is fed on barley-water is fat.
19. All rabbits, that are not greedy, are black;
No old rabbits are free from greediness.
20. Some pictures are not first attempts;
No first attempts are really good.

21. I never neglect important business;
Your business is unimportant.
22. Some lessons are difficult;
What is difficult needs attention.
23. All clever people are popular;
All obliging people are popular.
24. Thoughtless people do mischief;
No thoughtful person forgets a promise.
25. Pigs cannot fly;
Pigs are greedy.
26. All soldiers march well;
Some babies are not soldiers.
27. No bride-cakes are wholesome;
What is unwholesome should be avoided.
28. John is industrious;
No industrious people are unhappy.
29. No philosophers are conceited;
Some conceited persons are not gamblers.
30. Some excise laws are unjust;
All the laws passed last week relate to excise.
31. No military men write poetry;
None of my lodgers are civilians.
32. No medicine is nice;
Senna is a medicine.
33. Some circulars are not read with pleasure;
No begging-letters are read with pleasure.
34. All Britons are brave;
No sailors are cowards.
35. Nothing intelligible ever puzzles *me*;
Logic puzzles me.
36. Some pigs are wild;
All pigs are fat.
37. All wasps are unfriendly;
All unfriendly creatures are unwelcome.
38. No old rabbits are greedy;
All black rabbits are greedy.
39. Some eggs are hard-boiled;
No eggs are uncrackable.
40. No antelope is ungraceful;
Graceful creatures delight the eye.
41. All well-fed canaries sing loud;
No canary is melancholy if it sings loud.
42. Some poetry is original;

- No original work is producible at will.
43. No country, that has been explored, is infested by dragons;
Unexplored countries are fascinating.
44. No coals are white;
No niggers are white.
45. No bridges are made of sugar;
Some bridges are picturesque.
46. No children are patient;
No impatient person can sit still.
47. No quadrupeds can whistle;
Some cats are quadrupeds.
48. Bores are terrible;
You are a bore.
49. Some oysters are silent;
No silent creatures are amusing.
50. There are no Jews in the house;
No Gentiles have beards a yard long.
51. Canaries, that do not sing loud, are unhappy;
No well-fed canaries fail to sing loud.
52. All my sisters have colds;
No one can sing who has a cold.
53. All that is made of gold is precious;
Some caskets are precious.
54. Some buns are rich;
All buns are nice.
55. All my cousins are unjust;
All judges are just.
56. Pain is wearisome;
No pain is eagerly wished for.
57. All medicine is nasty;
Senna is a medicine.
58. Some unkind remarks are annoying;
No critical remarks are kind.
59. No tall men have woolly hair;
Niggers have woolly hair.
60. All philosophers are logical;
An illogical man is always obstinate.
61. John is industrious;
All industrious people are happy.
62. These dishes are all well-cooked;
Some dishes are unwholesome if not well-cooked.
63. No exciting books suit feverish patients;
Unexciting books make one drowsy.

64. No pigs can fly;
All pigs are greedy.
65. When a man knows what he's about, he can detect a sharper;
You and I know what we're about.
66. Some dreams are terrible;
No lambs are terrible.
67. No bald creature needs a hairbrush;
No lizards have hair.
68. All battles are noisy;
What makes no noise may escape notice.
69. All my cousins are unjust;
No judges are unjust.
70. All eggs can be cracked;
Some eggs are hard-boiled.
71. Prejudiced persons are untrustworthy;
Some unprejudiced persons are disliked.
72. No dictatorial person is popular;
She is dictatorial.
73. Some bald people wear wigs;
All your children have hair.
74. No lobsters are unreasonable;
No reasonable creatures expect impossibilities.
75. No nightmare is pleasant;
Unpleasant experiences are not eagerly desired.
76. No plumcakes are wholesome;
Some wholesome things are nice.
77. Nothing that is nice need be shunned;
Some kinds of jam are nice.
78. All ducks waddle;
Nothing that waddles is graceful.
79. Sandwiches are satisfying;
Nothing in this dish is unsatisfying.
80. No rich man begs in the street;
Those who are not rich should keep accounts.
81. Spiders spin webs;
Some creatures, that do not spin webs, are savage.
82. Some of these shops are not crowded;
No crowded shops are comfortable.
83. Prudent travelers carry plenty of small change;
Imprudent travelers lose their luggage.
84. Some geraniums are red;
All these flowers are red.
85. None of my cousins are just;

- All judges are just.
86. No Jews are mad;
All my lodgers are Jews.
87. Busy folk are not always talking about their grievances;
Discontented folk are always talking about their grievances.
88. None of my cousins are just;
No judges are unjust.
89. All teetotalers like sugar;
No nightingale drinks wine.
90. No riddles interest me if they can be solved;
All these riddles are insoluble.
91. All clear explanations are satisfactory;
Some excuses are unsatisfactory.
92. All elderly ladies are talkative;
All good-tempered ladies are talkative.
93. No kind deed is unlawful;
What is lawful may be done without scruple.
94. No babies are studious;
No babies are good violinists.
95. All shillings are round;
All these coins are round.
96. No honest men cheat;
No dishonest men are trustworthy.
97. None of my boys are clever;
None of my girls are greedy.
98. All jokes are meant to amuse;
No Act of Parliament is a joke.
99. No eventful tour is ever forgotten;
Uneventful tours are not worth writing a book about.
100. All my boys are disobedient;
All my girls are discontented.
101. No unexpected pleasure annoys me;
Your visit is an unexpected pleasure.

§ 6. Trios of Abstract Propositions, proposed as Syllogisms: to be examined.

1. Some x are m ; No m are y' . Some x are y .
2. All x are m ; No y are m' . No y are x' .
3. Some x are m' ; All y' are m . Some x are y .
4. All x are m ; No y are m . All x are y' .
5. Some m' are x' ; No m' are y . Some x' are y' .
6. No x' are m ; All y are m' . All y are x' .
7. Some m' are x' ; All y' are m' . Some x' are y' .
8. No m' are x' ; All y' are m' . All y' are x .

9. Some m are x' ; No m are y . Some x' are y' .
10. All m' are x' ; All m' are y . Some y are x' .
11. All x are m' ; Some y are m . Some y are x' .
12. No x are m ; No m' are y' . No x are y' .
13. No x are m ; All y' are m . All y' are x' .
14. All m' are x' ; All m' are y . Some y are x' .
15. Some m are x' ; All y are m' . Some x' are y' .
16. No x' are m ; All y' are m' . Some y' are x .
17. No m' are x ; All m' are y' . Some x' are y' .
18. No x' are m ; Some m are y . Some x are y .
19. Some m are x ; All m are y . Some y are x' .
20. No x' are m' ; Some m' are y . Some x are y' .
21. No m are x ; All m are y' . Some x' are y' .
22. All x' are m ; Some y are m . All x' are y' .
23. All m are x ; No m' are y' . No x' are y' .
24. All x are m' ; All m' are y . All x are y .
25. No x are m' ; All m are y . No x are y' .
26. All m are x' ; All y are m . All y are x' .
27. All x are m ; No m are y' . All x are y .
28. All x are m ; No y' are m' . All x are y .
29. No x' are m ; No m' are y' . No x' are y' .
30. All x are m ; All m are y' . All x are y' .
31. All x' are m' ; No y' are m' . All x' are y .
32. No x are m ; No y' are m' . No x are y' .
33. All m are x' ; All y' are m . All y' are x' .
34. All x are m' ; Some y are m . Some y are x .
35. Some x are m ; All m are y . Some x are y .
36. All m are x' ; All y are m . All y are x' .
37. No m are x' ; All m are y' . Some x are y' .
38. No x are m ; No m are y' . No x are y' .
39. No m are x ; Some m are y . Some x' are y' .
40. No m are x' ; Some y are m . Some x are y .

§ 7. Trios of Concrete Propositions, proposed as Syllogisms: to be examined.

1. No doctors are enthusiastic;
You are enthusiastic.
You are not a doctor.
2. Dictionaries are useful;
Useful books are valuable.
Dictionaries are valuable.
3. No misers are unselfish;
None but misers save egg-shells.
No unselfish people save egg-shells.
4. Some epicures are ungenerous;
All my uncles are generous.
My uncles are not epicures.
5. Gold is heavy;

- Nothing but gold will silence him.
Nothing light will silence him.
6. Some healthy people are fat;
No unhealthy people are strong.
Some fat people are not strong.
7. "I saw it in a newspaper."
"All newspapers tell lies."
It was a lie.
8. Some cravats are not artistic;
I admire anything artistic.
There are some cravats that I do not admire.
9. His songs never last an hour;
A song, that lasts an hour, is tedious.
His songs are never tedious.
10. Some candles give very little light;
Candles are *meant* to give light.
Some things, that are meant to give light, give very little.
11. All, who are anxious to learn, work hard;
Some of these boys work hard.
Some of these boys are anxious to learn.
12. All lions are fierce;
Some lions do not drink coffee.
Some creatures that drink coffee are not fierce.
13. No misers are generous;
Some old men are ungenerous.
Some old men are misers.
14. No fossil can be crossed in love;
An oyster may be crossed in love.
Oysters are not fossils.
15. All uneducated people are shallow;
Students are all educated.
No students are shallow.
16. All young lambs jump;
No young animals are healthy, unless they jump.
All young lambs are healthy.
17. Ill-managed business is unprofitable;
Railways are never ill-managed.
All railways are profitable.
18. No Professors are ignorant;
All ignorant people are vain.
No professors are vain.
19. A prudent man shuns hyænas;
No banker is imprudent.
No banker fails to shun hyænas.
20. All wasps are unfriendly;

- No puppies are unfriendly.
Puppies are not wasps.
21. No Jews are honest;
Some Gentiles are rich.
Some rich people are dishonest.
22. No idlers win fame;
Some painters are not idle.
Some painters win fame.
23. No monkeys are soldiers;
All monkeys are mischievous.
Some mischievous creatures are not soldiers.
24. All these bonbons are chocolate-creams;
All these bonbons are delicious.
Chocolate-creams are delicious.
25. No muffins are wholesome;
All buns are unwholesome.
Buns are not muffins.
26. Some unauthorised reports are false;
All authorised reports are trustworthy.
Some false reports are not trustworthy.
27. Some pillows are soft;
No pokers are soft.
Some pokers are not pillows.
28. Improbable stories are not easily believed;
None of his stories are probable.
None of his stories are easily believed.
29. No thieves are honest;
Some dishonest people are found out.
Some thieves are found out.
30. No muffins are wholesome;
All puffy food is unwholesome.
All muffins are puffy.
31. No birds, except peacocks, are proud of their tails;
Some birds, that are proud of their tails, cannot sing.
Some peacocks cannot sing.
32. Warmth relieves pain;
Nothing, that does not relieve pain, is useful in toothache.
Warmth is useful in toothache.
33. No bankrupts are rich;
Some merchants are not bankrupts.
Some merchants are rich.
34. Bores are dreaded;
No bore is ever begged to prolong his visit.
No one, who is dreaded, is ever begged to prolong his visit.
35. All wise men walk on their feet;

- All unwise men walk on their hands.
 No man walks on both.
36. No wheelbarrows are comfortable;
 No uncomfortable vehicles are popular.
 No wheelbarrows are popular.
37. No frogs are poetical;
 Some ducks are unpoetical.
 Some ducks are not frogs.
38. No emperors are dentists;
 All dentists are dreaded by children.
 No emperors are dreaded by children.
39. Sugar is sweet;
 Salt is not sweet.
 Salt is not sugar.
40. Every eagle can fly;
 Some pigs cannot fly.
 Some pigs are not eagles.

§ 8. Sets of Abstract Propositions, proposed as Premisses for Sorites: Conclusions to be found. [N.B. At the end of this Section instructions are given for varying these Examples.]

1.

1. No c are d ;
2. All a are d ;
3. All b are c .

2.

1. All d are b ;
2. No a are c' ;
3. No b are c .

3.

1. No b are a ;
2. No c are d' ;
3. All d are b .

4.

1. No b are c ;
2. All a are b ;
3. No c' are d .

5.

1. All b' are a' ;
2. No b are c ;
3. No a' are d .

6.

1. All a are b' ;
2. No b' are c ;
3. All d are a .

7.

1. No d are b' ;
2. All b are a ;
3. No c are d' .

8.

1. No b' are d ;
2. No a' are b ;
3. All c are d .

9.

1. All b' are a ;
2. No a are d ;
3. All b are c .

10.

1. No c are d ;
2. All b are c ;
3. No a are d' .

11.

1. No b are c ;
2. All d are a ;
3. All c' are a' .

12.

1. No c are b' ;
2. All c' are d' ;
3. All b are a .

13.

1. All d are e ;
2. All c are a ;
3. No b are d' ;
4. All e are a' .

14.

1. All e are b ;
2. All a are e ;
3. All d are b' ;
4. All a' are c ;

15.

1. No b' are d ;
2. All e are c ;
3. All b are a ;
4. All d' are c' .

16.

1. No a' are e ;
2. All d are c' ;
3. All a are b ;
4. All e' are d .

17.

1. All d are c ;
2. All a are e ;
3. No b are d' ;
4. All c are e' .

18.

1. All a are b ;
2. All d are e ;
3. All a' are c' ;
4. No b are e .

19.

1. No b are c ;
2. All e are h ;
3. All a are b ;
4. No d are h ;
5. All e' are c .

20.

1. No d are h' ;
2. No c are e ;
3. All h are b ;
4. No a are d' ;
5. No b are e' .

21.

1. All b are a ;
2. No d are h ;
3. No c are e ;
4. No a are h' ;
5. All c' are b .

22.

1. All e are d' ;
2. No b' are h' ;
3. All c' are d ;
4. All a are e ;
5. No c are h .

23.

1. All b' are a' ;
2. No d are e' ;
3. All h are b' ;
4. No c are e ;
5. All d' are a .

24.

1. All h' are k' ;
2. No b' are a ;
3. All c are d ;
4. All e are h' ;
5. No d are k' ;
6. No b are c' .

25.

1. All a are d ;
2. All k are b ;
3. All e are h ;
4. No a' are b ;
5. All d are c ;
6. All h are k .

26.

1. All a' are h ;
2. No d' are k' ;
3. All e are b' ;
4. No h are k ;
5. All a are e ;
6. No b' are d .

27.

1. All c are d' ;
2. No h are b ;
3. All a' are k ;
4. No c are e' ;
5. All b' are d ;
6. No a are c' .

28.

1. No a' are k ;
2. All e are b ;
3. No h are $\lceil k \rceil^4$;
4. No d' are c ;
5. No a are b ;
6. All c' are h .

29.

1. No e are k ;
2. No b' are m ;
3. No a are c' ;
4. All h' are e ;
5. All d are k ;
6. No c are b ;
7. All d' are l ;
8. No h are m' .

30.

1. All n are m ;
2. All a' are e ;
3. No c' are l ;
4. All k are r' ;
5. No a are $\lceil h \rceil^5$;
6. No d are l' ;
7. No c are $\lceil n \rceil^6$;
8. All e are b ;
9. All m are r ;
10. All h are d .

[N.B. In each Example, in Sections 8 and 9, it is possible to begin with *any* Premiss, at pleasure, and thus to get as many different Solutions (all of course yielding the *same* Complete Conclusion) as there are Premisses in the Example. Hence § 8 really contains 129 different Examples, and § 9 contains 273.]

§ 9. Sets of Concrete Propositions, proposed as Premisses for Sorites: Conclusions to be found.

⁴accidentally k

⁵accidentally h

⁶accidentally n

Other version:
→ 6.4, p. 998

1.

- (1) Babies are illogical;
- (2) Nobody is despised who can manage a crocodile;
- (3) Illogical persons are despised.

Univ. “persons”; a = able to manage a crocodile; b = babies; c = despised; d = logical.

2.

- (1) My saucepans are the only things I have that are made of tin;
- (2) I find all *your* presents very useful;
- (3) None of my saucepans are of the slightest use.

Univ. “things of mine”; a = made of tin; b = my saucepans; c = useful; d = your presents.

3.

- (1) No potatoes of mine, that are new, have been boiled;
- (2) All my potatoes in this dish are fit to eat;
- (3) No unboiled potatoes of mine are fit to eat.

Univ. “my potatoes”; a = boiled; b = eatable; c = in this dish; d = new.

4.

- (1) There are no Jews in the kitchen;
- (2) No Gentiles say “shpoonj”;
- (3) My servants are all in the kitchen.

Univ. “persons”; a = in the kitchen; b = Jews; c = my servants; d = saying “shpoonj.”

5.

- (1) No ducks waltz;
- (2) No officers ever decline to waltz;
- (3) All my poultry are ducks.

Univ. “creatures”; a = ducks; b = my poultry; c = officers; d = willing to waltz.

6.

- (1) Every one who is sane can do Logic;
- (2) No lunatics are fit to serve on a jury;
- (3) None of *your* sons can do Logic.

Univ. “persons”; a = able to do Logic; b = fit to serve on a jury; c = sane; d = your sons.

7.

- (1) There are no pencils of mine in this box;
- (2) No sugar-plums of mine are cigars;
- (3) The whole of my property, that is not in this box, consists of cigars.

Univ. "things of mine"; a = cigars; b = in this box; c = pencils; d = sugar-plums.

8.

- (1) No experienced person is incompetent;
- (2) Jenkins is always blundering;
- (3) No competent person is always blundering.

Univ. "persons"; a = always blundering; b = competent; c = experienced; d = Jenkins.

9.

- (1) No terriers wander among the signs of the zodiac;
- (2) Nothing, that does not wander among the signs of the zodiac, is a comet;
- (3) Nothing but a terrier has a curly tail.

Univ. "things"; a = comets; b = curly-tailed; c = terriers; d = wandering among the signs of the zodiac.

10.

- (1) No one takes in the *Times*, unless he is well-educated;
- (2) No hedge-hogs can read;
- (3) Those who cannot read are not well-educated.

Univ. "creatures"; a = able to read; b = hedge-hogs; c = taking in the *Times*; d = well-educated.

11.

- (1) All puddings are nice;
- (2) This dish is a pudding;
- (3) No nice things are wholesome.

Univ. "things"; a = nice; b = puddings; c = this dish; d = wholesome.

12.

- (1) My gardener is well worth listening to on military subjects;
- (2) No one can remember the battle of Waterloo, unless he is very old;
- (3) Nobody is really worth listening to on military subjects, unless he can remember the battle of Waterloo.

Univ. "persons"; a = able to remember the battle of Waterloo; b = my gardener; c = well worth listening to on military subjects; d = very old.

13.

- (1) All humming-birds are richly coloured;
- (2) No large birds live on honey;
- (3) Birds that do not live on honey are dull in colour.

Univ. "birds"; a = humming-birds; b = large; c = living on honey; d = richly coloured.

14.

- (1) No Gentiles have hooked noses;
- (2) A man who is a good hand at a bargain always makes money;
- (3) No Jew is ever a bad hand at a bargain.

Univ. "persons"; a = good hands at a bargain; b = hook-nosed; c = Jews; d = making money.

15.

- (1) All ducks in this village, that are branded 'B,' belong to Mrs. Bond;
- (2) Ducks in this village never wear lace collars, unless they are branded 'B';
- (3) Mrs. Bond has no gray ducks in this village.

Univ. "ducks in this village"; a = belonging to Mrs. Bond; b = branded 'B'; c = gray; d = wearing lace-collars.

16.

- (1) All the old articles in this cupboard are cracked;
- (2) No jug in this cupboard is new;
- (3) Nothing in this cupboard, that is cracked, will hold water.

Univ. "things in this cupboard"; a = able to hold water; b = cracked; c = jugs; d = old.

17.

- (1) All unripe fruit is unwholesome;
- (2) All these apples are wholesome;
- (3) No fruit, grown in the shade, is ripe.

Univ. "fruit"; a = grown in the shade; b = ripe; c = these apples; d = wholesome.

18.

- (1) Puppies, that will not lie still, are always grateful for the loan of a skipping-rope;
- (2) A lame puppy would not say "thank you" if you offered to lend it a skipping-rope.
- (3) None but lame puppies ever care to do worsted-work.

Univ. "puppies"; a = caring to do worsted-work; b = grateful for the loan of a skipping-rope; c = lame; d = willing to lie still.

19.

- (1) No name in this list is unsuitable for the hero of a romance;
- (2) Names beginning with a vowel are always melodious;
- (3) No name is suitable for the hero of a romance, if it begins with a consonant.

Univ. “names”; a = beginning with a vowel; b = in this list; c = melodious; d = suitable for the hero of a romance.

20.

- (1) All members of the House of Commons have perfect self-command;
- (2) No M.P., who wears a coronet, should ride in a donkey-race;
- (3) All members of the House of Lords wear coronets.

Univ. “M.P.’s”; a = belonging to the House of Commons; b = having perfect self-command; c = one who may ride in a donkey-race; d = wearing a coronet.

21.

- (1) No goods in this shop, that have been bought and paid for, are still on sale;
- (2) None of the goods may be carried away, unless labeled “sold”;
- (3) None of the goods are labeled “sold,” unless they have been bought and paid for.

Univ. “goods in this shop”; a = allowed to be carried away; b = bought and paid for; c = labeled “sold”; d = on sale.

22.

- (1) No acrobatic feats, that are not announced in the bills of a circus, are ever attempted there;
- (2) No acrobatic feat is possible, if it involves turning a quadruple somersault;
- (3) No impossible acrobatic feat is ever announced in a circus bill.

Univ. “acrobatic feats”; a = announced in the bills of a circus; b = attempted in a circus; c = involving the turning of a quadruple somersault; d = possible.

23.

- (1) Nobody, who really appreciates Beethoven, fails to keep silence while the Moonlight-Sonata is being played;
- (2) Guinea-pigs are hopelessly ignorant of music;
- (3) No one, who is hopelessly ignorant of music, ever keeps silence while the Moonlight-Sonata is being played.

Univ. “creatures”; a = guinea-pigs; b = hopelessly ignorant of music; c = keeping silence while the Moonlight-Sonata is being played; d = really appreciating Beethoven.

24.

- (1) Coloured flowers are always scented;
- (2) I dislike flowers that are not grown in the open air;
- (3) No flowers grown in the open air are colourless.

Univ. "flowers"; a = coloured; b = grown in the open air; c = liked by me; d = scented.

25.

- (1) Showy talkers think too much of themselves;
- (2) No really well-informed people are bad company;
- (3) People who think too much of themselves are not good company.

Univ. "persons"; a = good company; b = really well-informed; c = showy talkers; d = thinking too much of one's self.

26.

- (1) No boys under 12 are admitted to this school as boarders;
- (2) All the industrious boys have red hair;
- (3) None of the day-boys learn Greek;
- (4) None but those under 12 are idle.

Univ. "boys in this school"; a = boarders; b = industrious; c = learning Greek; d = red-haired; e = under 12.

27.

- (1) The only articles of food, that my doctor allows me, are such as are not very rich;
- (2) Nothing that agrees with me is unsuitable for supper;
- (3) Wedding-cake is always very rich;
- (4) My doctor allows me all articles of food that are suitable for supper.

Univ. "articles of food"; a = agreeing with me; b = allowed by my doctor; c = suitable for supper; d = very rich; e = wedding-cake.

28.

- (1) No discussions in our Debating-Club are likely to rouse the British Lion, so long as they are checked when they become too noisy;
- (2) Discussions, unwisely conducted, endanger the peacefulness of our Debating-Club;
- (3) Discussions, that go on while Tomkins is in the Chair, are likely to rouse the British Lion;
- (4) Discussions in our Debating-Club, when wisely conducted, are always checked when they become too noisy.

Univ. “discussions in our Debating-Club”; *a* = checked when too noisy; *b* = dangerous to the peacefulness of our Debating-Club; *c* = going on while Tomkins is in the chair; *d* = likely to rouse the British Lion; *e* = wisely conducted.

29.

- (1) All my sons are slim;
- (2) No child of mine is healthy who takes no exercise;
- (3) All gluttons, who are children of mine, are fat;
- (4) No daughter of mine takes any exercise.

Univ. “my children”; *a* = fat; *b* = gluttons; *c* = healthy; *d* = sons; *e* = taking exercise.

30.

- (1) Things sold in the street are of no great value;
- (2) Nothing but rubbish can be had for a song;
- (3) Eggs of the Great Auk are very valuable;
- (4) It is only what is sold in the street that is really *rubbish*.

Univ. “things”; *a* = able to be had for a song; *b* = eggs of the Great Auk; *c* = rubbish; *d* = sold in the street; *e* = very valuable.

31.

- (1) No books sold here have gilt edges, except what are in the front shop;
- (2) All the *authorised* editions have red labels;
- (3) All the books with red labels are priced at 5s. and upwards;
- (4) None but *authorised* editions are ever placed in the front shop.

Univ. “books sold here”; *a* = authorised editions; *b* = gilt-edged; *c* = having red labels; *d* = in the front shop; *e* = priced at 5s. and upwards.

32.

- (1) Remedies for bleeding, which fail to check it, are a mockery;
- (2) Tincture of Calendula is not to be despised;
- (3) Remedies, which will check the bleeding when you cut your finger, are useful;
- (4) All mock remedies for bleeding are despicable.

Univ. “remedies for bleeding”; *a* = able to check bleeding; *b* = despicable; *c* = mockeries; *d* = Tincture of Calendula; *e* = useful when you cut your finger.

33.

- (1) None of the unnoticed things, met with at sea, are mermaids;
- (2) Things entered in the log, as met with at sea, are sure to be worth remembering;
- (3) *I* have never met with anything worth remembering, when on a voyage;
- (4) Things met with at sea, that are noticed, are sure to be recorded in the log;

Univ. “things met with at sea”; a = entered in log; b = mermaids; c = met with by me; d = noticed; e = worth remembering.

34.

- (1) The only books in this library, that I do *not* recommend for reading, are unhealthy in tone;
- (2) The bound books are all well-written;
- (3) All the romances are healthy in tone;
- (4) I do not recommend you to read any of the unbound books.

Univ. “books in this library”; a = bound; b = healthy in tone; c = recommended by me; d = romances; e = well-written.

35.

- (1) No birds, except ostriches, are 9 feet high;
- (2) There are no birds in this aviary that belong to any one but *me*;
- (3) No ostrich lives on mince-pies;
- (4) I have no birds less than 9 feet high.

Univ. “birds”; a = in this aviary; b = living on mince-pies; c = my; d = 9 feet high; e = ostriches.

36.

- (1) A plum-pudding, that is not really solid, is mere porridge;
- (2) Every plum-pudding, served at my table, has been boiled in a cloth;
- (3) A plum-pudding that is mere porridge is indistinguishable from soup;
- (4) No plum-puddings are really solid, except what are served at *my* table.

Univ. “plum-puddings”; a = boiled in a cloth; b = distinguishable from soup; c = mere porridge; d = really solid; e = served at my table.

37.

- (1) No interesting poems are unpopular among people of real taste;
- (2) No modern poetry is free from affectation;
- (3) All *your* poems are on the subject of soap-bubbles;
- (4) No affected poetry is popular among people of real taste;
- (5) No ancient poem is on the subject of soap-bubbles.

Univ. "poems"; *a* = affected; *b* = ancient; *c* = interesting; *d* = on the subject of soap-bubbles; *e* = popular among people of real taste; *h* = written by you.

38.

- (1) All the fruit at this Show, that fails to get a prize, is the property of the Committee;
- (2) None of my peaches have got prizes;
- (3) None of the fruit, sold off in the evening, is unripe;
- (4) None of the ripe fruit has been grown in a hot-house;
- (5) All fruit, that belongs to the Committee, is sold off in the evening.

Univ. "fruit at this Show"; *a* = belonging to the Committee; *b* = getting prizes; *c* = grown in a hot-house; *d* = my peaches; *e* = ripe; *h* = sold off in the evening.

39.

- (1) Promise-breakers are untrustworthy;
- (2) Wine-drinkers are very communicative;
- (3) A man who keeps his promises is honest;
- (4) No teetotalers are pawnbrokers;
- (5) One can always trust a very communicative person.

Univ. "persons"; *a* = honest; *b* = pawnbrokers; *c* = promise-breakers; *d* = trustworthy; *e* = very communicative; *h* = wine-drinkers.

40.

- (1) No kitten, that loves fish, is unteachable;
- (2) No kitten without a tail will play with a gorilla;
- (3) Kittens with whiskers always love fish;
- (4) No teachable kitten has green eyes;
- (5) No kittens have tails unless they have whiskers.

Univ. "kittens"; *a* = green-eyed; *b* = loving fish; *c* = tailed; *d* = teachable; *e* = whiskered; *h* = willing to play with a gorilla.

41.

- (1) All the Eton men in this College play cricket;
- (2) None but the Scholars dine at the higher table;
- (3) None of the cricketers row;
- (4) *My* friends in this College all come from Eton;
- (5) All the Scholars are rowing-men.

Univ. “men in this College”; *a* = cricketers; *b* = dining at the higher table; *c* = Etonians; *d* = my friends; *e* = rowing-men; *h* = Scholars.

42.

- (1) There is no box of mine here that I dare open;
- (2) My writing-desk is made of rose-wood;
- (3) All my boxes are painted, except what are here;
- (4) There is no box of mine that I dare not open, unless it is full of live scorpions;
- (5) All my rose-wood boxes are unpainted.

Univ. “my boxes”; *a* = boxes that I dare open; *b* = full of live scorpions; *c* = here; *d* = made of rose-wood; *e* = painted; *h* = writing-desks.

43.

- (1) Gentiles have no objection to pork;
- (2) Nobody who admires pigsties ever reads Hogg’s poems;
- (3) No Mandarin knows Hebrew;
- (4) Every one, who does not object to pork, admires pigsties;
- (5) No Jew is ignorant of Hebrew.

Univ. “persons”; *a* = admiring pigsties; *b* = Jews; *c* = knowing Hebrew; *d* = Mandarins; *e* = objecting to pork; *h* = reading Hogg’s poems.

44.

- (1) All writers, who understand human nature, are clever;
- (2) No one is a true poet unless he can stir the hearts of men;
- (3) Shakespeare wrote “Hamlet”;
- (4) No writer, who does not understand human nature, can stir the hearts of men;
- (5) None but a true poet could have written “Hamlet.”;

Univ. “writers”; *a* = able to stir the hearts of men; *b* = clever; *c* = Shakespeare; *d* = true poets; *e* = understanding human nature; *h* = writer of ‘Hamlet.’

45.

- (1) I despise anything that cannot be used as a bridge;
- (2) Everything, that is worth writing an ode to, would be a welcome gift to me;
- (3) A rainbow will not bear the weight of a wheel-barrow;
- (4) Whatever can be used as a bridge will bear the weight of a wheel-barrow;
- (5) I would not take, as a gift, a thing that I despise.

Univ. “things”; *a* = able to bear the weight of a wheel-barrow; *b* = acceptable to me; *c* = despised by me; *d* = rainbows; *e* = useful as a bridge; *h* = worth writing an ode to.

46.

- (1) When I work a Logic-example without grumbling, you may be sure it is one that I can understand;
- (2) These Soriteses are not arranged in regular order, like the examples I am used to;
- (3) No easy example ever make my head ache;
- (4) I ca'n't understand examples that are not arranged in regular order, like those I am used to;
- (5) I never grumble at an example, unless it gives me a headache.

Univ. "Logic-examples worked by me"; a = arranged in regular order, like the examples I am used to; b = easy; c = grumbled at by me; d = making my head ache; e = these Soriteses; h = understood by me.

47.

- (1) Every idea of mine, that cannot be expressed as a Syllogism, is really ridiculous;
- (2) None of my ideas about Bath-buns are worth writing down;
- (3) No idea of mine, that fails to come true, can be expressed as a Syllogism;
- (4) I never have any really ridiculous idea, that I do not at once refer to my solicitor;
- (5) My dreams are all about Bath-buns;
- (6) I never refer any idea of mine to my solicitor, unless it is worth writing down.

Univ. "my ideas"; a = able to be expressed as a Syllogism; b = about Bath-buns; c = coming true; d = dreams; e = really ridiculous h = referred to my solicitor; k = worth writing down.

48.

- (1) None of the pictures here, except the battle-pieces, are valuable;
- (2) None of the unframed ones are varnished;
- (3) All the battle-pieces are painted in oils;
- (4) All those that have been sold are valuable;
- (5) All the English ones are varnished;
- (6) All those in frames have been sold.

Univ. "the pictures here"; a = battle-pieces; b = English; c = framed; d = oil-paintings; e = sold; h = valuable; k = varnished.

49.

- (1) Animals, that do not kick, are always unexcitable;
- (2) Donkeys have no horns;
- (3) A buffalo can always toss one over a gate;
- (4) No animals that kick are easy to swallow;
- (5) No hornless animal can toss one over a gate;
- (6) All animals are excitable, except buffaloes.

Univ. “animals”; *a* = able to toss one over a gate; *b* = buffaloes; *c* = donkeys;
d = easy to swallow; *e* = excitable; *h* = horned; *k* = kicking.

50.

- (1) No one, who is going to a party, ever fails to brush his hair;
- (2) No one looks fascinating, if he is untidy;
- (3) Opium-eaters have no self-command;
- (4) Every one, who has brushed his hair, looks fascinating;
- (5) No one wears white kid gloves, unless he is going to a party;
- (6) A man is always untidy, if he has no self-command.

Univ. “persons”; *a* = going to a party; *b* = having brushed one’s hair; *c* =
having self-command; *d* = looking fascinating; *e* = opium-eaters; *h* = tidy; *k* =
wearing white kid gloves.

51.

- (1) No husband, who is always giving his wife new dresses, can be a
cross-grained man;
- (2) A methodical husband always comes home for his tea;
- (3) No one, who hangs up his hat on the gas-jet, can be a man that
is kept in proper order by his wife;
- (4) A good husband is always giving his wife new dresses;
- (5) No husband can fail to be cross-grained, if his wife does not keep
him in proper order;
- (6) An unmethodical husband always hangs up his hat on the gas-jet.

Univ. “husbands”; *a* = always coming home for his tea; *b* = always giving his
wife new dresses; *c* = cross-grained; *d* = good; *e* = hanging up his hat on the
gas-jet; *h* = kept in proper order; *k* = methodical.

52.

- (1) Everything, not absolutely ugly, may be kept in a drawing-room;
- (2) Nothing, that is encrusted with salt, is ever quite dry;
- (3) Nothing should be kept in a drawing-room, unless it is free from
damp;
- (4) Bathing-machines are always kept near the sea;
- (5) Nothing, that is made of mother-of-pearl, can be absolutely ugly;
- (6) Whatever is kept near the sea gets encrusted with salt.

Univ. “things”; *a* = absolutely ugly; *b* = bathing-machines; *c* = encrusted with
salt; *d* = kept near the sea; *e* = made of mother-of-pearl; *h* = quite dry; *k* =
things that may be kept in a drawing-room.

53.

- (1) I call no day “unlucky,” when Robinson is civil to me;
- (2) Wednesdays are always cloudy;
- (3) When people take umbrellas, the day never turns out fine;

- (4) The only days when Robinson is uncivil to me are Wednesdays;
- (5) Everybody takes his umbrella with him when it is raining;
- (6) My “lucky” days always turn out fine.

Univ. “days”; a = called by me ‘lucky’; b = cloudy; c = days when people take umbrellas; d = days when Robinson is civil to me; e = rainy; h = turning out fine; k = Wednesdays.

54.

- (1) No shark ever doubts that it is well fitted out;
- (2) A fish, that cannot dance a minuet, is contemptible;
- (3) No fish is quite certain that it is well fitted out, unless it has three rows of teeth;
- (4) All fishes, except sharks, are kind to children;
- (5) No heavy fish can dance a minuet;
- (6) A fish with three rows of teeth is not to be despised.

Univ. “fishes”; a = able to dance a minuet; b = certain that he is well fitted out; c = contemptible; d = having 3 rows of teeth; e = heavy; h = kind to children; k = sharks.

55.

- (1) All the human race, except my footmen, have a certain amount of common-sense;
- (2) No one, who lives on barley-sugar, can be anything but a mere baby;
- (3) None but a hop-scotch player knows what real happiness is;
- (4) No mere baby has a grain of common sense;
- (5) No engine-driver ever plays hop-scotch;
- (6) No footman of mine is ignorant of what true happiness is.

Univ. “human beings”; a = engine-drivers; b = having common sense; c = hop-scotch players; d = knowing what real happiness is; e = living on barley-sugar; h = mere babies; k = my footmen.

56.

- (1) I trust every animal that belongs to me;
- (2) Dogs gnaw bones;
- (3) I admit no animals into my study, unless they will beg when told to do so;
- (4) All the animals in the yard are mine;
- (5) I admit every animal, that I trust, into my study;
- (6) The only animals, that are really willing to beg when told to do so, are dogs.

Univ. “animals”; a = admitted to my study; b = animals that I trust; c = dogs; d = gnawing bones; e = in the yard; h = my; k = willing to beg when told.

57.

- (1) Animals are always mortally offended if I fail to notice them;
- (2) The only animals that belong to *me* are in that field;
- (3) No animal can guess a conundrum, unless it has been properly trained in a Board-School;
- (4) None of the animals in that field are badgers;
- (5) When an animal is mortally offended, it always rushes about wildly and howls;
- (6) I never notice any animal, unless it belongs to me;
- (7) No animal, that has been properly trained in a Board-School, ever rushes about wildly and howls.

Univ. "animals"; *a* = able to guess a conundrum; *b* = badgers; *c* = in that field; *d* = mortally offended if I fail to notice them; *e* = my; *h* = noticed by me; *k* = properly trained in a Board-School; *l* = rushing about wildly and howling.

58.

- (1) I never put a cheque, received by me, on that file, unless I am anxious about it;
- (2) All the cheques received by me, that are not marked with a cross, are payable to bearer;
- (3) None of them are ever brought back to me, unless they have been dishonoured at the Bank;
- (4) All of them, that are marked with a cross, are for amounts of over £100;
- (5) All of them, that are not on that file, are marked "not negotiable";
- (6) No cheque of yours, received by me, has ever been dishonoured;
- (7) I am never anxious about a cheque, received by me, unless it should happen to be brought back to me;
- (8) None of the cheques received by me, that are marked "not negotiable," are for amounts of over £100.

Univ. "cheques received by me"; *a* = brought back to me; *b* = cheques that I am anxious about; *c* = honoured; *d* = marked with a cross; *e* = marked 'not negotiable'; *h* = on that file; *k* = over £100; *l* = payable to bearer; *m* = your.

59.

- (1) All the dated letters in this room are written on blue paper;
- (2) None of them are in black ink, except those that are written in the third person;
- (3) I have not filed any of them that I can read;
- (4) None of them, that are written on one sheet, are undated;
- (5) All of them, that are not crossed, are in black ink;
- (6) All of them, written by Brown, begin with "Dear Sir";
- (7) All of them, written on blue paper, are filed;
- (8) None of them, written on more than one sheet, are crossed;
- (9) None of them, that begin with "Dear Sir," are written in the third person.

Univ. “letters in this room”; *a* = beginning with “Dear Sir”; *b* = crossed; *c* = dated; *d* = filed; *e* = in black ink; *h* = in third person; *k* = letters that I can read; *l* = on blue paper; *m* = on one sheet; *n* = written by Brown.

60.

- (1) The only animals in this house are cats;
- (2) Every animal is suitable for a pet, that loves to gaze at the moon;
- (3) When I detest an animal, I avoid it;
- (4) No animals are carnivorous, unless they prowl at night;
- (5) No cats fails to kill mice;
- (6) No animals ever take to me, except what are in this house;
- (7) Kangaroos are not suitable for pets;
- (8) None but carnivora kill mice;
- (9) I detest animals that do not take to me;
- (10) Animals, that prowl at night, always love to gaze at the moon.

Univ. “animals”; *a* = avoided by me; *b* = carnivora; *c* = cats; *d* = detested by me; *e* = in this house; *h* = kangaroos; *k* = killing mice; *l* = loving to gaze at the moon; *m* = prowling at night; *n* = suitable for pets; *r* = taking to me.

Chapter II. Answers.

Answers to § 1.

1. “All” *Sign of Quantity.*
 “persons represented by the Name ‘I’” (or ‘I’s’) *Subject.*
 “are” *Copula.*
 “persons who have been out for a walk” *Predicate.*
 or, more briefly,
 “All | ‘I’s | are | persons who have been out for a walk”.
2. “All | ‘I’s | are | persons who feel better”.
3. “No | persons who are not ‘John’ | are | persons who have read the letter”.
4. “No | Members of the Class ‘you and I’ | are | old persons”.
5. “No | fat creatures | are | creatures that run well”.
6. “No | not-brave persons | are | persons deserving of the fair”.
7. “No | not-pale persons | are | persons who look poetical”.
8. “Some | judges | are | persons who lose their tempers”.
9. “All | ‘I’s | are | persons who do not neglect important business”.
10. “All | difficult things | are | things that need attention”.
11. “All | unwholesome things | are | things that should be avoided”.
12. “All | laws passed last week | are | laws relating to excise”.
13. “All | logical studies | are | things that puzzle me”.
14. “No | persons in the house | are | Jews”.
15. “Some | not well-cooked dishes | are | unwholesome dishes”.
16. “All | unexciting books | are | books that make one drowsy”.
17. “All | men who know what they’re about | are | men who can detect a sharper”.
18. “All | Members of the Class ‘you and I’ | are | persons who know what they’re about”.

19. "Some | bald persons | are | persons accustomed to wear wigs".
 20. "All | fully occupied persons | are | persons who do not talk about their grievances".
 21. "No | riddles that can be solved | are | riddles that interest me".

Answers to § 3.

1. Some xy exist, or some x are y , or some y are x .
2. No information.
3. All y' are x' .
4. No xy exist, &c.
5. All y' are x .
6. All x' are y .
7. All x are y .
8. All x' are y' , and all y are x .
9. All x' are y' .
10. All x are y' .
11. No information.
12. Some $x'y'$ exist, &c.
13. Some xy' exist, &c.
14. No xy' exist, &c.
15. Some xy exist, &c.
16. All y are x .
17. All x' are y , and all y' are x .
18. All x are y' , and all y are x' .
19. All x are y , and all y' are x' .
20. All y are x' .

Answers to § 4.

1. No x' are y' .
2. Some x' are y' .
3. Some x are y' .
4. [No Concl. Fallacy of Like Eliminands not asserted to exist.]
5. Some x' are y' .
6. [No Concl. Fallacy of Like Eliminands not asserted to exist.]
7. Some x are y' .
8. Some x' are y' .
9. [No Concl. Fallacy of Unlike Eliminands with an Entity-Premiss.]
10. All x are y , and all y' are x' .
11. [No Concl. Fallacy of Like Eliminands not asserted to exist.]
12. All y are x' .
13. No x' are y .
14. No x' are y' .
15. No x are y .
16. All x are y' , and all y are x' .
17. No x are y' .
18. No x are y .
19. Some x are y' .

20. No x are y' .
21. Some y are x' .
22. [No Concl. Fallacy of Unlike Eliminands with an Entity-Premiss.]
23. Some x are y .
24. All y are x' .
25. Some y are x' .
26. All y are x .
27. All x are y , and all y' are x' .
28. Some y are x' .
29. [No Concl. Fallacy of Like Eliminands not asserted to exist.]
30. Some y are x' .
31. [No Concl. Fallacy of Like Eliminands not asserted to exist.]
32. No x are y' .
33. [No Concl. Fallacy of Like Eliminands not asserted to exist.]
34. Some x ⁷ are y .
35. All y are x' .
36. Some y are x' .
37. Some x are y' .
38. No x are y .
39. Some x' are y' .
40. All y' are x .
41. All x are y' .
42. No x are y .

Answers to § 5.

1. Somebody who has been out for a walk is feeling better.
2. No one but John knows what the letter is about.
3. You and I like walking.
4. Honesty is sometimes the best policy.
5. Some greyhounds are not fat.
6. Some brave persons get their deserts.
7. Some rich persons are not Esquimaux.
8. [No Concl. Fallacy of Unlike Eliminands with an Entity-Premiss.]
9. John is ill.
10. Some things, that are not umbrellas, should be left behind on a journey.
11. No music is worth paying for, unless it causes vibration in the air.
12. Some holidays are tiresome.
13. Englishmen are not Frenchmen.
14. No photograph of a lady is satisfactory.
15. No one looks poetical unless he is phlegmatic.
16. Some thin persons are not cheerful.
17. Some judges do not exercise self-control.
18. Pigs are not fed on barley-water.
19. Some black rabbits are not old.
20. [No Concl. Fallacy of Unlike Eliminands with an Entity-Premiss.]

⁷accidentally x'

21. [No Concl. Fallacy of Like Eliminands not asserted to exist.]
22. Some lessons need attention.
23. [No Concl. Fallacy of Like Eliminands not asserted to exist.]
24. No one, who forgets a promise, fails to do mischief.
25. Some greedy creatures cannot fly.
26. [No Concl. Fallacy of Unlike Eliminands with an Entity-Premiss.]
27. No bride-cakes are things that need not be avoided.
28. John is happy.
29. Some people, who are not gamblers, are not philosophers.
30. [No Concl. Fallacy of Unlike Eliminands with an Entity-Premiss.]
31. None of my lodgers write poetry.
32. Senna is not nice.
33. [No Concl. Fallacy of Unlike Eliminands with an Entity-Premiss.]
34. [No Concl. Fallacy of Like Eliminands not asserted to exist.]
35. Logic is unintelligible.
36. Some wild creatures are fat.
37. All wasps are unwelcome.
38. All black rabbits are young.
39. Some hard-boiled things can be cracked.
40. No antelopes fail to delight the eye.
41. All well-fed canaries are cheerful.
42. Some poetry is not producible at will.
43. No country infested by dragons fails to be fascinating.
44. [No Concl. Fallacy of Like Eliminands not asserted to exist.]
45. Some picturesque things are not made of sugar.
46. No children can sit still.
47. Some cats cannot whistle.
48. You are terrible.
49. Some oysters are not amusing.
50. Nobody in the house has a beard a yard long.
51. Some ill-fed canaries are unhappy.
52. My sisters cannot sing.
53. [No Concl. Fallacy of Unlike Eliminands with an Entity-Premiss.]
54. Some rich things are nice.
55. My cousins are none of them judges, and judges are none of them cousins of mine.
56. Something wearisome is not eagerly wished for.
57. Senna is nasty.
58. [No Concl. Fallacy of Unlike Eliminands with an Entity-Premiss.]
59. Niggers are not any of them tall.
60. Some obstinate persons are not philosophers.
61. John is happy.
62. Some unwholesome dishes are not present here (i. e. cannot be spoken of as "these").
63. No books suit feverish patients unless they make one drowsy.
64. Some greedy creatures cannot fly.
65. You and I can detect a sharper.
66. Some dreams are not lambs.
67. No lizard needs a hairbrush.
68. Some things, that may escape notice, are not battles.

69. My cousins are not any of them judges.
70. Some hard-boiled things can be cracked.
71. [No Concl. Fallacy of Unlike Eliminands with an Entity-Premiss.]
72. She is unpopular.
73. Some people, who wear wigs, are not children of yours.
74. No lobsters expect impossibilities.
75. No nightmare is eagerly desired.
76. Some nice things are not plumcakes.
77. Some kinds of jam need not be shunned.
78. All ducks are ungraceful.
79. [No Concl. Fallacy of Like Eliminands not asserted to exist.]
80. No man, who begs in the street, should fail to keep accounts.
81. Some savage creatures are not spiders.
82. [No Concl. Fallacy of Unlike Eliminands with an Entity-Premiss.]
83. No travelers, who do not carry plenty of small change, fail to lose their luggage.
84. [No Concl. Fallacy of Unlike Eliminands with an Entity-Premiss.]
85. Judges are none of them cousins of mine.
86. All my lodgers are sane.
87. Those who are busy are contented, and discontented people are not busy.
88. None of my cousins are judges.
89. No nightingale dislikes sugar.
90. [No Concl. Fallacy of Like Eliminands not asserted to exist.]
91. Some excuses are not clear explanations.
92. [No Concl. Fallacy of Like Eliminands not asserted to exist.]
93. No kind deed need cause scruple.
94. [No Concl. Fallacy of Like Eliminands not asserted to exist.]
95. [No Concl. Fallacy of Like Eliminands not asserted to exist.]
96. No cheats are trustworthy.
97. No clever child of mine is greedy.
98. Some things, that are meant to amuse, are not Acts of Parliament.
99. No tour, that is ever forgotten, is worth writing a book about.
100. No obedient child of mine is contented.
101. Your visit does not annoy me.

Answers to § 9.

1. Babies cannot manage crocodiles.
2. *Your* presents to me are not made of tin.
3. All my potatoes in this dish are old ones.
4. My servants never say "shpoonj."
5. My poultry are not officers.
6. None of *your* sons are fit to serve on a jury.
7. No pencils of mine are sugar-plums.
8. Jenkins is inexperienced.
9. No comet has a curly tail.
10. No hedge-hog takes in the *Times*.
11. This dish is unwholesome.
12. My gardener is very old.
13. All humming-birds are small.
14. No one with a hooked nose ever fails to make money.
15. No gray ducks in this village wear lace collars.
16. No jug in this cupboard will hold water.
17. These apples were grown in the sun.
18. Puppies, that will not lie still, never care to do worsted work.
19. No name in this list is unmelodious.
20. No M.P. should ride in a donkey-race, unless he has perfect self-command.
21. No goods in this shop, that are still on sale, may be carried away.
22. No acrobatic feat, which involves turning a quadruple somersault, is ever attempted in a circus.
23. Guinea-pigs never really appreciate Beethoven.
24. No scentless flowers please me.
25. Showy talkers are not really well-informed.
26. None but red-haired boys learn Greek in this school.
27. Wedding-cake always disagrees with me.
28. Discussions, that go on while Tomkins is in the chair, endanger the peacefulness of our Debating-Club.
29. All gluttons, who are children of mine, are unhealthy.
30. An egg of the Great Auk is not to be had for a song.

31. No books sold here have gilt edges, unless they are priced at 5s. and upwards.
32. When you cut your finger, you will find Tincture of Calendula useful.
33. *I* have never come across a mermaid at sea.
34. All the romances in this library are well-written.
35. No bird in this aviary lives on mince-pies.
36. No plum-pudding, that has not been boiled in a cloth, can be distinguished from soup.
37. All *your* poems are uninteresting.
38. None of my peaches have been grown in a hot-house.
39. No pawnbroker is dishonest.
40. No kitten with green eyes will play with a gorilla.
41. All *my* friends dine at the lower table.
42. My writing-desk is full of live scorpions.
43. No Mandarin ever reads Hogg's poems.
44. Shakespeare was clever.
45. Rainbows are not worth writing odes to.
46. These Sorites-examples are difficult.
47. All my dreams come true.
48. All the English pictures here are painted in oils.
49. Donkeys are not easy to swallow.
50. Opium-eaters never wear white kid gloves.
51. A good husband always comes home for his tea.
52. Bathing-machines are never made of mother-of-pearl.
53. Rainy days are always cloudy.
54. No heavy fish is unkind to children.
55. No engine-driver lives on barley-sugar.
56. All the animals in the yard gnaw bones.
57. No badger can guess a conundrum.
58. No cheque of yours, received by me, is payable to order.
59. I cannot read any of Brown's letters.
60. I always avoid a kangaroo.

[...]⁸

Notes.

(A) [See p. 1091]. One of the favourite objections, brought against the Science of Logic by its detractors, is that a Syllogism has no real validity as an argument, since it involves the Fallacy of *Petitio Principii* (i. e. "Begging the Question", the essence of which is that the whole Conclusion is involved in *one* of the Premises).

This formidable objection is refuted, with beautiful clearness and simplicity, by these three Diagrams, which show us that, in each of the three Figures, the Conclusion is really involved in the *two* Premises taken together, each contributing its share.

⁸Remark: Chapter III "Solutions" of Book VIII is currently not included here. It contains the detailed solutions to the above problems.

Thus, in Fig. I., the Premiss xm_0 empties the *Inner* Cell of the N.W. Quarter, while the Premiss ym_0 empties its *Outer* Cell. Hence it needs the *two* Premisses to empty the *whole* of the N.W. Quarter, and thus to prove the Conclusion xy_0 .

Again, in Fig. II., the Premiss xm_0 empties the Inner Cell of the N.W. Quarter. The Premiss ym_1 merely tells us that the Inner Portion of the W. Half is *occupied*, so that we may place a 'I' in it, *somewhere*; but, if this were the *whole* of our information, we should not know in *which* Cell to place it, so that it would have to 'sit on the fence': it is only when we learn, from the other Premiss, that the *upper* of these two Cells is *empty*, that we feel authorised to place the 'I' in the *lower* Cell, and thus to prove the Conclusion $x'y_1$.

Lastly, in Fig. III., the information, that *m exists*, merely authorises us to place a 'I' *somewhere* in the Inner Square—but it has large choice of fences to sit upon! It needs the Premiss xm_0 to drive it out of the N. Half of that Square; and it needs the Premiss ym_0 to drive it out of the W. Half. Hence it needs the *two* Premisses to drive it into the Inner Portion of the S.E. Quarter, and thus to prove the Conclusion $x'y'_1$.

Appendix

Addressed to Teachers.

§ 1. Introductory. There are several matters, too hard to discuss with *Learners*, which nevertheless need to be explained to any *Teachers*, into whose hands this book may fall, in order that they may thoroughly understand what my Symbolic Method *is*, and in what respects it differs from the many other Methods already published.

These matters are as follows:—

- The "Existential Import" of Propositions.
- The use of "is-not" (or "are-not") as a Copula.
- The theory "two Negative Premisses prove nothing."
- Euler's Method of Diagrams.
- Venn's Method of Diagrams.
- My Method of Diagrams.
- The Solution of a Syllogism by various Methods.
- My Method of treating Syllogisms and Sorites.
- Some account of Parts II, III.

§ 2. The "Existential Import" of Propositions. The writers, and editors, of the Logical text-books which run in the ordinary grooves—to whom I shall hereafter refer by the (I hope inoffensive) title "The Logicians"—take, on this subject, what seems to me to be a more humble position than is at all necessary. They speak of the Copula of a Proposition "with bated breath", almost as if it were a living, conscious Entity, capable of declaring for itself what it chose to mean, and that we, poor human creatures, had nothing to do but to ascertain *what* was its sovereign will and pleasure, and submit to it.

In opposition to this view, I maintain that any writer of a book is fully authorised in attaching any meaning he likes to any word or phrase he intends to use. If I find an author saying, at the beginning of his book, "Let it be understood that by the word '*black*' I shall always mean '*white*', and that by

the word ‘*white*’ I shall always mean ‘*black*,’” I meekly accept his ruling, however injudicious I may think it.

And so, with regard to the question whether a Proposition is or is not to be understood as asserting the existence of its Subject, I maintain that every writer may adopt his own rule, provided of course that it is consistent with itself and with the accepted facts of Logic.

Let us consider certain views that may *logically* be held, and thus settle which of them may *conveniently* be held; after which I shall hold myself free to declare which of them *I* intend to hold.

The *kinds* of Propositions, to be considered, are those that begin with “some”, with “no”, and with “all”. These are usually called Propositions “in *I*”, “in *E*”, and “in *A*”.

First, then, a Proposition in *I* may be understood as asserting, or else as *not* asserting, the existence of its Subject. (By “existence” I mean of course whatever kind of existence suits its nature. The two Propositions, “*dreams* exist” and “*drums* exist”, denote two totally different kinds of “existence”. A *dream* is an aggregate of ideas, and exists only in the *mind of a dreamer*: whereas a *drum* is an aggregate of wood and parchment, and exists in *the hands of a drummer*.)

First, let us suppose that *I* “asserts” (i. e. “asserts the existence of its Subject”).

Here, of course, we must regard a Proposition in *A* as making the *same* assertion, since it necessarily *contains* a Proposition in *I*.

We now have *I* and *A* “asserting”. Does this leave us free to make what supposition we choose as to *E*? My answer is “No. We are tied down to the supposition that *E* does *not* assert.” This can be proved as follows:—

If possible, let *E* “assert”. Then (taking *x*, *y*, and *z* to represent Attributes) we see that, if the Proposition “No *xy* are *z*” be true, some things exist with the Attributes *x* and *y*: i. e. “Some *x* are *y*.”

Also we know that, if the Proposition “Some *xy* are *z*” be true, the same result follows.

But these two Propositions are Contradictories, so that one or other of them *must* be true. Hence this result is *always* true: i. e. the Proposition “Some *x* are *y*” is *always* true!

Quod est absurdum. (See Note (A), p. 1173).

We see, then, that the supposition “*I* asserts” necessarily leads to “*A* asserts, but *E* does not”. And this is the *first* of the various views that may conceivably be held.

Next, let us suppose that *I* does *not* “assert.” And, along with this, let us take the supposition that *E* *does* “assert.”

Hence the Proposition “No *x* are *y*” means “Some *x* exist, and none of them are *y*”: i. e. “*all* of them are *not-y*,” which is a Proposition in *A*. We also know, of course, that the Proposition “All *x* are *not-y*” proves “No *x* are *y*.” Now two Propositions, each of which proves the other, are *equivalent*. Hence every Proposition in *A* is equivalent to one in *E*, and therefore “*asserts*”.

Hence our *second* conceivable view is “*E* and *A* assert, but *I* does not.”

This view does not seem to involve any necessary contradiction with itself or with the accepted facts of Logic. But, when we come to *test* it, as applied to the actual *facts* of life, we shall find I think, that it fits in with them so badly that its adoption would be, to say the least of it, singularly inconvenient for ordinary folk.

Let me record a little dialogue I have just held with my friend Jones, who is trying to form a new Club, to be regulated on strictly *Logical* principles.

Author. "Well, Jones! Have you got your new Club started yet?"

Jones (rubbing his hands). "You'll be glad to hear that some of the Members (mind, I only say 'some') are millionaires! Rolling in gold, my boy!"

Author. "That sounds well. And how many Members have entered?"

Jones (staring). "None at all. We haven't got it started yet. What makes you think we have?"

Author. "Why, I thought you said that some of the Members——"

Jones (contemptuously). "You don't seem to be aware that we're working on strictly *Logical* principles. A *Particular* Proposition does *not* assert the existence of its Subject. I merely meant to say that we've made a Rule not to admit *any* Members till we have at least *three* Candidates whose incomes are over ten thousand a year!"

Author. "Oh, *that's* what you meant, is it? Let's hear some more of your Rules."

Jones. "Another is, that no one, who has been convicted seven times of forgery, is admissible."

Author. "And here, again, I suppose you don't mean to assert there *are* any such convicts in existence?"

Jones. "Why, that's exactly what I *do* mean to assert! Don't you know that a Universal Negative *asserts* the existence of its Subject? *Of course* we didn't make that Rule till we had satisfied ourselves that there are several such convicts now living."

The Reader can now decide for himself how far this *second* conceivable view would fit in with the facts of life. He will, I think, agree with me that Jones' view, of the 'Existential Import' of Propositions, would lead to some inconvenience.

Thirdly, let us suppose that neither *I* nor *E* "asserts".

Now the supposition that the two Propositions, "Some *x* are *y*" and "No *x* are not-*y*", do *not* "assert", necessarily involves the supposition that "All *x* are *y*" does *not* "assert", since it would be absurd to suppose that they assert, when combined, more than they do when taken separately.

Hence the *third* (and last) of the conceivable views is that neither *I*, nor *E*, nor *A*, "asserts".

The advocates of this third view would interpret the Proposition "Some *x* are *y*" to mean "If there *were* any *x* in existence, some of them *would* be *y*"; and so with *E* and *A*.

It admits of proof that this view, as regards *A*, conflicts with the accepted facts of Logic.

Let us take the Syllogism *Darapti*, which is universally accepted as valid. Its form is

"All *m* are *x*;
All *m* are *y*.
∴ Some *y* are *x*".

This they would interpret as follows:—

"If there were any *m* in existence, all of them would be *x*;
If there were any *m* in existence, all of them would be *y*.
∴ If there were any *y* in existence, some of them would be *x*".

That this Conclusion does *not* follow has been so briefly and clearly explained by Mr. Keynes (in his “Formal Logic”, dated 1894, pp. 356, 357), that I prefer to quote his words:—

“Let no proposition imply the existence either of its subject or of its predicate.

“Take, as an example, a syllogism in *Darapti*:—

‘All *M* is *P*,
All *M* is *S*,
∴ Some *S* is *P*.’

“Taking *S*, *M*, *P*, as the minor, middle, and major terms respectively, the conclusion will imply that, if there is any *S*, there is some *P*. Will the premisses also imply this? If so, then the syllogism is valid; but not otherwise.

“The conclusion implies that if *S* exists *P* exists; but, consistently with the premisses, *S* may be existent while *M* and *P* are both non-existent. An implication is, therefore, contained in the conclusion, which is not justified by the premisses.”

This seems to *me* entirely clear and convincing. Still, “to make sicker”, I may as well throw the above (*soi-disant*) Syllogism into a concrete form, which will be within the grasp of even a *non*-logical Reader.

Let us suppose that a Boys’ School has been set up, with the following system of Rules:—

“All boys in the First (the highest) Class are to do French, Greek, and Latin. All in the Second Class are to do Greek only. All in the Third Class are to do Latin only.”

Suppose also that there *are* boys in the Third Class, and in the Second; but that no boy has yet risen into the First.

It is evident that there are no boys in the School doing French: still we know, by the Rules, what would happen if there *were* any.

We are authorised, then, by the *Data*, to assert the following two Propositions:—

“If there were any boys doing French, all of them would be doing
Greek;
If there were any boys doing French, all of them would be doing
Latin.”

And the Conclusion, according to “The Logicians” would be

“If there were any boys doing Latin, some of them would be doing
Greek.”

Here, then, we have two *true* Premisses and a *false* Conclusion (since we know that there *are* boys doing Latin, and that *none* of them are doing Greek). Hence the argument is *invalid*.

Similarly it may be shown that this “non-existential” interpretation destroys the validity of *Disamis*, *Datisi*, *Felapton*, and *Fresison*.

Some of “The Logicians” will, no doubt, be ready to reply “But we are not *Aldrichians*! Why should *we* be responsible for the validity of the Syllogisms of so antiquated an author as Aldrich?”

Very good. Then, for the *special* benefit of these “friends” of mine (with what ominous emphasis that name is sometimes used! “I must have a private interview

with *you, my young friend,*” says the bland Dr. Birch, “in my library, at 9 a. m. tomorrow. And you will please to be *punctual!*”), for their *special* benefit, I say, I will produce *another* charge against this “non-existential” interpretation.

It actually invalidates the ordinary Process of “Conversion”, as applied to Proposition in ‘*I*’.

Every logician, Aldrichian or otherwise, accepts it as an established fact that “Some *x* are *y*” may be legitimately converted into “Some *y* are *x*.”

But is it equally clear that the Proposition “If there *were* any *x*, some of them *would* be *y*” may be legitimately converted into “If there *were* any *y*, some of them *would* be *x*”? I trow not.

The example I have already used—of a Boys’ School with a non-existent First Class—will serve admirably to illustrate this new flaw in the theory of “The Logicians.”

Let us suppose that there is yet *another* Rule in this School, viz. “In each Class, at the end of the Term, the head boy and the second boy shall receive prizes.”

This Rule entirely authorises us to assert (in the sense in which “The Logicians” would use the words) “Some boys in the First Class will receive prizes”, for this simply means (according to them) “If there *were* any boys in the First Class, some of them *would* receive prizes.”

Now the Converse of this Proposition is, of course, “Some boys, who will receive prizes, are in the First Class”, which means (according to “The Logicians”) “If there *were* any boys about to receive prizes, some of them *would* be in the First Class” (which Class we know to be *empty*).

Of this Pair of Converse Propositions, the first is undoubtedly *true*: the second, *as* undoubtedly, *false*.

It is always sad to see a batsman knock down his own wicket: one pities him, as a man and a brother, but, as a *cricketer*, one can but pronounce him “Out!”

We see, then, that, among all the conceivable views we have here considered, there are only *two* which can *logically* be held, viz.

I and *A* “assert”, but *E* does not.

E and *A* “assert”, but *I* does not.

The *second* of these I have shown to involve great practical inconvenience.

The *first* is the one adopted in this book. (See p. 1054.)

Some further remarks on this subject will be found in Note (B), at p. 1174.

§ 3. The use of “is-not” (or “are-not”) as a Copula. Is it better to say “John *is-not* in-the-house” or “John *is* not-in-the-house”? “Some of my acquaintances *are-not* men-I-should-like-to-be-seen-with” or “Some of my acquaintances *are* men-I-should-*not*-like-to-be-seen-with”? That is the sort of question we have now to discuss.

This is no question of Logical Right and Wrong: it is merely a matter of *taste*, since the two forms mean exactly the same thing. And here, again, “The Logicians” seem to me to take much too humble a position. When they are putting the final touches to the grouping of their Proposition, just before the curtain goes up, and when the Copula—always a rather fussy ‘heavy father’, asks them “Am *I* to have the ‘not’, or will you tack it on to the Predicate?” they are much too ready to answer, like the subtle cab-driver, “Leave it to

you, Sir!" The result seems to be, that the grasping Copula constantly gets a "not" that had better have been merged in the Predicate, and that Propositions are differentiated which had better have been recognised as precisely similar. Surely it is simpler to treat "Some men are Jews" and "Some men are Gentiles" as being both of them, *affirmative* Propositions, instead of translating the latter into "Some men are-not Jews", and regarding it as a *negative* Propositions?

The fact is, "The Logicians" have somehow acquired a perfectly *morbid* dread of negative Attributes, which makes them shut their eyes, like frightened children, when they come across such terrible Propositions as "All not-*x* are *y*"; and thus they exclude from their system many very useful forms of Syllogisms.

Under the influence of this unreasoning terror, they plead that, in Dichotomy by Contradiction, the *negative* part is too large to deal with, so that it is better to regard each Thing as either included in, or excluded from, the *positive* part. I see no force in this plea: and the facts often go the other way. As a personal question, dear Reader, if *you* were to group your acquaintances into the two Classes, men that you *would* like to be seen with, and men that you would *not* like to be seen with, do you think the latter group would be so *very* much the larger of the two?

For the purposes of Symbolic Logic, it is so *much* the most convenient plan to regard the two sub-divisions, produced by Dichotomy, on the *same* footing, and to say, of any Thing, either that it "is" in the one, or that it "is" in the other, that I do not think any Reader of this book is likely to demur to my adopting that course.

§ 4. The theory that "two Negative Premisses prove nothing". This I consider to be *another* craze of "The Logicians", fully as morbid as their dread of a negative Attribute.

It is, perhaps, best refuted by the method of *Instantia Contraria*.

Take the following Pairs of Premisses:—

"None of my boys are conceited;

None of my girls are greedy".

"None of my boys are clever;

None but a clever boy could solve this problem".

"None of my boys are learned;

Some of my boys are not choristers".

(This last Proposition is, in *my* system, an *affirmative* one, since *I* should read it "are not-choristers"; but, in dealing with "The Logicians," I may fairly treat it as a *negative* one, since *they* would read it "are-not choristers".)

If you, dear Reader, declare, after full consideration of these Pairs of Premisses, that you cannot deduce a Conclusion from *any* of them—why, all I can say is that, like the Duke in *Patience*, you "will have to be contented with our heart-felt sympathy"! [See Note (C), p. 1174.]

Quoted from *If Saphir I choose to marry* from *Patience* by Gilbert and Sullivan

§ 5. Euler's Method of Diagrams. Diagrams seem to have been used, at first, to represent *Propositions* only. In Euler's well-known Circles, each was supposed to contain a class, and the Diagram consisted of two circles, which

exhibited the relations, as to inclusion and exclusion, existing between the two Classes.

Thus, the Diagram, here given, exhibits the two Classes, whose respective Attributes are x and y , as so related to each other that the following Propositions are all simultaneously true:—"All x are y ", "No x are not- y ", "Some x are y ", "Some y are not- x ", "Some not- y are not- x ", and, of course, the Converses of the last four.

Similarly, with this Diagram, the following Propositions are true:—"All y are x ", "No y are not- x ", "Some y are x ", "Some x are not- y ", "Some not- x are not- y ", and, of course, the Converses of the last four.

Similarly, with this Diagram, the following are true:—"All x are not- y ", "All y are not- x ", "No x are y ", "Some x are not- y ", "Some y are not- x ", "Some not- x are not- y ", and the Converses of the last four.

Similarly, with this Diagram, the following are true:—"Some x are y ", "Some x are not- y ", "Some not- x are y ", "Some not- x are not- y ", and of course, their four Converses.

Note that *all* Euler's Diagrams assert "Some not- x are not- y ." Apparently it never occurred to him that it might *sometimes* fail to be true!

Now, to represent "All x are y ", the *first* of these Diagrams would suffice. Similarly, to represent "No x are y ", the *third* would suffice. But to represent any *Particular* Proposition, at least *three* Diagrams would be needed (in order to include all the possible cases), and, for "Some not- x are not- y ", all the *four*.

§ 6. **Venn's Method of Diagrams.** Let us represent "not- x " by " x' ".

Mr. Venn's Method of Diagrams is a great advance on the above Method.

He uses the last of the above Diagrams to represent *any* desired relation between x and y , by simply shading a Compartment known to be *empty*, and placing a $+$ in one known to be *occupied*.

Thus, he would represent the three Propositions "Some x are y ", "No x are y ", and "All x are y ", as follows:—

It will be seen that, of the *four* Classes, whose peculiar Sets of Attributes are xy , xy' , $x'y$, and $x'y'$, only *three* are here provided with closed Compartments, while the *fourth* is allowed the rest of the Infinite Plane to range about in!

This arrangement would involve us in very serious trouble, if we ever attempted to represent "No x' are y' ." Mr. Venn *once* (at p. 281) encounters this awful task; but evades it, in a quite masterly fashion, by the simple foot-note "We have not troubled to shade the outside of this diagram!"

To represent *two* Propositions (containing a common Term) *together*, a *three*-letter Diagram is needed. This is the one used by Mr. Venn.

Here, again, we have only *seven* closed Compartments, to accommodate the *eight* Classes whose peculiar Sets of Attributes are xym , xym' , &c.

“With four terms in request,” Mr. Venn says, “the most simple and symmetrical diagram seems to me that produced by making four ellipses intersect one another in the desired manner”. This, however, provides only *fifteen* closed compartments.

For *five* letters, “the simplest diagram I can suggest,” Mr. Venn says, “is one like this (the small ellipse in the centre is to be regarded as a portion of the *outside* of c ; i. e. its four component portions are inside b and d but are no part of c). It must be admitted that such a diagram is not quite so simple to draw as one might wish it to be; but then consider what the alternative is of one undertakes to deal with five terms and all their combinations—nothing short of the disagreeable task of writing out, or in some way putting before us, all the 32 combinations involved.”

This Diagram gives us 31 closed compartments.

For *six* letters, Mr. Venn suggests that we might use *two* Diagrams, like the above, one for the f -part, and the other for the not- f -part, of all the other combinations. “This”, he says, “would give the desired 64 subdivisions.” This, however, would only give 62 closed Compartments, and *one* infinite area, which the two Classes, $a'b'c'd'e'f$ and $a'b'c'd'e'f'$, would have to share between them.

Beyond *six* letters Mr. Venn does not go.

§ 7. My Method of Diagrams. My Method of Diagrams *resembles* Mr. Venn’s, in having separate Compartments assigned to the various Classes, and in marking these Compartments as *occupied* or as *empty*; but it *differs* from his Method,

in assigning a *closed* area to the *Universe of Discourse*, so that the Class which, under Mr. Venn's liberal sway, has been ranging at will through Infinite Space, is suddenly dismayed to find itself "cabin'd, cribb'd, confined", in a limited Cell like any other Class! Also I use *rectilinear*, instead of *curvilinear*, Figures; and I mark an *occupied* Cell with a 'I' (meaning that there is at least *one* Thing in it), and an *empty* Cell with a 'O' (meaning that there is *no* Thing in it).

Quoted from *Macbeth*
by William
Shakespeare

For *two* letters, I use this Diagram, in which the North Half is assigned to 'x', the South to 'not-x' (or 'x'), the West to *y*, and the East to *y'*. Thus the N.W. Cell contains the *xy*-Class, the N.E. Cell the *xy'*-Class, and so on.

For *three* letters, I subdivide these four Cells, by drawing an *Inner Square*, which I assign to *m*, the *Outer Border* being assigned to *m'*. I thus get *eight* Cells that are needed to accommodate the eight Classes, whose peculiar Sets of Attributes are *xym*, *xym'*, &c.

This last Diagram is the most complex that I use in the *Elementary* Part of my 'Symbolic Logic.' But I may as well take this opportunity of describing the more complex ones which will appear in Part II.

For *four* letters (which I call *a*, *b*, *c*, *d*) I use this Diagram; assigning the North Half to *a* (and of course the *rest* of the Diagram to *a'*), the West Half to *b*, the Horizontal Oblong to *c*, and the Upright Oblong to *d*. We have now got 16 Cells.

For *five* letters (adding *e*) I subdivide the 16 Cells of the previous Diagram by *oblique* partitions, assigning all the *upper* portions to *e*, and all the *lower* portions to *e'*. Here, I admit, we lose the advantage of having the *e*-Class all *together*, “in a ring-fence”, like the other 4 Classes. Still, it is very easy to find; and the operation, of erasing it, is nearly as easy as that of erasing any other Class. We have now got 32 Cells.

For *six* letters (adding *h*, as I avoid *tailed* letters) I substitute upright crosses for the oblique partitions, assigning the 4 portions, into which each of the 16 Cells is thus divided, to the four Classes *eh*, *eh'*, *e'h*, *e'h'*. We have now got 64 Cells.

For *seven* letters (adding *k*) I add, to each upright cross, a little inner square. All these 16 little squares are assigned to the *k*-Class, and all outside them to the *k'*-Class; so that 8 little Cells (into which each of the 16 Cells is divided) are respectively assigned to the 8 Classes *ehk*, *ehk'*, &c. We have now got 128 Cells.

For *eight* letters (adding *l*) I place, in each of the 16 Cells, a *lattice*, which is a reduced copy of the whole Diagram; and, just as the 16 large Cells of the whole Diagram are assigned to the 16 Classes *abcd*, *abcd'*, &c., so the 16 little Cells of each lattice are assigned to the 16 Classes *ehkl*, *ehkl'*, &c. Thus, the lattice in the N.W. corner serves to accommodate the 16 Classes *abc'd'ehkl*, *abc'd'eh'kl'*, &c. This Octoliteral Diagram (see next page) contains 256 Cells.

For *nine* letters, I place 2 Octoliteral Diagrams side by side, assigning one of them to *m*, and the other to *m'*. We have now got 512 Cells.

Finally, for *ten* letters, I arrange 4 Octoliteral Diagrams, like the above, in a square, assigning them to the 4 Classes mn , mn' , $m'n$, $m'n'$. We have now got 1024 Cells.

§ 8. Solution of a Syllogism by various Methods. The best way, I think, to exhibit the differences between these various Methods of solving Syllogisms, will be to take a concrete example, and solve it by each Method in turn. Let us take, as our example, No. 29 (see p. 1108).

“No philosophers are conceited;
 Some conceited persons are not gamblers.
 \therefore Some persons, who are not gamblers, are not philosophers.”

(1) Solution by ordinary Method.

These Premisses, as they stand, will give no Conclusion, as they are both negative.

If by ‘Permutation’ or ‘Obversion’, we write the Minor Premiss thus,

‘Some conceited persons are not-gamblers,’

we can get a Conclusion in *Fresison*, viz.

“No philosophers are conceited;
Some conceited persons are not-gamblers.
∴ Some not-gamblers are not philosophers”

This can be proved by reduction to *Ferio*, thus:—

“No conceited persons are philosophers;
Some not-gamblers are conceited.
∴ Some not-gamblers are not philosophers”.

The validity of *Ferio* follows directly from the Axiom ‘*De Omni et Nullo*’.

(2) Symbolic Representation.

Before proceeding to discuss other Methods of Solution, it is necessary to translate our Syllogism into an *abstract* form.

Let us take “persons” as our ‘Universe of Discourse’; and let x = “philosophers”, m = “conceited”, and y = “gamblers.”

Then the Syllogism may be written thus:—

“No x are m ;
Some m are y' .
∴ Some y' are x' .”

(3) Solution by Euler’s Method of Diagrams.

The Major Premiss requires only *one* Diagram, viz.

The Minor requires *three*, viz.

The combination of Major and Minor, in every possible way requires *nine*, viz.

Figs. 1 and 2 give

Figs. 1 and 3 give

Figs. 1 and 4 give

From this group (Figs. 5 to 13) we have, by disregarding m , to find the relation of x and y . On examination we find that Figs. 5, 10, 13 express the relation of entire mutual exclusion; that Figs. 6, 11 express partial inclusion and partial exclusion; that Fig. 7 expresses coincidence; that Figs. 8, 12 express entire inclusion of x in y ; and that Fig. 9 expresses entire inclusion of y in x .

We thus get five Biliteral Diagrams for x and y , viz.

where the only Proposition, represented by them all, is “Some not- y are not- x ,” i. e. “Some persons, who are not gamblers, are not philosophers”—a result which Euler would hardly have regarded as a *valuable* one, since he seems to have assumed that a Proposition of this form is *always* true!

(4) Solution by Venn’s Method of Diagrams.

The following Solution has been kindly supplied to me Mr. Venn himself.

”The Minor Premiss declares that some of the constituents in my' must be saved: mark these constituents with a cross.

The Major declares that all xm must be destroyed; erase it.
 Then, as some my' is to be saved, it must clearly be $my'x'$. That is, there must exist $my'x'$; or eliminating $m, y'x'$. In common phraseology,

‘Some y' are x' ,’ or, ‘Some not-gamblers are not-philosophers.’”

(5) Solution by my Method of Diagrams.

The first Premiss asserts that no xm exist: so we mark the xm -Compartment as empty, by placing a ‘O’ in each of its Cells.

The second asserts that some my' exist: so we mark the my' -Compartment as occupied, by placing a ‘I’ in its only available Cell.

The only information, that this gives us as to x and y , is that the $x'y'$ -Compartment is *occupied*, i. e. that some $x'y'$ exist.

Hence “Some x' are y' ”: i. e. “Some persons, who are not philosophers, are not gamblers”.

(6) Solution by my Method of Subscripts.

$$xm_0 \dagger my'_1 \mathbb{P} x'y'_1$$

i. e. “Some persons, who are not philosophers, are not gamblers.”

§ 9. My Method of treating Syllogisms and Sorites. Of all the strange things, that are to be met with in the ordinary text-books of Formal Logic, perhaps the strangest is the violent contrast one finds to exist between their ways of dealing with these two subjects. While they have elaborately discussed no less than *nineteen* different forms of *Syllogisms*—each with its own special and exasperating Rules, while the whole constitute an almost useless machine, for practical purposes, many of the Conclusions being incomplete, and many quite legitimate forms being ignored—they have limited *Sorites* to *two* forms only, of childish simplicity; and these they have dignified with special *names*, apparently under the impression that no other possible forms existed!

As to *Syllogisms*, I find that their nineteen forms, with about a score of others which they have ignored, can all be arranged under *three* forms, each with a very simple Rule of its own; and the only question the Reader has to settle, in working any one of the 101 Examples given at p. 1107 of this book, is “Does it belong to Fig. I., II., or III.?” As to *Sorites*, the only two forms, recognised by the text-books, are the *Aristotelian*, whose Premisses are a series of Propositions in *A*, so arranged that the Predicate of each is the Subject of the next, and the *Goclenian*, whose Premisses are the very same series, written backwards. Goclenius, it seems, was the first who noticed the startling fact that it does not affect the force of a Syllogism to invert the order of its Premisses, and who applied this discovery to a Sorites. If we assume (as surely we may?) that he is the *same* man as that transcendent genius who first noticed that 4 times 5 is the same thing as 5 times 4, we may apply to him what somebody (Edmund Yates, I think it was) has said of Tupper, viz., “here is a man who, beyond all others of his generation, has been favoured with Glimpses of the Obvious!”

These puerile—not to say infantine—forms of a Sorites I have, in this book, ignored from the very first, and have not only admitted freely Propositions in *E*, but have purposely stated the Premisses in random order, leaving to the Reader the useful task of arranging them, for himself, in an order which can be worked as a series of regular Syllogisms. In doing this, he can begin with *any one* of them he likes.

I have tabulated, for curiosity, the various orders in which the Premisses of the Aristotelian Sorites

1. All *a* are *b*;
 2. All *b* are *c*;
 3. All *c* are *d*;
 4. All *d* are *e*;
 5. All *e* are *h*.
- ∴ All *a* are *h*.

may be syllogistically arranged, and I find there are no less than *sixteen* such orders, viz., 12345, 21345, 23145, 23415, 23451, 32145, 32415, 32451, 34215,

34251, 34521, 43215, 43251, 43521, 45321, 54321. Of these the *first* and the *last* have been dignified with names; but the other *fourteen*—first enumerated by an obscure Writer on Logic, towards the end of the Nineteenth Century—remain without a name!

§ 10. Some account of Parts II, III. In Part II. will be found some of the matters mentioned in this Appendix, viz., the “Existential Import” of Propositions, the use of a *negative* Copula, and the theory that “two negative Premises prove nothing.” I shall also extend the range of Syllogisms, by introducing Propositions containing *alternatives* (such as “Not-all x are y ”), Propositions containing 3 or more Terms (such as “All ab are c ”, which, taken along with “Some bc are d ”, would prove “Some d are a ”), &c. I shall also discuss Sorites containing Entities, and the *very* puzzling subjects of Hypotheticals and Dilemmas. I hope, in the course of Part II., to go over all the ground usually traversed in the text-books used in our Schools and Universities, and to enable my Readers to solve Problems of the same kind as, and far harder than, those that are at present set in their Examinations.

In Part III. I hope to deal with many curious and out-of-the-way subjects, some of which are not even alluded to in any of the treatises I have met with. In this Part will be found such matters as the Analysis of Propositions into their Elements (let the Reader, who has never gone into this branch of the subject, try to make out for himself what *additional* Proposition would be needed to convert “Some a are b ” into “Some a are bc ”), the treatment of Numerical and Geometrical Problems, the construction of Problems, and the solution of Syllogisms and Sorites containing Propositions more complex than any that I have used in Part II.

I will conclude with eight Problems, as a taste of what is coming in Part II. I shall be very glad to receive, from any Reader, who thinks he has solved any one of them (more especially if he has done so *without* using any Method of Symbols), what he conceives to be its complete Conclusion.

It may be well to explain what I mean by the *complete* Conclusion of a Syllogism or a Sorites. I distinguish their Terms as being of two kinds—those which *can* be eliminated (e. g. the Middle Term of a Syllogism), which I call the “Eliminands,” and those which *cannot*, which I call the “Retinends”; and I do not call the Conclusion *complete*, unless it states *all* the relations among the Retinends only, which can be deduced from the Premises.

1.

All the boys, in a certain School, sit together in one large room every evening. They are of no less than *five* nationalities—English, Scotch, Welsh, Irish, and German. One of the Monitors (who is a great reader of Wilkie Collins’ novels) is very observant, and takes MS. notes of almost everything that happens, with the view of being a good sensational witness, in case any conspiracy to commit a murder should be on foot. The following are some of his notes:—

- (1) Whenever some of the English boys are singing “Rule Britannia”, and some not, some of the Monitors are wide-awake;
- (2) Whenever some of the Scotch are dancing reels, and some of the Irish fighting, some of the Welsh are eating toasted cheese;

Other versions:

→ 6.8, p. 1010

→ 6.7, p. 1009

- (3) Whenever all the Germans are playing chess, some of the Eleven are *not* oiling their bats;
- (4) Whenever some of the Monitors are asleep, and some not, some of the Irish are fighting;
- (5) Whenever some of the Germans are playing chess, and none of the Scotch are dancing reels, some of the Welsh are *not* eating toasted cheese;
- (6) Whenever some of the Scotch are *not* dancing reels, and some of the Irish *not* fighting, some of the Germans are playing chess;
- (7) Whenever some of the Monitors are awake, and some of the Welsh are eating toasted cheese, none of the Scotch are dancing reels;
- (8) Whenever some of the Germans are *not* playing chess, and some of the Welsh are *not* eating toasted cheese, none of the Irish are fighting;
- (9) Whenever all the English are singing "Rule Britannia," and some of the Scotch are *not* dancing reels, none of the Germans are playing chess;
- (10) Whenever some of the English are singing "Rule Britannia", and some of the Monitors are asleep, some of the Irish are *not* fighting;
- (11) Whenever some of the Monitors are awake, and some of the Eleven are *not* oiling their bats, some of the Scotch are dancing reels;
- (12) Whenever some of the English are singing "Rule Britannia", and some of the Scotch are *not* dancing reels, * * * *

Here the MS. breaks off suddenly. The Problem is to complete the sentence, if possible.

[N.B. In solving this Problem, it is necessary to remember that the Proposition "All x are y " is a *Double* Proposition, and is equivalent to "Some x are y , and none are y' ." See p. 1053.]

2.

- (1) A logician, who eats pork-chops for supper, will probably lose money;
- (2) A gambler, whose appetite is not ravenous, will probably lose money;
- (3) A man who is depressed, having lost money and being likely to lose more, always rises at 5 a. m.;
- (4) A man, who neither gambles nor eats pork-chops for supper, is sure to have a ravenous appetite;
- (5) A lively man, who goes to bed before 4 a. m., had better take to cab-driving;
- (6) A man with a ravenous appetite, who has not lost money and does not rise at 5 a. m., always eats pork-chops for supper;
- (7) A logician, who is in danger of losing money, had better take to cab-driving;
- (8) An earnest gambler, who is depressed though he has not lost money, is in no danger of losing any;

- (9) A man, who does not gamble, and whose appetite is not ravenous, is always lively;
- (10) A lively logician, who is really in earnest, is in no danger of losing money;
- (11) A man with a ravenous appetite has no need to take to cab-driving, if he is really in earnest;
- (12) A gambler, who is depressed though in no danger of losing money, sits up till 4 a. m.
- (13) A man, who has lost money and does not eat pork-chops for supper, had better take to cab-driving, unless he gets up at 5 a. m.
- (14) A gambler, who goes to bed before 4 a. m., need not take to cab-driving, unless he has a ravenous appetite;
- (15) A man with a ravenous appetite, who is depressed though in no danger of losing, is a gambler.

Univ. “men”; a = earnest; b = eating pork-chops for supper; c = gamblers; d = getting up at 5; e = having lost money; h = having a ravenous appetite; k = likely to lose money; l = lively; m = logicians; n = men who had better take to cab-driving; r = sitting up till 4.

[N.B. In this Problem, clauses, beginning with “though”, are intended to be treated as *essential* parts of the Propositions in which they occur, just as if they had begun with “and”.]

3.

- (1) When the day is fine, I tell Froggy “You’re quite the dandy, old chap!”;
- (2) Whenever I let Froggy forget that £10 he owes me, and he begins to strut about like a peacock, his mother declares “He shall *not* go out a-wooing!”;
- (3) Now that Froggy’s hair is out of curl, he has put away his gorgeous waistcoat;
- (4) Whenever I go out on the roof to enjoy a quiet cigar, I’m sure to discover that my purse is empty;
- (5) When my tailor calls with his little bill, and I remind Froggy of that £10 he owes me, he does *not* grin like a hyæna;
- (6) When it is very hot, the thermometer is high;
- (7) When the day is fine, and I’m not in the humour for a cigar, and Froggy is grinning like a hyæna, I never venture to hint that he’s quite the dandy;
- (8) When my tailor calls with his little bill and finds me with an empty purse, I remind Froggy of that £10 he owes me;
- (9) My railway-shares are going up like anything!
- (10) When my purse is empty, and when, noticing that Froggy has got his gorgeous waistcoat on, I venture to remind him of that £10 he owes me, things are apt to get rather warm;
- (11) Now that it looks like rain, and Froggy is grinning like a hyæna, I can do without my cigar;
- (12) When the thermometer is high, you need not trouble yourself to take an umbrella;

- (13) When Froggy has his gorgeous waistcoat on, but is *not* strutting about like a peacock, I betake myself to a quiet cigar;
- (14) When I tell Froggy that he's quite the dandy, he grins like a hyæna;
- (15) When my purse is tolerably full, and Froggy's hair is one mass of curls, and when he is *not* strutting about like a peacock, I go out on the roof;
- (16) When my railway-shares are going up, and when it is chilly and looks like rain, I have a quiet cigar;
- (17) When Froggy's mother lets him go a-wooing, he seems nearly mad with joy, and puts on a waistcoat that is gorgeous beyond words;
- (18) When it is going to rain, and I am having a quiet cigar, and Froggy is *not* intending to go a-wooing, you had better take an umbrella;
- (19) When my railway-shares are going up, and Froggy seems nearly mad with joy, *that* is the time my tailor always chooses for calling with his little bill;
- (20) When the day is cool and the thermometer low, and I say nothing to Froggy about his being quite the dandy, and there's not the ghost of a grin on his face, I haven't the heart for my cigar!

4.

- (1) Any one, fit to be an M.P., who is not always speaking, is a public benefactor;
- (2) Clear-headed people, who express themselves well, have had a good education;
- (3) A woman, who deserves praise, is one who can keep a secret;
- (4) People, who benefit the public, but do not use their influence for good purpose, are not fit to go into Parliament;
- (5) People, who are worth their weight in gold and who deserve praise, are always unassuming;
- (6) Public benefactors, who use their influence for good objects, deserve praise;
- (7) People, who are unpopular and not worth their weight in gold, never can keep a secret;
- (8) People, who can talk for ever and are fit to be Members of Parliament, deserve praise;
- (9) Any one, who can keep a secret and who is unassuming, is a never-to-be-forgotten public benefactor;
- (10) A woman, who benefits the public, is always popular;
- (11) People, who are worth their weight in gold, who never leave off talking, and whom it is impossible to forget, are just the people whose photographs are in all the shop-windows;
- (12) An ill-educated woman, who is not clear-headed, is not fit to go into Parliament;
- (13) Any one, who can keep a secret and is not for ever talking, is sure to be unpopular;

- (14) A clear-headed person, who has influence and uses it for good objects, is a public benefactor;
- (15) A public benefactor, who is unassuming, is not the sort of person whose photograph is in every shop-window;
- (16) People, who can keep a secret and who use their influence for good purposes, are worth their weight in gold;
- (17) A person, who has no power of expression and who cannot influence others, is certainly not a *woman*;
- (18) People, who are popular and worthy of praise, either are public benefactors or else are unassuming.

Univ. "persons"; *a* = able to keep a secret; *b* = clear-headed; *c* = constantly talking; *d* = deserving praise; *e* = exhibited in shop-windows; *h* = expressing oneself well; *k* = fit to be an M.P.; *l* = influential; *m* = never-to-be-forgotten; *n* = popular; *r* = public benefactors; *s* = unassuming; *t* = using one's influence for good objects; *v* = well-educated; *w* = women; *z* = worth one's weight in gold.

5.

Six friends, and their six wives, are staying in the same hotel; and they all walk out daily, in parties of various size and composition. To ensure variety in these daily walks, they have agreed to observe the following Rules:—

Other version:
→ 6.8, p. 1010

- (1) If Acres is with (i. e. is in the same party with) his wife, and Barry with his, and Eden with Mrs. Hall, Cole must be with Mrs. Dix;
- (2) If Acres is with his wife, and Hall with his, and Barry with Mrs. Cole, Dix must *not* be with Mrs. Eden;
- (3) If Cole and Dix and their wives are all in the same party, and Acres *not* with Mrs. Barry, Eden must *not* be with Mrs. Hall;
- (4) If Acres is with his wife, and Dix with his, and Barry *not* with Mrs. Cole, Eden must be with Mrs. Hall;
- (5) If Eden is with his wife, and Hall with his, and Cole with Mrs. Dix, Acres must *not* be with Mrs. Barry;
- (6) If Barry and Cole and their wives are all in the same party, and Eden *not* with Mrs. Hall, Dix must be with Mrs. Eden.

The Problem is to prove that there must be, every day, at least *one* married couple who are not in the same party.

6. After the six friends, named in Problem 5, had returned from their tour, three of them, Barry, Cole, and Dix, agreed, with two other friends of theirs, Lang and Mill, that the five should meet, every day, at a certain *table d'hôte*. Remembering how much amusement they had derived from their code of rules for walking-parties, they devised the following rules to be observed whenever beef appeared on the table:—

- (1) If Barry takes salt, then either Cole or Lang takes *one* only of the two condiments, salt and mustard: if he takes mustard, then either Dix takes neither condiment, or Mill takes both.

- (2) If Cole takes salt, then either Barry takes only *one* condiment, or Mill takes neither: if he takes mustard, then either Dix or Lang takes both.
- (3) If Dix takes salt, then either Barry takes neither condiment or Cole take both: if he takes mustard, then either Lang or Mill takes neither.
- (4) If Lang takes salt, then Barry or Dix takes only *one* condiment: if he takes mustard, then either Cole or Mill takes neither.
- (5) If Mill takes salt, then either Barry or Lang takes both condiments: if he takes mustard, then either Cole or Dix takes only *one*.

The Problem is to discover whether these rules are *compatible*; and, if so, what arrangements are possible.

[N.B. In this Problem, it is assumed that the phrase “if Barry takes salt” allows of *two* possible cases, viz. (1) “he takes salt *only*”; (2) “he takes *both* condiments”. And so with all similar phrases.

It is also assumed that the phrase “either Cole or Lang takes *one* only of the two condiments” allows *three* possible cases, viz. (1) “Cole takes *one* only, Lang takes both or neither”; (2) “Cole takes both or neither, Lang takes *one* only”; (3) “Cole takes *one* only, Lang takes *one* only”. And so with all similar phrases.

It is also assumed that every rule is to be understood as implying the words “and *vice versâ*.” Thus the first rule would imply the addition “and, if either Cole or Lang takes only *one* condiment, then Barry takes salt.”]

7.

- (1) Brothers, who are much admired, are apt to be self-conscious;
- (2) When two men of the same height are on opposite sides in Politics, if one of them has his admirers, so also has the other;
- (3) Brothers, who avoid general Society, look well when walking together;
- (4) Whenever you find two men, who differ in Politics and in their views of Society, and who are not both of them ugly, you may be sure that they look well when walking together;
- (5) Ugly men, who look well when walking together, are not both of them free from self-consciousness;
- (6) Brothers, who differs in Politics, and are not both of them handsome, never give themselves airs;
- (7) John declines to go into Society, but never gives himself airs;
- (8) Brothers, who are apt to be self-conscious, though not *both* of them handsome, usually dislike Society;
- (9) Men of the same height, who do not give themselves airs, are free from self-consciousness;
- (10) Men, who agree on questions of Art, though they differ in Politics, and who are not both of them ugly, are always admired;
- (11) Men, who hold opposite views about Art and are not admired, always give themselves airs;
- (12) Brothers of the same height always differ in Politics;
- (13) Two handsome men, who are neither both of them admired nor both of them self-conscious, are no doubt of different heights;

- (14) Brothers, who are self-conscious, and do not both of them like Society, never look well when walking together.

[N.B. See Note at end of Problem 2.]

8.

- (1) A man can always master his father;
- (2) An inferior of a man's uncle owes that man money;
- (3) The father of an enemy of a friend of a man owes that man nothing;
- (4) A man is always persecuted by his son's creditors;
- (5) An inferior of the master of a man's son is senior to that man;
- (6) A grandson of a man's junior is not his nephew;
- (7) A servant of an inferior of a friend of a man's enemy is never persecuted by that man;
- (8) A friend of a superior of the master of a man's victim is that man's enemy;
- (9) An enemy of a persecutor of a servant of a man's father is that man's friend.

The Problem is to deduce some fact about great-grandsons.

[N.B. In this Problem, it is assumed that all the men, here referred to, live in the same town, and that every pair of them are either "friends" or "enemies," that every pair are related as "senior and junior", "superior and inferior", and that certain pairs are related as "creditor and debtor", "father and son", "master and servant", "persecutor and victim", "uncle and nephew".]

9.

"Jack Sprat could eat no fat:
 His wife could eat no lean:
 And so, between them both,
 They licked the platter clean."

Quoted from nursery rhyme

Solve this as a Sorites-Problem, taking lines 3 and 4 as the Conclusion to be proved. It is permitted to use, as Premisses, not only all that is here *asserted*, but also all that we may reasonably understand to be *implied*.

Notes to Appendix.

(A) [See p. 1147.] It may, perhaps, occur to the Reader, who has studied Formal Logic that the argument, here applied to the Propositions *I* and *E*, will apply equally well to the Propositions *I* and *A* (since, in the ordinary text-books, the Propositions "All *xy* are *z*" and "Some *xy* are not *z*" are regarded as Contradictories). Hence it may appear to him that the argument might have been put as follows:—

"We now have *I* and *A* 'asserting.' Hence, if the Proposition 'All *xy* are *z*' be true, some things exist with the Attributes *x* and *y*: i. e. 'Some *x* are *y*.'

"Also we know that, if the Proposition 'Some *xy* are not-*z*' be true the same result follows.

“But these two Propositions are Contradictories, so that one or other of them *must* be true. Hence this result is always true: i. e. the Proposition ‘Some x are y ’ is *always* true!

“*Quod est absurdum*. Hence I cannot assert.”

This matter will be discussed in Part II; but I may as well give here what seems to me to be an irresistible proof that this view (that A and I are Contradictories), though adopted in the ordinary text-books, is untenable. The proof is as follows:—

With regard to the relationship existing between the Class ‘ xy ’ and the two Classes ‘ z ’ and ‘not- z ’, there are *four* conceivable states of things, viz.

- | | | | | |
|-----|-----------|-----------|----------|----------------|
| (1) | Some xy | are z , | and some | are not- z ; |
| (2) | ” | ” | none | ” |
| (3) | No xy | ” | some | ” |
| (4) | ” | ” | none | ” |

Of these four, No. (2) is equivalent to “All xy are z ”, No. (3) is equivalent to “All xy are not- z ”, and No. (4) is equivalent to “No xy exist.”

Now it is quite undeniable that, of these *four* states of things, each is, *a priori*, *possible*, some *one must* be true, and the other three *must* be false.

Hence the Contradictory to (2) is “Either (1) or (3) or (4) is true.” Now the assertion “Either (1) or (3) is true” is equivalent to “Some xy are not- z ”; and the assertion “(4) is true” is equivalent to “No xy exist.” Hence the Contradictory to “All xy are z ” may be expressed as the Alternative Proposition “Either some xy are not- z , or no xy exist,” but *not* as the Categorical Proposition “Some y are not- z .”

(B) [See p. 1150, at end of Section 2.] There are yet *other* views current among “The Logicians”, as to the “Existential Import” of Propositions, which have not been mentioned in this Section.

One is, that the Proposition “some x are y ” is to be interpreted, neither as “Some x exist and are y ”, nor yet as “If there *were* any x in existence, some of them *would* be y ”, but merely as “Some x can be y ; i. e. the Attributes x and y are *compatible*”. On *this* theory, there would be nothing offensive in my telling my friend Jones “Some of your brothers are swindlers”; since, if he indignantly retorted “What do you *mean* by such insulting language, you scoundrel?”, I should calmly reply “I merely mean that the thing is *conceivable*—that some of your brothers *might possibly* be swindlers”. But it may well be doubted whether such an explanation would *entirely* appease the wrath of Jones!

Another view is, that the Proposition “All x are y ” *sometimes* implies the actual *existence* of x , and *sometimes* does *not* imply it; and that we cannot tell, without having it in *concrete* form, *which* interpretation we are to give to it. *This* view is, I think, strongly supported by common usage; and it will be fully discussed in Part II: but the difficulties, which it introduces, seem to me too formidable to be even alluded to in Part I, which I am trying to make, as far as possible, easily intelligible to mere *beginners*.

(C) [See p. 1151, § 4.] The three Conclusions are

- “No conceited child of mine is greedy”;
- “None of my boys could solve this problem”;

“Some unlearned boys are not choristers.”

6.25 Symbolic Logic. Part II

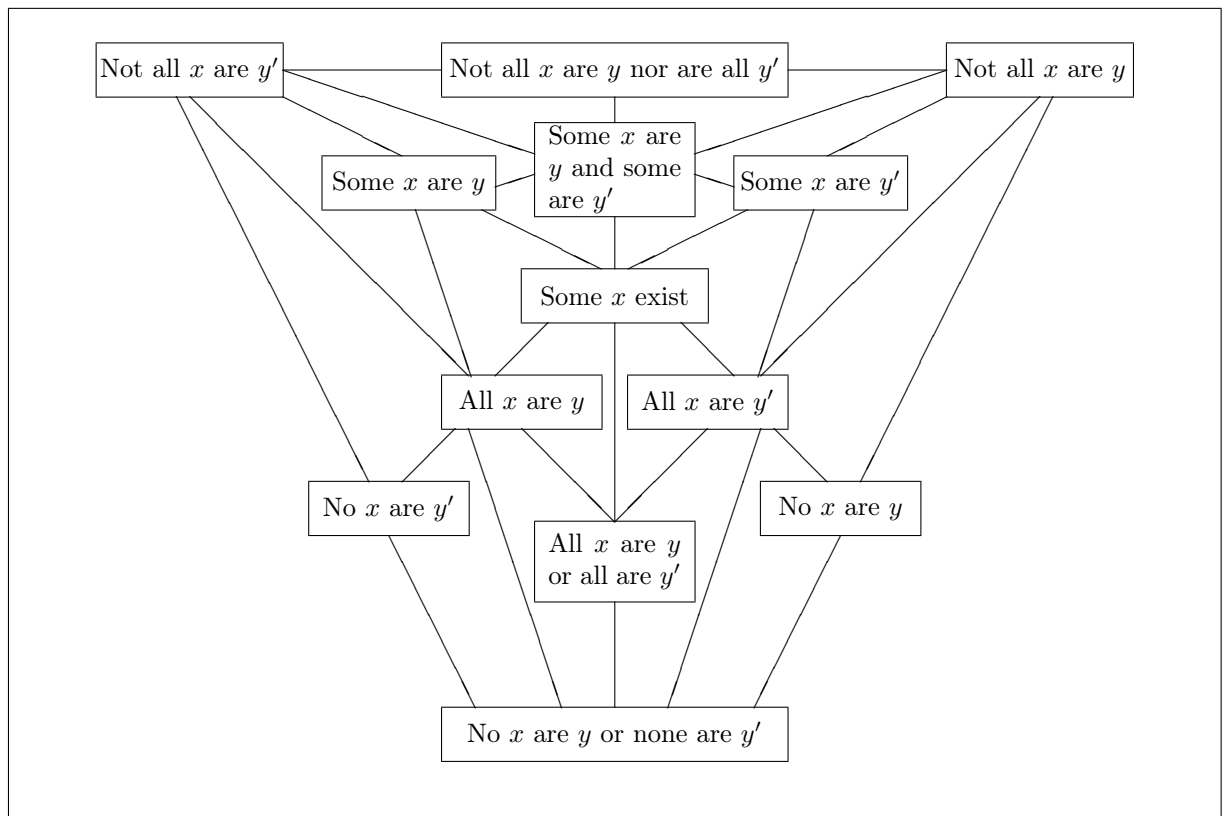

Source: unpublished proofs written 1896/1897

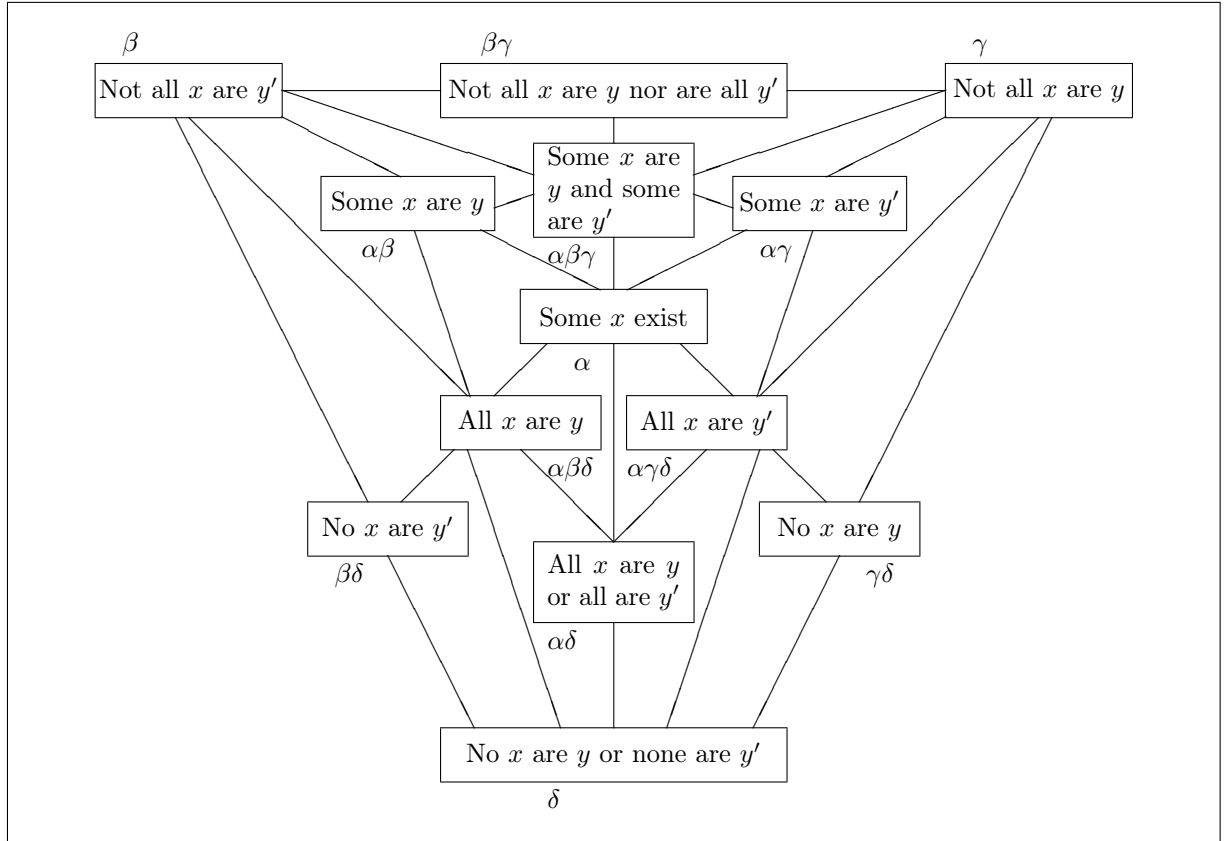

Not all content that survived is reproduced here. Omitted is the book on *Examples* (several of them reprinted with minor changes from the Papers on Logic, the others similar in style, see also <https://www.grahamhawker.net/logic/index.html>), and from *Book XXI: Logical Puzzles* the slightly amended version of “A Logical Paradox” from *Mind*. Additionally, there are many manuscripts probably intended for inclusion, containing classifications of syllogisms and fallacies, an additional diagram (*The Four Syllogisms. Analytical, Logic Pamphlets*, item 3), and more. Some of these are available at <https://www.chch.ox.ac.uk/other-works-lewis-carroll>.

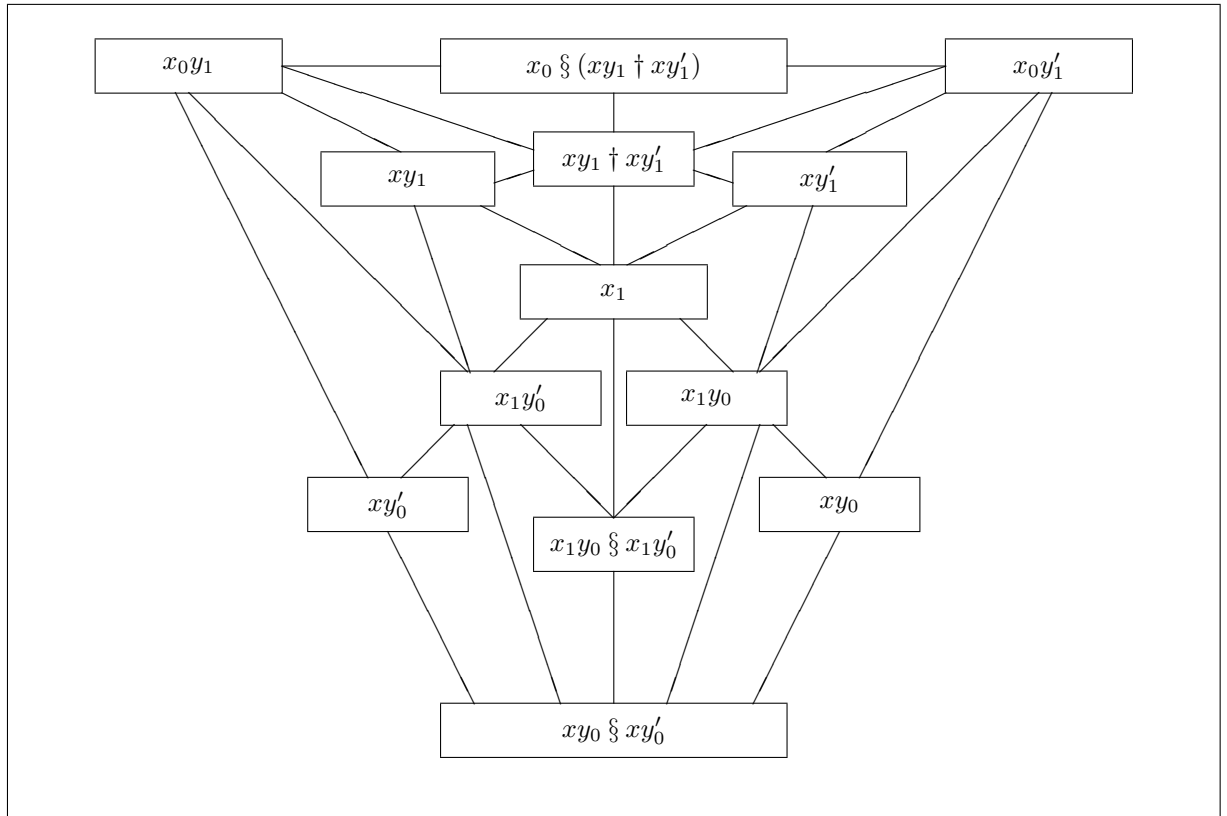

Even if fragmentary, most of the content can be understood easily. One notion is explained in a manuscript: “A ‘Cosmophase’ is the state of the Universe at some particular moment: and I regard any Proposition, which is true at that moment, as an *Attribute* of that Cosmophase.” Also note that \S is the symbol for “or”.

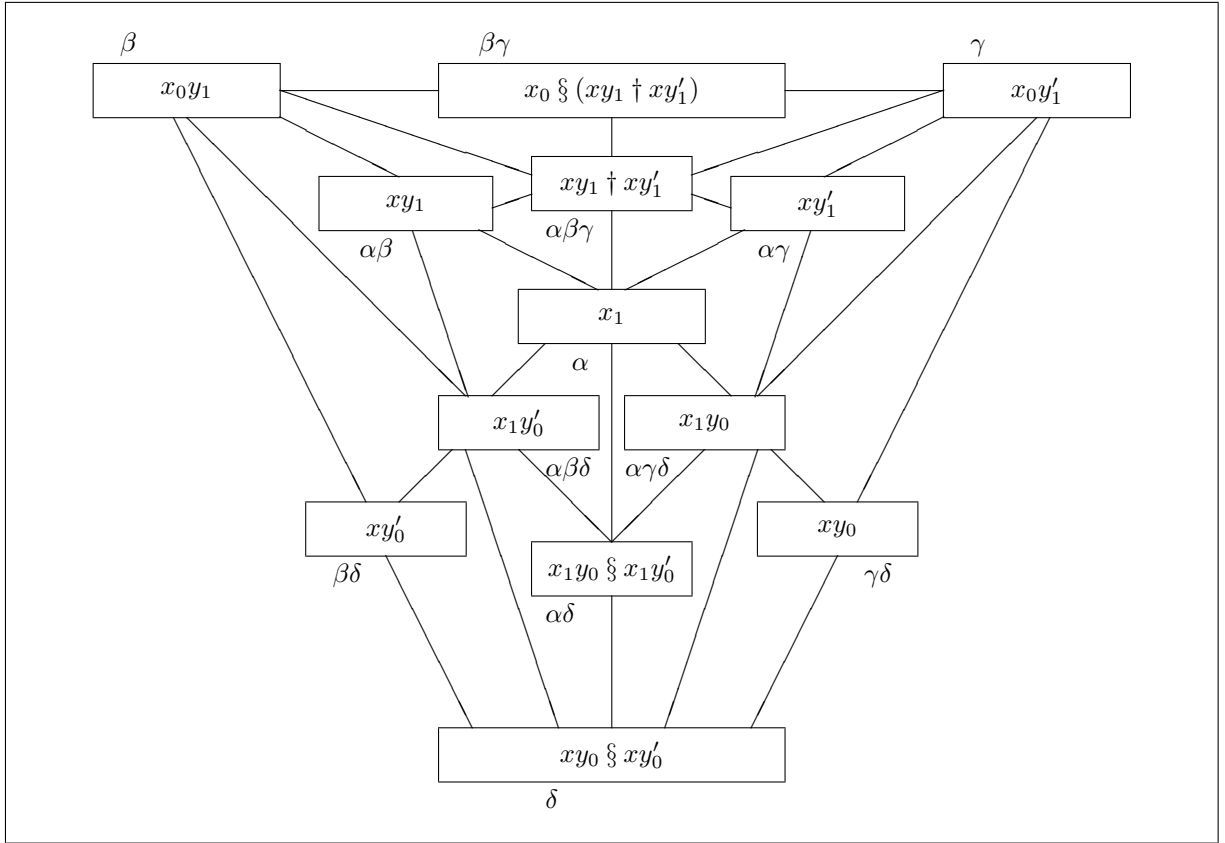

Diagrams

1

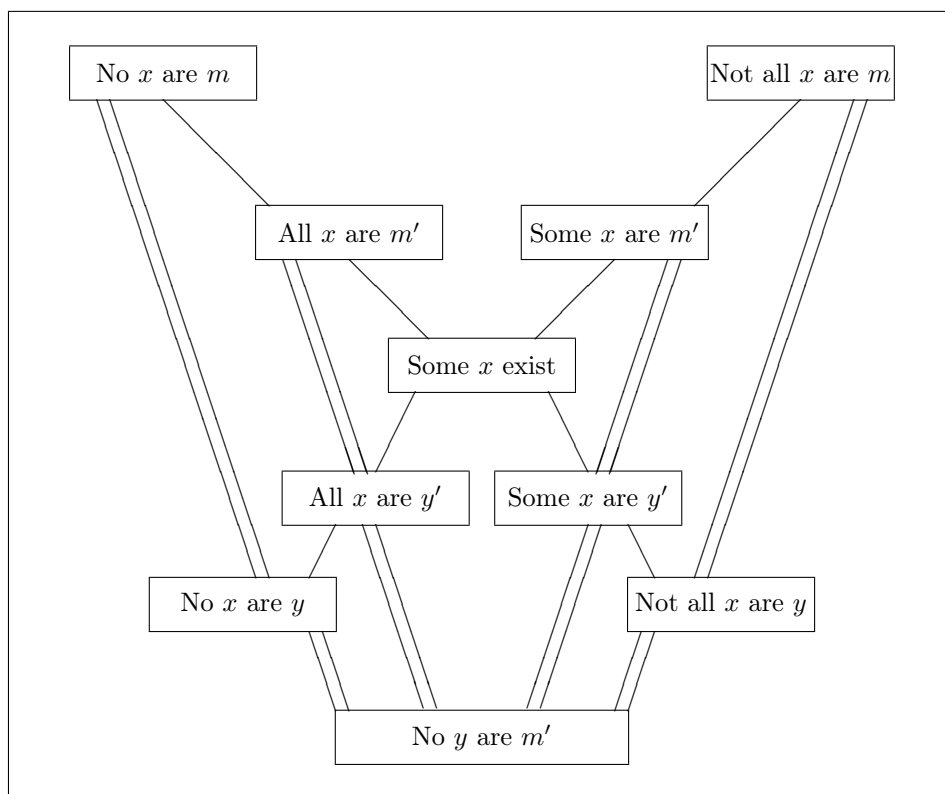

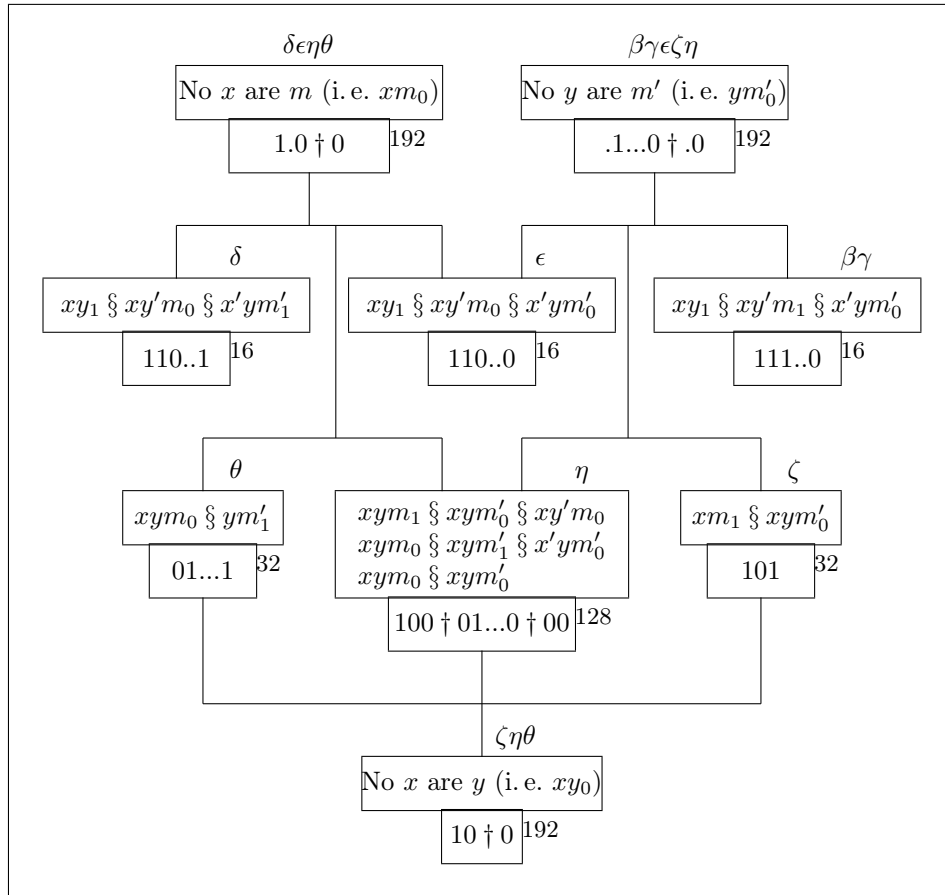

Charts 1 to 5 can be interpreted as tetrahedra, with terms at all vertices, at the centers of all edges, and at the the centers of all sides. Only the fourth side is not visible, the term for it is “No x exist.”

Where terms are connected by lines, the middle one is the conjunction of the outer ones. Since the four terms at the vertices together are contradictory, any term is the invers of the opposite term.

As before, where three terms are connected by a line, the middle one is derived from the two outer ones. Single line indicate bilateral connections, double line trilateral ones. The left side illustrates syllogisms of Figure I, the right side Figure II.

Note that the 0-1-sequences express the terms above them in the following way: The first digit stands for xym , the next for xym' , and so on. Missing terms are shown by dots or omitted (if at the end). So for example $01\dots 1$ stands for $xym_0 \S xym'_1 \S x'y'm'_1 = xym_0 \S ym'_1$. This excludes from the 2^8 possible states (as to which compartments of the trilateral diagram are empty and which are filled) 32 ones, which is the number next to it.

The greek letters show how the terms may be combined, though it is not clear how exactly the terms are split, and why $\beta\gamma$ are combined, or how the syllogism (from top to bottom) is worked.

The Method of Trees

Chapter I. Introductory

The essential character of an ordinary Sorites-Problem may be described as follows. Our *Data* are certain Nullities, involving Attributes, some of which occur both in the *positive* and in the *negative* form, and are the *Eliminands*; while others occur in *one* form only, and are the *Retinoids*. And our *Quaesitum* is to *annul* the aggregate of the Retinoids (i. e. to prove it to be a *Nullity*).

Hitherto we have done this by a *direct* Process: that is, we have begun with two of the given Nullities, containing a pair of Eliminands differing only in *sign* (e. g. a and a'), and we have treated them as the Premisses of a Syllogism in Fig. I, and have combined them so as to form a new Nullity, not containing the Eliminands: This *Partial Conclusion* we have then combined, in the same way, with some other given Nullity: and in this way we have proceeded, gradually turning out the Eliminands, till finally we have proved, as our *Complete Conclusion*, a Nullity consisting of the aggregate of the *Retinoids*.

In the *Method of Trees* this process is *reversed*. Its essential feature is that it involves a *Reductio ad Absurdum*. That is, we begin by assuming, *argumenti gratia*, that the aggregate of the Retinoids (which we wish to prove to be a *Nullity*) is an *Entity*: from this assumption we deduce a certain result: this result we show to be *absurd*: and hence we infer that our original assumption was *false*, i. e. that the aggregate of the Retinoids is a *Nullity*.

Chapter II. Sorites-Problems with Biliteral Premisses

As the simplest possible example of this Method, let us take the original typical Syllogism in Fig. I, viz.

$$xm_0 \dagger ym'_0 \mathbb{P} xy_0$$

Here our *Data* are the two Nullities, xm_0 and ym'_0 involving the Attribute m both in the *positive* and in the *negative* form: and our *Quaesitum* is the Nullity xy_0 .

We begin by assuming that the aggregate xy is an *Entity*: i. e. we assume that some existing Thing has *both* the Attributes x and y .

Now the *first* Premiss tells us that x is incompatible with m . Hence the “Thing” under consideration, which is assumed to have the Attribute x , *cannot* have the Attribute m . But it is bound to have one of the two m or m' , since these constitute an *Exhaustive Division* of the whole Universe. Hence it *must* have the Attribute m' .

Similarly, from the *second* Premiss, we can prove, as our *second* result, that the “Thing” under consideration has the Attribute m .

These two results, taken together, give us the startling assertion that this “Thing” has *both* the Attributes, m and m' , *at once*; i. e. we get

$$xy_1 \mathbb{P} xym'm_1$$

Now we know that m and m' are *Contradictories*: hence this result is evidently *absurd*: so we go back to our original assumption (that the aggregate xy was an Entity), and we say “hence xy *cannot* be an *Entity*: that is, it is a *Nullity*.”

Now let us arrange this argument in the form of a *Tree*.

I must explain, to begin with, that all the Trees, in this system, grow *head-downwards*: the Root is at the *top*, and the Branches are *below*. If it be objected that the name “Tree” is a misnomer, my answer is that I am only following the example of all writers on *Genealogy*. A *Genealogical* “Tree” *always* grows *downwards*: then why may not a *Logical* “Tree” do likewise?

Well, then, I put the *Root* of my Tree at the top. It consists of the aggregate *xy*: and the mere writing down of these two Letters is to be understood to mean (using the regular form of a *Reductio ad Absurdum*) “The aggregate *xy* shall be a *Nullity*: for, if not, let it be an *Entity*; that is, let a certain existing Thing have the two Attributes, *x* and *y*.”

Underneath this *xy* I then place the Letter *m'* (this is part of the *Stem* of our Tree): and on its left-hand side I place the Number 1, followed by a full-stop, so that our Tree is now

The meaning of this is, that the “Thing,” which is assumed to have the two Attributes *x* and *y*, *must also* have the Attribute *m'*: and the Number 1 refers you to the *first* Premiss as my authority for this assertion.

Next, I place the Letter *m* on the right-hand side of *m'*, and the Number 2, followed by a comma, on the *left*-hand side of the 1, so that our Tree now is

This means that the Thing *must also* have the Attribute *m* (i. e. that *xym'm* is an *Entity*), and that my authority, for asserting this, is the *second* Premiss. (Observe that the two *Letters*, in the lower line, are to be read *from left to right*, but the two *Reference-Numbers* *from right to left*.)

Now we know that *m'* and *m* are *Contradictories*: hence it is impossible for an Aggregate, which contains them *both*, to be an *Entity*, hence it is a *Nullity*. And *this* fact I indicate by drawing a little *circle* (representing a *nought*) underneath, so that our Tree now is

The meaning of the circle is “The aggregate of Attributes, beginning at the Root, down to this point, is a *Nullity*.”

Next, I place, underneath the little circle, the Conclusion $\therefore xy_0$, so that the Tree now is

The meaning of the last line is “We have now proved, from the assumption that xy was an *Entity*, that this aggregate, $xym'm$, must be an *Entity*. But it is evidently a *Nullity*. Which is *absurd*. Hence our assumption was *false*. Hence we have a right to say “Therefore xy is a *Nullity*.”

I will now exhibit, in one view, the whole Tree, bit by bit, with the meaning of each bit set against it.

xy	If possible, let xy be an <i>Entity</i> : i. e., let some existing Thing have the two Attributes x and y .
2, 1. $m'm$	Then, by Premisses 1, 2, this Thing must <i>also</i> have the Attributes m' and m ; i. e., $xym'm$ must be an <i>Entity</i> .
○	Now this aggregate ($xym'm$) is a <i>Nullity</i> (since it contains m' and m , which we know to be <i>Contradictories</i>).
$\therefore xy_0$	This result, that $xym'm$ is both an <i>Entity</i> and a <i>Nullity</i> , is absurd. Hence our original assumption was <i>false</i> . Therefore xy is a <i>Nullity</i> .

All this magnificent machinery, used to prove one single Syllogism, may perhaps remind the Reader of the proverbial absurdity of using a Nasmyth-hammer to crack a nut: but we shall find, when we get a little further in the subject, and begin to deal with more complex Problems, that our machinery is none too costly for the purpose.

My next example shall be a Sorites-Problem, with *five* Premisses, but still keeping to that childishly simple kind of Premiss (the *only* kind, as I pointed out in Part I, p. 1166, with which the ordinary Logical textbooks venture to deal), the *Bilateral Nullity*. I will take, from Book VIII, Chapter III, §3, 8 of Part I, the twenty-third Example, viz.

$$\begin{array}{ccccccccc} 1 & & 2 & & 3 & & 4 & & 5 \\ b'_1a_0 & \dagger & de'_0 & \dagger & h_1b_0 & \dagger & ce_0 & \dagger & d'_1a'_0 \end{array}$$

Here we can easily see, by inspection, that a, b, d, e , are the four *Eliminands*, and that c and h are *Retinends*. (As the Reader already knows, we cannot have more than *four* Eliminands, with *five* Premisses, though of course the number of *Retinends* is unlimited.)

I begin by placing ch at the top of the paper, as the *Root*. And I then look through the Premisses for the Letter c . I find it in No. 4, which tells me that c and e are *incompatible*. Hence the Thing which I have assumed to have the Attributes c and h , *cannot* have the Attribute e . Hence it *must* have the

Attribute e' . And this I express by placing e' underneath with the Reference-Number 4 on the left.

The Tree is now

$$\begin{array}{c} ch \\ 4.e' \end{array}$$

Next, I look for h among the Premises. I find it in No. 3, which authorises me to say that b' is *another* Attribute that the Thing *must* have (since it cannot have b). So I place b' in the same line with e' , and its Reference-Number 3, followed by a comma, away to the left.

The Tree is now

$$\begin{array}{c} ch \\ 3, 4.e'b' \end{array}$$

Next, I look for e' and b' among the Premises. I find them in Nos. 2 and 1, which authorise me to assert that d' and a' are *also necessary* Attributes of the Thing; that is, to assert that the whole aggregate $che'b'd'a'$ is an *Entity*.

The Tree is now

$$\begin{array}{c} ch \\ 3, 4.e'b' \\ 1, 2.d'a' \end{array}$$

Next, I look for d' and a' among the Premises. I find them *together*, in No. 5, which asserts that the pair $d'a'$ is a *Nullity*, and therefore authorises me to assert that the whole aggregate $che'b'd'a'$ is a *Nullity*.

The tree is now

$$\begin{array}{c} ch \\ 3, 4.e'b' \\ 1, 2.d'a' \\ 5.\bigcirc \end{array}$$

Hence I may write underneath this, $\therefore ch_0$, and the Tree is complete.

I now examine the Premises, to see whether either c or h is given as *existing*. I find that, in No. 3, h is so given. So I write the full Conclusion thus:

$$\therefore ch_0 \dagger h_1; \text{ i. e. } h_1c_0$$

I will now exhibit, in one view, the whole Tree, in the same form as in the previous example.

ch	If possible let ch be an <i>Entity</i> : i.e. let some existing Thing have the two Attributes c and h .
3, 4. $e'b'$	Then, by Premises 4, 3, this Thing must <i>also</i> have the Attributes e' and b' .
1, 2. $d'a'$	Hence, by Premises 2, 1, it must <i>also</i> have the Attributes d' and a' : the aggregate $che'b'd'a'$ must be an <i>Entity</i> .
5.○ ∴ $ch_0 \dagger h_1$; i.e. h_1c_0	Now, by Premiss 5, this aggregate $che'b'd'a'$ is a <i>Nullity</i> (since it contains the aggregate $d'a'$, which we know, by Premiss 5, to be a <i>Nullity</i>). (This result, that $che'b'd'a'$ is both an <i>Entity</i> and a <i>Nullity</i> , is <i>absurd</i> . Hence our original assumption was <i>false</i> .) Therefore ch is a <i>Nullity</i> . And we also know that h <i>exists</i> . Hence "All h are c ."

Here it will be well to pause for a moment in order to point out the beautiful fact that this "Tree" argument may be *verified*, by converting the *Tree* into a *Sorites*. And this may be done by the extremely simple rule of beginning at the *lower* end, and taking the rows of Reference-numbers *upwards* instead of *downwards*, viz. in the order 5, 2, 1, 4, 3. The result will be

$$\begin{array}{cccccc} 5 & & 2 & & 1 & & 4 & & 3 \\ d'a' & \dagger & de' & \dagger & b'a & \dagger & ce & \dagger & hb \end{array}$$

which proves ch_0 , as the Reader will see for himself, if he will take the trouble to copy it out, and to underscore the Eliminands.

Chapter III. Sorites-Problems with Triliteral and Multiliteral Premises

The Sorites-Problems, hitherto discussed, have involved *Bilateral* Premises only: the admission of *Triliteral*, and *Multiliteral*, Premises introduces a new feature in the construction of Trees, which needs some preliminary explanation.

Suppose we are in the course of constructing a Tree, and have just proved that the existing “Thing,” which we have assumed to possess the Retinends, must also possess the Attribute a . If, on looking up a in the Register, we find a Premiss containing it along with only *one* other Eliminand, b , of course we conclude, as in the previous Chapter, that, since the “Thing” *cannot* have the Attribute b , it *must* have the Contradictory of b , i. e. b' . But suppose there is no such Premiss: suppose the only one we can find, containing a , contains *two* other Eliminands, b and c , what conclusion can we draw from *this* Nullity? We may say, of course, “Since the Thing *cannot* have the Pair of Attributes bc , it *must* have the *Contradictory* to it.” But what is the Contradictory to a *Pair* of Attributes? The simplest way, I think, of answering this question, is to imagine our Univ. divided, by two successive Dichotomies, for these two Attributes. We know that this will give us the *four* Classes, bc , bc' , $b'c$, $b'c'$; and that in *one* of these four the Thing is bound to be; and that it is barred, by the Nullity we have just found, from being in the *first* of these four Classes. Hence it *must* be in some one of the other *three*, which together constitute the *Contradictory* to the Class bc : i. e. it *must* have some one of the *three* Pairs of Attributes, bc' , $b'c$, $b'c'$.

Now we might, if we liked, state the result in this way, and proceed to consider what would happen in each of these *three* events. But it would be a cumbrous process. If we were to treat a *Quadrilateral* Nullity on the same principle, we should have to allow the Thing the choice of *seven* different events, each of which we should have to investigate separately; and, with a *Quintilateral* Nullity there would be *fifteen*!

But we may easily *group* these *three* Classes under two headings: and the simplest way of doing so is to remember that bc is the *only* one, of these four Pairs of Attributes, which contains neither b' nor c' : i. e., every *other* Pair contains either b' or c' . Hence we are authorised to say the Thing *must* have either b' or c' . In other words we may say the Thing must have either the Contradictory of b or the Contradictory of c .

[Similarly, if the Nullity contained $ab'c$, we should say the Thing must have either b or c' . If the Nullity contained $ab'c'$, we should say the Thing *must* have either b or c .]

The Reader will easily see that the *three* possible Pairs, bc' , $b'c$, $b'c'$, can be grouped under these *two* headings. Under b' we can place $b'c$ and $b'c'$; and under c' we can place bc' and $b'c'$.

This is, of course, a case of *overlapping*, or what is called “Cross Division,” since $b'c'$ appears under *both* headings. Now there is no reason to be so lavish of accommodation for this pampered Class $b'c'$: it ought to be quite content with *one* appearance. So we may fairly say it shall *not* appear under the heading b' : *that* heading shall contain the Class $b'c$ *only*. This result we can secure by tacking on to b' the Letter c ; so that the two headings will be $b'c$ and c' . Or we may, if we prefer it, say it shall *not* appear under the heading c' : *that* heading shall contain the Class bc' *only*. And *this* result we can secure by tacking on c' the Letter b ; so that the two headings will be b' and $c'b$. It is worthwhile to note that, in *each* case, we tack on, to *one* of the single Letters, the *Contradictory* of the *other*: this fact should be remembered as a *rule*.

[Thus, if we found a Premiss proving that the Thing *could not* have the Pair of Attributes $b'c$, we might say it *must* have b or c' . And we might afterwards tack on, at pleasure, either c to b , making the two headings bc and c' , or b' to c' , making them

b and $c'b'$.]

We have now got a Rule of Procedure, to be observed whenever we are obliged to *divide* our Tree into *two* Branches, and, instead of saying the Thing *must* have this *one* Attribute, we say it *must* have one or other of these *two* Attributes.

I will now take some Sorites-Problems containing “Barred” Premisses. We shall find that the Method of Trees saves us a great deal of the trouble entailed by the earlier process. In that earlier process we were obliged to keep a careful watch on all the Barred Premisses, so as to be sure not to use any such Premiss until all its “Bars” had appeared in that Sorites. In this new Method, the Barred Premisses all take care of themselves: and we shall see, when we come to “verify” our Tree, by translating it into Sorites-form that no Barred Premiss will venture to make its appearance until all its Bars have been duly accounted for.

My first example shall be

1	2	3	4	5	6	7	8
$d'n'_1m'_0$	$\dagger ka'_1c'_0$	$\dagger le_1m_0$	$\dagger dh_1k'_0$	$\dagger h'la'_0$	$\dagger hm'_1b'_0$	$\dagger a'bn_0$	$\dagger am'_1e_0$

Here we see that some of the Letters occur more than once: for instance, h occurs in Nos. 4 and 6, in the *positive* form, and in No. 5 in the *negative* form. Hence, when we ask the question, as to any particular Letter, “In *which* of the Premisses does it occur?”, we should have to interrupt the construction of our Tree, in order to hunt through the whole Set of Premisses. To avoid this necessity, it will be convenient to draw up, once for all, a “Register of Attributes,” from which we get, at a glance, the required information. The rule, for making such a Register, is as follows:

At the left margin of the paper draw a short vertical line, and above it, a little to the right, place the letter a : and under it place *two* rows of numbers, the *upper* row referring to the Premisses where a occurs in the *positive* form, and the *lower* to those where it occurs in the *negative* form: then draw another short vertical, to divide the a 's from the b 's, write b over the next space, and proceed as before.

Thus, in the present example, after drawing the first vertical and writing a above, we look through the Premisses, to see which of them contain a or a' . In No. 2, we find a' : so we write 2 in the *lower* line: in Nos. 5 and 7, we find two more: so we write 5, 7, still in the *lower* line: lastly, in No. 8, we find a : so we write 8 in the *upper* line: then we draw another vertical, and write b over the

next space. The beginning of the Register will now be

a	b
8	
2, 5, 7	

I recommend my Reader to copy out these seven Premisses at the top of a large sheet of paper, and underneath them to construct a Register of Attributes for himself, which he can then compare with the one here given, to satisfy himself that he has made no mistake. The Register is as follows:

a	b	c	d	e	h	k	l	m	n
8	7		4	3, 8	4, 6	2	3, 5	3	7
2, 5, 7	6	2	1		5	4		1, 6, 8	1

This result we had better *verify*, before going further, by the following rule:

Name the Letters in No. 1, in alphabetical order: then look them up in the Register, and see that 1 occurs in its proper place under each. Then name the Letters in No. 2: and so on.

Thus, in this example, we look at No. 1, and say (naming the letters in alphabetical order) “*d*-dash, *n*-dash, *m*-dash.” Then we look up *d*, *n*, and *m* in the Register, and satisfy ourselves that *each* of them has a 1 under it in the *lower* line. Then we look at No. 2, and say “*a*-dash, *c*-dash, *k*,” and proceed as before.

This Register not only enables us to see, at a glance, in *which* Premisses any particular Letter occurs; but it also tells us that this Sorites-Problem contains *seven* Eliminands (every Letter, that has numbers under it in *both* rows, is an Eliminand), and *three* Retinends. It also tells us that there are *three* Barred Premisses; since, under *a*, we see that No. 8 is barred by Nos. 2, 5, and 7; under *h*, that No. 5 is barred by Nos. 4 and 6; and, under *m*, that No. 3 is barred by Nos. 1, 6, and 8. But these are *now* trifles, about which we need not trouble ourselves!

In working this Tree, I shall adopt a new plan, which I think the Reader will find beautifully clear and intelligible. Instead of exhibiting the Tree, piecemeal, as I proceed, I shall simply give my *soliloquy* as I work it out, with the “stage-directions” (given in italics, between square brackets) showing what I *do*: and, if the Reader will simply take a piece of paper, and pen and ink, and will copy, at the top of his paper, the eight Premisses and the Register, and will then, while reading my soliloquy, follow the stage-directions, and thus *do all the things himself*, he will find that he has constructed the Tree for himself: and he can *then*, for his own satisfaction, compare his finished result with mine. (Note that the letters [R.R.] will be used to represent the stage-direction *I refer to Register*.)

My soliloquy is as follows:

“So! *Eight* Premisses, and every one of them *trilateral*! However, there are *seven* Eliminands: so there ca’n’t be any superfluous Premisses. Well, the Conclusion *ought* to be *c’el₀*, of course.”

[*I write, under the Register, “There are 8 Premisses, 7 Eliminands, and 3 Retinends.” Then, under that in the middle, I write c’el.*]

“Now, what can we do with *c’*?”

[R.R.]

“It occurs in 2 only: and *that* tells me that it ca’n’t be *ka’*: so of course it *must* be (taking them in alphabetical order) *a* or *k’*. That would force me to divide the Tree at the very Root! Let’s try *e*.”

[R.R.]

“It occurs in 3 and 8: and in 3 it is kind enough to have *another* Retinend with it, and only *one* Eliminand! Well, *this* Premiss tells us that *el* ca’n’t be *m*: so of course it *must* be *m’*. Well, there’s *one* Letter for the Stem, at any rate!”

[*I place m’ underneath c, and the Reference-Number 3, followed by a full-stop, on its left.*]

“Let’s see if *l* gives us any other *certainty* for the second row.”

[R.R.]

“No! No. 5 is the only other Premiss: and *that* would ‘divide’ between *a* and *h*. We must go on to the third row. What will *m’* do for us?”

[R.R.]

“*Hm!* There’s good choice here! Nos. 1, 6, and 8. No. 1 divides between d and n . No. 6 divides between b and h' . No. 8 is more gracious: we’ve got both m' and e already: so this gives us a' .”

[*I place a' under m' with 8 on the left.*]

“Well, now, what will a' do for us?”

[R.R.]

“*Again* we have ample choice! No. 2 does beautifully, as we’ve got c upstairs: so *that* gives k' for the fourth row.”

[*I place k' under a' with 2 on the left.*]

“Any more results from a' ?”

“Yes. No. 5, $h'la'_0$, and we’ve got l upstairs: so *that* gives us h .”

[*I place h on the right of k' , and 5, followed by a comma, away to the left!*]

“Any more? No. 7 is the other one: and *that* would have to divide, as we haven’t got either b or n upstairs: so we’ll let it alone. Now for the *fifth* row. What will k' do for us?”

[R.R.]

“No. 4 is the only one: and that will do grandly, as we’ve got both h and k' : so it gives us d' as a *certainty*.”

[*I place d' under k' , and 4 on the left.*]

“And what will h do for us?”

[R.R.]

“It occurs in Nos. 4 and 6. But we’ve just *used* No. 4. Let’s try No. 6. Yes, that gives us b , as we have m' upstairs.”

[*I place b to the right of d' , and 6 away on the left.*]

“Now for the *sixth* row. What will d' do?”

[R.R.]

“No. 1’s the only one: *that* gives us n to follow, as we’ve got m' upstairs.”

[*I place n under d' , with 1 on the left.*]

“And will b do us any good?”

[R.R.]

“Yes, b gives us n' , as we’ve got a' upstairs.”

[*I place n' on the right of n , with 7 away to the left.*]

“Come! that finishes the thing: nn' is an absurdity!”

[*I draw a little circle under nn' .*]

“So now we’ve proved $c'el_Q$. The next thing is to examine the Premisses, and see if any of these three are given as *existing*.”

[*I inspect the Premisses, by the help of the Register.*]

“ c' occurs in No. 2 only—*non-existent*: e occurs in Nos. 3 and 8—and *exists* in No. 3, along with l . So we get $c'el_0 \dagger le_1$; that is, $le_1c'_0$; that is, All le are c ; and my task is done!”

[*I write, underneath the little circle, $\therefore c'el_0 \dagger le_1$; i. e. $le_1c'_0$; i. e. All le are c .*]

Here ends my soliloquy. If the Reader will now turn to the image above, he will see what the Tree *ought* to look like: and, between *that* and the Tree he has constructed for himself, I *hope* he will find a considerable family-likeness! He should then *verify* his Tree, by writing out the eight Premisses in the *reverse* order (i. e. in the order 1, 7, 4, 6, 2, 5, 8, 3), omitting all subscripts, and underscoring whatever letters he can eliminate: and the final result *ought* to be $c'el_0$.

My second example shall be

I will now construct the Tree, soliloquising as I do so.

“*Six* Eliminands, are there? And *seven* Premisses—none too many. And *three* Retinends, b , d' , and l . Well, those will make the *Root*.”

[*I take a piece of paper, and write $bd'l$ in the middle at the top.*]

“Now, then, what will b do for us?”

[R.R.]

“No. 4—why, that gives us a certainty at once! b and l are *both* of them *Retinends*.”

[*I place h under b , with 4 on the left.*]

“No. 7?”

[R.R.]

“Divides. Now for d' . No. 2?”

[R.R.]

“Divides. And now for l . No. 4? We’ve got it already. So that ends our *second* row. Now for the *third*. What will h do? No. 1?”

[R.R.]

“Divides. No. 3?”

[R.R.]

“Ditto. No. 6?”

[R.R.]

“Ditto. We *must* divide, this time: let’s go back to No. 1: ‘first come, first served,’ you know.”

[*I draw a short line (say $\frac{1}{8}$ inch long) downwards from h ; and, across the lower end of it, I draw a horizontal line (say 3 inches long); under it I write 1, and, from its ends, I draw two more short downward lines; and under them I write k' and m' .*]

“Now, shall we tack an m on to the k' ? Or shall we tack a k on to the m' ? Let's see if either of them would be of any future use.”

[R.R.]

“Well, m only occurs in No. 1, and *that* we've just used: so m' can be of no further use: but k occurs in No. 5 *also*: so perhaps it *may* be of use, further down.”

[I tack on k to m' .]

Here I cease to soliloquise, for a moment, in order to inform my Reader that the *meaning* of this division of the Tree into two Branches is to assert that the (supposed) existing “Thing,” which has the Attributes $bd'lh$, *must also* have *either* the single Attribute k' (which it may follow up with m or with m' , whichever it likes), *or else* the Pair of Attributes $m'k$. I resume my soliloquy.

“Now, in the left-hand branch, what will k' do for us?”

[R.R.]

“It occurs in No. 3. That'll do very nicely: we've got h and k' already, down this Branch: so that gives us a .”

[I place a under k' , with 3 on the left.]

“It also occurs in No. 7: and this gives us *another* certainty, as we've got b upstairs: so this gives us a' .”

[I tack on a' to a , and place a 7, followed by a comma, to the left of the 3.]

“Well, *that* Branch is annulled, anyhow!”

[I draw a circle under the aa' .]

“Now for the right-hand Branch. What will m' do for us?”

[R.R.]

“It occurs in No. 5 only. However, that gives us a *certainty*, as we've got both k and m' : so we *must* have c' to follow.”

[I place c' under the m' , with 5 on its left.]

“Now, what will c' lead to?”

[R.R.]

“It occurs in No. 2, and in No. 6. In No. 2, it gives us e to follow, as we've got d' upstairs; and, in No. 6, it gives us e' to follow, as we've got h upstairs.”

[I write ee' under c' , with 6, 2 on the left.]

“Well, that annuls the *right-hand* Branch: so the Tree is finished!”

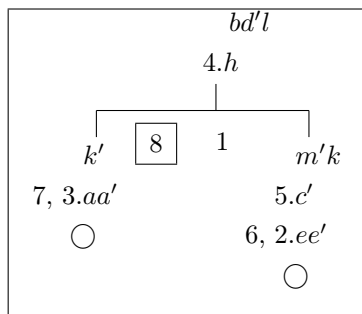

[I draw a circle under the ee' .]

“So now we've got $bd'l_0$: let's see which of them *exist* in the Premisses.”

[I refer to the Premisses, the Register telling me where the Retinends occur.]

“No. 4 gives us bl as *existing*: that'll do very well.”

[I write, underneath the Tree, $\therefore bd'l_0 \dagger bl_1$; *i. e.* $bl_1d'_0$; *i. e.* All bl are d .]

My reader may now refer to the Tree, given above, and see if he has drawn his correctly.

Observe that this Tree, though not containing a single word of English, expresses *symbolically* the whole of the following argument.

If possible, let $bd'l$ be an *Entity*, i. e. let there be a certain existing Thing, which has all three Attributes. Then, by No. 4, this same Thing *must also* have the Attribute h . Hence, by No. 1, it must *also* have *either* k' or $m'k$. If it chooses k' , then, by Nos. 3 and 7, it must *also* have aa' , which is absurd: if it chooses $m'k$, then, by Nos. 5, 2, and 6, it must *also* have $c'ee'$, which is absurd.

More briefly, if an existing Thing has the Attributes $bd'l$, it *must also* have *either* $hk'aa$ or $hm'kc'ee'$. But each of these aggregates is impossible.

Hence $bd'l$ cannot be an *Entity*.

Therefore it is a *Nullity*.

Here ends my soliloquy; and there is no logical *necessity* to do anything more: still it is very *satisfactory* to “verify” the Tree, by translating it into Sorites-form. There will be *two* Partial Conclusions, which I shall number as 9 and 10. But I must pause here, to instruct my Reader how to deal with *Branches*, in verifying a Tree. The simple Rule is, when there are two Branches, of which *one* is headed by a *single* Letter, and the *other* by a *Pair*, to take the *single* Letter first, turn it into a Sorites, and record its Partial Conclusion: then take the *double*-Letter Branch: turn it also into a Sorites—but there’s no need to *record* its result, as we may go on at once with the Premiss used in the Branching: then take the recorded result of the *single*-Letter Branch: then we can go “upstairs,” if there is any *Stem* leading down to the Branching. Thus, in the present instance, of the two main Branches, we take k' first. So our *first* Sorites consists of 3 and 7. So we draw a small square against k' , on the right side of it; and in that square we write 8. Our final Sorites will begin, in the $m'k$ -Branch, with Nos. 2, 6, and 5. This takes us up to $m'k$. Then we cross the bridge, by means of No. 1: then take in No. 8: then we can go upstairs, and take No. 4: and that *ought* to give us the desired Conclusion.

The following summary exhibits these two Soriteses in a handy form:

$$3, 7 \text{ P } hk'b_0 \dots (8); \quad 2, 6, 5, 1, 8, 4 \text{ P } d'bl_0$$

The Reader should satisfy himself that this is correct, by copying the above, substituting, for the reference-numbers, the actual Premisses, and underscoring all the Eliminands. The result ought to be as follows:

$$\begin{array}{ccc} 3 & & 7 \\ hk'a' & \dagger & \underline{ba}k' \text{ P } hk'b_0 \dots (8); \end{array}$$

$$\begin{array}{ccccccccc} 2 & & 6 & & 5 & & 1 & & 8 & & 4 \\ d'e'c' & \dagger & \underline{h}c'e & \dagger & \underline{c}k'm' & \dagger & \underline{h}m\underline{k} & \dagger & \underline{h}k'b & \dagger & \underline{bl}h' \text{ P } d'bl_0 \end{array}$$

I will now work out a rather harder Problem.

Let us take the Sorites,

$$\begin{array}{cccccccc} 1 & & 2 & & 3 & & 4 & & 5 & & 6 & & 7 & & 8 \\ knl'_0 & \dagger & ch_1e'_0 & \dagger & bl'a'_0 & \dagger & d_1e'n'_0 & \dagger & ahc'_0 & \dagger & nb_1k'_0 & \dagger & le'_1m_0 & \dagger & d'h'n'_0 \end{array}$$

a	b	c	d	e	h	k	l	m	n
5	3, 6	2	4		2, 5	1	7	7	1, 6
3		5	8	2, 4, 7	8	6	1, 3		4, 8

There are eight Premisses, seven Eliminands, and three Retinends.
My soliloquy is as follows:
“No superfluous Premisses, *this* time. *Two* Barred Premisses, and a Barred Group! But no matter: the *Tree* will take care of all *that!*”
[I write be'm as the Root.]
“Now, what will *b* do for us?”
[R.R.]
“*In 3* it divides: and *in 7* it divides. Let's try *e'*.”
[R.R.]
“*In 2* it divides; but *7* suits us better: both *e'* and *m* are Retinends: so the Thing, that's got *all* the Retinends, ca'n't be *l*, and therefore *must* be *l'*.”
[I write l' under b, with a 7 on the left.]
“Will *m* give us any more certainties?”
[R.R.]
“*No*: it only occurs in *7*, which we've just used. Now, what will *l'* do for us?”
[R.R.]
“*It* occurs in *1* and *3*. *In 1*, it divides: but we've better luck in *3*, as *b*'s a Retinend. So that gives us *a* to go on with.”
[I write a under l', with a 3 on the left.]
“*Now* for *a*.”
[R.R.]
“*It* occurs in *5* only: and that divides. Well, there's no help for it, *this* time! We must divide between *c* and *h'*.”
[I draw a short line downwards from a: across the lower end of it I draw a horizontal line: under the middle of this line I write a 5: from its ends I draw two short downward lines: and under them I write c and h'.]
“*Now*, we've got the right to tack on *c'* to the *h'*, or *h* to the *c*, whichever we like. Shall we do either? Let's see if either of them would be of any use, further down.”
[R.R.]
“*c'* is no use: it only occurs in *5*, the one we're using. But *h* occurs also in *2*: so we'd better tack it on.”
[I tack on h to the c.]
“*Now* what will *c*, or *h*, do for us?”
[R.R.]
“*c* occurs in *2*—and *h* along with it: and *e'* is a Retinend: so that gives us a Nullity at once.”
[I draw a small circle under ch, with 2 on the left.]
“*Now*, what can we do with *h'*?”
[R.R.]
“*Well* it divides in *8*; and I'm afraid there's no help for it, as that's the *only* one it occurs in.”
[I make a Branching under h', with 8 under the middle of it, and d and n under the ends.]
“*Now* shall we tack on *d'* to *n*? Or *n'* to *d*? Let's see if *d'* could be of any use further down.”

[R.R.]
 “No, it couldn’t. Could n' ?”
 [R.R.]
 “Yes, it *might*. Very well, then we’ll tack it on, on the chance.”
[I tack on n' to d .]
 “Well, there’s no use going back to the left-hand Branch: it’s extinct. So we must go on with *this* one. Will d help us at all?”
 [R.R.]
 “Yes! It occurs in 4, along with n' and a Retinend. So here we get *another Nullity!*”
[I draw a small circle under dn' , with 4 on the left.]
 “Now there’s only *one* Branch left to attend to. What can we do with n ?”
 [R.R.]
 “ n occurs in 1 and 6. In 1 it gives us k' , as we’ve got l' upstairs: and in 6 it gives us k , as we’ve got b upstairs. And $k'k$ is an obvious *absurdity*. So this brings the whole thing to an end.”
[I write $k'k$ under n , with 6, 1 on the left.]
 “Well, that proves $be'm$ to be a *Nullity*. But do any of them exist *separately*?”
 [R.R.]
 “Yes, each *one* exists, by itself: but we’re not told that any *two* exist together. Well, let’s make b exist, then.”
[I write, underneath the Tree, $\therefore be'm_0 \dagger b_1$; i. e. $b_1e'm_0$; i. e. All b are e or m' .]
 “So now the Tree is in full leaf!”

The Reader can now look above, and compare his Tree with the one there depicted.

The Verification of this tree shall now be given in a second soliloquy:

“Well, now to *verify* our result. Where are the Partial Conclusions to come? At the first Branching, of course we must take h' first: and, at the second Branching, we must take n first. So the first Partial Conclusion must be at n : and it must be No. 9, as we’ve got eight Premisses.”

[I draw a small square on the right side of n , and in it I write 9.]

“That first Sorites consists of Nos. 1 and 6. Then, for the second Sorites, we must take the *two*-Letter Branch—the dn' -Branch. So we take No. 4: then cross the bridge with 8: then take in 9: then we go upstairs, and record the result as No. 10.”

[I draw a small square against h' , and in it I write 10.]

“Then, for the final Sorites, we must begin with 2: then cross the bridge with 5: then take in 10; then we go upstairs, and take 3 and 7: and that *ought* to prove $be'm_0$.”

The Reader should now write out these three Soriteses, in full according to the following summary, and do all the necessary underscoring, and thus satisfy himself that they really *do* prove the Conclusion.

1, 6 \mathbb{P} $nl'b_0 \dots$ (9); 4, 8, 9 \mathbb{P} $e'h'l'b_0 \dots$ (10); 2, 5, 10, 3, 7 \mathbb{P} $e'bm_0$

I will now take a still harder Problem, and solve it in the same way.

1	2	3	4	5	6	7							
$an_1b'_0$	\dagger	$wm_1l'_0$	\dagger	csn_0	\dagger	$ar_1v'_0$	\dagger	$e_1c'l'_0$	\dagger	$mh_1t'_0$	\dagger	$k_1n'_0$	
8	9	10	11	12	13	14							
\dagger	$dr_1a'e'_0$	\dagger	$rl_1w'_0$	\dagger	$el'_1n'_0$	\dagger	$a's'_0$	\dagger	$db_1m'_0$	\dagger	$v_1e'k'_0$	\dagger	$bw'_1h'_0$

a	b	c	d	e	h	k	l
1, 4	12, 14	3	8, 12	5, 10	6	7	
8, 11	1	5		8, 13	14	13	2, 5, 10

m	n	r	s	t	v	w
2, 6	1, 3	4, 8, 9	3	9	13	2
12	7, 10		11	6	4	9, 14

There are fourteen Premisses, twelve Eliminands, and three Retinends.

The Reader should now take a large sheet of paper, and copy the above fourteen Premisses at the top: then put the book aside, and make and verify his own Register: then compare it with mine: then copy the words, “There are fourteen &c.”: and *then* he will be able to understand the following soliloquy:

“Fourteen Premisses, and only *twelve* Eliminands? There *may* be a superfluous Premiss. And *three* Retinends.”

[I write $dl'r$ underneath the words “There are &c.,” in the middle.]

“Now for d . No. 8? It occurs there, along with *another* Retinend, l ; but, even with that help, it has to divide. Let’s try the other Premisses containing Retinends. They are Nos. 12, 2, 5, 10, 4, 8, and 9. No, it’s no use! They all divide! So let’s go back to No. 8.”

[I make a Branching under d , with 8 under the middle of the horizontal, and a and e under the ends.]

“Now, we may tack on a' to e , or e' to a , whichever we like. Will either of them do any good? Well, a' might be used further down—and so might e' . Then it doesn’t matter *which* we take. Let’s move *from left to right*—moving the other way would seem like writing *backwards!*”

[I tack on a' to e .]

“Now, what does a give us? It occurs in 1 and 4. In 1, it divides. But, in 4, it gives us v , as we’ve got r upstairs.”

[I write v under a , with 4 on the left.]

“Now for the right-hand Branch. Is e of any use? It’s in 5, and 10. In 5, it gives us c , in 10, it gives us n .”

[I write cn under ea' , with 10, 5, on the left.]

“And will its partner, a' , help us? It occurs in 8 and 11; but of course 8 is no good, as we’ve used it in the Branching. However, 11 gives us another Letter s : so we’ve actually landed *three* fish in one haul *this* time!”

[I place s on the right of cn , with 11 away on the left.]

“Now we go back to v . Well, *that* only occurs in 13: so it’s got to divide, I’m afraid!”

[I make a Branching under v with 13 under the middle of it, and e and k under the ends.]

“Now, is it worthwhile tacking on an e' or a k' ? I see e' occurs in 8; but we couldn’t use 8, down *this* Branch, as it would want a' , and we’ve got an a upstairs: so *that’s* no good. Where does k' occur? Nowhere else, besides 13, I see. Then there’s no use tacking on *either*. So we’ll let them alone. Now we go back to our grand haul, cns . Where does c occur? No. 3? Why, that actually slays all three at once!”

[I draw a circle under cns , with 3, as its authority, on the left.]

“Now we return to e . Let’s see: we’ve had e somewhere before. Oh, there it is, in the right-hand Branch! So this e can *perhaps* make use of the annulment of the earlier one, *provided that* the other e didn’t need its partner, a' , to help to annul it, since *this* e has got a as a partner. *Did* it need it? What Premisses does a' occur in? Nos. 8 and 11. And was either of them used in the annulment? Yes, we used 11. Then I’m afraid this new e ca’n’t get any help from the old one. It must manage its own annulment. What can we do with it? It occurs in 5 and 10. In 5, it gives us c : in 10, it gives us n .”

[I write cn under e with 10, 5, on the left.]

“But we ca’n’t tack on an s , *this* time, as we haven’t got an a' to help us! Let’s go to the k -Branch. What will k do? It occurs in 7 only: and *that* gives us n .”

[I write n under k , with 7 on the left.]

“Now back to the left-hand again. What will c do? It occurs in 3—along with n luckily: so that gives us s' .”

[I write s' under c , with 3 on the left.]

“And will c ’s partner, n , do anything for us? Yes in 1, it gives us b , as we’ve got an a upstairs.”

[I write b after s' , with 1, away to the left of the 3.]

“Now back to the k -Branch. What can we do with n ? Why, we’ve got another n , on the same level, in the e -Branch! So this one had better *wait* on the chance of being able to avail itself of the annulment of the other.”

[I place a dot under n , to indicate that it is “waiting.”]

“Now to the left again. What can we do with $s'b$? Well, s' only occurs in 11, and *that* needs an a' : so s' gives us no assistance. Will b do any good? It occurs in 12 and 14. In 12, it gives us m : in 14, it divides.”

[I write m under $s'b$, with 12, on the left.]

“Any other Branch to go to? No, the other one is waiting: we must stick to this one till it’s finished. What can we do with m ? Well, it occurs in 2 and 6. In 2, it gives us w' : in 6, it divides.”

[I write w' under m , with 2 on the left.]

“Now for w' . It occurs in 9 and 14. In 9, it gives us t' : in 14, it gives us h .”

[I write $t'h$ under w' , with 14, 9, on the left.]

“Now, what will t' do? It occurs in 6 only: but *there* it comes along with h , and we’ve got m upstairs: so *that* annuls this Branch.”

[I draw a circle under *t'h*, with 6, on the left.]

“Now, we’ve got an *n* in the other Branch, patiently waiting to learn the fate of its namesake on *this* Branch. So, now that *this n* has got itself annulled, the question is whether the waiting *n* can use the *same* annulment, in which case we need only *refer* to it, without taking the trouble to write it out again. Now this new *n* has the same ancestors as the old *n*, with the exception of its brother *c*, and its father *e*. So, if the left-hand *n* managed to get *annulled* without using either of these two kinsmen, then its annulment will serve for the right-hand one: if not I’m afraid the new *n* must devise an annulment of its own. Now, *was c* or *e* used in that annulment?”

[R.R.]

“Yes! *c* was used in the very next row! it gave us *s'n*. So *this n* will have to devise an annulment for itself—no, stay! That *s'* was of no further use! So, after all, *c* was *not* used in the annulment. Well, then, *was e* used?”

[R.R.]

“No, *e* only occurs in 5 and 10; and neither of those was used in the annulment. So, after all this new *n* can use the old annulment.”

[I draw a little square against the *cn* in the *e*-Branchy and another little square under the *n* in the *k*-Branch, just where I placed the dot.]

“So now the Tree is complete, and we’ve proved the Nullity $dl'r_0$. Now, are any of these Letters given as *existent*? Let’s see.”

[I examine the Premisses containing them.]

“Yes, *dr* exist, *together*, in No. 8.”

[I write, under the Tree, $\therefore dl'r_0 \dagger dr_1$; *i. e.* $dr_1l'_0$; *i. e.* All *dr* are *l*.]

Here ends my soliloquy. But we had better *verify* our result, by translating our Tree into Sorites-form. This shall be done in a supplementary soliloquy.

“Well, now to *verify* this Tree. And first, what *reference-number* must be put under the *n* that we kept waiting so long? To answer this question, we must first settle in what *order* we’re going to take the Soriteses that are to prove our Partial Conclusions. Let’s see. At the first Branching, of course it’s the *a*-Branch that must be proved first, as it’s a *single*-Letter one, and the other

is a *double*-Letter one. At the second branching, *both* are single-Letters: but of course we must take the *e*-Branch first, as it's the only one we can *prove*, to begin with, since it ends in a *circle*. So the first Sorites must run up as far as *cn*, and then record its result, for the benefit of the waiting *n*: that Sorites will consist of Nos. 6, 9, 14, 2, 12, 3, and 1. But wait a moment! *Will* it contain No. 3? No, of course it wo'n't! No. 3 only served to give us *s'*, and *s'* turned out to be useless! Then the first Sorites will simply be 6, 9, 14, 2, 12, and 1. And we must call its result No. 15, as there are fourteen Premisses."

[I write 15 in the little square against *cn*, in the *e*-Branch, and another 15 in the little square under *n*, in the *k*-Branch.]

"Then the *second* Sorites had better take in the whole of the *e*-Branch, and record its result at the top. So *it* will be a *very* short one—merely containing 15 and 10: of course missing 5, as *that* was only wanted for the useless *c*."

[I draw a little square against *e*, and in it I write 16.]

"Then the third Sorites will have to work its way up the *k*-Branch. That is, it must begin with 15: then take 7: then cross the bridge, by means of 13: then take in 16: then go upstairs and take 4: and then we shall have to record its result."

[I draw a little square against the *a*, at the top of the great left-hand Branch, and in it I write 17.]

"And the *final* Sorites must of course run up the *ea'*-Branch. So it will begin with 3, 5, 10, 11: then cross the 8 bridge: then take in 17: and *that* ought to finish the thing, as there's no stem above that first Branching. So the four Soriteses will run as follows:

6, 9, 14, 2, 12, 1 P 15; 15, 10 P 16; 15, 7, 13, 16, 4 P 17; 3, 5, 10, 11, 8, 17 P *dl'r*₀."

The Reader should now write out these Soriteses, *in full*, and do all the necessary underscoring, and satisfy himself that they do really prove the desired Conclusion.

I will now go through a really long and hard Problem of this kind, soliloquy fashion, and I think that the Reader, if he has the patience to work it through, taking my soliloquy as his guide, will then find himself fully competent to solve any *ordinary* Sorites-Problem: those, that have *special* features, will be considered in subsequent chapters.

The twenty-four Premisses of this Problem are as follows:

1	2	3	4	5
$Cl_1E'_0$	$\dagger Av'_1D_0$	$\dagger k_1m'_0$	$\dagger lC'_1(b'n')'_0$	$\dagger dsb_1t'_0$
6	7	8	9	10
$tD_1w'_0$	$\dagger dr'a'_1A'_0$	$\dagger vw_1B_0$	$\dagger em'_1(r'b')'_0$	$\dagger Ha_1c'_0$
11	12	13	14	15
$dtmav'_0$	$\dagger dst_1A'_0$	$\dagger Dn'r'b'_1z_0$	$\dagger cE'z_0$	$\dagger bs'_1l'e'_0$
16	17	18	19	20
$atE_1v'_0$	$\dagger rDh'_1e'_0$	$\dagger mt'_1D_0$	$\dagger Anl'_1c'_0$	$\dagger rdk'_1h_0$
21	22	23	24	
ztB'_1d_0	$\dagger nl'_1H'_0$	$\dagger Et'_1z_0$	$\dagger dzrA'_1a'_0$	

Before making the Register, it may be well to point out that No. 4 means "All *lC'* are *b'n*"; i. e. "All *lC'* are *b'*, and all *lC'* are *n'*." Hence this Premiss really contains *two* distinct Propositions, which we might, if we chose, symbolise as $lC'_1b_0 \dagger lC'_1n_0$ (so that *b* and *n* must be reckoned as appearing in the *positive*

form in this Premiss). If I have to use the *whole* Premiss at once, I shall refer to it as 4, simply; but, if I have to use either part *by itself*, I shall refer to it as 4*, or as 4**. Similar remarks will apply to No. 9. Hence the *actual* number of Premisses is twenty-six.

I recommend the Reader to copy these Premisses at the top of a large sheet of paper, and then to make the Register for himself, without looking at mine; then to verify it, by the method he has already learned (see p. 1187); and lastly to compare it with the Register here given.

$\left \begin{array}{l} 2, 19 \\ 7, 12, 24 \end{array} \right $	$\left \begin{array}{l} 8 \\ 21 \end{array} \right $	$\left \begin{array}{l} 1 \\ 4 \end{array} \right $	$\left \begin{array}{l} 2, 6, 13, 17, 18 \end{array} \right $	$\left \begin{array}{l} 16, 23 \\ 1, 14 \end{array} \right $	$\left \begin{array}{l} 10 \\ 22 \end{array} \right $	

My soliloquy is as follows:

“Twenty-six Premisses, nineteen Eliminands, and three Retinends, *d*, *z*, and *D*. So there are *six* extra Premisses. Looks as if there *might* be some superfluous ones: and perhaps a *Retinend* might be spared: let’s try.”

[*I ascertain, taking each Retinend in turn, what Premisses would be lost by its omission: but I find they go faster than the Eliminands, and so give up the quest.*]

“No: there seems no chance of getting rid of a Retinend. So now for our Tree.”

[*I write dzD at top of available space in middle.*]

“Now what can we do with *d*? It occurs in 5, 7, 11, 12, 20, 21, 24. Alas, they *all* divide! And so do the *z*’s: and so do the great *D*’s. Well, there’s no help for it: we must divide at the very first start! Let’s get a *biliteral* division, if we *can*. No. 21 is the first I can find, as it contains *two* Retinends: so it merely divides for *t* and *B*’.”

[*I make a wide Branching under d: under the middle of the horizontal line I write 21, and under the two ends I write t' and B.*]

“Now, is there any use tacking on *t* or *B*’? Let’s see. Yes, *t* *can* be of further use, but *B*’ of none.”

[*I tack on t to B.*]

“Now, for the *t*’-Branch. 5 divides, but 18 doesn’t: it gives us *m*’. And 23 gives us *E*’. That’s a good beginning.”

[*I write m'E' under t', with 23, 18 on the left.*]

“Now for the *Bt*-Branch. *B* only occurs in 8; and *that* divides. However, *t* helps us in 6, and gives us *w*: in all the other Premisses it divides.”

[*I write w under Bt, with 6 on the left.*]

“Now we go back to the t' -Branch. What will m' and E' do for us? m' occurs in 3, and that gives us k' . In 9 it divides, even if we take 9 piecemeal. E' divides in 1, but in 14 it gives us c' . That'll do capitally.”

[I write $k'c'$ under $m'E'$, with 14, 3 on the left.]

“Now for the Bt -Branch again. What will w do? It occurs in 8, and gives us v' .”

[I write v' under w , with 8 on the left.]

“Now we go back to the t' -Branch again. What can we do with k' and c' ? k' only occurs in 20, and *that* divides, c' occurs in 10 and 19, but they both divide. Then we will take k' : *that* will give us h' and r' for our Branches.”

[I make a Branching under $k'c'$: under the middle of it I write 20, and under the ends I write h' and r' .]

“Now would either h or r be of any further use? h wo'n't, but r occurs in *three* other Premisses.”

[I tack on r to h' .]

“Now back to the Bt -Branch. What will v' do? It occurs in 2, 11, and 16. In 2 it gives us A' . In 11 and 16 it divides.”

[I write A' under v' , with 2 on the left.]

“Now back to that last Branching. What will $h'r$ do? h' occurs in 17; and that gives us e at once, as we've got *three* of the four letters already. And r occurs in 9 (which we must break up, and take $em'r_0$ by itself), and that gives us e' . No use troubling about 24: we've got our Nullity already.”

[I write ee' under $h'r$, with 9*, 17 on the left. And under ee' I draw a little circle.]

“Come, there's *one* Branch annulled already! The r' -Branch is the only one we have to go on with, at present. Let's see what r' does for us. It occurs in 7 and 13, and *both* divide. Let's take 7.”

[I make a Branching under r' : under the middle I write 7, and under the ends I write a and A .]

“Now, would a' or A' be of further use? Well, a' occurs in 24; but *there* it wants A' as a partner, which of course it can't have: so *it's* no use. Great A' occurs in 12 and 24; but in 12 it wants t , which it can't have; and 24 we *know* to be useless. So there's no tacking on to be done, *this* time! Now we go back to A' . In 7 it divides: in 12 it gives us s' : in 24 it divides.”

[I write s' under A' , with 12 on the left.]

“Now back to the left again. What will a do for us? In 10 it gives us H' , as we've got c' upstairs. We can't use 11, as it wants t , and we've got t' upstairs: and 16 wants E , and we've got E' upstairs: so 10's the only one.”

[I write H' under a , with 10 on the left.]

“Now for the A -Branch. A gives us v in 2: in 19 it divides: a' occurs only in 24 (besides 7, which made the Branching) and there it wants A' : so we can't use it.”

[I write v under A , with 2 on the left.]

“Now away to the right again. What will s' do?”

[R.R.]

“It occurs *only* in 15, and there, alas, it divides into *three* Branches! That's a very cumbrous process, and a thing to be avoided as long as possible. So let's draw a double-line under s' , to show that we've rejected its guidance for the present, and ‘hark back’ for something that will divide into *two* Branches.”

[I draw a double-line under s' .]

“Now, will A' serve our purpose? Yes, that'll do very well: in 7 it divides into a and r . And we must remember, in case we succeed in annulling this Branch, to examine whether we've used this s' anywhere below; for, if not, No. 12 will be a superfluous Premiss—unless it happens to be used in the left-hand Branch.”

[I write A' under the double-line: and under A' I make a Branching, with 7 under the middle of it, and a and r under the ends.]

“Now, would a' , or r' , be of any further use? Yes, a' could be used in 24: that will do.”

[I tack on a' to r .]

“And r' could be used in 13. Which will be best? I see that a has appeared before. Now we go back to the left. What will H' do? It occurs *only* in 22; and *there* it divides. This is a *very* branchy Tree!”

[I make a Branching under H' with 22 under the middle of it, and l and n' under the ends.]

“Now, will l' or n be of further use? Yes, *each* of them might. l' occurs in 15 and 19; and neither of those demand impossible partners. And n occurs in 4 and 19. In 4 we could use it, as it wants l for a partner; but not in 19, as *there* it demands l' . Well, it's arbitrary *which* we tack on: let's keep l as the *single* Letter.”

[I tack on l' to n .]

“Now for the other Branch. What can we do with v ? Well, it occurs *only* in 8. So we've no choice.”

[I make a Branching under v , with 8 under the middle of it, and w' and B' under the ends.]

“Would w or B be of further use? No, *neither* of them. So we go away to the right again, and try our luck with the *Bt*-Branch. What can we do with a ? It occurs in 10, 11, and 16. In 10, it divides: but in 11 it gives us m' : and in 16 it gives us E' .”

[I write $m'E'$ under a , with 16, 11 on the left.]

“Now for ra' . What will r do? In 9 it divides: in 17, ditto: in 20, ditto: but in 24 it gives us a Nullity!”

[I draw a small circle under ra' , with 24 on the left.]

“Now we go back to the extreme left-hand again, and take the first Branch we find, that's still growing. What will l do for us? In 1, it gives us C' . No. 4 we ca'n't use, *yet*; though we shall be able to, *next* time we come this way.”

[I write C' under l , with 1 on the left.]

“Now for $n'l'$. n' occurs in 13, which *looks* alarming, it's so full of Letters: however, we've got all but *one*, upstairs! So that gives us b : l' occurs in 15; but *that* would divide. It also occurs in 19; but *there* it wants n for a partner. Well, we've got *one* Letter, anyhow!”

[I write b under $n'l'$, with 13 on the left.]

“Now for w' . Well, w' occurs *only* in 6: and *there* it wants t for a partner, and ca'n't have it! So *this* Branch wo'n't grow any further. Will the B' -Branch be more vigorous? No, not a bit of it! It only occurs in 21, and there it demands t for a partner! So *both* these Branches come to a deadlock. Well, there's nothing for it but to draw a double-line under each, and 'hark back' for some ancestor that will give us a Branching (for of course it ca'n't give us any *single* Letter) that we've not yet used.”

[I draw a double-line under w' , and another under B' .]

“Now, to hark back. Will *v* do? No. Will *A*? Yes, it will: we’ve not used 19 yet. So of course No. 2 would be a superfluous Premiss, were it not that it happens to be used in the *other* Branch.”

[In the open space under the two double lines I repeat A, and under it I make afresh Branching, with 19 under the middle of it, and l and n' under the two ends.]

“But stay! We’ve had *both* these Letters before! There they are, away on the left, supplied by No. 22, and calling *H'* their father! Well, these are *very* affectionate children: they don’t seem to mind *who* is to be called their father, so long as *somebody* will own them! Well, *one* of the two sets must wait, anyhow, and see what happens to the other set. Which shall it be? This new set? Well, it could only utilise the experiences of the *other* *l* and *n'*, *provided* that they don’t use, in their annulment, either *a* or *H'*, for those do *not* occur in the ancestral line of this new set. This we must look into. I see that *a* occurs in 10, 11, and 16. It ca’n’t use 10 again, as it used *that* before we got down to *l* and *n'*. No. 11 it ca’n’t use, because that wants *t*: and No. 16 it ca’n’t use, because it wants *E*. Well, *a* is safe, then. And *H'* occurs *only* in 22, which it uses in branching. So this new set of *l* and *n'* *may* wait.”

[I place dots under them.]

“Now we go back to the *Bt*-Branch. What will *m'* do for us? It occurs in 3 and 9. In 3 it gives us *k'*: in 9 it divides. And what will *E'* do? In 1 it divides: but in 14 it gives us *c'*.”

[I write k'c' under m'E', with 14, 3 on the left.]

“Now we return to the extreme left. What will *C'* do? *C'* occurs only in 4; but that’s very helpful, as it gives us *two* fresh Letters at once, *b'* and *n'*.”

[I write b'n' under C', with 4 on the left.]

“Now for *b*. Well, *b* occurs in no less than *four* Premisses. It ca’n’t use 4, as *that* would want *l* as a partner: but it *can* use 5; and that gives us *s'*. Also it *can* use 9 (or rather the second *bit* of 9); and *that* gives us *e'*. No. 15 it ca’n’t use *yet*.”

*[I write s'e' under b, with 9**, 5 on the left.]*

“Now we return to the *Bt*-Branch. What can we do with *k'*? It only occurs in 20, and *that* divides. Is *c'* of any use? Yes, in 10 it gives us *H'*: 19 it ca’n’t use.”

[I write H' under k'c', with 10 on the left.]

“Now we return to the extreme left. What can we do with *b'n'*? Well, *b'* occurs in 13, along with *n'*, and also with *D*, *r'*, and *z*, *all* of which we’ve got upstairs! So here’s *another* Nullity!”

[I draw a small circle under b'n', with 13 on the left.]

“Now for *s'e'*. Well, *s'* occurs in 15, which gives us *another* Nullity!”

[I draw a small circle under s'e', with 15 on the left.]

“Come! That finishes up *all* the branches on this side, except the two that are waiting, *l* and *n'*; and those we *know* are all right: we’ve discussed *that* matter already.”

[I draw two little squares, to hold reference-numbers, on the right-hand sides of the l and n'l which stand at the tops of the two branches just annulled: and under the new l and n' I draw two similar little squares, which will contain the same two reference-numbers.]

“Now there’s nothing left but the *Bt*-Branch. What can we do with *H'*? Can we utilise, for its benefit, the *H'* that has already appeared, higher up, in the left-hand Branch? I must examine the Branches dependent from the earlier

H' , and refer to the List of Premisses, to see whether all these, used in its annulment, can lawfully be used *here*.”

[*I do so.*]

“No, I find that the earlier uses 13 in *both* the Branches dependent from it: and that requires r' : and *that* we haven't got *here*. So *this* H' must get annulled in some other way. What can we do with it? Well, we must divide *here*.”

[*I make a Branching under H' , with 22 under the middle of it, and l and n' under the ends.*]

“Now, would l' or n be of any further use? Yes, l' would.”

[*I tack on l' to n .*]

“Now what will l do? In 1 it gives us C' : 4 it ca'n't use *yet*.”

[*I write C' under l , with 1 on the left.*]

“Now for $n'l'$. What will n' do? It only occurs in 13, and there it divides. Let's try l' . In 15 it divides: 19 it can't use—nor 22. Well, then, we *must* divide. Let's do it with 13.”

[*I make a Branching under $n'l'$, with 13 under the middle of it, and b and r under the ends.*]

“Now, would b' or r' be of any further use? No, neither of them: so there's no tacking on to be done. Now for C' . In 4 it gives us two Letters at once, b' and n' .”

[*I write $b'n'$ under C' , with 4 on the left.*]

“Now for that Branching. What will b do? It ca'n't use 4—nor 5, since we've got s' upstairs: in 9 it gives us e' : and in 15 it gives us e . So we've finished *that* Branch.”

[*I write $e'e$ under b , with 15, 9 on the left, and a small circle underneath.*]

“Now for r . In 9 it gives us e' : 17 it ca'n't use yet: in 20 it gives us h' : 24 it ca'n't use.”

[*I write $e'h'$ under r , with 20, 9 on the left.*]

“Now back to the l -Branch. Our last entry was $b'n'$. What will b' do? In 13 it gives us r : that's all it will do.”

[*I write r under $b'n'$, with 13 on the left.*]

“Now back to the extreme right. What will e' do? In 15 it gives b' ; but in 17 it gives us a *Nullity!* So we needn't trouble about 15.”

[*I draw a small circle under $e'h'$, with 17 on the left.*]

“Now there's nothing left but the l -Branch. Our last entry was r : and, as we've just annulled an r on the extreme right, we may as well utilise it, if possible. Let's see if this new r can lawfully use 9, 20, and 17.”

[*I examine them.*]

“Yes, it *can*.”

[*I draw a small square against the r at the top of the right-hand Branch, and another one, to hold the same reference-number, under the new r .*]

“So now the Tree is finished! And we've proved dzD to be a *Nullity*. Let's see if any of them exist *separately*.”

[*I examine the List of Premisses.*]

“Yes, dz exists in 24. So now for our Conclusion.”

[*I write, in the space below the Tree, $\therefore dzD_0 \dagger dz_1$; i. e. dz_1D_0 ; i. e. All dz are D' .*]

“Now, was No. 12 superfluous, after all?”

[*I examine the Tree.*]

“No, it wasn't: we had to use that s' in order to bring in No. 15. So, 'now

Quoted from *Comus*
by John Milton

my task is fairly done, I can fly or I can run'—only, I *ca'n't* fly, and, on the whole, I prefer *not* to run!"

Here ends my long (and, I fear, tedious) soliloquy. But does not my exhausted Reader, who has patiently obeyed all its instructions, feel a certain glow of pride at having constructed so splendid a Tree—such a veritable Monarch of the Forest?

We have now completed the *Solution* of this Problem. But it is always desirable to *verify* every such Tree, by translating it into Sorites-form: this will require a supplementary soliloquy, with stage-directions as before.

"Now let's *verify* this Tree. At Branching 21 I take the t' -Branch first: and in it, at Branching 20, I take r' first. Under r' , at Branching 7, a and A are *both* single Letters. Well, let's take a first. Under a , of course I take l first: and, as that ends with a circle, we can begin with that Branch, which must be numbered 25, as there are 24 Premisses."

[I write 25 in the little square placed against l , in the South-West corner, and another 25 in the little square placed under the l which belongs to Branching 19.]

"Now, which Partial Conclusion shall we take for 26? Best take the other part of Branching 22."

[I write 26 in the little square placed against $n'l'$, under Branching 22, in the South-West corner, and another 26 in the little square placed under the n' belonging to Branching 19.]

"Then of course we go up this Branch for 27. The Sorites will begin with 26: then cross by bridge 22: then take in 25: then upstairs, and take in 10—and there you are!"

[I draw a little square against the a under Branching 7, which depends from r' : and in it I write 27.]

"Then, for 28, of course we must work up to r' , just above. The Sorites will be—we must take the A -Branch first, as it isn't yet worked up to the top—the Sorites will be 26 (we *must* take the n' -Branch *first*, as it refers to the *biliteral* Branch $n'l'$): then cross by 19: then take in 25: then, upstairs and take in 2. Now we've got to A . Then cross by the 7-bridge: then take in 27: that finishes it."

[I draw a little square against the r' , that stands over Branching 7, and in it I write 28.]

"Then, 29 must come at the top of the t' -Branch. The sorites must begin with the circle at the foot of the $h'r$ -Branch. So it will be 17, 9*: then the 20-bridge: then take in 28: then upstairs, and take 3, 14, 18, and 23. That gives us 29."

[I draw a little square against the t' , at the top of the left-hand Branch, and in it I write 29.]

"Now for the great Bt -Branch. At Branching 7 of course we take a : and, under it, at Branching 22, we take l : and that ends in a circle: so let's begin there. But we mustn't do it all at once: a Partial Conclusion must be recorded at r , for the benefit of the r -Branch just to the right, so the Sorites will be 17, 9*, and 20."

[I write 30 in the little square placed against r , and another 30 in the little square placed below the r -Branch on the right.]

"Then we had better have 31 at the top of this same Branch: and the Sorites will be 30, 13, 4, and 1."

[I draw a little square against the l at the top of this Branch, and in it I write 31.]

“Well, now for the $n'l'$ -Branch. It doesn't matter *which* we take first, b or r : both are *single* Letters: but b wants working up: so of course we begin *there*. Our Sorites will be 9^{**} , 15: then bridge 13: then take in 30: that brings us up to $n'l'$: then bridge 22: then take in 31: then upstairs, taking 10, 3, 14, 11, 16: then we must record, as a is the *single*-Letter Branch.”

[I draw a little square against the a , and in it I write 32.]

“Now, there's only *one* more Sorites wanted: so there'll be no more recording to do. Our final Sorites must begin with 24, to take in the ra' -Branch: then cross by the bridge 7: then take in 32: then—do we go up to A' at once? Or do we take in s' ? Oh, I remember! We are *not* to miss s' : it's used down below. Well, then, the Sorites goes on with 12, 2, 8, 6: then bridge 21: then take in 29: and that *ought* to give us our final Nullity dzD_0 !”

[I write out these nine Soriteses, and do all the underscoring, and at last reach the desired Conclusion, when I smile a satisfied smile, and lay down my pen with a sigh of relief.]

...¹

Book XXI. Logical Puzzles

Chapter I. Introductory

Under this general heading I shall discuss various arguments, which are variously described by Logical writers. Some have been classified as ‘**Sophisms**’, that is, according to etymology, “cunning arguments”, whose characteristic Attribute seems to be that they are intended to *confuse*: others as ‘**Paradoxes**’, that is, according to etymology, “things contrary to expectation”, whose characteristic Attribute seems to be that they seem to prove what we know to be false: but all may be described by the general name “Puzzles.”

Chapter II. Classical Puzzles

§ 1. **Introductory** I shall here enunciate five certain well-known Puzzles, which have come down to us from ancient times, and which the Reader will no doubt like to know by their classical titles.

§ 2. **Pseudomenos** This may also be described as “*Mentiens*”, or “*The Liar*”. In its simplest form it runs thus:—

“If a man says ‘I am telling a lie’, and speaks truly, he *is* telling a lie, and therefore speaks falsely: but, if he speaks falsely, he is *not* telling a lie, and therefore speaks truly.”

§ 3. **Crocodilus** That is, “*The Crocodile*”. This tragical story runs as follows:—

“A Crocodile had stolen a Baby off the banks of the Nile. The Mother implored him to restore her darling. “Well”, said the Crocodile, ‘if you say truly what I shall do, I will restore it: if not, I will devour it.’ “You will devour it!” cried the distracted Mother. “Now”, said the wily Crocodile, “I *cannot* restore your Baby: for, if I do, I shall make you speak *falsely*: and I warned you that,

¹Remark: The tree for this problem is not reproduced here, it looks as described in the text.

if you spoke *falsely*, I would *devour* it.” “On the contrary”, said the yet wiler Mother, “you cannot *devour* my Baby: for, if you do, you will make me speak *truly*, and you promised me that, if I spoke *truly*, you would *restore* it!” (We assume, of course, that he was a Crocodile of his word; and that his sense of honour outweighed his love of Babies.)

§ 4. Antistrephon That is “The Retort”. This is a tale of the law-courts.

“Protagoras had agreed to train Euathius for the profession of a barrister, on the condition that half his fee should be paid at once, and that the other half should be paid, or not paid, according as Euathius should win, or lose, his first case in Court. After a time, Protagoras, becoming impatient, brought an action against his pupil, to recover the second half of his fee. It seems that Euathius decided to plead his own cause. “Now, if I *win* this action”, said Protagoras, “you will have to pay the money by the decision of the Court: if I *lose* it, you will have to pay by our agreement. Therefore, in any case, you must pay it.” “On the contrary”, retorted Euathius, “if you *win* this action, I shall be released from payment by our agreement: if you *lose* it, I shall be released by the decision of the Court. Therefore, in any case, I need not pay the money.”

§ 5. Achilles This may be described, more fully, as “*Achilles and the Tortoise*”. The legend runs as follows:—

Achilles and the Tortoise were to run a race on a circular course; and, as it was known that Achilles could run ten times as fast as the Tortoise, the latter was allowed 100 yards’ start. There was no winning-post, but the race was to go on until Achilles either overtook the Tortoise or resigned the contest. Now it is evident that, by the time Achilles had run the 100 yards, the Tortoise would have got 10 yards further; and so on for ever. Hence, in order to overtake the Tortoise, he must pass over an *infinite* number of successive distances. Hence, Achilles can never overtake the Tortoise.

§ 6. Raw Meat

The meat that I eat at dinner is meat that I buy in the market;
The meat that I buy in the market is raw meat.
Therefore, the meat that I eat at dinner is raw meat.

Chapter III. Other Puzzles

§ 1. About Less

He, who says that 5 is less than 10, speaks truly;
He, who says that 5 is less than 10 and more than 6, says that 5 is less than 10.
Therefore, he who says that 5 is less than 10 and more than 6, speaks truly.

§ 2. Men Tall and Numerous

Men over 5 feet high are numerous;
Men over 10 feet high are not numerous.
Therefore, men over 10 feet high are not over 5 feet high.

§ 3. **The Socialist Orator and the Irish Mob** “Isn’t one man as good as another?” demanded a Socialist orator, addressing an Irish mob. “Av *coorse* he is”, was the eager response, “*and a great deal betther!*”

§ 4. **Death at Any Moment** “You *may* die at any moment, and probably *will*.” (See *The Mystery of Ms. E. Drood*, by Orpheus C. Kerr, p. 136/217.)

The *first* part of this statement seems reasonable enough: the *second* is obviously absurd. Yet how can it be absurd to assert that you *will* do what it is quite reasonable to assert that you *may* do?

§ 5. **The Small Girl and Her Sympathetic Friend** *Small Girl*: I’m so glad I don’t like asparagus!

Sympathetic Friend: Why, my dear?

Small Girl: Because, if I did, I should have to eat it—and I ca’n’t bear it!

Examine the reasoning process, if any, which has taken place in the mind of the Small Girl.

A Notice at the Seaside The blue ensign denotes that all boats, licensed to carry from two to four persons, are prohibited from putting off, and no other boat must put to sea without a licensed boatman.

The red ensign denotes that only large rowing-boats carrying from five to seven persons, and sailing boats, can put to sea with boatmen.

[N.B. The above Notice is exhibited at a certain seaside-place not 100 miles from the Needles.]

What boats, if any, *can* put to sea when one of these two ensigns is hoisted, but *cannot* when the other is *hoisted*?

Chapter IV. Solutions of Classical Puzzles

§ 1. **Introductory** The following Solutions have *not* come down to us from ancient times, but are merely modern speculations, which the Reader can take or reject “at his own sweet will.”

§ 2. **Pseudomenos** This Puzzle might be described as a “Paradox”, since it seems to prove that the man in question is speaking both truly and falsely at the same moment.

The best way out of the difficulty seems to be to raise the question whether the Proposition “I am telling a lie” can reasonably be supposed to refer to *itself* as its own subject-matter: to which the answer seems to be that it can *not*, since its doing so would lead to an absurdity.

Symbolically, it may be solved as follows:

Let Univ. be “Cosmophases”; a = the man speaks truly; b = the Proposition, stated by the man, can be its own subject-matter.

Then we have $a \text{ P } a'b$, and $a'b \text{ P } a$; i. e. $aba_0 \dagger a'ba'_0$; i. e. $ab_0 \dagger a'b_0$, which together prove b_0 : i. e. the Proposition can *not* be its own subject-matter.

Let us now consider what result would have followed if the man’s statement had been “I am telling the truth” instead of “I am telling a lie.”

Here, if we assume that the Proposition can be its own subject-matter, it evidently follows that, if he speaks truly, he *is* telling the thruth, and that, if he

Quoted from
Composed upon
Westminster Bridge
by William
Wordsworth

speaks falsely, he is *not* telling the truth. In either case, the supposition does *not* lead to any absurdity.

Symbolically, it would run as follows, using the same Dictionary as before: $ab \mathbb{P} a$, and $a'b \mathbb{P} a'$; i. e. $aba'_0 \dagger a'ba_0$; each of which Nullities is a truism, and proves nothing as to the existence, or non-existence, of b . Hence there is nothing in the *Data* to prevent the Proposition from being its own subject-matter, and nothing to tell us whether the man is speaking truly or falsely.

In short, such Data lends to no result at all, and it is not worth while to discuss them.

This Puzzle is sometimes given in a more complex form, viz.

Epimenides the Cretan asserted that Cretans were *always* liars. If he spoke truly, they *were* always liars, and therefore he, being a Cretan, was lying at that moment, and therefore spoke falsely. Hence he did *not* speak truly; that is, he *must* have been lying.

Here we cannot show that, if he spoke falsely, he also spoke truly. Hence no absurdity follows from the supposition that the Proposition can be its own subject-matter; and the conclusion, however unwelcome to Epimenides, is correct.

Symbolically, it runs thus:

Let Univ. be "Cosmophases"; a = Epimenides speaks truly; b = the Proposition, stated by him, can be its own subject-matter.

Then we have $ab \mathbb{P} a'$; i. e. aba_0 ; i. e. ab_0 ; i. e. $b \mathbb{P} a'$; i. e. On the supposition that the Proposition, stated by Epimenides, *could* be its own subject-matter, he was certainly lying.

If the statement made by Epimenides had been "The Cretans always speak the truth," there would have been nothing in the *Data* to prevent the Proposition from being its own subject-matter, and nothing to tell us whether Epimenides was speaking truly or falsely.

§ 3. Crocodilus On this Sophism Lotze makes the discouraging remark, "There is no way out of this dilemma." I think, however, that we shall find the machinery of Symbolic Logic sufficient for its solution.

Let Univ. be "Cosmophases"; a = the Mother speaks truly; b = the Crocodile keeps his word; c = the Crocodile devours the Baby.

Then we have, as *Data*,

$$\begin{array}{cccccc} 1 & 2 & 3 & 4 & 5 & 6 \\ ab_1c_0 \dagger & ab'_1c'_0 \dagger & a'b_1c'_0 \dagger & a'b'_1c_0 \dagger & c_1a'_0 \dagger & c'_1a_0 \end{array}$$

Here we may ignore 2, 4, as being contained in 6, 5; and we see, by inspection, that b is the only Retinend.

∴ b_0 ; i. e. Whatever the Crocodile does, he *breaks* his word.

Thus, if he devours the Baby, he makes her speak truly, and so *breaks* his word; and if he restores it, he makes her speak falsely, and so *breaks* his word. His sense of honour being thus hopeless of satisfaction, we cannot doubt that he would act in accordance with his *second* ruling passion, his love of *Babies!*

[The Reader will find it an interesting exercise to work out for himself the result which would have followed if the Mother's first statement had been "You will *restore* the Baby." He will find that, in that case, whatever the Crocodile does, he *keeps his* word. Hence his sense of honour is entirely satisfied, whatever he does: so that, again, his only guide is his *second* ruling passion—and the result to the Baby would, I fear, be much the same as before.]

§ 4. Antistropheon The best way out of this Paradox must seem to be to demand an answer to the question "*Which* of the two things, the agreement and the decision of the Court, is to over-rule the other, in case they should come into collision?"

- (1) Let us suppose that the *agreement* is to be supreme. In this case, if Protagoras *wins* his action, he *loses* the money; and, if he *loses* his action, he *wins* the money.
- (2) Let us suppose the *decision of the Court* to be supreme. In this case, if Protagoras *wins* his action, he *wins* the money; and, if he *loses* his action, he *loses* the money.

The *Data* do not enable us to answer this question. Protagoras naturally makes one, or the other, supreme, as best suits his purpose: and his docile pupil follows his example.

The right decision of the Court would obviously be *against* Protagoras, seeing that the terms of the agreement were still unfulfilled. And, when that decision had been pronounced, the practical result would be that, if the *agreement* was to be supreme, Euathius would have to pay the money: if the *decision of the Court* was to be supreme, he would be released from payment.

§ 5. Achilles This is a *mathematical* Fallacy, and involves the false assumption that a series of distances, infinite as to *number*, is also infinite as to *total length*.

Here the assumption is that

$$\left(111 + \frac{1}{10} + \frac{1}{10^2} + \frac{1}{10^3} + \&c. \right)$$

of a mile, where the number of terms can be made greater than any assigned *number*, can be made greater than any assigned *length*. But the above series is the circulating decimal 111.1 which as the Reader probably knows, can never reach the limit $111\frac{1}{9}$. Hence, by the time Achilles has run $111\frac{1}{9}$ yards, he must necessarily have overtaken the Tortoise.

§ 6. Raw Meat The best way of escaping from this savage Paradox seems to be to introduce the Dated Copula. *Two* epoches have to be taken into consideration, viz.

- (a) The time (say 10 A.M.) at which I purchased the meat;
- (b) The time (say 7 P.M.) at which I dine.

At epoche (a), the *second* Premiss is true; and the piece of meat in question possesses, at that moment, the Pair of Attributes, "bought by me in the market" and "raw."

At epoche (b), the *first* Premiss becomes true, and the second ceases to be true. That is to say, the piece of meat possesses, at that moment, the Pair of Attributes, "eaten by me at dinner" and "bought by me in the market," but it has ceased to possess the Attribute "raw".

Hence, we cannot assert that the two Premisses are true *at the same moment*. Hence there is no Conclusion.

[Professor DeMorgan (in his *Formal Logic*, p. 251/336) says that this Puzzle involves the Fallacy *a dicto simpliciter ad dictum secundum quid*, which consists, he tells us, "in inferring of the subject with an accident that which was premissed of the subject only."

Mr. J. Welton (in his *Manual of Logic*, Vol. II, p. 244/292) takes the same view, and adds that "the fallacy lies in not making clear that the 'rawness' in not regarded in the second Premiss as a relevant circumstance, and then assuming it to be relevant in the Conclusion."]

Chapter V. Solutions of Other Puzzles

§ 1. About Less This (apparently valid) Syllogism belongs to the Class "Paradoxes," since it seems to prove that 5 *is* less than 10 and more than 6.

The first thing to be said about it is that its second Premiss is mere tautology, being of the form "All *xy* are *x*." Hence, if the Conclusion follows at all, it must follow as an *Immediate Inference* from the first Premiss.

But such an Inference would involve the Fallacy of *Vox Ambigua*, since the phrase "speaks truly" is capable of *two* interpretations, viz.

- (a) Says what is wholly true;
- (b) Says what contains a truth.

With (a), the first Premiss cannot be accepted as true, unless we are assured that the speaker *says no more*.

With (b), the Inference is a valid one, and the Conclusion true.

[Professor DeMorgan (in his *Formal Logic*, p. 242/336) explains this Puzzle as follows. (He treats of another example: so, in quoting him, I have had to make some verbal alterations.) "The middle term is 'He who says that 5 is *one* among all numbers less than 10.' He speaks truth; and he, who says that 5 is less than 10 and more than 6, certainly says that 5 is *one* among all numbers less than 10. The equivocation is in the two different uses of the word 'one': in the first Premiss, it is an entirely indefinite 'one'; in the second it is a less indefinite 'one.' The 'one' is not attached to the quantity of the middle term, which is universal in the first Premiss, and particular in the second; but it is part of the middle term itself."]

§ 2. Men Tall and Numerous This involves the Fallacy of *Vox Ambigua*. The phrase "men over 5 feet high" may be taken to mean, either "*every* man over 5 feet high," or "the *Class* composed of men over 5 feet high" regarded as *one single Thing*. (See Part I, Book I, Chapter II.)

With the *first* interpretation, the Premises are not true: the Attribute “numerous” cannot be applied to an individual man.

With the *second* interpretation, the Subject of each Premiss is a *single Thing*: and what the Conclusion asserts is that one of these two single Things in *not* the other. In this case, the Syllogism is valid, and the Conclusion is true.

§ 3. The Socialist Orator and the Irish Mob At first sight, this reply might be thought to *support* the position taken by the orator: but, on further examination, it is seen to *contradict* it. The Paradox, here involved, may be logically stated as follows:

The orator’s implied assertion is that, in *every* Pair of men, *each* is *not less good* than the other: from which it may easily be proved that *every* Pair of men possesses the Attribute “*equal* in merit.”

Pat’s ready reply asserts that, in *every* Pair of men, *each* is better than the other; i. e. that *every* Pair of men possesses the Attribute “*unequal* in merit.” This not only contradicts the previous assertion, but also contradicts *itself*, since it may easily be shown to involve the assertion that *each* is at once *better*, and *worse*, than the other. But *self-contradiction*, in a Proposition, is not an Attribute that would for a moment discredit it in the Emerald Isle!

§ 4. Death at Any Moment The best explanation I can find, for this bewildering Paradox, does not altogether satisfy me; and I shall be grateful to any Reader who will suggest a better. My solution is as follows:

This is a *mathematical* Paradox. The first clause of it asserts that, at any given moment during a certain period (say the next ten years), the death of Mr. E. Drood *possibly may* occur: Now, if we take n to represent the number of moments in the period, and assume that the event is equally likely at each moment, the probability of its occurrence is $1/n$ th of certainty, and therefore is *not* (what the word “probable” usually implies) *greater than one-half* of certainty. Hence the Proposition is necessarily *false*, even if we assign to n the *minimum* possible value, viz. 2. If, however, we re-word the Proposition thus, “At any given moment, during the next period of n moments, your death *possibly may* occur, and there is a probability, amounting to $1/n$ th of certainty, that it *will* occur,” we make it logically correct. But it is to be feared that it has lost, during the corrective process, all the sparkle and humour with which it came from the pen of its ingenious author!

Book XXII. Solutions of Problems Set by Other Writers

Chapter I. Problems

The books, from which the following twenty-five Problems are quoted, are as follows:

- [A] *An Investigation of the Laws of Thought*. By George Boole, LL.D. London, 1854, Demy 8vo.
- [B] *Formal Logic*. By Augustus DeMorgan. London, 1847, Demy 8vo.
- [C] *Memoir of Augustus DeMorgan*. London, 1882, Demy 8vo.

- [D] Article, by Augustus DeMorgan, published in *Notes and Queries*, 2nd Series, Vol. IX, p. 25. London, 1860.
- [E] Articles, by W. B. Grove, B.A., published in *The Educational Times*. London, 1881.
- [F] *The Principles of Science*. By W. Stanly Jevons, M.A., F.R.S. London, 1874. Demy 8vo.
- [G] *Studies and Exercises in Formal Logic*. By John Neville Keynes, M.A., Sc.D. Second Edition, London, 1887, Crown 8vo.
- [H] The same. Third Edition, London, 1894, Demy 8vo.
- [J] *Symbolic Logic*. By John Venn, Sc.D., F.R.S. Second Edition, London, 1894. Crown 8vo.
- [K] *Studies in Logic*. By Members of the John Hopkins University. Boston, 1883, Demy 12vo.

1. [F] Vol. I, p. 77

All planets are subject to gravity;
Fixed stars are not planets.

Let a = planets; b = fixed stars; c = subject to gravity. The Reader will try in vain to produce from these Premisses, by legitimate substitution, any relation between b and c .

[Nevertheless I recommend him to try!]

2. [B] p. 124. Quoted in [H] p. 432 Every A is one only of the two B or C . Every D is both B and C , except when B is C , and then it is neither.

[The Problem is to prove that no A is D .]

3. [J] p. 342 If x that is not- a is the same as b , and a that is not- x is the same as c , what is x in terms of a , b , and c ?

4. [J] p. 340 At a certain town where an examination is held, it is known that

- (1) Every candidate is either a junior who does not take Latin, or a senior who takes Composition;
- (2) Every junior candidate takes either Latin or Composition;
- (3) Every candidate, who takes Composition, also takes Latin, and is a junior.

Show that, if this be so, there can be no candidates.

5. [F] Vol. I, p. 191 For every man in the house there is a person who is aged: some of the men are not aged.

[The Problem is to prove that some persons in the house are not men.]

6. [J] p. 336. Quoted in [H] p. 433 There is a certain Class of Things, from which A picks out all the x that are z and all the y that are not- z ; and B picks out from the remainder the z which are y and the x that are not- y . It is then found that what is left exactly comprises the Class of z that are not- x . What can be determined as to the original Class?

7. [J] p. 350. Quoted in [H] p. 437, and [K] p. 53 Given $xy = a$, $yz = c$: find xz in terms of a and c .

8. [C] p. 209

- (1) For every Z there is an X which is not Y ;
 - (2) Some Y 's are Z 's.
- Required is the inference.

9. [J] p. 345 There are four girls at school, Anna, Bertha, Cora, and Dora. It has been observed that

- (1) When Anna or Bertha (or both) stopped at home, Cora stopped at home;
- (2) When Bertha went out, Anna went out;
- (3) When Cora stopped at home, Anna stopped at home.

What information is here conveyed concerning Dora?

10. [D] p. 25 A Question in Logic. A great many persons think that without any systematic study it is in their power to see at once all the relations of Propositions to one another. With some persons this is nearer the truth than with others: with some it is all but the truth; that is, as to all such relations as frequently occur. I propose a case which does not frequently occur; and I shall be curious to see whether you receive more than one answer; for I am satisfied, by private trial, that you will not receive many.

Take the following assertions:

- (1) A master of a parent is a superior;
- (2) A servant of an inferior is not a parent;
- (3) An inferior of a child is not a master.

It is to be understood that *absolute* equality between two persons is supposed impossible; so that, any two persons being named, one of them is the superior of the other. Is either of these Propositions a consequence of another? Is either a contradiction of another? Are any two of them indifferent?

[The wording of these Propositions is a little confusing. The writer's meaning may, I think, be more clearly expressed as follows:

- (1) The master of a man's father is that man's superior;
- (2) A man-servant of a man's inferior is not that man's father;
- (3) An inferior of a man's son is not that man's master.

It is evident, from the writer's own solution of this Problem, that he does not regard these Premises as asserting the *existence* of their Subjects.]

11. [G] p. 209 "To say nothing of those who succeeded by effort, there were some who owed all to fortune, for they gained the end without any attempt whatever, if indeed it be not more correct to say that the end gained them. But for every one who was successful with or without effort, at least one could be pointed out who began, but abandoned the trial before the result was declared. And yet, so strangely is desert rewarded in this world, there was none of these

faint-hearted men but was as fortunate as any of those who used their best endeavours.”

I will answer for it that, if this were presented to any writer on Logic without warning, he would pass it over as not self-contradictory at least. But, for all that, it contains the same error as the following: “All men are animals and some are not.”

12. [J] p. 343 If every xy is zw , does it follow that the Class, in which every z is x , is the same as that in which every y is w ?

13. [G] p. 418 At a certain examination it was observed that (i) All candidates, who took Greek, took Latin also; (ii) All, who did not take Greek, took English and French, and if they took Latin, they took German also; (iii) All, who took Latin and Greek, but not English, did not take French; (iv) All, who took Latin and Greek but not French, did not take German.

Show that (1) All took either English or else both Latin and Greek; (2) All took either Latin or else both English and French; (3) All, who took French, took English also; (4) All, who took German, also took both English and French; (5) All, who did not take English, did not take either French or German, but took both Latin and Greek; (6) All, who did not take French, took Latin and Greek but not German; (7) All, who took Latin, and also either took German or did not take Greek, took English, French, and German; (8) All, who took both Greek and German, took English, Latin, and French; (9) All, who took neither Greek nor German, took English and French but not Latin; (10) Every candidate took at least two languages, and no candidate, who took only two, took German.

14. [G] p. 408 A given Class is made up of those who are not either male guardians, or female rate-payers, or lodgers who are neither guardians nor rate-payers. How can we simplify the description of this Class, if we know that all guardians are rate-payers, that every person who is not a lodger is either a guardian or a rate-payer, and that all male rate-payers are guardians?

15. [G] p. 410 If thriftlessness and poverty are inseparable, and virtue and misery are incompatible, and if thrift be a virtue, can any relation be proved to exist between misery and poverty? If moreover all thriftless people are either virtuous or not miserable, what follows?

[The writer evidently means the phrase “thrift is a virtue” to be regarded as equivalent to “all thrifty people are virtuous.”]

16. [G] p. 380, and [H] p. 413 Given that whatever is hk or ah is $b'cd$ or $a'b'd'e$ or $a'bcd'e$ or $ab'c'd'$, shew that (1) All $a'b'h$ is cd or $d'e$ or k' ; (2) All dh is $b'c$ or $a'k'$; (3) All b or cd' or $c'd$ is a' or h' ; (4) All b is c or h' or $a'k'$; (5) All cd' is a' or h' ; (6) All ab is h' ; (7) All $a'e'$, that is c' or d' , is h' or k' ; (8) All bh , that is c' or d , is $a'k'$.

17. [A] p. 146. Quoted in [H] p. 434, [J] p. 351, and [K] p. 82 Let the observation of a class of natural productions be supposed to have led to the following general results.

First, that, in whichever of these productions the properties A and C are missing, the property E is found, together with one of the properties B and D , but not with both.

Second, that, wherever the properties A and D are found, while E is missing, the properties B and C will either both be found or both be missing.

Third, that, wherever the property A is found in conjunction with either B or E or both of them, there either the property C or the property D will be found, but not both of them. And conversely, wherever the property C or D is found singly, there the property A will be found in conjunction with either B or E or both of them.

[The inference which Mr. Boole proposes, to be proved from these *Data*, are as follows:]

In whatever substances the property A is found, there will also be found either the property C , or the property D , but not both, or else the properties B , C , and D will all be missing. And conversely, wherever either the property C or the property D is found singly, or the properties B , C , and D are together missing, there the property A will be found.

Wherever the property A is absent and C is present, the property D is present.

Wherever the property B is present, either the properties A , C , and D are all absent, or else some one alone of them is absent. And conversely, wherever they are all absent, the property B is present.

Wherever the properties A and C are both present or both absent, the property D is absent.

[Mr. Venn says, in reference to the above Problem, that it is, he thinks, “the most intricate of any given by Boole.”]

18. [K] p. 52 What are the precise points of agreement and difference between two disputants, A and B , if A asserts that “space = three-way spread with points as elements,” while B asserts that “space = three-way spread,” and at the same time admits that “space has points as elements”?

19. [K] p. 53. Quoted in [H] p. 438 From the Premises, (1) ax' is not $c'(d'$ or $y')$; (2) bx is not $c'(d'$ or $y')e'$; (3) $a'b'$ is not $x'(d'$ or $e)c'$; (4) a or b or c is not $x'y'$, deduce a Proposition containing neither x nor y .

20. [A] p. 134

- (1) Virtue is either a passion or a faculty or a habit;
- (2) Passions are neither things according to which we are praised or blamed, nor things in which we exercise deliberate preference;
- (3) Faculties are not things according to which we are praised or blamed, and which are accompanied by deliberate preference;
- (4) Virtue is something according to which we are praised or blamed, and which is accompanied by deliberate preference;
- (5) Whatever art or science makes its work to be in a good state avoids extremes, and keeps the mean in view relative to human nature;
- (6) Virtue is more exact and excellent than any art or science.

[What can be inferred concerning virtue? The writer evidently regards Premisses (5) and (6) as equivalent to “Every thing human, which makes its work to be in a good state, keeps the mean in view relative to human nature“ and “Virtue makes its work to be in a good state.”]

21. [E] Feb. 1, 1881. Quoted in [H] p. 439, and [K] p. 54 The Members of a scientific Society are divided into three sections, which are denoted by a , b , c . Every Member must join one, at least, of these sections, subject to the following conditions:

- (1) Any one, who is member of a but not of b , of b but not of c , or of c but not of a , may deliver a lecture to the other members, if he has paid his subscription, but otherwise not;
- (2) Any one, who is a member of a but not of c , of c but not of a , or of b but not of a , may exhibit an experiment to the other members, if he has paid his subscription, but otherwise not;
- (3) Every Member of the Society must either deliver a lecture or exhibit an experiment every year.

Find the least possible addition to these rules which will compel every Member of the Society to pay his subscription or forfeit his Membership.

22. [E] Ap. 1, 1881. Quoted in [A] p. 237 A number of pieces of cloth, striped with different colours, were submitted to inspection, and the following two observations were made upon them:

- (1) Every piece, striped with white and green, was also striped with black and yellow; and *vice versâ*.
- (2) Every piece, striped with red and orange, was also striped with blue and yellow; and *vice versâ*.

It is required to eliminate yellow, and to express the conclusions in terms of green.

23. [K] p. 58. Quoted in [G] p. 423, and [H] p. 440 Six children, A , B , C , D , E , F , are required to obey the following rules:

- (1) On Monday and Tuesday no four can go out;
- (2) On Thursday, Friday, and Saturday, no three can stay in;
- (3) On Tuesday, Wednesday, and Saturday, if B and C are together (i. e. if both go out, or both stay in), then the other four must be together;
- (4) On Monday and Saturday, B cannot go out, unless either D stays in or A , C , and E stay in.

A and B are first to decide what they will do; and C makes his decision before the other three.

Find (1) when C must go out, (2) when he must stay in, (3) when he may do as he pleases.

24. [F] Vol. II, p. 368 Let us suppose that eight objects are presented to us, which exhibit the following combinations of the five properties a, b, c, d, e .

- | | |
|---------------|----------------|
| 1. $abcd'e$ | 5. $a'bcd'e$ |
| 2. $abc'd'e$ | 6. $a'bc'd'e'$ |
| 3. $ab'cde$ | 7. $a'b'cde$ |
| 4. $ab'c'de'$ | 8. $a'b'c'de'$ |

[The Problem is to discover certain “laws of correlation” which must be as few and as simple as possible, which shall make these combinations the *only possible ones*.]

25. [F] Vol. II, p. 369 If the reader entertains any doubt as to the difficulty of classifying combinations so as to disclose their relations, let him test the matter practically upon the following series of combinations. They involve only six properties, which are subject to four laws of correlation of no great complexity.

I shall be happy to receive the solution of this problem from any reader who thinks he has solved it.

Part 7

Alternative Methods of Computation

Carroll developed several alternative methods of computation that in some situations are more efficient than the standard ones.

7.1 Condensation of Determinants

Source: Proceedings of the Royal Society of London, 1866/1867

being a new and brief Method for computing their arithmetical values

*By the Rev. C. L. DODGSON, M.A., Student of Christ Church, Oxford.
Communicated by the Rev. BARTHOLOMEW PRICE, M.A., F.R.S. Received
May 15, 1866.*

If it be proposed to solve a set of n simultaneous linear equations, not being all homogeneous, involving n unknowns, or to test their compatibility when all are homogeneous, by the method of determinants, in these, as well as in other cases of common occurrence, it is necessary to compute the arithmetical values of one or more determinants—such, for example, as

$$\begin{vmatrix} 1, & 3, & -2 \\ 2, & 1, & 4 \\ 3, & 5, & -1 \end{vmatrix}.$$

Now the only method, so far as I am aware, that has been hitherto employed for such a purpose, is that of multiplying each term of the first row or column by the determinant of its complemental minor, and affecting the products with the signs + and – alternately, the determinants required in the process being, in their turn, broken up in the same manner until determinants are finally arrived at sufficiently small for mental computation.

This process, in the above instance, would run thus:—

Other version:
→ 9.4, p. 1370

$$\begin{vmatrix} 1, & 3, & -2 \\ 2, & 1, & 4 \\ 3, & 5, & -1 \end{vmatrix} = 1 \times \begin{vmatrix} 1, & 4 \\ 5, & -1 \end{vmatrix} - 2 \times \begin{vmatrix} 3, & -2 \\ 5, & -1 \end{vmatrix} + 3 \times \begin{vmatrix} 3, & -2 \\ 1, & 4 \end{vmatrix} = -21 - 14 + 42 = 7.$$

But such a process, when the block consists of 16, 25, or more terms, is so tedious that the old method of elimination is much to be preferred for solving simultaneous equations; so that the new method, excepting for equations containing 2 or 3 unknowns, is practically useless.

The new method of computation, which I now proceed to explain, and for which "Condensation" appears to be an appropriate name, will be found, I believe, to be far shorter and simpler than any hitherto employed.

In the following remarks I shall use the word "Block" to denote any number of terms arranged in rows and columns, and "interior of a block" to denote the block which remains when the first and last rows and columns are erased.

The process of "Condensation" is exhibited in the following rules, in which the given block is supposed to consist of n rows and n columns:—

(1) Arrange the given block, if necessary, so that no ciphers occur in its interior. This may be done either by transposing rows or columns, or by adding to certain rows the several terms of other rows multiplied by certain multipliers.

(2) Compute the determinant of every minor consisting of $\overline{\text{four}}$ adjacent terms. These values will constitute a second block, consisting of $\overline{n-1}$ rows and $\overline{n-1}$ columns.

(3) Condense this second block in the same manner, dividing each term, when found, by the corresponding term in the interior of the first block.

(4) Repeat this process as often as may be necessary (observing that in condensing any block of the series, the r th for example, the $\overline{\text{terms}}$ so found must be divided by the corresponding terms in the interior of the $\overline{r-1}$ th block), until the block is condensed to a single term, which will be the required value.

As an instance of the foregoing rules, let us take the block

$$\begin{vmatrix} -2 & -1 & -1 & -4 \\ -1 & -2 & -1 & -6 \\ -1 & -1 & 2 & 4 \\ 2 & 1 & -3 & -8 \end{vmatrix}.$$

By rule (2) this is condensed into $\begin{vmatrix} 3 & -1 & 2 \\ -1 & -5 & 8 \\ 1 & 1 & -4 \end{vmatrix}$; this, again, by rule

(3), is condensed into $\begin{vmatrix} 8 & -2 \\ -4 & 6 \end{vmatrix}$; and this, by rule (4), into -8 , which is the required value.

The simplest method of working this rule appears to be to arrange the series of blocks one under another, as here exhibited; it will then be found very easy to pick out the divisors required in rules (3) and (4).

$$\begin{vmatrix} -2 & -1 & -1 & -4 \\ -1 & -2 & -1 & -6 \\ -1 & -1 & 2 & 4 \\ 2 & 1 & -3 & -8 \end{vmatrix}$$

$$\begin{vmatrix} 3 & -1 & 2 \\ -1 & -5 & 8 \\ 1 & 1 & -4 \end{vmatrix}$$

$$\begin{vmatrix} 8 & -2 \\ -4 & 6 \end{vmatrix}$$

−8.

This process cannot be continued when ciphers occur in the interior of any one of the blocks, since infinite values would be introduced by employing them as divisors. When they occur in the given block itself, it may be rearranged as has been already mentioned; but this cannot be done when they occur in any one of the derived blocks; in such a case the given block must be rearranged as circumstances require, and the operation commenced anew.

The best way of doing this is as follows:—

Suppose a cipher to occur in the *h*th row and *k*th column of one of the derived blocks (reckoning both row and column from the *nearest* corner of the block); find the term in the *h*th row and *k*th column of the given block (reckoning from the corresponding corner), and transpose rows or columns cyclically until it is left in an outside row or column. When the necessary alterations have been made in the derived blocks, it will be found that the cipher now occurs in an outside row or column, and therefore need no longer be used as a divisor.

The advantage of *cyclical* transposition is, that most of the terms in the new blocks will have been computed already, and need only be copied; in no case will it be necessary to compute more than *one* new row or column for each block of the series.

In the following instance it will be seen that in the first series of blocks a cipher occurs in the interior of the third. We therefore abandon the process at that point and begin again, rearranging the given block by transferring the top row to the bottom; and the cipher, when it occurs, is now found in an exterior row. It will be observed that in each block of the new series, there is only *one* new row to be computed; the other rows are simply copied from the work already done.

$$\begin{vmatrix} 2 & -1 & 2 & 1 & -3 \\ 1 & 2 & 1 & -1 & 2 \\ 1 & -1 & -2 & -1 & -1 \\ 2 & 1 & -1 & -2 & -1 \\ 1 & -2 & -1 & -1 & 2 \end{vmatrix} \begin{vmatrix} 1 & 2 & 1 & -1 & 2 \\ 1 & -1 & -2 & -1 & -1 \\ 2 & 1 & -1 & -2 & -1 \\ 1 & -2 & -1 & -1 & 2 \\ 2 & -1 & 2 & 1 & -3 \end{vmatrix}$$

$$\begin{vmatrix} 5 & -5 & -3 & -1 \\ -3 & -3 & -3 & 3 \\ 3 & 3 & 3 & -1 \\ -5 & -3 & -1 & -5 \end{vmatrix} \begin{vmatrix} -3 & -3 & -3 & 3 \\ 3 & 3 & 3 & -1 \\ -5 & -3 & -1 & -5 \\ 3 & -5 & 1 & 1 \end{vmatrix}$$

$$\begin{vmatrix} -30 & 6 & -12 \\ 0 & 0 & 6 \\ 6 & -6 & 8 \end{vmatrix} \begin{vmatrix} 0 & 0 & 6 \\ 6 & -6 & 8 \\ -17 & 8 & -4 \end{vmatrix}$$

$$\begin{vmatrix} 0 & 12 \\ 18 & 40 \end{vmatrix}$$

The fact that, whenever ciphers occur in the interior of a derived block, it is necessary to recommence the operation, may be thought a great obstacle to the use of this method; but I believe it will be found in practice that, even though this should occur several times in the course of one operation, the whole amount of labour will still be much less than that involved in the old process of computation.

I now proceed to give a proof of the validity of this process, deduced from a well-known theorem in determinants; and in doing so, I shall use the word “adjugate” in the following sense:—if there be a square block, and if a new block be formed, such that each of its terms is the determinant of the complementary minor of the corresponding term of the first block, the second block is said to be *adjugate* to the first.

The theorem referred to is the following:—

“If the determinant of a block = R , the determinant of any minor of the m th degree of the adjugate block is the product of R^{m-1} and the coefficient which, in R , multiplies the determinant of the corresponding minor.”

Let us first take a block of 9 terms,

$$\begin{vmatrix} a_{1,1} & a_{1,2} & a_{1,3} \\ a_{2,1} & a_{2,2} & a_{2,3} \\ a_{3,1} & a_{3,2} & a_{3,3} \end{vmatrix} = R;$$

and let $\alpha_{1,1}$ represent the determinant of the complementary minor of $a_{1,1}$, and so on.

If we “condense” this, by the method already given, we get the block $\begin{Bmatrix} \alpha_{3,3} & \alpha_{3,1} \\ \alpha_{1,3} & \alpha_{1,1} \end{Bmatrix}$, and, by the theorem above cited, the determinant of this, viz.

$$\begin{vmatrix} \alpha_{3,3} & \alpha_{3,1} \\ \alpha_{1,3} & \alpha_{1,1} \end{vmatrix} = R \times a_{2,2}.$$

Hence $R = \frac{\begin{vmatrix} \alpha_{3,3} & \alpha_{3,1} \\ \alpha_{1,3} & \alpha_{1,1} \end{vmatrix}}{a_{2,2}}$, which proves the rule.

Secondly, let us take a block of 16 terms:

$$\begin{vmatrix} a_{1,1} & \cdots & a_{1,4} \\ \vdots & & \vdots \\ a_{4,1} & \cdots & a_{4,4} \end{vmatrix} = R.$$

If we “condense” this, we get a block of 9 terms; let us denote it by $\begin{Bmatrix} b_{1,1} & \cdots & b_{1,3} \\ \vdots & & \vdots \\ b_{3,1} & \cdots & b_{3,3} \end{Bmatrix}$,

in which $b_{1,1} = \begin{vmatrix} a_{1,1} & a_{1,2} \\ a_{2,1} & a_{2,2} \end{vmatrix}$, &c.

If we “condense” this block again, we get a block of 4 terms, each of which, by the preceding paragraph, is the determinant of 9 terms of the original block;

that is to say, we get the block $\begin{Bmatrix} \alpha_{4,4} & \alpha_{4,1} \\ \alpha_{1,4} & \alpha_{1,1} \end{Bmatrix}$; but, by the theorem already

quoted, $\begin{vmatrix} \alpha_{4,4} & \alpha_{4,1} \\ \alpha_{1,4} & \alpha_{1,1} \end{vmatrix} = R \times b_{2,2}$; therefore $R = \frac{\begin{vmatrix} \alpha_{4,4} & \alpha_{4,1} \\ \alpha_{1,4} & \alpha_{1,1} \end{vmatrix}}{b_{2,2}}$; that is, R may be obtained by “condensing” the block $\begin{Bmatrix} \alpha_{4,4} & \alpha_{4,1} \\ \alpha_{1,4} & \alpha_{1,1} \end{Bmatrix}$.

This proves the rule for a block of 16 terms; and similar proofs might be given for larger blocks.

I shall conclude by showing how this process may be applied to the solution of simultaneous linear equations.

If we take a block consisting of n rows and $\overline{n+1}$ columns, and “condense” it, we reduce it at last to 2 terms, the first of which is the determinant of the first n columns, the other of the last n columns.

Hence, if we take the n simultaneous equations,

$$\begin{aligned} a_{1,1}x_1 + a_{1,2}x_2 + \cdots + a_{1,n}x_n + a_{1,n+1} &= 0, \\ &\dots \\ a_{n,1}x_1 + a_{n,2}x_2 + \cdots + a_{n,n}x_n + a_{n,n+1} &= 0; \end{aligned}$$

and if we condense the whole block of coefficients and constants, viz.

$$\begin{Bmatrix} a_{1,1} & \cdots & a_{1,n+1} \\ \vdots & & \vdots \\ a_{n,1} & \cdots & a_{n,n+1} \end{Bmatrix},$$

we reduce it at last to 2 terms: let us denote them by S , T , so that $S =$

$$\begin{vmatrix} a_{1,1} & \cdots & a_{1,n} \\ \vdots & & \vdots \\ a_{n,1} & \cdots & a_{n,n} \end{vmatrix}, \text{ and } T = \begin{vmatrix} a_{1,2} & \cdots & a_{1,n+1} \\ \vdots & & \vdots \\ a_{n,2} & \cdots & a_{n,n+1} \end{vmatrix}.$$

Now we know that $x_1 = (-)^n \frac{T}{S}$, which may be written in the form $(-)^n S \cdot x_1 = T$.

Hence the 2 terms obtained by the process of condensation may be converted into an equation for x_1 , by multiplying the first of them by x_1 , affected with + or −, according as n is even or odd. The latter part of the rule may be simply expressed thus:—“place the signs + and − alternately over the several columns, beginning with the last, and the sign which occurs over the column containing x_1 is the sign with which x_1 is to be affected.”

When the value of x_1 has been thus found, it may be substituted in the first $\overline{n-1}$ equations, and the same operation repeated on the new block, which will now consist of $\overline{n-1}$ rows and n columns. But in calculating the second series of blocks, it will be found that most of the work has been already done; in fact, of the 2 determinants required in the new block, one has been already computed correctly, and the other so nearly so that it only requires the *last* column in each of the derived blocks to be corrected.

In the example given opposite, after writing + and − alternately over the columns, beginning with the last, we first condense the whole block, and thus obtain the 2 terms 36 and −72. Observing that the x -column has the sign −

placed over it, we multiply the 36 by $-x$, and so form the equation $-36x = -72$, which gives $x = 2$.

Hence the x -terms in the first four equations become respectively 2, 2, 4, and 2; adding these values to the constant terms in the same equations, we obtain a

block of which we need only write down the last two columns, viz.
$$\begin{vmatrix} 2 & 4 \\ -1 & -2 \\ -1 & -2 \\ 2 & 6 \end{vmatrix}.$$

We then condense these into the column $\begin{vmatrix} 0 \\ 0 \\ 2 \end{vmatrix}$, and, supplying from the

second block of the first series the column $\begin{vmatrix} 3 \\ -1 \\ -5 \end{vmatrix}$, we obtain $\begin{vmatrix} 3 & 0 \\ -1 & 0 \\ -5 & 2 \end{vmatrix}$ as the

last two columns of the *second* block of the new series; and proceeding thus we ultimately obtain the two terms 12, 12. Observing that the y -column has the sign + placed over it, we multiply the first 12 by $+y$, and so form the equation $12y = 12$, which gives $y = 1$. The values of z , u , and v are similarly found.

It will be seen that when once the given block has been successfully condensed, and the value of the first unknown obtained, there is no further danger of the operation being interrupted by the occurrence of ciphers.

$$\begin{array}{rcccccc} - & & + & & - & & + & & - & & + \\ x & + & 2y & + & z & - & u & + & 2v & +2 & = 0 \\ x & - & y & - & 2z & - & u & - & v & -4 & = 0 \\ 2x & + & y & - & z & - & 2u & - & v & -6 & = 0 \\ x & - & 2y & - & z & - & u & + & 2v & +4 & = 0 \\ 2x & - & y & + & 2z & + & u & - & 3v & -8 & = 0 \end{array}$$

$$\begin{vmatrix} 1 & 2 & 1 & -1 & 2 & 2 \\ 1 & -1 & -2 & -1 & -1 & -4 \\ 2 & 1 & -1 & -2 & -1 & -6 \\ 1 & -2 & -1 & -1 & 2 & 4 \\ 2 & -1 & 2 & 1 & -3 & -8 \end{vmatrix} \begin{vmatrix} 2 & 4 \\ -1 & -2 \\ -1 & -2 \\ 2 & 6 \end{vmatrix} \begin{vmatrix} 2 & 6 \\ -1 & -3 \\ -1 & -1 \end{vmatrix} \begin{vmatrix} 2 & 5 \\ -1 & -1 \end{vmatrix} \begin{vmatrix} 2 & 4 \end{vmatrix} \therefore -2v = 4 \dots v = -2$$

$$\begin{vmatrix} -3 & -3 & -3 & 3 & -6 \\ 3 & 3 & 3 & -1 & 2 \\ -5 & -3 & -1 & -5 & 8 \\ 3 & -5 & 1 & 1 & -4 \end{vmatrix} \begin{vmatrix} 3 & 0 \\ -1 & 0 \\ -5 & -2 \end{vmatrix} \begin{vmatrix} 3 & 0 \\ -1 & -2 \end{vmatrix} \begin{vmatrix} 3 & 3 \end{vmatrix} \therefore 3u = 3 \dots u = 1$$

$$\begin{vmatrix} 0 & 0 & 6 & 0 \\ 6 & -6 & 8 & -2 \\ -17 & 8 & -4 & 6 \end{vmatrix} \begin{vmatrix} 6 & 0 \\ 8 & -2 \end{vmatrix} \begin{vmatrix} 6 & 6 \end{vmatrix} \therefore -6z = 6 \dots z = -1$$

$$\begin{vmatrix} 0 & 12 & 12 \\ 18 & 40 & -8 \end{vmatrix} \begin{vmatrix} 12 & 12 \end{vmatrix} \therefore 12y = 12 \dots y = 1$$

$$\begin{vmatrix} 36 & -72 \end{vmatrix} \therefore -36x = -72 \dots x = 2$$

$$\begin{array}{rccccrcr}
& - & & + & & - & & + \\
5x & + & 2y & - & 3z & +3 & = & 0 \\
3x & - & y & - & 2z & +7 & = & 0 \\
2x & + & 3y & + & z & -12 & = & 0
\end{array}$$

$$\left| \begin{array}{cccc} 5 & 2 & -3 & 3 \\ 3 & -1 & -2 & 7 \\ 2 & 3 & 1 & -12 \end{array} \right| \quad \left| \begin{array}{cc} -3 & 8 \\ -2 & 10 \end{array} \right| \quad | -3 \quad 12 | \quad \therefore 3z = 12 \dots z = 4$$

$$\left| \begin{array}{ccc} -11 & -7 & -15 \\ 11 & 5 & 17 \end{array} \right| \quad | -7 \quad -14 | \quad \therefore -7y = -14 \dots y = 2$$

$$| -22 \quad 22 | \quad \therefore 22x = 22 \dots x = 1$$

The Society then adjourned over the Whitsuntide Recess to Thursday, May 31.

7.2 Practical Hints on Teaching

Long Multiplication Worked with a Single Line of Figures

To the Editor of the Educational Times

Sir,—If the following brief method of working Long Multiplication should prove to be new, I hope you may think it worth publishing:—

Suppose we wish to multiply 56248 by 3726. We set the sum in the usual way, thus:—

$$\begin{array}{r} 56248 \\ 3726 \\ \hline \end{array}$$

We then write out the upper line, *backwards*, on the lower edge of a separate slip of paper, placing a mark over the unit-digit, as a guide to the eye: with this slip we cover the upper line of the given sum, bringing the marked digit over the unit of the lower line, thus:—

$$\begin{array}{r} \bar{8}4265 \\ 3726 \\ \hline \end{array}$$

We then take the product of the digits which are in the same vertical line (viz., 8, 6); this gives us 48; we write the unit of this (viz., 8) vertically under the scored digit, and “carry” the 4, thus:—

$$\begin{array}{r} \bar{8}4265 \\ 3726 \\ \hline 8 \\ 4 \end{array}$$

We then shift the slip one place to the left, thus:—

$$\begin{array}{r} \bar{8}4265 \\ 3726 \\ \hline 8 \\ 4 \end{array}$$

We then add together the carried digit and the products of the digits which are in the same vertical lines, and write the result as before. The mental process being, “4 + 24 = 28, +16 = 44; set down 4 and carry 4.”

$$\begin{array}{r} \bar{8}4265 \\ 3726 \\ \hline 48 \\ 4 \end{array}$$

We then shift the slip again, and proceed as before; the mental process being, “4 + 12 = 16; +8 = 24; +56 = 80; set down 0 and carry 8.”

$$\begin{array}{r} \bar{8}4265 \\ 3726 \\ \hline 048 \\ 4 \end{array}$$

1227

We then shift the slip again, and so on; the last step being reached when the sum stands thus, with 5 to carry:—

$$\begin{array}{r} \bar{8}4265 \\ 3726 \\ \hline 9580048 \end{array}$$

Hence the mental process of the last step is, “5 + 15 = 20; set it down.” We then remove the slip, and the result appears thus:—

$$\begin{array}{r} 56248 \\ 3726 \\ \hline 209580048 \end{array}$$

A similar method will serve for multiplying decimals: all we have to remember is, to bring the marked digit of the slip vertically over whatever decimal place we wish to carry the working to. For example, if we wish to multiply together .63624 and .25873; and if, in order to have the answer correct to 3 places, we wish to carry the working to 4 places, we set the sum thus:—

$$\begin{array}{r} 0.63624 \\ 0.25873 \\ \hline \end{array}$$

We then write 426360 on a separate slip of paper, and place it so that its marked digit comes vertically over the 4th decimal place in the answer, thus:—

$$\begin{array}{r} 42\ 636\bar{0} \\ 0.25873 \\ \hline \end{array}$$

The mental process of the first step will be “0 + 48 = 48; + 15 = 63; + 12 = 75; set down 5 and carry 7.”

$$\begin{array}{r} 42\ 636\bar{0} \\ 0.25873 \\ \hline 5 \end{array}$$

We then shift the slip to the left and proceed as before, the last step being reached when the sum stands thus, with 1 to carry:—

$$\begin{array}{r} 42636\bar{0} \\ 0.25873 \\ \hline 635 \end{array}$$

Hence the mental process of the last step is “1 + 0 = 1; set it down.” We then remove the slip, and the result appears thus:—

$$\begin{array}{r} 0.63624 \\ 0.25873 \\ \hline .1635 \end{array}$$

Hence the answer, correct to 3 places, will be .164. This method seems to me not only to save space and time, but also to avoid the risk of mistakes involved in writing all the intermediate lines of figures required in the old method, as well as the constant risk of losing one’s place while carrying the eye obliquely from one figure to another figure several rows above it.

Your obedient servant,

*Charles L. Dodgson,
Senior Student and Mathematical Lecturer of Christ Church, Oxford.*

7.3 Divisibility by Seven

Source: Knowledge, July 4, 1884

[1324]—Mr. Askew, in 1274, May 30, asks for a proof of a method for ascertaining the divisibility of a number by 7, which he states to have been discovered by Mr. Rickard, of Birmingham. Probably many have discovered it: my father did, for one, and taught it to me some thirty years ago. The test-number is equally useful for 7, 11, and 13. The method, as worked by my father, gives, in the case of a number divisible by all three factors, the other factor as well, without further labour: and in this respect it has an advantage over that of Mr. Rickard.

If a number, N , be marked off from the right-hand end in periods of three digits; and if $a, b, c, \&c.$, be the periods; and if M be the difference between the sums of the alternate periods; we have, writing r for 1000,

$$N = a + br + cr^2 + dr^3 + \&c.$$

$$M = a - b + c - d + \&c.$$

$$\therefore N - M = b(r + 1) + c(r^2 - 1) + d(r^3 + 1) + \&c.$$

and is divisible by $(r + 1)$; hence, if M be divisible by $(r + 1)$ or any factor of it, so also is N . And in this case $r + 1 = 1001 = 7 \times 11 \times 13$.

$$\begin{array}{r|l|l|l} 8 & 026 & 518 & 423 \\ \hline 931 & 095 & 423 & \\ \hline 924 & & & \end{array}$$

My father's rule was to set the right-hand period under the next, and subtract, setting the remainder under the next, and so on. In the last period, the subtraction is *downwards*

if the lower number be the larger. In this instance, since we have 1 to carry into the last period, the 931 must be read as 932. The ultimate remainder, 924, is the test-number; and, since this is divisible by 7 and 11, so also is the whole number.

If the test-number chanced to be zero, the second line would be the quotient produced by dividing the given number by 1001; *i. e.*, it is the factor remaining after dividing out 7, 11, and 13. For let us call the second line " V ;" writing three ciphers at the end, we get $1000V$; and we know that, if this be deducted from the upper line, the remainder = V . Hence $N = 1001V = 7 \times 11 \times 13 \times V$. In the above example, if the left-hand period were 932 instead of 8, the test-number would be zero.

$$\begin{array}{r} 6\ 4\ 3\ 7\ 2\ 5\ 8\ 3 \\ 0\ 5\ 8\ 5\ 2\ 0\ 5\ 3 \end{array}$$

If the periods be *single* digits, *i. e.*, if $r = 10$, we get a test for divisibility by 11, and at the same time the quotient after dividing out 11. The rule is to set

the last digit under the next, and subtract, setting the remainder under the next, and so on. In this instance the test-number = 0; hence the given number = 11×5852053 .

With periods of two digits, we get a test for divisibility by 101; and so for four or more digits.

*C. L. Dodgson.
Ch. Ch., Oxford.*

P.S.—The sum of *all* the periods gives us, for periods of 1, 2, 3, &c., digits, a test for divisibility by 9, 99, 999 (= 27×37), &c., or for any factors of these numbers. This method may also be worked by a rule analogous to that given above; *e. g.*, to test for 999, mark off in periods of three, write 000 over the

right-hand period, and subtract, writing the remainder over the next, and so on. Hence, also, if the test-number chanced to be zero, the upper line (omitting the 000) would be the quotient produced by dividing the given number by 999.

Probably similar rules may be made for most primes. I have myself made fairly simple rules for 17 and for 19; but such processes are rather curious than useful.

7.4 Brief Method of Dividing a Given Number by 9 or 11

Source: Nature, October 14, 1897

Other version:
→ 7.6, p. 1243

I shall be grateful if you will allow me to communicate, through your columns, to mathematicians generally, but specially to those engaged in teaching arithmetic, two new rules, which effect such a saving of time and trouble that I think they ought to be regularly taught in schools.

Years ago I had discovered the curious fact that, if you put a “0” over the unit-digit of a given number, which happens to be a multiple of 9, and subtract all along, always putting the remainder over the next digit, the final subtraction gives remainder “0,” and the upper line, omitting its final “0,” is the “9-quotient” of the given Number (*i. e.*, the quotient produced by dividing it by 9).

Having discovered this, I was at once led, by analogy, to the discovery that, if you put a “0” *under* the unit-digit of a given number, which happens to be a multiple of 11, and proceed in the same way, you get an analogous result.

In each case I obtained the quotient of a division-sum by the shorter and simpler process of *subtraction*: but, as this result was only obtainable in the (comparatively rare) case of the given number being an exact multiple of 9, or of 11, the discovery seemed to be more curious than useful.

Lately, it occurred to me to examine cases where the given number was *not* an exact multiple. I found that, in these cases, the final subtraction yielded a number which was sometimes the actual remainder produced by division, and which always gave materials from which that remainder could be found. But, as it did not yield the quotient (or only by a very “bizarre” process, which was decidedly longer and harder than actual division), the discovery still seemed to be of no practical use.

But, quite lately, it occurred to me to try what would happen if, after discovering the remainder, I were to put it, instead of a “0,” over or under the unit-digit, and then subtract as before. And I was charmed to find that the old result followed: the final subtraction yielded remainder “0,” and the new line, omitting its unit-digit, was the required quotient.

Now there are shorter processes, for obtaining the 9-remainder or the 11-remainder of a given number, than my subtraction-rule (the process for finding the 11-remainder is another discovery of mine). Adopting these, I brought my rule to completion on September 28, 1897 (I record the exact date, as it is pleasant to be the discoverer of a new and, as I hope, a practically useful, truth).

(1) Rule for finding the quotient and remainder produced by dividing a given number by 9.

To find the 9-remainder, sum the digits: then sum the digits of the result: and so on, till you get a single digit. If this be less than 9, it is the required remainder: if it be 9, the required remainder is 0.

To find the 9-quotient, draw a line under the given number, and put its 9-remainder under its unit-digit: then subtract downwards, putting the remainder under the next digit, and so on. If the left-hand end-digit of the given number be less than 9, its subtraction ought to give remainder “0”: if it be 9, it ought

to give remainder "1," to be put in the lower line, and "1" to be carried, whose subtraction will give remainder "0." Now mark off the 9-remainder at the right-hand end of the lower line, and the rest of it will be the 9-quotient.

Examples. $\begin{array}{r} 9/75309\ 6 \\ \underline{83677/3} \end{array}$, $\begin{array}{r} 9/94613\ 8 \\ \underline{105126/4} \end{array}$, $\begin{array}{r} 9/58317\ 3 \\ \underline{64797/0} \end{array}$.

(2) Rule for finding the quotient and remainder produced by dividing a given number by 11.

To find the 11-remainder, begin at the unit-end, and sum the 1st, 3rd, &c., digits, and also the 2nd, 4th, &c., digits; and find the 11-remainder of the difference of these sums. If the former sum be the greater, the required remainder is the number so found: if the former sum be the lesser, it is the difference between this number and 11: if the sums be equal, it is "0."

To find the 11-quotient, draw a line under the given number and put its 11-remainder under its unit-digit: then subtract, putting the remainder under the next digit, and so on. The final subtraction ought to give remainder "0." Now mark off the 11-remainder at the right-hand end of the lower line, and the rest of it will be the 11-quotient.

Examples. $\begin{array}{r} 11/73210\ 8 \\ \underline{66555/3} \end{array}$, $\begin{array}{r} 11/85347\ 1 \\ \underline{77588/3} \end{array}$, $\begin{array}{r} 11/59426\ 3 \\ \underline{54023/10} \end{array}$, $\begin{array}{r} 11/47568\ 4 \\ \underline{43244/0} \end{array}$.

These new rules have yet another advantage over the rule of actual division, viz. that the final subtraction supplies a *test* of the correctness of the result: if it does not give remainder "0," the sum has been done wrong: if it does, then either it has been done right, or there have been *two* mistakes—a rare event.

Mathematicians will not need to be told that rules, analogous to the above, will necessarily hold good for the divisors 99, 101, 999, 1001, &c. The only modification needed would be to mark off the given number in periods of 2 or more digits, and to treat each period in the same way as the above rules have treated single digits. Here, for example, is the whole of the working needed for dividing a given number of 17 digits by 999 and by 10001:—

$$\begin{array}{r} 999/75410836428139\ 214 \\ \underline{75486322750890/104} \end{array}$$

$$\begin{array}{r} 1001/75410836428139\ 214 \\ \underline{75335500927212/2} \end{array}$$

But such divisors are not in common use: and, for the purposes of school-teaching, it would not be worth while to go beyond the rules for division by 9 and 11.

Charles L. Dodgson.
Ch. Ch., Oxford.

7.5 Abridged Long Division

Source: Nature, January 20, 1898

Other version:
→ 7.6, p. 1245

A Brief Method of dividing a given Number by a Divisor of the Form $(h \cdot 10^n \pm k)$, where at least one of the two numbers, h and k , is greater than 1.

My former paper on this subject, which appeared in NATURE for October 14, 1897, dealt only with the case where $h = 1$ and $k = 1$. It elicited, from other correspondents of NATURE, several interesting letters, which the editor kindly allowed me to see. One, from Mr. Alfred Sang, quotes Mons. L. Richard's "Sténarithmie," as containing my Rule for dividing by 11. Mons. Richard's book, which I had not previously met with, does certainly contain the rule, but the author has failed to see that the test, which this Method furnishes, for the correctness of the working, is absolutely *definite*. He says "La dernière différence, ou cette différence augmontée de 1, égalera le chiffre de gauche du nombre proposé." So ambiguous a test as this would of course be useless. But the "difference" he is speaking of is really the *last but one*: the very *last* will always (as I stated in my former paper) be equal to zero. Another correspondent, Mr. Otto Sonne, says that my Rules, both for 9 and for 11, are to be found in a school-book, by a Mr. Adolph Steen, which was published at Copenhagen in 1847. So I fear I must reduce my claim, from that of being the first to discover them, to that of being the first to publish them in English.

The Method, now to be described, is applicable to three distinct cases:—

- (1) where $h > 1$, $k = 1$;
- (2) where $h = 1$, $k > 1$;
- (3) where $h > 1$, $k > 1$.

With certain limitations of the values of h , k , and n , this Method will be found to be a shorter and safer process than that of ordinary Long Division. These limitations are that neither h nor k should exceed 12, and that, when $k > 1$, n should not be less than 3; outside these limits, it involves difficulties which make the ordinary process preferable.

In this Method, two distinct processes are required—one, for dealing with cases where $h > 1$, the other, for cases where $k > 1$. The former of these processes was, I believe, first discovered by myself, the latter by my nephew, Mr. Bertram J. Collingwood, who communicated to me his Method of dealing with Divisors of the form $(10^n - k)$.

In what follows, I shall represent 10 by t .

Mr. Collingwood's Method, for Divisors of the form $(t^n - k)$, may be enunciated as follows:—

"To divide a given Number by $(t^n - k)$, mark off from it a period of n digits, at the units-end, and under it write k -times what would be left of it if its last period were erased. If this number contains more than n digits, treat it in the same way; and so on, till a number is reached which does not contain more than n digits. Then add up. If the last period of the result, *plus* k -times whatever was carried out of it, in the adding-up, be less than the Divisor, it is the required Remainder; and the rest of the result is the required Quotient. If it be not less,

find what number of times it contains the Divisor, and add that number to the Quotient, and subtract that multiple of the Divisor from the Remainder.”

For example, to divide 86781592485703152764092 by 9993 (*i. e.*, by $t^4 - 7$), he would proceed thus:—

9993	867 8159 2485 7031 5276	4092
	6074 7114 7399 9220	6932
	4 2522 9803 1799	4540
	29 7660 8622	2593
	208 3626	0354
	1458	5382
	1	0206
		7

Quot. $\overline{868\ 4238\ 2153\ 2104\ 0004} \overline{||4106} + 14 = 4120$ Rem.

The new Method will be best explained by beginning with case (3): it will be easily seen what changes have to be made in it when dealing with cases (1) and (2).

The Rule for case (3), when the sign is “-,” may be enunciated thus:—

Mark off the Dividend, beginning at its units-end, in periods of n digits. If there be an overplus, at the left-hand end, less than h , do not mark it off, but reckon it and the next n digits as one period.

To set the sum, write the Divisor, followed by a double vertical; then the Dividend, divided into its periods by single verticals, with width allowed in each space for $(n + 2)$ digits. Below the Dividend draw a single line, and, further down, a double one, leaving a space between, in which to enter the Quotient, having its units-digit below that of the last period but one of the Dividend, and also the Remainder, having its units-digit below that of the last period of the Dividend. In this space, and in the space below the double line, draw verticals, corresponding to those in the Dividend; and make the last in the upper space double, to separate the Quotient from the Remainder.

For example, if we had to divide 5984407103826 by 6997 (*i. e.*, $7.t^3 - 3$), the sum, as set for working, would stand thus:—

6997		5984	407	103	826	
Quot.						Rem.

To work the sum, divide the 1st period by h : enter its quotient in the 1st Column below the double line, and place its Remainder above the 2nd period, where it is to be regarded as *prefixed* to that period. To the 2nd period, with its prefix, add k -times the number in the 1st Column, and enter the result at the top of the 2nd Column. If this number *is not* less than the Divisor, find what number of times it contains the Divisor, and enter that number in the 1st Column, and k -times it in the 2nd; and then draw a line below the 2nd Column, and add in this new item, deducting from the result t^n -times the number just entered in the 1st Column; and then add up the 1st Column, entering the result in the Quotient. If the number at the top of the 2nd Column *is* less than the Divisor, the number in the 1st Column may be at once entered in the Quotient. The number entered in the Quotient, and the number at the foot of the 2nd Column, are the Quotient and Remainder that would result if the Dividend ended with its 2nd period. Now take the number at the foot of the 2nd Column

as a new 1st period, and the 3rd period as a new 2nd period, and proceed as before.

The above example, worked according to this Rule, would stand thus:—

		6	5	3	
6997	5984	407	103	826	
Quot.	855	281	849	6373	Rem.
	854	8969	5946		
	1	3	849		
		1972			
		281			

the Mental Process being as follows:—

Divide the 5984 by 7, entering its Quotient, 854, in the 1st Column, and placing its Remainder, 6, above the 2nd period. Then add, to the 6407, 3-times the 854, entering the result in the 2nd Column, thus: “7 and 12, 19.” Enter the 9, and carry the 1. “1 and 15, 16.” Enter the 6, and carry the 1. “5 and 24, 29.” Enter the 9, and carry the 2, which, added to the prefix 6, makes 8, which also you enter. Observing that this 8969 *is not* less than the Divisor, and that it contains the Divisor *once*, enter 1 in the 1st Column, and 3-times 1 in the 2nd, and then draw a line below, and add in this new item, remembering to deduct from the result 7-times t^3 , *i. e.*, 7000: the result is 1972. Then add up the 1st Column, as far as the double line, and enter the result, 855, in the Quotient. Now take the 1972 as a new 1st period, and the 3rd period, 103, as a new 2nd period, and proceed as before.

The Rule for case (3), when the sign is “+,” may be deduced from the above Rule by simply changing the sign of k . This will, however, introduce a new phenomenon, which must be provided for by the following additional clause:—

When you add, to the 2nd period with its prefix, $(-k)$ -times the number in the 1st Column, *i. e.*, when you *subtract* k -times this number *from* the 2nd period with its prefix, it will sometimes happen that the subtrahend exceeds the minuend. In this case the subtraction will end with a *minus* digit, which may be indicated by an asterisk. Now find what number of Divisors must be added to the 2nd Column to cancel this *minus* digit, and enter that number, marked with an asterisk, in the 1st Column, and that multiple of the Divisor in the 2nd; and then draw a line below the 2nd Column, and add in this new item.

As an example, let us take a new Dividend, but retain the previous Divisor, changing the sign of k , so that it will become 7003 (*i. e.*, $7.t^3 + 3$). The sum, as set for working, would stand thus:—

7003	6504	318	972	526	
Quot.					Rem.

After working, it would stand thus:—

		1	4	5	
7003	6504	318	972	526	
Quot.	928	790	371	4413	Rem.
	929	2*531	2602		
		1*	7 003	371	
			5 534		
			790		

the Mental Process being as follows:—

Divide the 6504 by 7, and enter the Quotient, 929, in the 1st Column, and the Remainder, 1, above the 2nd period. Then subtract, from the 1318, 3-times the 929, entering the result in the 2nd Column, thus: “27 from 8 I ca’n’t, but 27 from 28, 1.” Enter the 1, and carry the borrowed 2. “8 from 1 I ca’n’t, but 8 from 11, 3.” Enter the 3, and carry the borrowed 1. “28 from 3 I ca’n’t, but 28 from 33, 5.” Enter the 5, and carry the borrowed 3. “3 from 1, *minus 2*.” Enter it, with an asterisk. Observing that, to cancel this *minus 2*, it will suffice to add *once* the Divisor, enter a (-1) in the 1st Column, and 7003 in the 2nd; and then draw a line below the 2nd Column, and add in this new item: the result is 5534. Then add up the 1st Column, and enter the result, 928, in the Quotient. Now take the 5534 as a new 1st period, and the third period, 972, as a new 2nd period, and proceed as before.

The Rules for case $\sphericalangle(1)^1$ may be derived, from the above, by making $k = 1$; and those for case $\sphericalangle(2)^2$ by making $h = 1$. I will give worked examples of these; but it will not be necessary to give the Mental Processes.

By making $k = 1$, we get Divisors of the form $(h \cdot t^n \pm 1)$: let us take $(11t^4 - 1)$ and $(6t^5 + 1)$

		9	10	4	
109999	107523	8168	9662	0985	
Quot.	9774	9813	0861	41846	Rem.
	9774	107942	119474		
		9812	1		
		1	9475		
			861		

		3	3	
600001	7239	51798	2 6004	13825
Quot.	1206	58431	9 4595	219230
		350592	4*7572	
		58432	60 0001	
		1*	56 7573	
			9 4595	

In this last example there is no need to enter the Quotient, produced by dividing the 7239 by 7, in the 1st Column: we easily foresee that the number at the top of the 2nd Column *will be* less than the Divisor, so that there will be no new item in the 1st: hence we at once enter the 1206 in the Quotient.

¹mistakenly (2)

²mistakenly (3)

By making $h = 1$, we get Divisors of the form $(t^n \pm k)$: let us take $(t^4 - 7)$ and $(t^5 + 12)$.

9993	867	8159	2485	7031	5276	4092	
Quot.	868	4238	2153	2104	0004	4120	Rem.
	867	14228	32130	22088	19990		
	1	7	21	14	14		
		4235	2151	2102	4		
		3	2	2			

100012	7185	6 2039	10327	53118
	7184	7 5822	00463	47562
	7185	3*5819	9*00355	
	1*	10 0012	9 00108	
		7 5831	463	
		9*		

The first of these two sums is the one I gave to illustrate Mr. Collingwood's Method of working with Divisors of the the form $(t^n - k)$.

It may interest the reader to see the 3 Methods of working the above example—ordinary Division, Mr. Collingwood's Method, and my version of it—compared as to the amount of labour which each entails in the working:—

	Ordinary Division.	Mr. C's Method.	My version of it.
Digits written:	202	82	44
Additions, or Subtractions:	204	97	25
Multiplications:	0	70	22

I am assuming that any one, working this example by ordinary Division, would begin by making a table of Multiples of 9993 for reference: so that he would have *no* Multiplications to do. Still, the great number of digits he would have to write, and of Additions and Subtractions he would have to do, involving a far greater risk of error than either of the other Methods, would quite outweigh this advantage.

By whatever process a Question in Long Division has been worked, it is very desirable to be able to test, easily and quickly, the correctness of the Answer. The ordinary test is to multiply together the Divisor and Quotient, add the Remainder, and observe whether these together make up the given Number, as they ought to do.

Thus, if N be the given Number, D the given Divisor, Q the Quotient, and R the Remainder, we ought to have

$$N = D \cdot Q + R.$$

This test is specially easy to apply, when $D = (h \cdot t^n \pm k)$, for then we ought to have

$$\begin{aligned} N &= (h \cdot t^n \pm k) \cdot Q + R; \\ &= (h \cdot Q \cdot t^n + R) \pm kQ. \end{aligned}$$

Now $hQ \cdot t^n$ may be found by multiplying Q by h , and tacking on n ciphers. Hence $(hQ \cdot t^n + R)$ may be found by making R occupy the place of the n

ciphers. If R contains less than n digits it must have ciphers prefixed; if more, the overplus must be carried on into the next period, and added to hQ .

Having found our "Test," viz. $(hQ \cdot t^n + R)$, we can write it on a separate slip of paper, and place it below the working of the example, so as to come vertically below N , which is at the top. When the sign in D is '-', we must add kQ to N , and see if the result = T ; when it is '+,' we must add kQ to T , and see if the result = N .

Now it has been already pointed out that when, in the new Method, the 1st and 2nd Columns have been worked, the 1st period of the Quotient and the number at the foot of the 2nd Column are the Quotient and Remainder that would result if the Dividend ended with its 2nd period. Hence the Test can be at once applied, before dealing with the 3rd Column. This constitutes a very important new feature in my version of Mr. Collingwood's Method. Every two adjacent Columns contain a separate Division-sum, which can be tested *by itself*. Hence, in working my Method, as soon as I have entered the 1st period of the Quotient, I can test it, and, if I have made any mistake, I can correct it. But the hapless computator, who has spent, say, an hour in working some gigantic sum in Long Division—whether by the ordinary process or by Mr. Collingwood's Method—and who has chanced to get a figure wrong at the very outset, which makes every subsequent figure wrong, has no warning of the fatal error till he has worked out the whole thing "to the bitter end," and has begun to test his Answer. Whereas, if working by *my* Method, he would have been warned of his mistake almost as soon as he made it, and would have been able to set it right before going any further.

As an aid to the Reader, I will give the Mental Process in full, for the 2nd and 3rd Columns of the first of the examples worked above.

The Divisor is 6997 (where $h = 7, k = 3$). Here you are supposed to have just entered the 281 in the Quotient. The Dividend, for these 2 columns, is 1972 | 103; the Quotient is 281, and the Remainder 5946. The Test is $hQ \cdot t^n + R$ (*i. e.*, $7 \times 281000 + 5946$), the Mental Process being as follows. You write, on a separate slip of paper, the last 3 digits of R , viz., 946, and carry the 5 into the next period, adding it to the 7×281 : thus, "5 and 7, 12." Enter the 2, and carry the 1. "1 and 56, 57." Enter the 7, and carry the 5. "5 and 14, 19." Enter it. Having got your Test, try whether $(N + kQ)$ is equal to it. This you compute, comparing it with your Test, digit by digit, as you go on, thus, "3 and 3, 6." Observe it in the Test. "0 and 24, 24." Observe the 4, and carry the 2. "3 and 6, 9." Observe it. "1972 and 0, 1972." Observe it. The Test is satisfied.

	6	5
	407	103
	281	
	8969	5946
	3	
	1972	
	281	
Test	1972	946

For Divisors of the form $(t^n \pm k)$ there is no need to write out the Test: the numbers, which compose it, already occur in the working, and may be used as they stand.

Charles L. Dodgson.

7.6 Curiosa Mathematica. Part III

Book II. Brief Methods of Performing Some Processes in Arithmetic.

Source: unpublished proof written 1897

Chapter I. Long Multiplication

Other version:

→ 7.2, p. 1227

The principle of this Method occurred to me on the 19th of September, 1879. I had been thinking of the great inconvenience arising, in the ordinary process of Long Multiplication, from the distance which often separates the two digits that are to be multiplied together, and what an advantage it would be if the sum could be so arranged that they should be close together. Then came the lucky thought that, by writing the lesser Number *backwards*, and moving it along above the other Number, we should have, at each stage of its progress, visible all at once, the set of pairs of digits, whose products have to be added together to make one column of working in the ordinary way.

The Method, which I evolved from this idea, may be enunciated as follows:—

Write down the 2 given Numbers, placing the lesser, if they are of unequal lengths, above the other, and bringing their units-digits into a vertical line. Draw a line below. On a separate slip of paper write the upper Number *backwards*, putting a mark over the units-digit. With this slip cover up the upper given Number, bringing the two units-digits into a vertical line. Looking at this pair of digits, write the units-digit of their product just below the line and vertically below the mark, and its tens-digit further down and one place to the left. Shift the slips one place to the left. Looking at the 2 pairs of digits, which now stand in vertical lines, sum their products, beginning with the right-hand pair, and write the units-digit of the result just below the line and vertically below the mark, and its tens-digit further down and one place to the left. Shift the slip again, and proceed as before.

An example will make this clear. Let the given Numbers be 574, 3819. Write them as here shown, drawing a line below, and write the 574, backwards, on a separate slip, with a mark above the 4.

$$\begin{array}{r} \boxed{475} \\ 574 \\ 3819 \\ \hline \end{array}$$

With this slip cover the upper Number, so that the mark stands vertically above the units-digit of the lower Number.

$$\begin{array}{r} \boxed{475} \\ 3819 \\ \hline \end{array}$$

Looking at the pair of digits, which stand in a vertical line, say “36,” and write the 6 just below the line and vertically below the mark, and the 3 further down and one place to the left.

$$\begin{array}{r}
 \boxed{475} \\
 3819 \\
 \hline
 6 \\
 3
 \end{array}$$

Shift the slip one place to the left.

$$\begin{array}{r}
 \boxed{475} \\
 3819 \\
 \hline
 6 \\
 3
 \end{array}$$

Looking at the 2 vertical pairs of digits, say "63 and 4, 67." Enter it.

$$\begin{array}{r}
 \boxed{475} \\
 3819 \\
 \hline
 76 \\
 63
 \end{array}$$

Shift the slip one place to the left.

$$\begin{array}{r}
 \boxed{475} \\
 3819 \\
 \hline
 76 \\
 63
 \end{array}$$

Looking at the 3 vertical pairs of digits, say "45 and 7, 52; and 32, 84." Enter it.

$$\begin{array}{r}
 \boxed{475} \\
 3819 \\
 \hline
 476 \\
 863
 \end{array}$$

Shift the slip as before.

$$\begin{array}{r}
 \boxed{475} \\
 3819 \\
 \hline
 476 \\
 863
 \end{array}$$

Looking at the 3 vertical pairs of digits, say "5 and 56, 61; and 12, 73." Enter it.

$$\begin{array}{r}
 \boxed{475} \\
 3819 \\
 \hline
 3476 \\
 7863 \\
 \\
 1240
 \end{array}$$

Shift the slip as before.

$$\begin{array}{r}
 \boxed{475} \\
 3819 \\
 \hline
 3476 \\
 7863
 \end{array}$$

Looking at the 2 vertical pairs of digits, say "40 and 21, 61." Enter it.

$$\begin{array}{r}
 \boxed{475} \\
 3819 \\
 \hline
 13476 \\
 67863
 \end{array}$$

Shift the slip as before.

$$\begin{array}{r}
 \boxed{475} \\
 3819 \\
 \hline
 13476 \\
 67863
 \end{array}$$

Looking at the vertical pair of digits, say "15." Enter it.

$$\begin{array}{r}
 \boxed{475} \\
 3819 \\
 \hline
 513476 \\
 167863
 \end{array}$$

Now remove the slip, draw a line below, and add together the 2 lines of working.

$$\begin{array}{r}
 574 \\
 3819 \\
 \hline
 513476 \\
 167863 \\
 \hline
 2192106
 \end{array}$$

The Reader will notice that the working, for each position of the slip, is a distinct thing, and can be done *by itself*, without reference to the rest of the work. Hence, if there is a doubt as to any particular digit in the answer, the digits, whose sum it is, can be tested *by themselves*, *e. g.*, if it were suspected that the 9 was wrong, we might test the 7, which stands vertically above it, by placing the slip in the position of the 8th diagram; and then the 1, which stands above the 7, by placing it in the position of the 10th diagram.

When the upper given Number does not contain more than 4 or 5 digits, the above Rule can be easily worked; but, with a really *large* upper given Number, it

will be found convenient to go along each series of products *twice* first summing their *units*-digits, and entering the units-digit of the result in the upper line of the working, and then summing their *tens*-digits. Thus, the Mental Process for the 6th diagram might be as follows: "5 and 7, 12; and 2, 14." Enter the 4, and carry the 1. "5 and 3, 8." Enter it.

In working this form of the Method, the following Rules should be borne in mind:—

In collecting the *units*-digits of a set of products of pairs of digits, remember that, if *one* member of a pair is 1, the units-digit is the *other*: if *one* is 5, the units-digit is 5 or 0, according as the *other* is odd or even: if *one* is 9, the units-digit is 10 *minus* the *other*.

In collecting the *tens*-digits, remember that, if *one* member of a pair is 1, or if the sum of the two members is less than 7, there is *no* tens-digit; if one is 5, the tens-digit is the number of 2's contained in the *other*: if one is 9, the tens-digit is the *other minus* 1.

Many of these Long Multiplication sums will need only *two* lines of working: when a set of products occurs, whose sum contains 3 digits, a *third* line will be needed: when it contains 4, a *fourth*—but this can only happen when the lesser Number contains at least 13 digits: and, when it contains 5, a *fifth* will be needed—but *this* can only happen when the lesser Number contains at least 124 digits, and therefore exceeds a trillion of sextillions!

This Method can easily be applied to the Multiplication of Decimals: all that is needed is to place the slip, to begin with, so that the mark comes vertically above that decimal place to which we wish to carry the working. I will give two examples, exhibiting, in each, first, the sum as set, ready for working; secondly, the state of things just before the slip is shifted for the first time; thirdly, the final state, just before the slip is removed; fourthly, the sum added up.

730·0	341·86

.007973	11
	162146-2685

Hence the Answer to the first sum, correct to 4 places, is .0080; and the Answer to the second, correct to 2 places, is 162146-27.

Chapter II. Long Division, Where Both Quotient and Remainder are Required.

§ 1. Divisors of the form $(10^n \pm 1)$.

Other version:
→ 7.4, p. 1231

Years ago I had discovered the curious fact that, if you put a “0” over the unit-digit of a given Number, which happens to be a multiple of 9, and subtract all along, always putting the remainder over the next digit, the final subtraction gives remainder “0,” and the upper line, omitting its final “0,” is the “9-Quotient” of the given Number (*i. e.*, the Quotient produced by dividing it by 9).

Having discovered this, I was at once led, by analogy, to the discovery that, if you put a “0” *under* the unit-digit of a given Number, which happens to be a multiple of 11, and proceed in the same way, you get an analogous result.

In each case I obtained the Quotient of a Division-sum by the shorter and simpler process of *subtraction*: but, as this result was only obtainable in the (comparatively rare) case of the given Number being an exact multiple of 9, or of 11, the discovery seemed to be more curious than useful.

Lately, it occurred to me to examine cases where the given Number was *not* an exact multiple. I found that, in these cases, the final subtraction yielded a Number which was sometimes the actual Remainder produced by Division, and which always gave materials from which that Remainder could be found. But, as it did not yield the Quotient (or only by a very “bizarre” process, which was decidedly longer and harder than actual Division), the discovery still seemed to be of no practical use.

But, quite lately, it occurred to me to try what would happen if, after discovering the Remainder, I were to put it, instead of a “0,” over or under the unit-digit, and then subtract as before. And I was charmed to find that the old result followed: the final subtraction yielded remainder “0,” and the new line, omitting its units-digit, was the required Quotient.

Now, there are shorter processes for obtaining the 9-Remainder or the 11-Remainder of a given Number, than my subtraction-rule (the process for finding the 11-Remainder is another discovery of mine). Adopting these, I brought my rule to completion on September 28, 1897.

(1) Rule for finding the Quotient and Remainder produced by dividing a given Number by 9.

To find the 9-Remainder, sum the digits; then sum the digits of the result: and so on till you get a single digit. If this be less than 9, it is the required

Remainder: if it be 9, the required Remainder is 0. Throughout this process, 9's may be "cast out" *ad libitum*.

To find the 9-Quotient, draw a line below the given Number and put its 9-Remainder under its unit-digit; then subtract downwards, putting the remainder under the next digit, and so on. If the left-hand end-digit of the given Number be less than 9, its subtraction ought to give remainder "0": if it be 9, it ought to give remainder "1," to be put in the lower line, and "1" to be carried, whose subtraction will give remainder "0." Now mark off the 9-Remainder at the right-hand end of the lower line, and the rest of it will be the 9-Quotient.

Examples:—

$$\begin{array}{r} 9//75309 \quad 6 \\ \hline 83677//3 \end{array} \quad \begin{array}{r} 9//94613 \quad 8 \\ \hline 105126//4 \end{array} \quad \begin{array}{r} 9//58317 \quad 3 \\ \hline 64797//0 \end{array}$$

(2) Rule for finding the Quotient and Remainder produced by dividing a given Number by 11.

To find the 11-Remainder, begin at the units-end, and sum the 1st, 3rd, &c., digits, and also the 2nd, 4th, &c., digits; and find the 11-Remainder of the difference of these sums. If the former sum be the greater, the required Remainder is the number so found: if the former sum be the lesser, it is the difference between this number and 11: if the sums be equal, it is "0."

To find the 11-Quotient, draw a line below the given Number and put its 11-Remainder under its units-digit: then subtract, putting the remainder under the next digit, and so on. The final subtraction ought to give remainder "0." Now mark off the 11-Remainder at the right-hand end of the lower line, and the rest of it will be the 11-Quotient.

Examples:—

$$\begin{array}{r} 11//73210 \quad 8 \\ \hline 66555//3 \end{array} \quad \begin{array}{r} 11//85347 \quad 1 \\ \hline 77588//3 \end{array} \\ \begin{array}{r} 11//59426 \quad 3 \\ \hline 54023//10 \end{array} \quad \begin{array}{r} 11//47568 \quad 4 \\ \hline 43244//0 \end{array}$$

These new Rules have yet another advantage over the Rule of actual Division, viz., that the final subtraction supplies a *test* of the correctness of the result: if it does not give remainder "0," the sum has been done wrong: if it does, then either it has been done right, or there have been *two* mistakes—a rare event.

Mathematicians will not need to be told that rules, analogous to the above, will necessarily hold good for the divisors 99, 101, 999, 1001, &c. The only modification needed would be to mark off the given Number in periods of 2 or more digits, and to treat each period in the same way as the above rules have treated single digits. Here, for example, is the whole of the working needed for dividing 2 given Numbers by 999 and by 10001:—

$$\begin{array}{r|l|l|l|l|l} & & & 2 & | & 437 \\ 999//73 & | & 201 & | & 584 & | & 668 & | & 902 \\ \hline & 73 & | & 283 & | & 868 & | & 537 & // & 439 \end{array}$$

$$\begin{array}{r|l|l|l|l|l} & & & & & 1 & | & 1383 \\ 10001//547 & | & 2915 & | & 0836 & | & 9354 \\ \hline & 547 & | & 2367 & | & 8469 & // & 885 \end{array}$$

In the first of these examples, the $2 \mid 437$, written above, is the sum of the periods. As this contains 2 periods, it is treated in the same way; and the final result, 439, is the 999-Remainder.

In the second, the $1 \mid 2269$, written above, is the sum of the 1st and 3rd periods: the 1383 is the sum of the 2nd and 4th. The difference of these sums is 10886, whose 10001-Remainder is 885.

§ 2. Divisors of the form $(h \cdot 10^n \pm k)$, where at least one of the two numbers, h and k , is greater than 1.

The Method, now to be described, is applicable to three distinct cases:—

Other version:
→ 7.5, p. 1233

- (1) Where $h > 1, k = 1$;
- (2) Where $h = 1, k > 1$;
- (3) Where $h > 1, k > 1$.

With certain limitations of the values of h, k , and n , this Method will be found to be a shorter and safer process than that of ordinary Long Division. These limitations are that neither h nor k should exceed 12, and that, when $k > 1, n$ should not be less than 3; outside these limits, it involves difficulties which make the ordinary process preferable.

In this Method, two distinct processes are required—one, for dealing with cases where $h > 1$, the other, for cases where $k > 1$. The former of these processes was, I believe, first discovered by myself, the latter by my nephew, Mr. Bertram J. Collingwood, who communicated to me his Method of dealing with Divisors of the form $(10^n - k)$.

In what follows, I shall represent 10 by t .

Mr. Collingwood's Method, for Divisors of the form $(t^n - k)$, may be enunciated as follows:—

“To divide a given Number by $(t^n - k)$, mark off from it a period of n digits, at the units-end, and under it write k -times what would be left of it if its last period were erased. If this number contains more than n digits, treat it in the same way; and so on, till a number is reached which does not contain more than n digits. Then add up. If the last period of the result, *plus* k -times whatever was carried out of it, in the adding up, be less than the Divisor, it is the required Remainder; and the rest of the result is the required Quotient. If it be not less, find what number of times it contains the Divisor, and add that number to the Quotient, and subtract that multiple of the Divisor from the Remainder.”

For example, to divide 86781592485703152764092 by 9993 (*i. e.*, by $t^4 - 7$), he would proceed thus:—

9993//	867 8159 2485 7031 5276	4092
	6074 7114 7399 9220	6932
	4 2522 9803 1799	4540
	29 7660 8622	2593
	208 3626	0354
	1458	5382
	1	0206
		7

Quot. $\overline{868\ 4238\ 2153\ 2104\ 0004} // 4106 + 14 = 4120$ Rem.

This new Method will be best explained by beginning with case (3): it will be easily seen what changes have to be made in it when dealing with cases (1) and (2).

The Rule for case (3), when the sign is “-,” may be enunciated thus:—

Mark off the Dividend, beginning at its units-end, in periods of n digits. If there be an overplus, at the left-hand end, less than h , do not mark it off, but reckon it and the next n digits as one period.

To set the sum, write the Divisor, followed by a double vertical; then the Dividend, divided into its periods by single verticals, with width allowed in each space for $(n + 2)$ digits. Below the Dividend draw a single line, and, further down, a double one, leaving a space between, in which to enter the Quotient, having its units-digit below that of the last period but one of the Dividend, and also the Remainder, having its units-digit below that of the last period of the Dividend. In this space, and in the space below the double line, draw verticals, corresponding to those in the Dividend; and make the last in the upper space double, to separate the Quotient from the Remainder.

For example, if we had to divide 5984407103826 by 6997 (*i. e.*, $7.t^3 - 3$), the sum, as set for working, would stand thus:—

6997//	5984	407	103	826	
Quot.					Rem.

To work the sum, divide the 1st period by h ; enter its quotient in the 1st Column below the double line, and place its remainder above the 2nd period, where it is to be regarded as *prefixed* to that period. To the 2nd period, with its prefix, add k -times the number in the 1st Column, and enter the result at the top of the 2nd Column. If this number *is not* less than the Divisor, find what number of times it contains the Divisor, and enter that number in the 1st Column, and k -times it in the 2nd, and then draw a line below the 2nd Column, and add in this new item, deducting from the result t^n -times the number just entered in the 1st Column; and then add up the 1st Column, entering the result in the Quotient. If the number at the top of the 2nd Column *is* less than the Divisor, the number in the 1st Column may be at once entered in the Quotient. The number entered in the Quotient, and the number at the foot of the 2nd Column, are the Quotient and Remainder that would result if the Dividend ended with its 2nd period. Now take the number at the foot of the 2nd Column as a new 1st period, and the 3rd period as a new 2nd period, and proceed as before.

The above example, worked according to this Rule, would stand thus:—

		6	5	3	
6997	5984	407	103	826	
Quot.	855	281	849	6373	Rem.
	854	8969	5946		
	1	3	849		
		1972			
		281			

The Mental Process being as follows:—

Divide the 5984 by 7, entering its Quotient, 854, in the 1st Column, and placing its Remainder, 6, above the 2nd period. Then add, to the 6407, 3-times the 854, entering the result in the 2nd Column, thus: "7 and 12, 19." Enter the 9, and carry the 1. "1 and 15, 16." Enter the 6, and carry the 1. "5 and 24, 29." Enter the 9, and carry the 2, which, added to the prefix 6, makes 8, which also you enter. Observing that this 8969 *is not* less than the Divisor, and that it contains the Divisor *once*, enter 1 in the 1st Column, and 3-times 1 in the 2nd, and then draw a line below, and add in this new item, remembering to deduct from the result 7-times t^3 , *i. e.*, 7000: the result is 1972. Then add up the 1st Column, as far as the double line, and enter the result, 855, in the Quotient. Now take the 1972 as a new 1st period, and the 3rd period, 103, as a new 2nd period, and proceed as before, thus: Draw a double line below the 1972, and divide it by 7, entering its Quotient, 281, below it, and its Remainder, 5, above the 3rd period. Then add, to the 5103, 3-times the 281, entering the result, 5946, in the 3rd column; and observe that this *is* less than the Divisor. Then add up the 2nd Column, as far as its lowest double line, and enter the result, 281, in the Quotient. Now take the 5946 as a new 1st period, and the final period, 826, as a new 2nd period, and proceed as before, thus: Draw a double line below the 5946, and divide it by 7, entering the Quotient, 849, below it, and the Remainder, 3, above the final period. Now add, to the 3826, 3-times the 849, entering the result, 6373, which you can foresee *will be* less than the Divisor, as the Remainder. Then add up the 3rd Column, as far as its lowest double line, and enter the result, 849, as the final period of the Quotient.

It may be well to explain the real effect of the three processes described in the 5th sentence of the preceding paragraph, *viz.*, (1) "enter 1 in the 1st Column"; (2) "enter 3 times 1 in the 2nd Column"; (3) "add in this new item, remembering to deduct from the result 7000." The effect of (2) and (3), combined, is to *increase* the 2nd Column by 3 and to *diminish* it by 7000; *i. e.*, to *diminish* it by $(7000 - 3)$, which is 6997. And the effect of (1) is to account for this 6997, which has been thus deducted from the Remainder (thus reducing it to the *true* Remainder), by adding 1 to the Quotient (thus raising it to the *true* Quotient).

The Rule for case (3), when the sign is "+," may be deduced from the above Rule by simply changing the sign of k . This will, however, introduce a new phenomenon, which must be provided for by the following additional clause:—

When you add to the 2nd period with its prefix $(-k)$ -times the number in the 1st Column, *i. e.*, when you *subtract* k -times this number *from* the 2nd period with its prefix, it will sometimes happen that the subtrahend exceeds the minuend. In this case the subtraction will end with a *minus* digit, which may be indicated by an asterisk. Now find what number of Divisors must be added to the 2nd Column to cancel this *minus* digit, and enter that number, marked with an asterisk, in the 1st Column, and that multiple of the Divisor in the 2nd; and then draw a line below the 2nd Column, and add in this new item.

As an example, let us take a new Dividend, but retain the previous Divisor, changing the sign of k , so that it will become 7003 (*i. e.*, $7 \cdot t^3 + 3$). The sum, as set for working, would stand thus:—

7003	6504	318	972	526	
Quot.	_____	_____	_____	_____	Rem.

After working, it would stand thus:—

		1	4	5	
7003	6504	318	972	526	
Quot.	928	790	371	4413	Rem.
	929	2*531	2602		
	1*	7 003	371		
		5 534			
		790			

the Mental Process being as follows:—

Divide the 6504 by 7, and enter the Quotient, 929, in the 1st Column, and the Remainder, 1, above the 2nd period. Then subtract, from the 1318, 3-times the 929, entering the result in the 2nd Column, thus: “27 from 8 I can’t, but 27 from 28, 1.” Enter the 1, and carry the borrowed 2. “8 from 1 I can’t, but 8 from 11, 3.” Enter the 3, and carry the borrowed 1. “28 from 3 I can’t, but 28 from 33, 5.” Enter the 5, and carry the borrowed 3. “3 from 1, *minus* 2.” Enter it, with an asterisk. Observing that, to cancel this *minus* 2, it will suffice to add *once* the Divisor, enter a (–1) in the 1st Column, and 7003 in the 2nd; and then draw a line below the 2nd Column, and add in this new item: the result is 5534. Then add up the 1st Column, and enter the result, 928, in the Quotient. Now take the 5534 as a new 1st period, and the third period, 972, as a new 2nd period, and proceed as before, thus: Draw a double line below the 5534, and divide it by 7, entering the Quotient, 790, below it, and the Remainder, 4, above the 3rd period. Then subtract, from the 4972, 3-times the 790, entering the result, 2602, in the 3rd Column; and observe that this *does not* contain a *minus* digit. Then add up the 2nd Column, as far as its lowest double line, and enter the result, 790, in the Quotient. Now take the 2602 as a new 1st period, and the final period, 526, as a new 2nd period, and proceed as before, thus. Draw a double line below the 2602, and divide it by 7, entering the Quotient, 371, below it, and the Remainder, 5, above the final period. Then subtract, from the 5526, 3-times the 371, entering the result, 4413, which you can foresee will be less than the Divisor, as the Remainder. Then add up the 3rd Column, as far as its lowest double line, and enter the result, 371, as the final period of the Quotient.

The Rules for case $\lfloor(1)\rfloor^1$ may be derived, from the above, by making $k = 1$; and those for case $\lfloor(2)\rfloor^2$ by making $h = 1$. I will give worked examples of these; but it will not be necessary to give the Mental Processes.

By making $k = 1$, we get Divisors of the form $(h \cdot t^n \pm 1)$: let us take $(11t^4 - 1)$ and $(6t^5 + 1)$

		9	10	4	
109999	107523	8168	9662	0985	
Quot.	9774	9813	0861	41846	Rem.
	9774	107942	119474		
		9812	1		
		1	9475		
			861		

¹mistakenly (2)

²mistakenly (3)

600001		3	7239	51798	2 6004	13825	
Quot.			1206	58431	9 4595	219230	Rem.
				350592			
				58432			
				1*			

In this last example there is no need to enter the Quotient, produced by dividing the 7239 by 7, in the 1st Column; we easily foresee that the number at the top of the 2nd Column *will be* less than the Divisor, so that there will be no new item in the 1st: hence we at once enter the 1206 in the Quotient.

By making $h = 1$, we get Divisors of the form $(t^n \pm k)$: let us take $(t^4 - 7)$ and $(t^5 + 12)$.

9993	867	8159	2485	7031	5276	4092	
Quot.	868	4238	2153	2104	0004	4120	Rem.

	1*	10 0012	9 00108	
		7 5831	463	
		9*		

The first of these two sums is the one I gave to illustrate Mr. Collingwood's Method of working with Divisors of the the form $(t^n - k)$.

It may interest the reader to see the three methods of working the above example—ordinary Division, Mr. Collingwood's Method, and my version of it—compared as to the amount of labour which each entails in the working:—

	Ordinary Division.	Mr. C's Method.	My version of it.
Digits written	202	82	44
Additions, or Subtractions	204	97	25
Multiplications	0	70	22

I am assuming that any one, working this example by ordinary Division, would begin by making a table of Multiples of 9993 for reference: so that he would have *no* Multiplications to do. Still, the great number of digits he would have to write, and of Additions and Subtractions he would have to do, involving a far greater risk of error than either of the other Methods, would quite outweigh this advantage.

By whatever process a Question in Long Division has been worked, it is very desirable to be able to test, easily and quickly, the correctness of the Answer. The ordinary test is to multiply together the Divisor and Quotient, add the Remainder, and observe whether these together make up the given Number, as they ought to do.

Thus, if N be the given Number, D the given Divisor, Q the Quotient, and R the Remainder, we ought to have

$$N = D \cdot Q + R.$$

This test is specially easy to apply, when $D = (h \cdot t^n \pm k)$, for then we ought to have

$$\begin{aligned} N &= (h \cdot t^n \pm k) \cdot Q + R; \\ &= (h \cdot Q \cdot t^n + R) \pm kQ. \end{aligned}$$

Now $hQ \cdot t^n$ may be found by multiplying Q by h , and tacking on n ciphers. Hence $(hQ \cdot t^n + R)$ may be found by making R occupy the place of the n ciphers. If R contains less than n digits it must have ciphers prefixed; if more, the overplus must be carried on into the next period, and added to hQ .

Having found our "Test," viz. $(hQ \cdot t^n + R)$, we can write it on a separate slip of paper, and place it below the working of the example, so as to come vertically below n , which is at the top. When the sign in D is " $-$," we must add kQ to N , and see if the result = T ; when it is " $+$ " we must add kQ to T , and see if the result = N .

Now it has been already pointed out that when, in the new Method, the 1st and 2nd Columns have been worked, the 1st period of the Quotient and the number at the foot of the 2nd Column are the Quotient and Remainder that would result if the Dividend ended with its 2nd period. Hence the Test can be at once applied, before dealing with the 3rd Column. This constitutes a very important new feature in my version of Mr. Collingwood's Method. Every two adjacent Columns contain a separate Division-sum, which can be tested *by itself*. Hence, in working my Method, as soon as I have entered the 1st period of the Quotient, I can test it, and, if I have made any mistake, I can correct it. But the hapless computator, who has spent, say, an hour in working out some gigantic sum in Long Division—whether by the ordinary process or by Mr. Collingwood's Method—and who has chanced to get a figure wrong at the very outset, which makes every subsequent figure wrong, has no warning of the fatal error till he has worked out the whole thing "to the bitter end," and has begun to test his Answer. Whereas, if working by *my* Method, he would have been warned of his mistake almost as soon as he made it, and would have been able to set it right before going any further.

As an aid to the reader, I will give the Mental Process in full, for the 2nd and 3rd Columns of the first of the examples worked above.

The Divisor is 6997 (where $h = 7$, $k = 3$). Here you are supposed to have just entered the 281 in the Quotient. The Dividend, for these two columns, is 1972 | 103; the Quotient is 281, and the Remainder 5946. The Test is $hQ \cdot t^n + R$ (*i. e.*, $7 \times 281000 + 5946$), the Mental Process being as follows: Write down, on a separate slip of paper, the last three digits of R , viz., 946, and carry the 5 into the next period, adding it to the 7×281 , thus, "5 and 7, 12." Enter the 2, and carry the 1. "1 and 56, 57." Enter the 7, and carry the 5. "5 and 14, 19." Enter it. Having got your Test, try whether $(N + kQ)$ is equal to it. This you compute, comparing it with your Test, digit by digit, as you go on, thus, "3 and 3, 6." Observe it in

	6	5
	407	103
	281	
	8969	5946
	3	
	1972	
	281	
Test	1972	946

the Test. “0 and 24, 24.” Observe the 4, and carry the 2. “3 and 6, 9.” Observe it. “1972 and 0, 1972.” Observe it. The Test is satisfied.

For Divisors of the form $(t^n \pm k)$ there is no need to write out the Test: the numbers, which compose it, already occur in the working, and may be used as they stand.

Chapter III.

Long Division, Where Remainder is Required, but not Quotient.

§ 1. Divisors of the form $(t^n \pm 1)$.

The Methods here required were described in the last Chapter, § 1, as processes preliminary to that of finding the Quotient.

For Divisors of the other forms there discussed, the methods, for finding Quotient and Remainder, can of course be used for finding Remainder only: the only cases which we need consider here are those in which, owing to the Quotient *not* being required, these Methods are capable of abridgment.

§ 2. Divisors of the form $(ht \pm 1)$.

Here the Methods, described in the last Chapter, § 2, may be abridged by leaving out all the written work below the double line.

As examples of this abridged Method, let us take 27910385642558361 as our Dividend, and find its 29-Remainder, and its 71-Remainder.

The first, when worked, stands thus:—

$$29 \parallel \underline{279103856425583611} \text{ Rem. } 2,$$

the Mental Process being as follows: Begin by dividing 27 by 3, and adding its quotient, 9, to the number made up by prefixing its remainder, 0, to the next digit, 9: *i. e.*, you say “9 and 9, 18.” Then divide this 18 by 3, and add its quotient, 6, to the number made up by prefixing its remainder, 0, to the next digit, 1: *i. e.*, say, “6 and 1, 7.” Then say, “2 and 10, 12; 4 and 3, 7; 2 and 18, 20; 6 and 25, 31.” Here you “cast out” a 29, and say “which gives 2.” To this you tack on the next digit, 6, and proceed thus: “8 and 24, 32; which gives 3; 1 and 2, 3; 1 and 5, 6; 2 and 5, 7; 2 and 18, 20; 6 and 23, 29: which gives 0; 2 and 1, 3; 1 and 1, 2.”

The second, when worked, stands thus:—

$$71 \parallel \underline{279103856425583611} \text{ Rem. } 68,$$

the Mental Process being as follows: Begin by dividing 27 by 7, and subtracting its quotient, 3, from the number made up by prefixing its remainder, 6, to the next digit, 9: *i. e.*, you say “3 from 69, 66.” Then divide this 66 by 7, and subtract its quotient, 9, from the number made up by prefixing its remainder, 3, to the next digit, 1; *i. e.*, say “9 from 31, 22.” Then say “3 from 10, 7; 1 from 3, 2; 0 from 28, 28; 4 from 5, 1; 0 from 16, 16; 2 from 24, 22; 3 from 15, 12; 1 from 55, 54; 7 from 58, 51; 7 from 23, 16; 2 from 26, 24; 3 from 31, 28; 4 from 1, I can’t, but” (here you throw in an extra Divisor) “4 from 72, 68.”

§ 3. Powers of 10.

The 10-Remainder is the last digit: the 10^2 -Remainder is the number composed of the last 2 digits; and so on.

These Remainders will serve as trial-dividends for all numbers whose factors are powers of the factors of 10, viz., 2 and 5. Thus the 32-Remainder may be found by taking the number composed of the last 5 digits, and dividing by 32. Similarly, 80 is $2^4 \times 5$: hence the 10^4 -Remainder will serve for it.

§ 4. Factors of Divisors of the form $(ht \pm 1)$.

The 21-Remainder will serve as a trial-dividend for 7 (the factor, 3, is also a factor of 9). But this Remainder is (owing to the small value of h , which constantly gives a subtrahend greater than the minuend) so troublesome to find, that I should prefer to find the 7-Remainder by ordinary Division.

The 39-Remainder will serve for 13; the 51 for 17; the 69 for 23.

sign same as given quantity.

$a^2 + 2ab + b^2.$

$a^2 - 2ab + b^2.$

$a^3 + 3a^2b + 3ab^2 + b^3.$

$a^3 - 3a^2b + 3ab^2 - b^3.$

$a^n + n \cdot a^{n-1}b + \&c.$ Index of a decreases while that of b increases. Coefficient of each term is formed from preceding by multiplying together coefficient and index of a and dividing by place of term. Signs all “+”.

$a^n - n \cdot a^{n-1}b + \&c.$, as before. Signs alternately “+” and “-”.

collect the terms into 2 brackets, and proceed as before.

divide each index by index of required root.

$x^{\frac{a}{n}} \cdot y^{\frac{b}{n}} \cdot z^{\frac{c}{n}} \cdot \&c..$
 $x^{\frac{1}{n}}.$

sign of answer is “+” or “-”.

root does not really exist.

sign same as given quantity.

divide out all monomial factors, placing them outside a bracket. For the factor within the bracket try the following formulæ.

has no factors.

$(a + b) \cdot (a - b).$

$(a + b) \cdot (a^2 - ab + b^2).$

$(a - b) \cdot (a^2 + ab + b^2).$

$(a + b) \cdot (a^n - a^{n-1}b + \&c.)$ Index of a decreases while that of b increases. Signs alternately “+” and “-”.

$(a - b) \cdot (a^n + a^{n-1}b + \&c.)$, as before. Signs all “+”.

$(a + b)^2.$

$(a - b)^2.$

$A \cdot (x + \frac{B+K}{2A} \cdot y) \cdot (x + \frac{B-K}{2A} \cdot y).$

take each factor that occurs in *all*, with *lowest* index it bears.

take each factor that occurs, with *highest* index it bears.

G. C. M. of binomials, &c.:—

(α) two quantities:—

(1) general rule

(2) particular rules:—

(a) when a factor is observed in *one* of the quantities

(b) when in *both*

(c) when first term of divisor will not exactly divide that of dividend

(β) three or more quantities

L. C. M. of binomials, &c.:—

(α) two quantities

(β) three or more quantities

arrange both in order of indices of some one letter, bracketing coefficients of any terms which contain the same power of it: then divide greater by less, and divisor by remainder, and so on till there is no remainder: the last divisor is the G. C. M.

divide it out.

divide out, and multiply the answer by it

find L. C. M. of their coefficients, and multiply dividend by such a number as will raise coefficient of first term to this L. C. M.: but first try whether this multiplier, or any factor of it, will divide divisor.

find G. C. M. of the first two; then G. C. M. of answer and third quantity, and so on.

product divided by G. C. M.

find L. C. M. of first two; then L. C. M. of answer and third quantity, and so on.

for the Use of Candidates for Responsions

G. C. M.:—

(α) two numbers

(β) three or more numbers

L. C. M.:—

(α) two numbers

(β) three or more numbers

Vulgar Fractions:—

(α) to multiply by integer

(β) to divide by integer

(γ) to multiply by fraction

(δ) to divide by fraction

Decimal Fractions:—

(α) to multiply together:—

(1) rule for multiplying

(2) rule for pointing answer

(β) to divide one by another:—

(1) rule for dividing

(2) rule for pointing answer:—

(a) if dividend has *more* decimal places than divisor

(b) if *as many*

(c) if *less*

Circulating Decimals, to reduce to vulgar Fractions

divide greater by less, and divisor by remainder, and so on till there is no remainder. The last divisor is the G. C. M. find G. C. M. of first two; then G. C. M. of answer and third number; and so on.

product divided by G. C. M.

divide out all primes which are factors of 2 or more of them; then multiply together remaining numbers and primes so divided out.

multiply numerator.

multiply denominator.

multiply numerators for new numerator, and denominators for new denominator. invert divisor, and proceed as in multiplication.

multiply as in whole numbers.

mark off in answer so many decimal places as there are in all the factors together.

divide as in whole numbers, annexing ciphers to decimal part of dividend if necessary.

mark off in answer so many places as difference denotes.

answer is integer.

answer is integer; annex so many ciphers as difference denotes.

for numerator, take to end of first circulating period, subtracting from it non-circulating period; for denominator, take so many nines, as there are figures that circulate, and so many ciphers as there are figures that do not.

Tables of Weights, &c.

Avoirdupois Weight:—

|

Dram (*dr.*)

16	Drams	= 1 Ounce (<i>oz.</i>)
16	Ounces	= 1 Pound (<i>lb.</i>)
28	Pounds	= 1 Quarter (<i>qr.</i>)
4	Quarters	= 1 Hundredweight (<i>cwt.</i>)
20	Hundredweights	= 1 Ton.

Troy Weight:—

		Grain (<i>gr.</i>)
24	Grains	= 1 Pennyweight (<i>dwt.</i>)
20	Pennyweights	= 1 Ounce (<i>oz.</i>)
12	Ounces	= 1 Pound (<i>lb.</i>)

Apothecaries' Weight:—

		Grain (<i>gr.</i>)
20	Grains	= 1 Scruple (<i>scr.</i>) = 1 _
3	Scruples	= 1 Dram (<i>dr.</i>) = 1 _
8	Drams	= 1 Ounce (<i>oz.</i>) = 1 _
12	Ounces	= 1 Pound (<i>lb.</i>)

Miscellaneous Weight:—

14	Pounds (Avoird.)	= 1 Stone (<i>st.</i>)
7000	Grains (Troy)	= 1 Pound (Avoird.)
<i>gr., oz., lb.</i>		are same in Troy and Apoth. Weight.

Length:—

		Barleycorn.
3	Barleycorns	= 1 Inch (<i>in.</i>)
12	Inches	= 1 Foot (<i>ft.</i>)
3	Feet	= 1 Yard (<i>yd.</i>)
220	Yards	= 1 Furlong.
8	Furlongs, or	} = 1 Mile (<i>m.</i>)
1760	Yards	
3	Miles	= 1 League.

Surface:—

		Square Inch.
12 × 12	Square Inches	= 1 Square Foot.
3 × 3	Square Feet	= 1 Square Yard.
4840	Square Yards	= 1 Acre.
640	Acres, or	} = 1 Square Mile
1760 × 1760	Square Yards	

Solid Contents:—

$12 \times 12 \times 12$ $3 \times 3 \times 3$	Cubic Inch. Cubic Inches = 1 Cubic Foot. Cubic Feet = 1 Cubic Yard.
---	---

Miscellaneous Lengths:—

4	Inches = 1 Hand.
2	Yards, or
6	Feet } = 1 Fathom.
$5\frac{1}{2}$	Yards = 1 Rod, Pole, or Perch.
40	Poles = 1 Furlong.

Proportion:—

if $a : b :: c : d$,
 values of a, b, c, d , each in terms of the other three, are

Proportional parts: to divide a given number into parts which shall be proportional to certain other given numbers

$$\frac{bc}{d}, \frac{ad}{c}, \frac{ad}{b}, \frac{bc}{a}.$$

divide by sum of given numbers and multiply by each separate.

Simple Interest, and Discount:—

let P = Principal, or Present value of future debt,

T = Time (in years),

R = Rate per cent,

D = Interest on principal, or Discount on future debt,

F = Future amount of Principal, or Future debt;

then,

(α) Interest on £100=

(β) Amount of £100=

(γ) formula connecting P, D, F

(δ) P, T, R, D

(ε) P, T, R, F

$$T \times R.$$

$$£100 + T \times R.$$

$$P + D = F.$$

$$\text{as } £100 : P :: T \times R : D.$$

$$\text{as } £100 : P :: £100 + T \times R : F.$$

Compound Interest:—

given Principal, Time and Rate:

(α) to find Amount

(β) Interest

=

find Amount of £1 in one year: multiply Principal by this so many times as there are years.
Amount minus Principal.

Stocks:—

let S = amount of Stock,

R = Rate per cent.,

Y = Yearly income,

M = Market price of £100 Stock,

C = Cash value of amount of Stock,

formula connecting these

as £100 : S :: R : Y :: M : C

Part 9

Other Mathematical Texts

9.1 Notes on the First Part of Algebra

Source: Notes on the First Part of Algebra

(i. e. To Simple Equations Inclusive.)

Designed for Candidates for Responsions.

Preface

The following List of Subjects with its accompanying Cycle has been drawn up as a guide to the Student in choosing examples to work. They are so arranged as to secure his giving the most attention to those which are most important. Space has been left at the end of the Cycle for recording, at the close of each day's work, the point reached in it.

To illustrate the use of this Cycle, we will suppose 40 to be the last entry made in this space. Looking to No. 41 in the Cycle, the Student finds 8ξ , which the List explains as "simplifying continued fractions:" he turns to his book of examples for some of this kind, and, after working one or two, goes on to No. 42 of the Cycle, against which he finds 13α , which the List explains as "Involution of single term: integral coefficient," and so on till he has reached (say) No. 47 of the Cycle. He then enters 47 in the space at the end, to serve as a guide in beginning work next time.

If this List and Cycle be thought to be too complicated for convenient use, they may be simplified by disregarding the small Greek letters, and attending to the numerals only. In this case the Student may begin the Cycle again after reaching No. 113.

A few Rules, which ought to be committed to memory, are added at the end.

N.B. The Student is recommended to draw a line down the margin of the "List of Subjects," to mark how far he has got in learning the subject; and in using the Cycle, he will of course select only those examples which fall within the range so marked.¹

¹Remark: "List of Subjects" and "Cycle for Working Examples" omitted here

Rules to be Committed to Memory

N.B. By covering the lower part of the page, the Student may test for himself his recollection of these rules.

- Addition,
 when all the signs are alike. (2)
 when some are +, and some -. (3)
- Subtraction,
 when the signs are alike, and the upper quantity largest. (4)
 when this is not the case. (5)
- Brackets, to put on or take off.
 when the sign outside the bracket is +. (6)
 when it is -. (7)
- Multiplication and Division,
 as to indices:
 $a^m \times a^n =$ (8)
 $a^m \div a^n =$ (9)
 as to signs:
 when the signs of the 2 quantities are alike. (10)
 when they are different. (11)
- Resolving into factors,
 when the quantity is of the form $(a^2 - b^2)$. (12)
 $(a^2 + b^2)$. (13)
 $(a^3 - b^3)$. (14)
 $(a^3 + b^3)$. (15)
 $(a^2 + 2ab + b^2)$. (16)
 $(a^2 - 2ab + b^2)$. (17)
- G. C. M. (particular cases,)
 when a factor is observed which will divide one of the quantities,
 but not the other. (18)
 when a factor is observed which will divide both quantities.
 (19)

²add all the terms together, and bring down the sign.

³add all the + terms together, and add all the - terms together: and set down the *difference* of the 2 results, with the sign of the *greater*.

⁴subtract, and bring down the sign.

⁵change the sign of the lower quantity, and proceed as in Addition.

⁶leave the signs of all terms within the bracket unchanged.

⁷change the signs of all terms within the bracket.

⁸ $= a^{m+n}$.

⁹ $= a^{m-n}$.

¹⁰the sign of the result is +.

¹¹the sign of the result is -.

¹²it $= (a + b) \cdot (a - b)$.

¹³it cannot be resolved.

¹⁴it will divide by $(a - b)$.

¹⁵is will divide by $(a + b)$.

¹⁶it $= (a + b)^2$.

¹⁷it $= (a - b)^2$.

¹⁸divide it out of that quantity.

¹⁹divide it out of both, and multiply the answer by it.

when the first term of the divisor will not exactly divide the first term of the dividend. (20)

Theory of negative indices, and of a^0

$$a^{-m} = \tag{21}$$

$$a^0 = \tag{22}$$

Involution and Evolution,

$$a^{m^n} = \tag{23}$$

$$\text{the } n\text{th root of } a^m, \text{ i. e. } \sqrt[n]{a^m} = \tag{24}$$

$$\text{hence, the } n\text{th root of } a, \text{ i. e. } \sqrt[n]{a} \tag{25}$$

²⁰find the L. C. M. of coefficients of these 2 terms, and multiply the dividend by such a quantity as will raise the coefficient of its first term to this L. C. M.

²¹ $= \frac{1}{a^m}$.

²² $= 1$.

²³ $= a^{mn}$.

²⁴ $= a^{\frac{m}{n}}$.

²⁵ $= a^{\frac{1}{n}}$.

9.2 A Guide to the Mathematical Student

Source: General List of Subjects (without preface); A Guide to the Mathematical Student

Preface

The object of the following pages is twofold:—

First, to exhibit, in a compendious form, the whole subject-matter of Pure Mathematics, arranged in the order in which it would usually be advisable that the student should go through it. This Syllabus may be useful as an aid in laying out plans of reading and reviewing, and in shewing the student at a glance where he is on his course, how much is done, and how much remains to be done.

Secondly, to furnish a guide for working examples in the whole subject, so arranged as to secure that the most important subjects shall have the largest share of attention. The Cycle intended for this purpose consists of two columns: one containing the numbers from 1 to 1702, the other, references to the Syllabus. It is intended that the student using it should turn to the Syllabus for each reference, and work two or three examples in the subject there indicated, (of course passing over all references to subjects he has not read,) and at the end of each day's work mark what point in the Cycle he has reached.

In the Syllabus, the small figures to the left of the line indicate how often each subject is referred to in the Cycle: so that if the teacher should consider that the examples assigned to any subject are either too many or too few, he can remedy the defect by erasing references in the Cycle, or by inserting additional ones.

The present attempt is, no doubt, deficient and faulty in many respects: and any suggestions from Mathematical teachers for remedying its defects will be gratefully received by the compiler.

December, 1864.*

General List of Subjects

30	A. Arithmetic.
20	B. Euclid I, II.
75	C. Algebra; to Quadratic Equations.
23	D. Euclid III, IV.
45	E. Algebra; from Quadratic Equations to Binomial Theorem. ¹
16	F. Euclid V, VI.
114	G. Linear Algebraical Geometry. Plane do. to end of Trigonometry (1st time).
45	H. Geometrical Conic Sections.
100	I. Algebra; from Binomial Theorem to Theory of Equations.
45	J. Higher Plane Pure Geometry.
110	K. Plane Algebraical Geometry; from end of Trigonometry to Quadratic Loci (constructed from Geometrical prop- erties).
24	L. Plane Algebraical Geometry; Trigonometry (2nd time).

120	M. Plane Algebraical Geometry; Quadratic Loci (constructed from Equations).
135	N. Differential Calculus (1st time).
19	O. Calculus of Finite Differences (1st time).
20	P. Euclid XI, XII, and higher Solid Pure Geometry.
22	Q. Solid Algebraical Geometry; to end of Stereometry.
65	R. Solid Algebraical Geometry; from end of Stereometry to Quadratic Superficial Loci (constructed from Geometrical properties).
37	S. Higher Plane Algebraical Geometry.
135	T. Integral Calculus (1st time).
45	U. Solid Algebraical Geometry; Quadratic Superficial Loci (constructed from Equations).
77	V. Higher Algebra.
145	W. Differential Calculus (2nd time).
102	X. Integral Calculus (2nd time).
25	Y. Calculus of Finite Differences (2nd time).
35	Z. Calculus of Variations.

Subjects Subdivided

A.

Arithmetic.

1	1. Addition, Subtraction, Multiplication, and Division; (Simple.)
2	2. Greatest Common Measure and Least Common Multiple.
2	3. Square root and Cube root.
3	4. Vulgar Fractions; addition, subtraction, multiplication, and division.
3	5. Decimal Fractions; addition, subtraction, multiplication, and division.
2	6. Circulating Decimals.
1	7. Reduction from one denomination to another.
1	8. Addition, Subtraction, &c. (Compound).
3	9. Reduction of Fractions (vulgar and decimal) of higher denomination to lower; and of lower denomination to fractions (vulgar and decimal) of higher.
1	10. Practice.
2	11. Mensuration, Superficial and Solid.
1	12. Duodecimals.
2	13. Rule of Three; Direct, Inverse, and Double. Proportional parts.
3	14. Interest, Simple and Compound. Discount. Equation of payments. Stocks.
4	15. Miscellaneous, viz.: Exchange. Profit and Loss. Partnership, &c.

C.

Algebra; to Quadratic Equations.

2	1. Addition, Subtraction, Multiplication, and Division.
2	2. Greatest Common Measure and Least Common Multiple.
5	3. Fractions.
3	4. Involution and Evolution.
4	5. Fractional Indices.
9	6. Equations, one unknown quantity; Simple.
10	7. do. do. Quadratic.
6	8. do. two or more unknown quantities; Simple.
6	9. do. do. Quadratic.
	Problems leading to Equations,
5	10. One unknown quantity; Simple.
6	11. do. Quadratic.
5	12. Two or more unknown quantities; Simple.
6	13. do. Quadratic.
2	14. Theory of Equations (1st time).
4	15. Miscellaneous.

D.

Euclid III, IV.

	1. Book III.
	2. Book IV.
6	3. Deductions from Book III. Problems.
8	4. do. do. Theorems.
4	5. do. Book IV. Problems.
5	6. do. do. Theorems.

E.

Algebra; from Quadratic Equations to Binomial Theorem.

2	1. Inequalities.
6	2. Ratio, Proportion, and Variation.
9	3. Series; Arithmetical, Geometrical, and Harmonical.
9	4. Permutations and Combinations.
5	5. Binomial Theorem.

- 6 | 6. Logarithms, use of.
- 4 | 7. Chances (1st time).
- 4 | 8. Miscellaneous.

F.

Euclid V, VI.

- 1. Book V.
- 2. Book VI.
- 8 | 3. Deductions from Book VI. Problems.
- 8 | 4. do. do. Theorems.

G.

Linear Algebraical Geometry.

Plane do. to end of Trigonometry (1st time).

Linear Algebraical Geometry.

- 5 | 1. Representation and discussion of lengths absolute.
- 2. do. do. do. with direction.
- 3. do. of positions of Points by means of lengths; and discussion of such lengths.
- 3 | 4. Interpretation of Equations; and discussion of Points.

Plane Algebraical Geometry.

- 5 | 5. Representation and discussion of magnitudes absolute.
- 6. do. do. do. with direction.
- 7. Goniometry: i. e., representation of angles, with direction, by means of ratios; and discussion of such ratios.
- 12 | 8. Angles; relations between goniometrical ratios of an angle.
- 6 | 9. do. goniometrical ratios of particular angles.

9.3 The Science of Betting

November 19, 1866

Source: Pall Mall Gazette, November 19, 1866 (also reprinted in the *Times*, November 20, 1866,

<https://www.thetimes.co.uk/archive/article/1866-11-20/9/12.html>)

A similar letter to *Bell's Life* in May 1857 was not published, just acknowledged.

To the EDITOR *of the* PALL MALL GAZETTE

SIR,—The magical system of betting, the secret of which Messrs. H. and J. Smith offer to the world on such reasonable terms, has probably been known, and practised, ever since betting has been in existence. It is applicable to almost every event on which bets are made, and it may be mathematically demonstrated that, provided all the bets are paid, winning is a certainty. I chanced upon the principle myself some years ago, and, in the hope that it may serve to deter some from throwing away their money, I now beg to offer it to your readers gratis.

The rule may be stated thus:—“Write all possible events in a column, placing opposite to each the odds offered against it: this will give two columns of figures. For the third column add together the odds in each case, and find the least common multiple of all the numbers in this column. For the fourth column divide this least common multiple by the several numbers in the third column. For the fifth and sixth columns multiply the original odds by the several numbers in the fourth column. These odds are to be given, or taken, according as the sum total of the sixth column is greater or less than the least common multiple.” The last two columns give the *relative amounts* to be invested in each bet.

	1	2	3	4	5	6
A	2	to 3	5	12	24	to 36
B	4	to 1	5	12	48	to 12
C	5	to 1	6	10	50	to 10
D	9	to 1	10	6	54	to 6
The Field	14	to 1	15	4	56	to 4

An example will make this clear. Suppose that in a race about to be run there are four horses in the betting, the odds being 3 to 2 *on* the favourite, which is equivalent to 2 to 3 *against*. The least common multiple of the third column is 60, and the sum total of the last 68, and as this is *greater* than 60, the odds in this case are all to be *given* in the *relative amounts* given in the fifth and sixth columns. Suppose, for example, that I multiply these columns by 10, and make the bets in pounds; that is, I *take* £360 to £240 on A., I *give* £480 to £120 against B., and so on. Now suppose C. to win the race; in this case I lose £500, and win £(360 + 120 + 60 + 40) = £580. It will be found on trial that I win the same sum, £80, in each of the five events.

If all betting men tried to work this system, they would either be all offering odds or all taking odds on each event, and so no bets could be made. But the fact that this system of winning is *ever* possible arises from the odds being unevenly adjusted, so that they do not represent the real chances of the several events. Supposing this system to be applied only in cases where the odds were evenly adjusted, the sum total of the sixth column would always be equal to

the least common multiple, and thus, whether the odds were given or taken, the concluding entry in every betting-book would be “Gain=Loss=Nil”—a most desirable result,—I am, Sir, your obedient servant,

To the EDITOR of the PALL MALL GAZETTE

SIR,—In the arithmetical example of the rule which I sent you on this subject, 30 should have been given instead of 60 as the least common multiple. The mistake does not affect the validity of the rule, as *any* common multiple will serve the purpose.—I am your obedient servant,

*Charles L. Dodgson,
Ch. Ch., Oxford.*

To the Editor of the Times

Sir,—As you have thought my communication to the *Pall-mall Gazette* on the above subject worth republishing in your columns, will you allow me to correct a mistake in the arithmetical example? It should stand thus:—

	1.		2.		3.		4.		5.		6.
A	2	to	3	...	5	...	6	...	12	to	18
B.....	4	to	1	...	5	...	6	...	24	to	6
C.....	5	to	1	...	6	...	5	...	25	to	5
D.....	9	to	1	...	10	...	3	...	27	to	3
The Field	14	to	1	...	15	...	2	...	28	to	2

The least common multiple of the third column is 30, not 60. The truth of the rule is not affected by this, as any common multiple would serve the purpose. I am, Sir, your obedient servant,

*Charles L. Dodgson.

9.4 An Elementary Treatise on Determinants

Source: An Elementary Treatise on Determinants

with Their Application to Simultaneous Linear Equations and Algebraical Geometry

Preface

Of the seventy Propositions contained in the following treatise, ten are substantially taken from Baltzer's treatise on Determinants; also the Geometrical Tests, given in Chapter VIII, are to be found in most works on Algebraical Geometry: the rest of the matter is, so far as I know, original, and consists of a series of Propositions which the object I had in view obliged me to introduce. That object was to present the subject as a continuous chain of argument, separated from all accessories of explanation or illustration, a form which I venture to think better suited for a treatise on exact science than the semi-colloquial semi-logical form often adopted by Mathematical writers. I say 'semi-logical' advisedly, for nothing is more easy than to forget, in an argument thus interwoven with illustrative matter, what has, and what has not, been proved.

With this object in view I have introduced all such explanation and illustration as seemed necessary for a beginner, either in the form of footnotes, or, where that would have occupied too much room, of Appendices.

New words and symbols are always a most unwelcome addition to a Science, especially to one already burdened with an enormous vocabulary, yet I think the Definitions given of them will be found to justify their introduction, as the only way of avoiding tedious periphrasis. The symbols employed to represent the single elements of a Determinant, $(1)2, (1)3, \&c.$ require perhaps a word of apology, and it may be well to enumerate those already in use, and to point out what seem to be their chief defects.

We may commence with $\left\{ \begin{matrix} a_1, b_1, \dots \\ a_2, b_2, \dots \end{matrix} \right\}$, where the change of *letter* indicates a change of *column*, and the change of *subscript* a change of *row*. Now the properties of Determinants, relating to columns, being always convertible into properties relating to rows, and vice versa, it was a sufficient objection to this system of notation, that it represented things distinctly analogous by methods so different, and it was properly superseded by the notation introduced by Leibnitz, $\left\{ \begin{matrix} a_{1,1}, a_{1,2}, \dots \\ a_{2,1}, a_{2,2}, \dots \end{matrix} \right\}$, where the changes, both of column and row, are alike denoted by subscripts. But it seems a fatal objection to this system that most of the space is occupied by a number of *a*'s, which are wholly superfluous, while the only important part of the notation is reduced to minute subscripts, alike difficult to the writer and the reader. It was almost an obvious improvement on this system to raise the subscripts into the line, and omit the *a*'s altogether, as suggested by Baltzer, thus— $\left\{ \begin{matrix} (1, 1), (1, 2), \dots \\ (2, 1), (2, 2), \dots \end{matrix} \right\}$ and this system, though tedious for writing, might serve very well, were it not for its liability to be confused with the notation, common in Plane Algebraical Geometry, by which $(1, 1)$ denotes the Point $x = 1, y = 1$. The symbol $1)1$, which I have ventured to suggest as an

emendation on this last, will be found, I have great hopes, sufficiently simple, distinct, and easy to be written. I have turned the symbol towards the left, in order to avoid all chance of confusion with \int , the symbol for integration.

I proceed to make a few introductory remarks on the various portions of the book, taken in order.

Chap. II. Def. I. I am aware that the word ‘Matrix’ is already in use to express the very meaning for which I use the word ‘Block’; but surely the former word means rather the mould, or form, into which algebraical quantities may be introduced, than an actual assemblage of such quantities; for instance, $\frac{(\quad) \times (\quad)}{(\quad)}$ would deserve the name, rather than $\frac{(a+b) \times (c+d)}{(e+f)}$.

Chap. II. Def. I, VIII. Those who have read the chapters on Determinants in Mr. Todhunter’s ‘Theory of Equations’ will notice that the meanings of the words ‘Element’ and ‘Constituent’ are here transposed: as to the former, I have only returned to Baltzer’s nomenclature; and the word ‘Constituent’ seems to me more expressive than his word ‘Term’.

Chap. III. A complete analysis of a system of simultaneous Linear Equations has always appeared to me to be a desideratum in Algebra: the subject is only touched on in Baltzer; a more complete attempt will be found in Peacock’s Algebra, but I have nowhere seen anything like an exhaustive analysis. This chapter aims at furnishing this, but it has been so often altered and re-written that I put it forth at last, hoping, rather than expecting, that it will be found complete and satisfactory.

Chap. VII. This chapter will also, I hope, fulfil my aim at furnishing an *exhaustive* analysis of such properties of the Loci here considered, as can be conveniently exhibited in the form of Determinants. I had added propositions concerning the Line in Solid Geometry, but these I omit, believing that its properties are more simply investigated by other methods.

Appendix II. Section 4. This process, though extremely convenient where no ciphers, or where one or two at most, occur in the interior of a Block, nevertheless fails entirely, it must be admitted, where they occur in larger numbers: I therefore offer it merely as a fanciful addition to the processes already in use, which may in some cases lessen the labour of computation.

Appendix V. I am doubtful whether this process will ever prove of much practical use: still I think cases might arise, where in the course of a problem an algebraical function is proved to vanish, and where, by throwing it into the form of a Determinant, and so forming a set of simultaneous Equations, whose consistency depends on its vanishing, new and curious properties of the function under consideration might be evolved.

The formulæ given at the end of the book are so arranged that the student may, by covering one or more of the columns on the right hand, test for himself his knowledge of the theorems from which they are taken.

Chapter I. Laws of Arrangement

Definitions

I. A set of different numerals, arranged in an ascending order, is said to be **orderly arranged**: but if there be among them 2, of which the second is less

than the first, the set is said to contain a **derangement**.¹

II. If 2 numbers be both even, or both odd, they are said to be **similar**; if otherwise, **dissimilar**.

Proposition I. Th.

If there be a set of different numerals, arranged in any order, and if one of them be made to pass over the next r of them, either way: the number of derangements is increased, or diminished, by a number similar to r .

If it be made to pass over *one*, the number is increased or diminished, by unity;

\therefore if over *two*, by an even number;

\therefore if over *three*, by an odd number; and so on.

Therefore, if there be a set, &c. Q. E. D.²

Proposition II. Th.

If there be a set of different numerals, and if 2 of them be interchanged: the number of derangements is increased, or diminished, by an *odd* number.

Call the 2 numerals, α , β ; and let there be r numerals between them;

firstly, let α be made to pass over these r numerals;

then the number of derangements is increased, or diminished, by a number similar to r ; (PROP. I.

secondly, let β be made to pass over α and over these r numerals;

then the number of derangements is thereby increased, or diminished, by a number similar to $r + 1$; (PROP. I.

\therefore it is ultimately increased, or diminished, by the sum or difference of 2 dissimilar numbers;

i. e. it is increased, or diminished, by an *odd* number.

Therefore, if there be a set, &c. Q. E. D.³

Proposition III. Th.

If there be a set of pairs of numerals, in which the antecedents are all different, as also are the consequents; and if they be arranged, firstly in order of antecedents, and secondly in order of consequents: the number of derangements

¹Def. I. Thus the set 12346789 is *orderly* arranged; but the same set placed thus, 43186972, contains one derangement on account of the 4 and 3, another on account of the 4 and 1, another on account of the 8 and 7, and so on.

²Prop. I. In the set 43186972, let us make the 7 pass over the preceding 3 numerals. By passing it over the 9, a derangement is lost, i. e. the number of derangements is diminished by unity; by passing it over the 6, a derangement is gained, i. e. the number is what it was at first, i. e. it is increased by zero, which is *even*; by passing it over the 8, a derangement is lost, i. e. the number is diminished by unity, which is *odd*; and so on.

³Prop. II. In the set 43186972, let us interchange the 1 and the 7. By passing the 1 over the intermediate 3 numerals, 3 derangements are gained, i. e. the number of derangements is increased by a number similar to 3; and the set now stands thus, 43869172; by passing the 7 over the 1 and over the same 3 numerals, two derangements are gained and two lost, i. e. the number is increased by zero, which is similar to $(3 + 1)$; hence it is on the whole increased by a number similar to the *sum* of 3 and $(3 + 1)$, and, as these are *dissimilar* numbers, their sum is *odd*.

among the consequents in the first case, and the number of derangements among the antecedents in the second case, are equal.

Let the pairs be so placed that the antecedents are orderly arranged, and let 2 of them be selected, and call them (H, r) , (K, s) ;

$\therefore H < K$;

now, if these 2 pairs contain a derangement of consequents, $r > s$;

\therefore when the pairs are re-arranged in order of consequents, these 2 will stand in the order ... (K, s) ... (H, r) ...;

\therefore they will then contain a derangement of antecedents;

but if these 2 pairs do not contain a derangement of consequents, $r < s$;

\therefore when the pairs are re-arranged in order of consequents, these 2 will stand in the order ... (H, r) ... (K, s) ...;

\therefore they will then not contain a derangement of antecedents.

And the same thing may be proved for every other 2 pairs.

Therefore, if there be, &c. Q. E. D.⁴

Definition III.

If there be a set of pairs of numerals, in which the antecedents are all different, as also are the consequents; and if, when they are arranged in order of antecedents, the number of derangements among the consequents be *even*, or (which is the same thing) if, when they are arranged in order of consequents, the number of derangements among the antecedents be *even*: the set is said to be **of the even class**; if otherwise, **of the uneven class**.⁵

Proposition IV. Th.

If there be a set of pairs of numerals, in which the antecedents are all different, as also are the consequents; and if 2 of the antecedents, or 2 of the consequents, be interchanged: the class, to which the set belongs, is changed.

Let the set be arranged in order of antecedents, and let 2 of the consequents be interchanged;

then the number of derangements among them is increased, or diminished, by an *odd* number; (PROP. II.

⁴*Prop. III.* Let the set be $(1, 3)$, $(3, 8)$, $(4, 6)$, $(7, 5)$, $(8, 2)$, which is arranged in order of antecedents: if this be rearranged in order of consequents, it will stand thus:— $(8, 2)$, $(1, 3)$, $(7, 5)$, $(4, 6)$, $(3, 8)$. Now let us select 2 of these pairs, $(1, 3)$ and $(7, 5)$; these, as they stand in the first arrangement, contain no derangement of consequents; hence, in the second arrangement, they preserve the same relative order, and so contain no derangement of antecedents. Again, let us select $(3, 8)$ and $(7, 5)$; these, as they stand in the first arrangement, contain a derangement of consequents; hence, in the second arrangement, they take the order $(7, 6)$, ... $(3, 8)$, and so contain a derangement of antecedents. And so for every other 2.

⁵*Def. III.* Taking the set $(1, 3)$, $(3, 8)$, $(4, 6)$, $(7, 5)$, $(8, 2)$, let us ascertain, by counting the derangements among the consequents, to which class it belongs. This may be conveniently done by observing, for each consequent in turn, how many of its predecessors are *greater* than it, since every instance of this will constitute a derangement: thus the 3 gives none, the 8 gives none, the 6 gives one, the 5 gives two, and the 2 gives four; hence there are seven derangements among the consequents. Again, let us arrange the set in order of consequents, $(8, 2)$, $(1, 3)$, $(7, 5)$, $(4, 6)$, $(3, 8)$, and count the derangements among the antecedents: thus the 8 gives none, the 1 gives one, the 7 gives one, the 4 gives two, and the 3 gives three; hence there are now seven derangements among the antecedents. Thus the set of pairs of numerals, tried by either test, is of the uneven class.

It should be observed that the class, to which a set of pairs of numerals belongs, is unaffected by the order in which they happen to be given.

i. e. if even, it becomes odd; if odd, even;
 \therefore the class, to which the set belongs, is changed;
 hence, if the set be arranged in any order, and 3 of the consequents be interchanged, the class, to which the set belongs, is changed.
 Similarly, if 2 of the antecedents be interchanged.
 Therefore, if there be, &c. Q. E. D.⁶

Proposition V. Th.

If there be a set of n pairs of numerals, in which the antecedents are a certain permutation of the numbers from 1 to n , as also are the consequents; and if one pair be erased: the class, to which the remaining set belongs, is the same as that of the original set, or different, according as the numerals in the erased pair are similar or dissimilar.

Let the set be arranged in order of antecedents; and call the pair that is to be erased (H, k) ;

firstly, let it be brought to the first place, by making it pass over the preceding $\overline{H - 1}$ pairs;

then the number of derangements among the consequents is increased, or diminished, by a number similar to $\overline{H - 1}$; (PROP. I.

and, since the consequent k now precedes the $\overline{k - 1}$ consequents which are less than it, there are now, by reason of this pair, $\overline{k - 1}$ derangements among the consequents;

secondly, let the pair (H, k) be erased;

then the number of derangements among the consequents is thereby diminished by a number similar to $\overline{k - 1}$;

\therefore it is ultimately increased, or diminished, by a number similar to the sum or difference of $\overline{H - 1}$ and $\overline{k - 1}$;

i. e. it is ultimately increased, or diminished, by an even, or odd, number, according as $\overline{H - 1}$ and $\overline{k - 1}$ are similar or dissimilar;

i. e. according as H and k are similar or dissimilar.

Therefore, if there be a set, &c. Q. E. D.⁷.

⁶Prop. IV. In the set (arranged, for convenience, in order of antecedents), (1, 3), (3, 8), (4, 6), (7, 5), (8, 2), let us interchange the two consequents, 8 and 5; the set will thus become (1, 3), (3, 5), (4, 6), (7, 8), (8, 2). Now, by this interchange, the number of derangements among the consequents is diminished by three; i. e. from being *odd*, it becomes *even*; and the set of numerals is therefore transferred from the *uneven* to the *even* class.

⁷Prop. V. Let us take the following set, (arranged, for convenience, in order of antecedents), (1, 2), (2, 4), (3, 1), (4, 5), (5, 6), (6, 3); and let us select (4, 5) as the pair to be erased, in which the numerals are dissimilar. Firstly, let us bring it to the first place, so that the set now stands thus:— (4, 5), (1, 2), &c.; in doing this, we have made the consequent 5 pass over the preceding (4 - 1) consequents, and have thus increased, or diminished, the number of derangements among the consequents, by a number similar to (4 - 1). And since this consequent 5 now precedes all the lesser consequents, 1, 2, 3, 4, there are now, by reason of it, (5 - 1) derangements among the consequents. Next, let the pair (4, 5) be erased; then these (5 - 1) derangements are done away with, and the number of derangements is, on the whole, increased, or diminished, by a number similar to the sum, or difference, of (4 - 1) and (5 - 1), i. e. to the sum, or difference, of 4 and 5, and since they are *dissimilar* numbers, their sum, or difference, is *odd*; hence the class, to which the set belongs, is *changed*.

In this instance it will be found that the given set contains 5 derangements of consequents, and so is of the uneven class; and that the new set, (1, 2), (2, 4), (3, 1), (5, 6), (6, 3), contains 4, and so is of the even class.

Chapter II. Analysis of Determinants

Definitions.

I. If mn quantities be so placed as to form m rows and n columns: they are said to form a **Block**; and the mn quantities are called the **Elements** of such a Block.

II. A square Block of n^2 Elements is said to be **of the n^{th} degree**.

III. An oblong Block containing m rows and n columns, or m columns and n rows, where m is greater than n , is said to be **of the length m** , and **of the breadth n** .

IV. In an oblong Block, the rows, if they be longer than the columns, or the columns, if they be longer than the rows, are called the **longitudinals** of the Block: and the others, its **laterals**.

V. If, in a given Block, any rows, and as many columns, be selected: the square Block formed of their common Elements is called a **Minor** of the given Block⁸.

Hence any single Element of a Block, being common to one row and one column, is a Minor of it.

VI. If n be that dimension of a Block which is not greater than the other: its Minors of the n^{th} degree are called its **principal Minors**; those of the $n - 1^{\text{th}}$ degree its **secondary Minors**, and so on⁹.

Hence a square Block is its own principal Minor.

VII. If, in a square Block, any rows, and as many columns, be selected: the Minor formed of their common Elements, and the Minor formed of the Elements common to the other rows and columns, are said to be **complemental** to each other¹⁰.

⁸Def. V. Thus, in the Block $\begin{Bmatrix} d & b & m & s \\ f & c & g & d \\ e & h & r & l \end{Bmatrix}$, if we select the 2nd and 3rd rows, and the 2nd and 4th columns, we obtain the Minor $\begin{Bmatrix} c & d \\ h & l \end{Bmatrix}$.

⁹Def. VI. Thus, in the same Block, the Minors $\begin{Bmatrix} d & b & m \\ f & c & g \\ e & h & r \end{Bmatrix}$, $\begin{Bmatrix} d & m & s \\ f & g & d \\ e & r & l \end{Bmatrix}$, &c., are *principal* Minors; while $\begin{Bmatrix} d & m \\ f & g \end{Bmatrix}$, $\begin{Bmatrix} d & s \\ f & d \end{Bmatrix}$, $\begin{Bmatrix} h & s \\ k & l \end{Bmatrix}$, &c., are *secondary* Minors.

¹⁰Def. VII. Thus, in the Block $\begin{Bmatrix} b & g & h & r \\ e & l & t & v \\ d & m & f & c \\ a & s & x & q \end{Bmatrix}$, the Minors $\begin{Bmatrix} b & g \\ e & l \end{Bmatrix}$ and $\begin{Bmatrix} f & c \\ x & q \end{Bmatrix}$ are *complemental* to each other; as also are the Minors $\begin{Bmatrix} e & v \\ a & q \end{Bmatrix}$ and $\begin{Bmatrix} g & h \\ m & f \end{Bmatrix}$. Thus, again, the single Element f and the Minor $\begin{Bmatrix} b & g & r \\ e & l & v \\ a & s & q \end{Bmatrix}$ are *complemental* to each other.

Conventions.

I. Let it be agreed to represent the Elements of a square Block by symbols of the form $h \left(k \right)$, in which the first numeral indicates the row, and the second the column, to which the Element belongs. Thus, a Block of m rows and n columns may be represented thus:—

$$\left\{ \begin{array}{ccc} 1 \left(1 \right), & 1 \left(2 \right) & \cdots & 1 \left(n \right) \\ 2 \left(1 \right), & 2 \left(2 \right) & \cdots & 2 \left(n \right) \\ \vdots & \vdots & & \vdots \\ m \left(1 \right), & m \left(2 \right) & \cdots & m \left(n \right) \end{array} \right\}.$$

II. And if it be required to represent 2 or more such Blocks, let them be distinguished by suffixing a certain letter to the symbol of each Block: e. g.:—

$$\left\{ \begin{array}{ccc} 1 \left(1 \right) & \cdots & 1 \left(n \right) \\ \vdots & & \vdots \\ m \left(1 \right) & \cdots & m \left(n \right) \end{array} \right\}_a, \left\{ \begin{array}{ccc} 1 \left(1 \right) & \cdots & 1 \left(n \right) \\ \vdots & & \vdots \\ m \left(1 \right) & \cdots & m \left(n \right) \end{array} \right\}_b.$$

III. And if it be required to represent an Element of such a Block by itself, let it be distinguished by the same suffix: e. g., $h \left(k_a \right)$ represents an Element of the Block

$$\left\{ \begin{array}{ccc} 1 \left(1 \right) & \cdots & 1 \left(n \right) \\ \vdots & & \vdots \\ m \left(1 \right) & \cdots & m \left(n \right) \end{array} \right\}_a;$$

$h \left(k_b \right)$ represents the corresponding Element of the Block

$$\left\{ \begin{array}{ccc} 1 \left(1 \right) & \cdots & 1 \left(n \right) \\ \vdots & & \vdots \\ m \left(1 \right) & \cdots & m \left(n \right) \end{array} \right\}_b.$$

Definitions (continued)

VIII. If there be a square Block of the n^{th} degree, and if all possible products be made of its Elements, taken n together, so that no product contain 2 Elements of the same row or of the same column; and if, representing the Elements of the Block by the symbols

$$\left\{ \begin{array}{ccc} 1 \left(1 \right) & \cdots & 1 \left(n \right) \\ \vdots & & \vdots \\ m \left(1 \right) & \cdots & m \left(n \right) \end{array} \right\},$$

each such product be affected with + or −, according as the set of pairs of numerals, corresponding to that product, be of the even or the uneven class: the sum of these products, thus affected, is called the **Determinant** of the Block. And each of these products is called a **Constituent** of the Determinant.

IX. The Constituent represented by the product $1\{1.2\}2\dots n\}n$ is called the **Diagonal** of the Determinant¹¹.

X. If a square Block be such that its Determinant vanishes, or if an oblong Block be such that the Determinant of every one of its principal Minors vanishes: in either case the Block is said to be **evanescent**.

XI. If there be a square Block, and if one of its Elements be selected; and if all the Constituents of its Determinant, which contain that Element, be collected together and formed into 2 factors, whereof that Element is one: the other factor is called the **determinantal coefficient** of that Element.

XII. If 2 square Blocks be such that each Element of the second is equal to the determinantal coefficient of the corresponding Element of the first: the second Block is said to be **adjugate** to the first.

Conventions (continued)

IV. Let it be agreed that the Determinant of a Block shall be represented by placing a perpendicular line on each side of it. Thus the Determinant of the Block

$$\left\{ \begin{array}{ccc} a & b & c \\ d & e & f \\ g & h & k \end{array} \right\}$$

will be represented by the symbol

$$\left| \begin{array}{ccc} a & b & c \\ d & e & f \\ g & h & k \end{array} \right|.$$

¹¹Def. VIII, IX. Thus, in the Block,

$$\left\{ \begin{array}{cccc} b & g & h & r \\ c & l & t & v \\ d & m & f & e \\ a & s & x & q \end{array} \right\},$$

the Diagonal is $blfq$, and the other Constituents are $blxe$, $bmtq$, $dstr$, &c. And to determine the *sign* of each Constituent, let us take as an example $dstr$; now this corresponds to the set of general symbols $3\{1.4\}2.2\{3.1\}4$, and since this is arranged in order of consequents and there are 5 derangements among the antecedents, it is of the *uneven* class, and so must be affected with the sign −.

V. If a Block be represented by the symbol

$$\left\{ \begin{array}{ccc} 1 \left(\begin{array}{c} 1 \\ \vdots \\ n \end{array} \right) & \cdots & 1 \left(\begin{array}{c} n \\ \vdots \\ n \end{array} \right) \\ \vdots & & \vdots \\ n \left(\begin{array}{c} 1 \\ \vdots \\ n \end{array} \right) & \cdots & n \left(\begin{array}{c} n \\ \vdots \\ n \end{array} \right) \end{array} \right\}_a,$$

so that any Element of it is represented by a symbol of the form $h \left(\begin{array}{c} k_a \\ \vdots \\ n \end{array} \right)$: let it be agreed that the determinantal coefficient of that Element shall be represented by a symbol of the form $h \left(\begin{array}{c} k_A \\ \vdots \\ n \end{array} \right)$.

VI. If there be 2 equally numerous sets of terms; and if each term of the one set be multiplied by the corresponding term of the other, and the products added: let it be agreed that this operation shall be denoted by placing the sign § between the symbols denoting the 2 sets.

$$\text{Thus } (a_1, a_2, \dots, a_n) \S (b_1, b_2, \dots, b_n) = a_1 b_1 + a_2 b_2 + \dots + a_n b_n.$$

Axioms.

I. Each Constituent of the Determinant

$$\left| \begin{array}{ccc} 1 \left(\begin{array}{c} 1 \\ \vdots \\ n \end{array} \right) & \cdots & 1 \left(\begin{array}{c} n \\ \vdots \\ n \end{array} \right) \\ \vdots & & \vdots \\ n \left(\begin{array}{c} 1 \\ \vdots \\ n \end{array} \right) & \cdots & n \left(\begin{array}{c} n \\ \vdots \\ n \end{array} \right) \end{array} \right|$$

contains n pairs of numerals, such that the antecedents are a certain permutation of the numbers 1 to n , as also are the consequents.

II. If any row, or column, of a square Block be selected: each Constituent of the Determinant contains one term of that row or column.

Thus the Determinant

$$\left| \begin{array}{ccc} 1 \left(\begin{array}{c} 1 \\ \vdots \\ n \end{array} \right) & \cdots & 1 \left(\begin{array}{c} n \\ \vdots \\ n \end{array} \right) \\ \vdots & & \vdots \\ n \left(\begin{array}{c} 1 \\ \vdots \\ n \end{array} \right) & \cdots & n \left(\begin{array}{c} n \\ \vdots \\ n \end{array} \right) \end{array} \right|_a$$

$$= 1 \left(\begin{array}{c} 1_a \cdot 1 \\ \vdots \\ 1_A + 1 \end{array} \right) 1 \left(\begin{array}{c} 2_a \cdot 1 \\ \vdots \\ 2_A + \dots + 1 \end{array} \right) \dots + 1 \left(\begin{array}{c} n_a \cdot 1 \\ \vdots \\ n_A \end{array} \right) n_A;$$

$$\text{or} = 1 \left(\begin{array}{c} 1_a \cdot 1 \\ \vdots \\ 1_A + 2 \end{array} \right) 1 \left(\begin{array}{c} 1_a \cdot 2 \\ \vdots \\ 1_A + \dots + n \end{array} \right) 1_a \cdot n \left(\begin{array}{c} 1_A \\ \vdots \\ 1_A \end{array} \right);$$

$$\text{or} = h \left(\begin{array}{c} 1_a \cdot h \\ \vdots \\ 1_A + h \end{array} \right) h \left(\begin{array}{c} 2_a \cdot h \\ \vdots \\ 2_A + \dots + h \end{array} \right) \dots + h \left(\begin{array}{c} n_a \cdot h \\ \vdots \\ n_A \end{array} \right) n_A;$$

$$\text{or} = 1 \left(\begin{array}{c} k_a \cdot 1 \\ \vdots \\ k_A + 2 \end{array} \right) k_a \cdot 2 \left(\begin{array}{c} k_a \cdot 2 \\ \vdots \\ k_A + \dots + n \end{array} \right) k_a \cdot n \left(\begin{array}{c} k_A \\ \vdots \\ k_A \end{array} \right).$$

Hence if, in a square Block, the Elements of any one row, or column, be multiplied by v ; the Determinant of the new Block is equal to that of the first multiplied by v .

And if the Elements of any q rows, or q columns, or r rows and s columns, where $\overline{r+s} = q$, be multiplied by v ; the Determinant of the new Block is equal to that of the first multiplied by v^q .

And if each Element of any row, or column, be the sum of m terms: the Determinant may be expressed as the sum of m Determinants. For one Determinant may be formed, such that its corresponding row, or column, consists of the first terms of these sums; another, such that its corresponding row, or column, consists of the second terms of these sums; and so on.

Proposition I. Th.

The determinantal coefficient of any Element of a square Block is the Determinant of its complementary Minor, affected with $+$ or $-$ according as the numerals which constitute its symbol are similar or dissimilar.

Let the Block be represented by the symbol:—

$$\left\{ \begin{array}{ccc} 1 \mid 1 & \cdots & 1 \mid n \\ \vdots & & \vdots \\ n \mid 1 & \cdots & n \mid n \end{array} \right\};$$

and call the selected Element $h \mid k$;

then it is evident that the determinantal coefficient of $h \mid k$ is the aggregate of all possible products of the Elements of its complementary Minor, taken $\overline{n-1}$ together, so that no product contain 2 Elements of the same row, or of the same column;

i. e. it is the aggregate of the Constituents of the Determinant of its complementary Minor; (DEF. VIII.)

also the *sign* of each such product is $+$ or $-$, according as the corresponding set of pairs of numerals, taken along with the symbol $h \mid k$ itself, is of the even or of the uneven class; (DEF. VIII.)

but if the symbol $h \mid k$ be erased, the class, to which the remaining set belongs, is the same as that of the original set, or different, according as h and k are similar, or dissimilar; (CHAP. I. PROP. V.)

\therefore the *sign* of each such product follows the Determinant law, or reverses it, according as h and k are similar, or dissimilar;

\therefore the determinantal coefficient of any Element $h \mid k$ is the Determinant of its complementary Minor, affected with $+$ or $-$, according as h and k are similar or dissimilar.

Q. E. D¹².

¹² Prop. I. Thus the Determinant of the Block $\left\{ \begin{array}{cc} a & b \\ c & d \end{array} \right\}$ is $(ad - bc)$; and that of the Block $\left\{ \begin{array}{ccc} a & b & c \\ d & e & f \\ g & h & k \end{array} \right\}$ is $(ack - ahf - bdk + bgf + cdh - cge)$.

Here the Determinantal coefficient of e is $(ak - cg)$, i. e. $\left| \begin{array}{cc} a & c \\ g & k \end{array} \right|$; and as e corresponds to the symbol $2 \mid 2$, the numerals of which are *similar*, the sign of this Determinant ought to be $+$, and so we find it. Again, the Determinantal coefficient of f is $(-ah + bg)$, i. e. $-\left| \begin{array}{cc} a & b \\ g & h \end{array} \right|$;

Corollaries to Prop. I.

1. If, in a square Block, any row, or column, be selected: the Determinant of the Block may be resolved into terms, each consisting of one of the Elements of that row, or column, multiplied by the Determinant of its complemental Minor¹³.

2. If, in a square Block, the Elements in any one row, or column, all vanish but one: the Determinant of the Block is the product produced by multiplying the Determinant of the complemental Minor of that Element by that Element itself, affected with + or -, according as the numerals in its symbol are similar or dissimilar.

3. Hence, if that Element be unity, the Determinant of the Block is the Determinant of the complemental Minor of that Element, affected with + or -, as before.

Proposition II. Th.

If, in a square Block, 2 rows, or 2 columns, be interchanged: the Determinant of the new Block has the same absolute value as that of the first, but the opposite sign.

Let the Block be represented by

$$\left\{ \begin{array}{ccc} 1 \binom{1}{n} & \cdots & 1 \binom{1}{n} \\ \vdots & & \vdots \\ n \binom{1}{n} & \cdots & n \binom{1}{n} \end{array} \right\}_a,$$

and first let 2 rows be interchanged; call them the h^{th} and k^{th} rows; and let the new Block be represented by

$$\left\{ \begin{array}{ccc} 1 \binom{1}{n} & \cdots & 1 \binom{1}{n} \\ \vdots & & \vdots \\ n \binom{1}{n} & \cdots & n \binom{1}{n} \end{array} \right\}_b;$$

$\therefore h \binom{r_a}{r_b} = k \binom{r_a}{r_b}$, and $k \binom{r_a}{r_b} = h \binom{r_a}{r_b}$, r taking any value $1 \dots n$;

next let any Constituent of the Determinant of the original Block be selected; call it $1 \binom{a_a \dots h}{s_a \dots k} t_a \dots$; and let it = M ;

and as f corresponds to the symbol $2 \binom{3}{3}$, the numerals of which are *dissimilar*, the sign of this Determinant ought to be -, and so we find it.

¹³Prop. I. Cor. 1. This gives us a simple method for computing the value of a Determinant arithmetically. Thus, $\begin{vmatrix} 3 & 1 & 2 & 4 \\ 4 & 5 & 2 & 3 \\ 3 & 1 & 3 & 2 \\ 4 & 2 & 1 & 3 \end{vmatrix} = 3 \begin{vmatrix} 5 & 2 & 3 \\ 1 & 3 & 2 \\ 2 & 1 & 3 \end{vmatrix} - 1 \begin{vmatrix} 4 & 2 & 3 \\ 3 & 3 & 2 \\ 4 & 1 & 3 \end{vmatrix} + 2 \begin{vmatrix} 4 & 5 & 3 \\ 3 & 1 & 2 \\ 4 & 2 & 3 \end{vmatrix} - 4 \begin{vmatrix} 4 & 5 & 2 \\ 3 & 1 & 3 \\ 4 & 2 & 1 \end{vmatrix} = \left\{ 5 \begin{vmatrix} 3 & 2 \\ 1 & 3 \end{vmatrix} - 2 \begin{vmatrix} 1 & 2 \\ 2 & 3 \end{vmatrix} + 3 \begin{vmatrix} 1 & 3 \\ 2 & 1 \end{vmatrix} \right\} - \&c. = 3\{35 + 2 - 15\} - \&c. = 3 \times 22 - \&c. = 66 - \&c.$

now $1 \left\{ a_a = 1 \right\} a_b$ and so for the other factors of it, with the exception of $h \left\{ s_a \right.$ and $k \left\{ t_a \right.$ which respectively $= k \left\{ s_b \right.$ and $h \left\{ t_b \right.$;

$\therefore M = 1 \left\{ a_b \dots h \left\{ t_b \dots k \left\{ s_b \dots \right. \right.$, which is a Constituent of the new Block;

\therefore for any Constituent M in the Determinant of the original Block, there is a Constituent in that of the new Block, of the same absolute value;

and the symbol representing the one may be deduced from that representing the other by *one* interchange of consequents;

\therefore the 2 symbols are of different classes; (CH. I. PROP. IV.)

\therefore the Constituents, represented by them, have opposite signs;

\therefore the whole Determinants are equal in value, but have opposite signs.

Similarly, if 2 columns be interchanged.

Therefore, if there be &c., Q. E. D¹⁴.

Corollary to Prop. II.

If, in a square Block, a row, or a column, be made to pass over the next r rows, or columns, either way: the Determinant of the new Block has the same sign as that of the first, or the opposite sign, according as r is even or odd: that is, it is equal to the Determinant of the first Block multiplied by $(-1)^{r-1}$.

For this may be effected by interchanging it with each of these r rows, or columns, in turn; and after *one* such interchange, the sign of the Determinant is changed, after *two*, it is the same again, and so on¹⁵.

Proposition III. Th.

If, in a square Block, 2 rows, or 2 columns, be identical: the Determinant vanishes.

Call the Determinant " D ".

Now if the 2 identical rows, or columns, be interchanged, the Determinant of the new Block $= -D$; (PROP. II.)

but the new Block is identical with the first;

$\therefore D = -D$;

i. e. $D = 0$.

¹⁴Prop. II. Thus the Determinant

$$\begin{vmatrix} a & b & c \\ d & e & f \\ g & h & l \end{vmatrix} = - \begin{vmatrix} c & b & a \\ f & e & d \\ l & h & g \end{vmatrix}.$$

¹⁵Prop. II. Cor. Thus the Determinant

$$\begin{vmatrix} a & b & c \\ d & e & f \\ g & h & k \end{vmatrix} = - \begin{vmatrix} b & a & c \\ e & d & f \\ h & g & k \end{vmatrix},$$

where the first column has been passed over *one* column: but the same Determinant

$$= + \begin{vmatrix} b & c & a \\ e & f & d \\ h & k & g \end{vmatrix},$$

where the first column has been passed over *two* columns.

Therefore, if in a square Block, &c. Q. E. D¹⁶.

Corollaries to Prop. III.

1. If a square Block of the n^{th} degree be represented by

$$\left\{ \begin{array}{ccc} 1 & \cdots & 1 \\ \vdots & & \vdots \\ n & \cdots & n \end{array} \right\}_a,$$

and its adjugate Block by

$$\left\{ \begin{array}{ccc} 1 & \cdots & 1 \\ \vdots & & \vdots \\ n & \cdots & n \end{array} \right\}_A,$$

then $r \left(1_a \cdot s \left(1_A + r \right) 2_a \cdot s \left(2_A + \dots + r \right) n_a \cdot s \left(n_A \right) = 0,$

and $1 \left(r_a \cdot 1 \left(s_A + 2 \right) r_a \cdot 2 \left(s_A + \dots + n \right) r_a \cdot n \left(s_A \right) = 0,$

so long as $r \neq s$. For the quantity $s \left(1_a \cdot s \left(1_A + \dots \right) \right)$ is the Determinant of the given Block, and if, for the several terms of the s^{th} row, there be substituted terms equal to those in the r^{th} row, this may be written $r \left(1_a \cdot s \left(1_A + \dots \right) \right)$; and since the new Block, so formed, has 2 rows identical, its Determinant vanishes.

2. If, in a Block whose length exceeds its breadth by unity, the Elements of any one longitudinal be each multiplied by the Determinant of the Minor formed by erasing the lateral containing that Element: the sum of these products, affected with + and - alternately, is zero¹⁷.

3. If, in a square Block, there be added to the several Elements of any row, or column, the corresponding Elements of any other row, or column, multiplied

¹⁶ Prop. III. Thus the Determinant $\begin{vmatrix} a & b & c \\ a & b & c \\ d & e & f \end{vmatrix} = 0.$

¹⁷ Prop. III. Cor. 2. Thus, in the Block

$$\left\{ \begin{array}{cccc} a & b & c & d \\ e & f & g & h \\ k & l & m & n \end{array} \right\},$$

the sum of

$$a \cdot \begin{vmatrix} b & c & d \\ f & g & h \\ l & m & n \end{vmatrix} - b \cdot \begin{vmatrix} a & c & d \\ e & g & h \\ k & m & n \end{vmatrix} + c \cdot \begin{vmatrix} a & b & d \\ e & f & h \\ k & l & n \end{vmatrix} - d \cdot \begin{vmatrix} a & b & c \\ e & f & g \\ k & l & m \end{vmatrix}$$

is zero: for this is the same thing as the Determinant of the Block $\left\{ \begin{array}{cccc} a & b & c & d \\ a & b & c & d \\ e & f & g & h \\ k & l & m & n \end{array} \right\}$, and,

as this Block has 2 identical rows, its Determinant must vanish.

by any number: the Determinant of the new Block is the same as that of the first¹⁸.

Proposition IV. Th.

If there be a square Block, and if, retaining the first term of the first row in its place, the rows be made columns, and the columns rows: the Determinant of the new Block is equal to that of the first.

Let the Block be represented by

$$\left\{ \begin{array}{ccc} 1 \left(\begin{array}{c} 1 \\ \vdots \\ n \end{array} \right) & \dots & 1 \left(\begin{array}{c} n \\ \vdots \\ n \end{array} \right) \\ \vdots & & \vdots \\ n \left(\begin{array}{c} 1 \\ \vdots \\ n \end{array} \right) & \dots & n \left(\begin{array}{c} n \\ \vdots \\ n \end{array} \right) \end{array} \right\}_a$$

and the new Block by

$$\left\{ \begin{array}{ccc} 1 \left(\begin{array}{c} 1 \\ \vdots \\ n \end{array} \right) & \dots & 1 \left(\begin{array}{c} n \\ \vdots \\ n \end{array} \right) \\ \vdots & & \vdots \\ n \left(\begin{array}{c} 1 \\ \vdots \\ n \end{array} \right) & \dots & n \left(\begin{array}{c} n \\ \vdots \\ n \end{array} \right) \end{array} \right\}_b ;$$

and let a certain Constituent of the original Block, arranged in order of antecedents, be represented by $1 \left(\begin{array}{c} \alpha_a \\ \vdots \\ \alpha_a \end{array} \right) 2 \left(\begin{array}{c} \beta_a \\ \vdots \\ \beta_a \end{array} \right) \dots n \left(\begin{array}{c} \zeta_a \\ \vdots \\ \zeta_a \end{array} \right)$, where $\alpha, \beta, \dots, \zeta$, are a certain permutation of the numbers 1 to n ;

now $1 \left(\begin{array}{c} \alpha_a = \alpha \\ \vdots \\ \alpha_a = \alpha \end{array} \right) 2 \left(\begin{array}{c} \beta_a = \beta \\ \vdots \\ \beta_a = \beta \end{array} \right) \dots n \left(\begin{array}{c} \zeta_a = \zeta \\ \vdots \\ \zeta_a = \zeta \end{array} \right) n_b$;

hence this Constituent = $\alpha \left(\begin{array}{c} 1_b \\ \vdots \\ 1_b \end{array} \right) \beta \left(\begin{array}{c} 2_b \\ \vdots \\ 2_b \end{array} \right) \dots \zeta \left(\begin{array}{c} n_b \\ \vdots \\ n_b \end{array} \right)$;

that is, it = a certain Constituent of the new Block, arranged in order of consequents;

and the antecedents in the second case are the same permutation of the numbers 1 to n as the consequents in the first case;

\therefore the two Constituents are of the same class; (CHAP. I. DEF. III.)

\therefore they have the same sign; (CHAP. II. DEF. VIII.)

\therefore for every Constituent of the original Block, there is one of the new Block, equal to it, and with the same sign;

\therefore the two Determinants are equal.

¹⁸Prop. III. Cor. 3. Thus, in the Block

$$\left\{ \begin{array}{ccc} a & b & c \\ d & e & f \\ g & h & k \end{array} \right\},$$

let us add to the first column the Elements of the third, multiplied by m : then the Determinant

of the new Block is $\left| \begin{array}{ccc} (a + mc), & b, & c \\ (d + mf), & e, & f \\ (g + mk), & h, & k \end{array} \right|$, and this is equal to

$$\left| \begin{array}{ccc} a & b & c \\ d & e & f \\ g & h & k \end{array} \right| + m \left| \begin{array}{ccc} c & b & c \\ f & e & f \\ k & h & k \end{array} \right| = \left| \begin{array}{ccc} a & b & c \\ d & e & f \\ g & h & k \end{array} \right|,$$

since the second Determinant vanishes.

Therefore, if there be, &c. Q. E. D¹⁹.

Proposition V. Th.

If there be given 2 Blocks, each consisting of n rows and r columns; and if each row of one Block be combined with each row of the other, by the process of multiplyhig the first term of one by the first term of the other, the second by the second, and so on, and adding the products; and if the n^2 quantities, so formed, be arranged as a square Block, in such a way that the Elements of the first row of the new Block are all formed from the first row of the first Block, by combining it with the n rows of the second Block successively, and so on; then

firstly,

if $r < n$: the Determinant of the new Block vanishes:

secondly,

if $r = n$: the Determinant of the new Block is the product of the Determinants of the 2 given Blocks:

thirdly,

if $r > n$: the Determinant of the new Block is the sum of all possible products that can be made, by taking any n columns of one of the given Blocks, in the order in which they stand, and the corresponding n columns of the other Block, and multiplying together the Determinants of the 2 Blocks so formed.

Let the 2 Blocks be represented by

$$\left\{ \begin{array}{ccc} 1 & \dots & 1 \\ \vdots & & \vdots \\ n & \dots & n \end{array} \right\}_a \left(\begin{array}{ccc} 1 & \dots & 1 \\ \vdots & & \vdots \\ n & \dots & n \end{array} \right)_b ;$$

and the new Block by

$$\left\{ \begin{array}{ccc} 1 & \dots & 1 \\ \vdots & & \vdots \\ n & \dots & n \end{array} \right\}_c,$$

wherein any Element $h \left(k \right)_c = \left\{ h \left(1 \dots h \right)_a \right\} \S \left\{ k \left(1 \dots k \right)_b \right\};$

$$= \sum \left\{ h \left(\alpha_a \cdot k \right) \alpha_b \right\},$$

in which α takes all values from 1 to r ;

¹⁹*Prop. IV.* Thus the Determinant

$$\left| \begin{array}{ccc} a & b & c \\ d & e & f \\ g & h & k \end{array} \right| = \left| \begin{array}{ccc} a & d & g \\ b & e & h \\ c & f & k \end{array} \right|$$

now let a certain Constituent of the Determinant of the new Block be arranged in order of antecedents, and be represented by $1 \left(Q_c . 2 \right) R_c \dots u \left(T_c \right)$, in which $Q, R, \dots T$, are a certain permutation of the numbers 1 to n ;
then this Constituent

$$= \sum \{ 1 \left(\alpha_a . Q \right) \alpha_b \} . \sum \{ 2 \left(\beta_a . R \right) \beta_b \} \dots \sum \{ n \left(\delta_a . T \right) \delta_b \};$$

in which *each* of the quantities $\alpha, \beta, \dots \delta$, takes all values from 1 to r ;

$$\begin{aligned} \therefore \text{it} &= \sum \{ 1 \left(\alpha_a . Q \right) \alpha_b . 2 \left(\beta_a . R \right) \beta_b \dots n \left(\delta_a . T \right) \delta_b \}; \\ &= \sum \{ 1 \left(\alpha_a . 2 \left(\beta_a \dots n \left(\delta_a . Q \right) \alpha_b . R \right) \beta_b \dots T \right) \delta_b \}; \end{aligned}$$

also this Constituent is affected with $+$ or $-$, according as the series $Q, R, \dots T$, contains an even or odd number of derangements;

\therefore the Determinant of the new Block

$$= \sum \{ 1 \left(\alpha_a . 2 \left(\beta_a \dots n \left(\delta_a . Q \right) \alpha_b . R \right) \beta_b \dots T \right) \delta_b \},$$

in which not only does each of the quantities $\alpha, \beta, \dots \delta$, take all values from 1 to r , but also the series $Q, R, \dots T$, takes the values of all possible permutations of the numbers 1 to n ;

$$\therefore \text{it} = \sum \left\{ 1 \left(\alpha_a . 2 \left(\beta_a \dots n \left(\delta_a . \sum \left(Q \left(\alpha_b . R \right) \beta_b \dots T \right) \delta_b \right) \right) \right) \right\};$$

wherein, whatsoever values are assigned to $\alpha, \beta, \dots \delta$, in the outer bracket, the same are assigned to them in the inner bracket:

now the sum $\sum \left(Q \left(\alpha_b . R \right) \beta_b \dots T \right) \delta_b$, each term of which is affected with $+$ or $-$, according as the series $Q, R, \dots T$, contains an even or odd number of derangements, is the Determinant

$$\begin{vmatrix} 1 \left(\alpha \right) & \dots & 1 \left(\delta \right) \\ \vdots & & \vdots \\ n \left(\alpha \right) & \dots & n \left(\delta \right)_b \end{vmatrix};$$

that is, it is the Determinant of the square Block formed by taking from the b -Block its α^{th} column, its β^{th} column, and so on, until n columns have been taken, it being immaterial whether these be all different, or one or more of them be repeated any number of times.

\therefore the Determinant of the new Block

$$= \sum \left\{ 1 \left(\alpha_a . 2 \left(\beta_a \dots n \left(\delta . \begin{vmatrix} 1 \left(\alpha \right) & \dots & 1 \left(\delta \right) \\ \vdots & & \vdots \\ n \left(\alpha \right) & \dots & n \left(\delta \right)_b \end{vmatrix} \right) \right) \right\}.$$

Now, firstly,

let r be $< n$;

then it is not possible to take from the b -Block n different columns;

\therefore the Determinant

$$\begin{vmatrix} 1\alpha & \dots & 1\delta \\ \vdots & & \vdots \\ n\alpha & \dots & n\delta \end{vmatrix}_b$$

always contains 2 identical columns;

\therefore it always vanishes;

(PROP. III.

\therefore the Determinant of the new Block vanishes.

Secondly,

let $r = n$;

then, if the series $\alpha, \beta, \dots, \delta$, be a permutation of the numbers 1 to n , the Determinant

$$\begin{vmatrix} 1\alpha & \dots & 1\delta \\ \vdots & & \vdots \\ n\alpha & \dots & n\delta \end{vmatrix}_b = \begin{vmatrix} 11 & \dots & 1n \\ \vdots & & \vdots \\ n1 & \dots & nn \end{vmatrix}_b,$$

affected with $+$, or $-$, according as the series $\alpha, \beta, \dots, \delta$, contains an even or odd number of derangements; for either of these may be obtained from the other by interchanging columns; hence the 2 Determinants have the same absolute magnitudes, and have the same sign, or not, according as their diagonals have the same sign or not;

but if the series $\alpha, \beta, \dots, \delta$, be not such a permutation, the Determinant

$$\begin{vmatrix} 1\alpha & \dots & 1\delta \\ \vdots & & \vdots \\ n\alpha & \dots & n\delta \end{vmatrix}_b$$

vanishes as in the first case;

\therefore the Determinant of the new Block

$$\begin{aligned} & \sum \left\{ \pm 1 \alpha_a \cdot 2 \beta_a \dots n \delta_a \cdot \begin{vmatrix} 11 & \dots & 1n \\ \vdots & & \vdots \\ n1 & \dots & nn \end{vmatrix}_b \right\}; \\ & = \sum \left\{ \pm 1 \alpha_a \cdot 2 \beta_a \dots n \delta_a \right\} \cdot \begin{vmatrix} 11 & \dots & 1n \\ \vdots & & \vdots \\ n1 & \dots & nn \end{vmatrix}_b; \\ & = \begin{vmatrix} 11 & \dots & 1n \\ \vdots & & \vdots \\ n1 & \dots & nn \end{vmatrix}_a \times \begin{vmatrix} 11 & \dots & 1n \\ \vdots & & \vdots \\ n1 & \dots & nn \end{vmatrix}_b; \end{aligned}$$

that is, it is the product of the Determinants of the 2 given Blocks²⁰.

Thirdly,

let r be $> n$;

and let A, B, \dots, N , be a certain set of n different numbers, selected from the numbers 1 to r , and orderly arranged; and let $\alpha, \beta, \dots, \delta$, each take any of the values A, B, \dots, N ;

then, if the series $\alpha, \beta, \dots, \delta$, be a permutation of the numbers A, B, \dots, N , the Determinant

$$\begin{vmatrix} 1\alpha & \dots & 1\delta \\ \vdots & & \vdots \\ n\alpha & \dots & n\delta \end{vmatrix}_b = \begin{vmatrix} 1A & \dots & 1N \\ \vdots & & \vdots \\ nA & \dots & nN \end{vmatrix}_b,$$

affected with $+$ or $-$, according as the series $\alpha, \beta, \dots, \delta$, contains an even or odd number of derangements;

but if the series $\alpha, \beta, \dots, \delta$, be not such a permutation, the Determinant

$$\begin{vmatrix} 1\alpha & \dots & 1\delta \\ \vdots & & \vdots \\ n\alpha & \dots & n\delta \end{vmatrix}_b$$

vanishes as in the first case;

\therefore the Determinant of the new Block contains the quantity

$$\sum \left\{ \pm 1 \alpha_a \cdot 2 \beta_a \dots n \delta_a \cdot \begin{vmatrix} 1A & \dots & 1N \\ \vdots & & \vdots \\ nA & \dots & nN \end{vmatrix}_b \right\};$$

$$\therefore \text{it contains } \sum \left\{ \pm 1 \alpha_a \cdot 2 \beta_a \dots n \delta_a \right\} \times \begin{vmatrix} 1A & \dots & 1N \\ \vdots & & \vdots \\ nA & \dots & nN \end{vmatrix}_b;$$

$$\therefore \text{it contains } \begin{vmatrix} 1A & \dots & 1N \\ \vdots & & \vdots \\ nA & \dots & nN \end{vmatrix}_a \times \begin{vmatrix} 1A & \dots & 1N \\ \vdots & & \vdots \\ nA & \dots & nN \end{vmatrix}_b;$$

and the same thing may be proved for any other set of n different numbers, selected from the numbers 1 to r , and orderly arranged;

²⁰ Prop. V. Part 2. Thus

$$\begin{vmatrix} a & b & c \\ d & e & f \\ g & h & k \end{vmatrix} \times \begin{vmatrix} A & B & C \\ D & E & F \\ G & H & K \end{vmatrix} = \begin{vmatrix} (aA + bB + cC), & (aD + bE + cF), & (aG + bH + cK) \\ (dA + eB + fC), & (dD + eE + fF), & (dG + eH + fK) \\ (gA + hB + kC), & (gD + hE + kF), & (gG + hH + kK) \end{vmatrix}.$$

but if the series A, B, \dots, N , though selected from the numbers 1 to r , be not all *different* numbers, the Determinant

$$\begin{vmatrix} 1(A) & \dots & 1(N) \\ \vdots & & \vdots \\ n(A) & \dots & n(N) \end{vmatrix}$$

vanishes as in the first case;

\therefore the Determinant of the new Block

$$= \sum \left\{ \begin{vmatrix} 1(A) & \dots & 1(N) \\ \vdots & & \vdots \\ n(A) & \dots & n(N) \end{vmatrix}_a \times \begin{vmatrix} 1(A) & \dots & 1(N) \\ \vdots & & \vdots \\ n(A) & \dots & n(N) \end{vmatrix}_b \right\},$$

in which the series A, \dots, N , take the values of every possible set of n different numbers, selected from the numbers 1 to r , and orderly arranged;

that is, it is the sum of all possible products that can be made, by taking any n columns of one of the given Blocks, in the order in which they stand, and the corresponding n columns of the other Block, and multiplying together the Determinants of the 2 Blocks so formed.

Therefore, if there be given 2 Blocks, &c. Q. E. D.

Corollary to Prop. V.

If $r = n$: then, in each of the given Blocks, rows may be made columns, and columns rows, without altering the Determinants; (PROP. IV.)

\therefore the new Block may be such that any Element of it, $h(k_c)$, has any one of the 4 values,

$$\begin{aligned} & \{h(1 \dots h)(n)\} \S \{k(1 \dots k)(n)_b\}, \\ & \{h(1 \dots h)(n)\} \S \{1(k \dots n)(k)_b\}, \\ & \{1(h \dots n)(h)\} \S \{k(1 \dots k)(n)_b\}, \\ & \{1(h \dots n)(h)\} \S \{1(k \dots n)(k)_b\}. \end{aligned}$$

Proposition VI. Th.

If there be a square Block of the n^{th} degree: the Determinant of the adjugate Block is equal to the $\overline{n-1}^{\text{th}}$ power of the Determinant of the first Block.

Let the Block be represented by

$$\begin{Bmatrix} 1(1) & \dots & 1(n) \\ \vdots & & \vdots \\ n(1) & \dots & n(n) \end{Bmatrix}_a,$$

and the adjugate Block by

$$\left\{ \begin{array}{ccc} 1 & \dots & 1 \\ \vdots & & \vdots \\ n & \dots & n \end{array} \right\}_A ;$$

and let a Block of the n^{th} degree be formed, represented by

$$\left\{ \begin{array}{ccc} 1 & \dots & 1 \\ \vdots & & \vdots \\ n & \dots & n \end{array} \right\}_c,$$

and such that any term $h \left\{ k_c = (h \left\{ 1_a \dots h \left\{ n_a \right\} \right\} (k \left\{ 1_A \dots k \left\{ n_A \right\} \right\} \right)$;

and let their Determinants be represented by D_a, D_A, D_c .

Then $D_c = D_a \cdot D_A$;

(PROP. V.

now $h \left\{ k_c = h \left\{ 1_a \cdot k \left\{ 1_A + \dots + h \left\{ n_a \cdot k \left\{ n_A \right\} \right\} \right)$;

\therefore when $h = k, h \left\{ k_c = D_a$;

(AX. II.

and when $h \neq k, h \left\{ k_c = 0$;

(PROP. III. COR. 1.

\therefore all the Elements of D_c vanish, except $1 \left\{ 1_c, \dots, n \left\{ n_c, \right.$ each of which $= D_a$;

$\therefore D_c = D_a^n$;

i. e. $D_a \cdot D_A = D_a^n$;

$\therefore D_A = D_a^{n-1}$.

Q. E. D²¹.

Proposition VII. Th.

If there be a square Block of the n^{th} degree, and if in it any Minor of the m^{th} degree be selected: the Determinant of the corresponding Minor in the adjugate Block is equal, in absolute magnitude, to the product of the $\overline{m-1}^{\text{th}}$ power of the Determinant of the first Block, multiplied by the Determinant of the Minor complementary to the one selected.

Also, if the numerals, indicating the selected rows, be represented by α, β, \dots , and those indicating the selected columns by κ, λ, \dots ; and their respective sums by $\sum(\alpha), \sum(\kappa)$: the relationship of sign between the equal magnitudes will be secured by multiplying either of them by $(-1)^{m \cdot (\sum \alpha + \sum \kappa)}$.

²¹ Prop. VI. Thus, if the first Block be $\left\{ \begin{array}{ccc} a & b & c \\ d & e & f \\ g & h & k \end{array} \right\}$; then

$$\left| \begin{array}{cc} \left| \begin{array}{cc} e & f \\ h & k \end{array} \right|, & - \left| \begin{array}{cc} d & f \\ g & k \end{array} \right|, & \left| \begin{array}{cc} d & e \\ g & h \end{array} \right| \\ - \left| \begin{array}{cc} b & c \\ h & k \end{array} \right|, & \left| \begin{array}{cc} a & c \\ g & k \end{array} \right|, & - \left| \begin{array}{cc} a & b \\ g & k \end{array} \right| \\ \left| \begin{array}{cc} b & c \\ e & f \end{array} \right|, & - \left| \begin{array}{cc} a & c \\ d & f \end{array} \right|, & \left| \begin{array}{cc} a & b \\ d & f \end{array} \right| \end{array} \right| = \left| \begin{array}{ccc} a & b & c \\ d & e & f \\ g & h & k \end{array} \right|^2.$$

Let the Block be re-arranged, if necessary, by transposing rows and columns, so that the selected rows and columns shall stand first; and let it, when so arranged, be represented by

$$\left\{ \begin{array}{ccc} 1 \binom{1}{1} & \dots & 1 \binom{1}{n} \\ \vdots & & \vdots \\ n \binom{1}{1} & \dots & n \binom{1}{n} \end{array} \right\}_a,$$

and its adjugate Block by

$$\left\{ \begin{array}{ccc} 1 \binom{1}{1} & \dots & 1 \binom{1}{n} \\ \vdots & & \vdots \\ n \binom{1}{1} & \dots & n \binom{1}{n} \end{array} \right\}_A;$$

also let a Block of the n^{th} degree be formed, represented by

$$\left\{ \begin{array}{ccc} 1 \binom{1}{1} & \dots & 1 \binom{1}{n} \\ \vdots & & \vdots \\ n \binom{1}{1} & \dots & n \binom{1}{n} \end{array} \right\}_b,$$

and such that its first m rows are identical with those of the A -Block, the rest of its diagonal consists of units, and all its other Elements are zero;

hence, $\left\{ \begin{array}{ccc} 1 \binom{1}{1} & \dots & 1 \binom{1}{n} \\ \vdots & & \vdots \\ n \binom{1}{1} & \dots & n \binom{1}{n} \end{array} \right\}_b$ is identical with

$$\left\{ \begin{array}{cccccc} 1 \binom{1}{1_A} & \dots & 1 \binom{1}{m_A} & 1 \binom{1}{m+1_A} & \dots & 1 \binom{1}{n_A} \\ \vdots & & \vdots & \vdots & & \vdots \\ m \binom{1}{1_A} & \dots & m \binom{1}{m_A} & m \binom{1}{m+1_A} & \dots & m \binom{1}{n_A} \\ 0 & \dots & 0 & 1 & 0 \dots & 0 \\ \vdots & & \ddots & \ddots & \ddots & \vdots \\ \vdots & & & \ddots & \ddots & 0 \\ 0 & \dots & \dots & \dots & \dots 0 & 1 \end{array} \right\};$$

$$\therefore D_b = \left| \begin{array}{ccc} 1 \binom{1}{1_A} & \dots & 1 \binom{1}{m_A} \\ \vdots & & \vdots \\ m \binom{1}{1_A} & \dots & m \binom{1}{m_A} \end{array} \right|; \quad (\text{PROP. I. COR. 3.})$$

also let a Block of the n^{th} degree be formed, represented by

$$\left\{ \begin{array}{ccc} 1 \binom{1}{1} & \dots & 1 \binom{1}{n} \\ \vdots & & \vdots \\ n \binom{1}{1} & \dots & n \binom{1}{n} \end{array} \right\}_c$$

and such that any term $h \left\{ k_c = (h \left\{ 1_a \dots h \left\{ n_a \right\} \right\} \right\} \left\{ k \left\{ 1_b \dots k \left\{ n_b \right\} \right\} \right\}$;

$$\therefore D_a \cdot D_b = D_c, \quad (\text{PROP. V.})$$

Now, for all values of $k \neq m$,

$$\text{if } h = k, h \left\{ k_c = D_a; \quad (\text{AX. II.})$$

$$\text{if } h \neq k, h \left\{ k_c = 0; \quad (\text{PROP. III. COR. 1.})$$

i. e. in the first m columns of the c -Block, all the Elements vanish, except $1 \left\{ 1_c, 2 \left\{ 2_c, \dots m \left\{ m_c, \right. \right. \right.$ each of which $= D_a$;

also, for all values of $k > m$,

$$h \left\{ k_c = (h \left\{ 1_a, \dots h \left\{ k_a, \dots h \left\{ n_a \right\} \right\} \right\} \right\} \left\{ 0, \dots 1, \dots 0 \right\},$$

since all the terms of the second series vanish, except $k \left\{ k_b, \right.$ which $= 1$;

$$\therefore \text{for all values of } k > m, h \left\{ k_c = h \left\{ k_a;$$

i. e. in the $\overline{m+1}^{\text{th}}$ and following columns of the c -Block, the Elements are identical with the corresponding Elements of the a -Block;

$$\text{i. e. } \left\{ \begin{array}{ccc} 1 \left\{ 1 & \dots & 1 \left\{ n \right. \\ \vdots & & \vdots \\ n \left\{ 1 & \dots & n \left\{ n \right. \end{array} \right\} \right\}_c \text{ is identical with}$$

$$\left\{ \begin{array}{ccc} D_a, 0 & \dots & 0, & 1 \left\{ m+1_a & \dots & 1 \left\{ n_a \right. \\ 0 & \ddots & \vdots & \vdots & & \vdots \\ \vdots & \ddots & 0 & \vdots & & \vdots \\ \vdots & \ddots & D_a, & m \left\{ m+1_a & \dots & m \left\{ n_a \right. \\ \vdots & & 0, & m+1 \left\{ m+1_a & \dots & m+1 \left\{ n_a \right. \\ \vdots & & \vdots & \vdots & & \vdots \\ 0 & \dots & 0, & n \left\{ m+1_a & \dots & n \left\{ n_a \right. \end{array} \right\}.$$

$$\therefore D_c = D_a^m \cdot \left| \begin{array}{ccc} m+1 \left\{ m+1_a & \dots & m+1 \left\{ n_a \right. \\ \vdots & & \vdots \\ n \left\{ m+1_a & \dots & n \left\{ n_a \right. \end{array} \right|;$$

$$\therefore D_a \cdot D_b = \text{do.}$$

$$\therefore D_a \cdot \left| \begin{array}{ccc} 1 \left\{ 1_A & \dots & 1 \left\{ m_A \right. \\ \vdots & & \vdots \\ m \left\{ 1_A & \dots & m \left\{ m_A \right. \end{array} \right| = \text{do.}$$

$$\text{i. e. } \left| \begin{array}{ccc} 1 \left\{ 1_A & \dots & 1 \left\{ m_A \right. \\ \vdots & & \vdots \\ m \left\{ 1_A & \dots & m \left\{ m_A \right. \end{array} \right| = D_a^{m-1} \cdot \left| \begin{array}{ccc} m+1 \left\{ m+1_a & \dots & m+1 \left\{ n_a \right. \\ \vdots & & \vdots \\ n \left\{ m+1_a & \dots & n \left\{ n_a \right. \end{array} \right|.$$

Now let the Determinant of the original Blocks before re-arrangement, be represented by 'D'; the Determinant of the Minor, complementary to the one selected, by 'C'; and if a Block be formed, adjugate to the original Block before re-arrangement, and if in it a Minor be taken corresponding to the one selected, let the Determinant of this Minor be represented by 'J'.

Then, having regard to absolute magnitude only,

$$D_a = D;$$

$$\begin{vmatrix} m+1 & m+1_a & \dots & m+1 & n_a \\ \vdots & & & & \vdots \\ n & m+1_a & \dots & n & n_a \end{vmatrix} = C;$$

$$\begin{vmatrix} 1 & 1_A & \dots & 1 & m_A \\ \vdots & & & & \vdots \\ m & 1_A & \dots & m & m_A \end{vmatrix} = J;$$

$$J = \pm D^{m-1} \cdot C.$$

Therefore, if there be, &c. Q. E. D²².

Secondly, the relationship of sign between these equal magnitudes will be secured by multiplying either by $(-1)^{m \cdot (\Sigma(a) + \Sigma(\kappa))}$.

Let the numeral, indicating the last of the selected rows, be represented by 'ζ'.

Now, firstly, D_a is equal to D in absolute magnitude; and it has the same, or a different, sign, according as the number of rows, over which other rows are transposed, together with the number of columns, over which other columns are transposed, is even or odd;

for each transposition over one row, or over one column, changes the sign of the Determinant; (PROP. II.

now the first of the selected rows, namely the α^{th} , is transposed over all the preceding $\alpha - 1$ rows;

the second, namely the β^{th} , is transposed over all the preceding $\beta - 1$ rows, excepting the α^{th} row itself; that is, it is transposed over $\beta - 2$ rows;

similarly the γ^{th} row is transposed over $\gamma - 3$ rows, and so on; and finally the ζ^{th} is transposed over $\zeta - m$ rows;

∴ the number of rows, over which other rows are transposed,

$$= \alpha + \beta + \dots + \zeta - (1 + 2 + \dots + m);$$

²² Prop. VII. Part I. Thus, if the Block be $\begin{Bmatrix} a & b & c & d \\ e & f & g & h \\ k & l & m & n \\ p & q & r & s \end{Bmatrix}$, and if the Minor $\begin{Bmatrix} f & g \\ q & r \end{Bmatrix}$ be

selected;

$$\text{then } \begin{vmatrix} a & c & d \\ k & m & n \\ p & r & s \\ a & c & d \\ e & g & h \\ k & m & n \end{vmatrix}, - \begin{vmatrix} a & b & d \\ k & l & n \\ p & q & s \\ a & b & d \\ e & f & h \\ k & l & n \end{vmatrix} = \pm \begin{vmatrix} a & b & c & d \\ e & f & g & h \\ k & l & m & n \\ p & q & r & s \end{vmatrix}^{(2-1)} \times \begin{vmatrix} a & d \\ k & n \end{vmatrix}$$

$$= \sum(\alpha) - \frac{m \cdot (m+1)}{2};$$

similarly, the number of columns, over which other columns are transposed,

$$= \sum(\kappa) - \frac{m \cdot (m+1)}{2};$$

\therefore their sum = $\sum(\alpha) + \sum(\kappa) - m \cdot (m+1)$;

but $m \cdot (m+1)$ is necessarily even;

$\therefore D_a$ has the same sign as D , or a different one, according as $\sum(\alpha) + \sum(\kappa)$ is even or odd.

$$\therefore D_a = D \cdot (-1)^{\sum(\alpha) + \sum(\kappa)};$$

$$\therefore D_a^{m-1} = D^{m-1} \cdot (-1)^{(\sum(\alpha) + \sum(\kappa)) \cdot (m-1)}.$$

Secondly, $\begin{vmatrix} m+1 \binom{m+1}{m+1_a} & \dots & m+1 \binom{m+1}{n_a} \\ \vdots & & \vdots \\ n \binom{m+1}{m+1_a} & \dots & n \binom{m+1}{n_a} \end{vmatrix}$ is equal to C in absolute magni-

tude, and has the same sign;

for the two Determinants contain the same Elements, arranged in the same order.

Thirdly, $\begin{vmatrix} 1 \binom{m}{1_A} & \dots & 1 \binom{m}{m_A} \\ \vdots & & \vdots \\ m \binom{m}{1_A} & \dots & m \binom{m}{m_A} \end{vmatrix}$ is equal to J in absolute magnitude, and it

has the same, or a different, sign, according as $(\sum(\alpha) + \sum(\kappa))$ is even or odd;

for the Elements of the first of these Determinants are the determinantal coefficients of the Elements of the selected Minor, after the re-arrangement of the Block; and those of the other are the same coefficients before the re-arrangement;

hence the Elements of the one Determinant have the same absolute magnitude as those of the other, and the same, or a different, sign, according as the Determinant of the Block has, after the re-arrangement, the same, or a different, sign;

$$\therefore \begin{vmatrix} 1 \binom{m}{1_A} & \dots & 1 \binom{m}{m_A} \\ \vdots & & \vdots \\ m \binom{m}{1_A} & \dots & m \binom{m}{m_A} \end{vmatrix} = J \cdot (-1)^{\sum(\alpha) + \sum(\kappa)}.$$

Hence, substituting in the Equation already established, we get

$$J \cdot (-1)^{\sum(\alpha) + \sum(\kappa)} = D^{m-1} \cdot C \cdot (-1)^{(\sum(\alpha) + \sum(\kappa)) \cdot (m-1)};$$

$$\therefore J = D^{m-1} \cdot C \cdot (-1)^{m \cdot (\sum(\alpha) + \sum(\kappa))} \text{ }^{23}$$

Therefore, if the numerals, &c. Q. E. D.

Corollary to Prop. VII.

If $D_a = 0$, the Determinant of any Minor in the adjugate Block = 0, since it contains D_a , as a factor.

²³The resulting Equation really is $J = D^{m-1} \cdot C \cdot (-1)^{(m-2) \cdot (\sum(\alpha) + \sum(\kappa))}$, but the factor $(-1)^{2(\sum(\alpha) + \sum(\kappa))} = 1$, and so may be neglected.

As a particular case of this, let $m = 2$, and let the selected Minor contain the Elements common to the h^{th} and k^{th} rows and the r^{th} and s^{th} columns;

$$\text{then } \begin{vmatrix} h \left\{ r_A, & h \right\} s_A \\ k \left\{ r_A, & k \right\} s_A \end{vmatrix} = 0;$$

$$\text{i. e. } h \left\{ r_A, k \right\} s_A = k \left\{ r_A, h \right\} s_A;$$

$$\therefore h \left\{ r_A : h \right\} s_A :: k \left\{ r_A, k \right\} s_A;$$

$$\therefore \text{the ratios } h \left\{ 1_A : h \right\} 2_A : h \left\{ 3_A : \&c. : h \right\} n_A \text{ are independent of } h.$$

Chapter III. Analysis of Equations.

N.B. The Equations Discussed in this Chapter are of the First Degree Only.

Definitions.

I. Any quantity that is not zero is called **actual**.

II. In any Equation, or set of Equations, any Algebraical quantity, which has an actual coefficient, is said to be **contained actually** in it or them.

III. In any Equation, or set of Equations, all Numbers, and all Algebraical quantities whose values are determinable independently of the Equations, are called **Constants** with reference to them: but if there be in them Algebraical quantities which may bear any values whatsoever that are consistent with the truth of the Equations, these are called **Variables** with reference to them.

IV. In an Equation containing Variables, any set of values which can be assigned to the Variables, consistently with the truth of the Equations, is called a set of **values for the Variables**.

V. If a set of Equations, containing Variables, be such that there is a set of finite values for the Variables, they are said to be **consistent**; if not, **inconsistent**.

VI. If there be an Equation, or set of consistent Equations, containing Variables, and another such Equation; and if, whatsoever values for the Variables satisfy the first Equation or set of Equations, the same also satisfy that other Equation: that other Equation is said to be **dependent** on the rest.

VII. If 2 Equations be each dependent on the other: they are said to be **identical**.

Conventions.

I. If a Block of terms be distinguished by prefixing a letter, as “the A -Block:” let $\|A\|$ represent “the Determinants of all its principal Minors,” $|A|$ “the Determinant of one of its principal Minors,” and (if the Block be square) let A represent “the Determinant of the Block.”

Thus, if a Block be square, these three symbols will bear the same meaning.

Also, in an oblong Block,

$\|A\| = 0$ may be read “all the A -Determinants vanish,” or “the A -Block is evanescent.”

$|A| = 0$ may be read “one of the A -Determinants vanishes.”

$|A| \neq 0$ may be read “one of the A -Determinants does not vanish,” or “the A -Block is not evanescent.”

$\|A\| \neq 0$ may be read “none of the A -Determinants vanish.”

II. If there be a set of Equations containing Variables: let the Block formed of the coefficients of the Variables be called “the V -Block,” and let the Block formed of these together with the constant terms be called “the B -Block.”

III. If a set of Equations be said to contain n Variables, and if, in any one of them, any Variable be not actually contained, let it be understood that, in forming the V -Block or B -Block, such Variable is introduced with a zero coefficient. And if any one of the Equations contain no actual constant term, let it be understood that, in forming the B -Block, a zero term is introduced as the constant term²⁴.

Axioms.

I. If there be a set of homogeneous Equations containing Variables: they may be satisfied by assigning to each Variable the value zero.

II. But if there be a set of values for the Variables, whereof one is actual: at least one other is actual also.

III. If there be a set of homogeneous Equations containing Variables: whatsoever values for the Variables satisfy them, any equimultiples of these values also satisfy them.

²⁴Conv. III. Thus, in the Equations

$$\begin{array}{rclcl} 3x & +2y & & -1 & = 0, \\ x & & +5z & & = 0, \\ x & -y & & +3 & = 0, \end{array}$$

the V -Block is $\left\{ \begin{array}{ccc} 3, & 2, & 0 \\ 1, & 0, & 5 \\ 1, & -1, & 0 \end{array} \right\}$, and the B -Block $\left\{ \begin{array}{cccc} 3, & 2, & 0, & -1 \\ 1, & 0, & 5, & 0 \\ 1, & -1, & 0, & 3 \end{array} \right\}$.

Again, if the Equations

$$\begin{array}{rclcl} x & +3y & +2 & = 0, \\ x & -y & -1 & = 0, \\ 2x & +y & +3 & = 0, \end{array}$$

be said to contain *two* Variables, their V -Block is $\left\{ \begin{array}{cc} 1, & 3 \\ 1, & -1 \\ 2, & 1 \end{array} \right\}$; but if they be said to contain

three, it is $\left\{ \begin{array}{ccc} 1, & 3, & 0 \\ 1, & -1, & 0 \\ 2, & 1, & 0 \end{array} \right\}$.

IV. If there be 2 identical Equations, containing m Variables: there are $\overline{m-1}$ of the Variables, to which arbitrary values may be assigned.

Section I. Consistency of Equations under given conditions of evanescence of their V -Blocks or B -Blocks.

Proposition I. Th.

If there be n Equations containing n Variables, and if $V \neq 0$: the Equations are consistent, and there is only one set of values for the Variables.

First, let $n = 2$.

Let the Equations be represented by

$$\begin{aligned} 1 \left(1. x_1 + 1 \right) 2 \left(2. x_2 + 1 \right) 3 = 0, \\ 2 \left(1. x_1 + 2 \right) 2 \left(2. x_2 + 2 \right) 3 = 0, \end{aligned}$$

and let the Determinants of the principal Minors of the B -Block, formed by successively erasing the columns containing the Variables and the column of constants, be represented by the symbols D_1, D_2, V ;

then, if the first Equation be multiplied by 2, and the second by -1 , and the 2 Equations added together, the coefficient of x_2 in the resulting Equation will be zero;

\therefore the resulting Equation is

$$x_1 \cdot (1 \left(1. 2 \right) 2 - 2 \left(1. 1 \right) 2) + (1 \left(3. 2 \right) 2 - 2 \left(3. 1 \right) 2) = 0;$$

$$\text{i. e. } x_1 \cdot \begin{vmatrix} 1 \left(1, & 1 \right) 2 \\ 2 \left(1, & 2 \right) 2 \end{vmatrix} + \begin{vmatrix} 1 \left(3, & 1 \right) 2 \\ 2 \left(3, & 2 \right) 2 \end{vmatrix} = 0;$$

$$\text{i. e. } x_1 \cdot \begin{vmatrix} 1 \left(1, & 1 \right) 2 \\ 2 \left(1, & 2 \right) 2 \end{vmatrix} - \begin{vmatrix} 1 \left(2, & 1 \right) 3 \\ 2 \left(2, & 2 \right) 3 \end{vmatrix} = 0; \quad (\text{CH. II. PROP. II. COR.})$$

$$\text{i. e. } x_1 \cdot V - D_1 = 0.$$

By a similar process it may be proved that

$$-x_2 \cdot V - D_2 = 0;$$

and, dividing these Equations throughout by V ,

$$x_1 = \frac{D_1}{V}, -x_2 = \frac{D_2}{V};$$

and since, by hypothesis, $V \neq 0$, these values are both finite.²⁵

²⁵Changed according to *Corrigenda* from:

and since, by hypothesis, $V \neq 0$, these Equations may be divided throughout by V , and written

$$x_1 = \frac{D_1}{V}, -x_2 = \frac{D_2}{V}.$$

Next, these values shall satisfy both Equations;

for let them be substituted in the first;

then its left-hand side will become $\frac{1}{V} \cdot (1 \left\{ 1. D_1 - 1 \right\} 2. D_2 + 1 \left\{ 3. V \right\})$;

and this = 0;

(CH. II. PROP. III. COR. 2.

similarly it may be proved for the second Equation;

\therefore the Equations are consistent.

Also it is evident that, whatsoever values there are for the Variables, they may be proved equal to $\frac{D_1}{V}, \frac{-D_2}{V}$;

\therefore there is only one set of values for the Variables.

Secondly, let $n > 2$.

Let the equations be represented by

$$\begin{aligned} 1 \left\{ 1. x_1 + 1 \right\} 2. x_2 + \dots + 1 \left\{ n. x_n + 1 \right\} n + 1 &= 0, \\ 2 \left\{ 1. x_1 + 2 \right\} 2. x_2 + \dots + 2 \left\{ n. x_n + 2 \right\} n + 1 &= 0, \\ &\text{\&c.} \\ n \left\{ 1. x_1 + n \right\} 2. x_2 + \dots + n \left\{ n. x_n + n \right\} n + 1 &= 0; \end{aligned}$$

and let the Determinants of the principal Minors of the B -Block be represented, as before, by $D_1, \dots D_n, V$.

Now the Block

$$\left\{ \begin{array}{ccc} 1 \left\{ 2 \dots 1 \right\} n \\ \vdots & & \vdots \\ n \left\{ 2 \dots n \right\} n \end{array} \right\}$$

contains n rows and $\overline{n-1}$ columns;

hence, if the Elements of any column in it be respectively multiplied by the Determinants of its principal Minors, affected with + and - alternately, the sum of the products is zero;

(CH. II. PROP. III. COR. 2.

hence, if the n Equations be respectively multiplied by these Determinants, thus affected, and added together, the coefficients of $x_2, \dots x_n$, in the resulting Equation will all be zero;

\therefore the resulting Equation is

$$\begin{aligned} x_1 \cdot \left\{ 1 \left\{ 1. \begin{vmatrix} 2 \left\{ 2 \dots 2 \right\} n \\ \vdots & & \vdots \\ n \left\{ 2 \dots n \right\} n \end{vmatrix} - 2 \left\{ 1. \begin{vmatrix} 1 \left\{ 2 \dots 1 \right\} n \\ 3 \left\{ 2 \dots 3 \right\} n \\ \vdots & & \vdots \\ n \left\{ 2 \dots n \right\} n \end{vmatrix} + \&c. \right\} + \left\{ 1 \left\{ n+1. \begin{vmatrix} 2 \left\{ 2 \dots 2 \right\} n \\ \vdots & & \vdots \\ n \left\{ 2 \dots n \right\} n \end{vmatrix} - 2 \left\{ n+1. \begin{vmatrix} 1 \left\{ 2 \dots 1 \right\} n \\ 3 \left\{ 2 \dots 3 \right\} n \\ \vdots & & \vdots \\ n \left\{ 2 \dots n \right\} n \end{vmatrix} \right\} \right. \\ \text{i. e. } x_1 \cdot \left. \left\{ \begin{vmatrix} 1 \left\{ 1 \dots 1 \right\} n \\ \vdots & & \vdots \\ n \left\{ 1 \dots n \right\} n \end{vmatrix} + \begin{vmatrix} 1 \left\{ n+1, 1 \right\} 2 \dots 1 \left\{ n \right\} \\ \vdots & & \vdots \\ n \left\{ n+1, n \right\} 2 \dots n \left\{ n \right\} \end{vmatrix} = 0; \right. \end{aligned}$$

(CH. II.)

$$\text{i. e. } x_1 \cdot \begin{vmatrix} 1 \binom{1}{1} & \dots & 1 \binom{1}{n} \\ \vdots & & \vdots \\ n \binom{1}{1} & \dots & n \binom{1}{n} \end{vmatrix} (-)^{n-1} \begin{vmatrix} 1 \binom{2}{2} & \dots & 1 \binom{2}{n+1} \\ \vdots & & \vdots \\ n \binom{2}{2} & \dots & n \binom{2}{n+1} \end{vmatrix} = 0;$$

PROP. II. COR.

$$\text{i. e. } x_1 \cdot V(-)^{n-1} D_1 = 0.$$

By a similar process it may be proved that

$$x_2 \cdot V(-)^{n-1} D_2 = 0, \\ \&c.;$$

and, dividing these Equations throughout by V ,

$$x_1 = \frac{(-)^n D_1}{V}, -x_2 = \frac{(-)^n D_2}{V}, \&c.;$$

and since, by hypothesis, $V \neq 0$, these values are all finite.

Next, these values shall satisfy all the Equations;
for let them be substituted in the Equation

$$h \binom{1}{1} x_1 + h \binom{2}{2} x_2 + \dots + h \binom{n}{n} x_n + h \binom{n+1}{n+1} = 0;$$

then the left-hand side of this Equation will become

$$\frac{(-1)^n}{V} \cdot \left\{ h \binom{1}{1} D_1 - h \binom{2}{2} D_2 + \dots (-)^{n-1} h \binom{n}{n} D_n (-)^n h \binom{n+1}{n+1} V \right\};$$

and this = 0; (CH. II. PROP. III. COR. 2.)

similarly it may be proved for any other of the Equations;

\therefore the Equations are consistent.

Also it is evident that, whatsoever values there are for the Variables, they may be proved equal to $\frac{(-)^n D_1}{V}$, &c.;

\therefore there is only one set of values for the Variables.

Therefore, if there be, &c. Q. E. D.

Corollary to Prop. I.

The values for the Variables may be briefly exhibited thus;—

$$x_1 : -x_2 : \&c. : (-1)^n :: D_1 : D_2 : \&c. : V;$$

or thus; $\frac{x_1}{D_1} = \frac{-x_2}{D_2} = \&c. = \frac{(-1)^n}{V}$ ²⁶;

wherein it is to be observed that, if any of the quantities D_1, D_2, \dots, D_n be zero, the value of the corresponding Variable must also be zero.

²⁶ Prop. I. Thus, in the Equations $\left. \begin{matrix} 2x + 3y + 1 = 0 \\ 5x - y - 2 = 0 \end{matrix} \right\}$, we have $\begin{vmatrix} x & 1 \\ 3 & -2 \end{vmatrix} =$

$$\begin{vmatrix} -y & 1 \\ 2 & -2 \end{vmatrix} = \begin{vmatrix} 1 & 3 \\ 2 & -1 \end{vmatrix};$$

$$\text{i. e. } \frac{x}{-5} = \frac{-y}{-9} = \frac{1}{-17}; \therefore x = \frac{5}{17}, \text{ and } y = -\frac{9}{17}.$$

Proposition II. Th.

If there be n Equations containing $\overline{n+r}$ Variables, and if $|V| \neq 0$: the Equations are consistent, and, if any non-evanescent principal Minor of the V -Block be selected, the r Variables, whose coefficients are not contained in it, may have arbitrary values assigned to them; and, for each such set of arbitrary values, there is only one value for each of the remaining Variables.

Since $|V| \neq 0$, the Equations must contain actually n at least of the Variables.

Let a non-evanescent principal Minor of the V -Block be selected, and let arbitrary values be given to the r Variables whose coefficients are not contained in it;

then there are n Equations, containing n Variables, and such that their V -Block does not vanish;

\therefore they are consistent, &c. (PROP. I.

Therefore, if there be, &c. Q. E. D²⁷.

Corollary to Prop. II.

If the Equations be homogeneous, and if $r = 1$; then, in every set of values for the Variables, the values bear to each other one and the same set of ratios.

For if the Determinants of the principal Minors of the B -Block be represented by $D_1, \dots D_{n+1}$, it may be proved, as in the last Proposition, that

$$\frac{x_1}{D_1} = \frac{-x_2}{D_2} = \&c. = \frac{(-)^n x_{n+1}}{D_{n+1}}.$$

Proposition III. Th.

If there be n Equations containing $\overline{n-1}$ Variables, and if $B \neq 0$; the Equations are inconsistent.

It is evident that the Equations cannot be all homogeneous, and that they must contain actually all the Variables.

Again, in the Equations

$$\begin{array}{cccccc} 3x & -y & +z & +4 & = & 0, \\ x & +3y & & -5 & = & 0, \\ 2x & +y & -3z & +3 & = & 0, \end{array}$$

we have

$$\begin{vmatrix} -1, & 1, & 4 \\ 3, & 0, & -5 \\ 1, & -3, & 3 \end{vmatrix} = \begin{vmatrix} -y & & \\ 3, & 1, & 4 \\ 1, & 0, & -5 \end{vmatrix} = \begin{vmatrix} z & & \\ 3, & -1, & 4 \\ 1, & 3, & -5 \end{vmatrix} = \begin{vmatrix} -1 & & \\ 3, & -1, & 1 \\ 1, & 3, & 0 \end{vmatrix} =$$

i. e. $\frac{x}{-35} = \frac{y}{70} = \frac{z}{35} = \frac{1}{35}$;
 $\therefore x = -1, y = 2, z = 1.$

²⁷ Prop. II. Thus, in the Equations

$$\begin{array}{cccccc} x & -y & -2z & +v & -4 & = & 0 \\ 3x & +2y & +4z & -2v & +3 & = & 0 \end{array}$$

we have $\begin{vmatrix} 1, & -1 \\ 3, & 2 \end{vmatrix} \neq 0$: hence we may assign arbitrary values to z and v ; let us assign to them the values 0, 2; then we have

$$x = 1, y = -1.$$

First, let $n = 2$.

Let the Equations be represented by

$$\begin{aligned} 1 \begin{vmatrix} 1 & x+1 \end{vmatrix} 2 &= Q_1 = 0, \\ 2 \begin{vmatrix} 1 & x+2 \end{vmatrix} 2 &= Q_2 = 0. \end{aligned}$$

Now the quantity $Q_1 \cdot 2 \begin{vmatrix} 1 & -Q_2 \cdot 1 \end{vmatrix} 1$

$$\begin{aligned} &= 1 \begin{vmatrix} 1 & x & 2 \end{vmatrix} 1 + 1 \begin{vmatrix} 2 & 2 \end{vmatrix} 1 \\ &\quad - 2 \begin{vmatrix} 1 & x & 1 \end{vmatrix} 1 - 2 \begin{vmatrix} 2 & 1 \end{vmatrix} 1; \end{aligned}$$

and, in this quantity, the first column = 0, and the other = $-B$;

$$\therefore Q_1 \cdot 2 \begin{vmatrix} 1 & -Q_2 \cdot 1 \end{vmatrix} 1 \neq 0;$$

\therefore the value for x , which makes $Q_1 = 0$, cannot also make $Q_2 = 0$.

Secondly, let $n > 2$.

Let the n Equations be represented by

$$\begin{aligned} 1 \begin{vmatrix} 1 & x_1 + \dots + 1 \end{vmatrix} n - 1 \begin{vmatrix} x_{n-1} + 1 \end{vmatrix} n &= Q_1 = 0, \\ &\quad \&c. \\ n \begin{vmatrix} 1 & x_1 + \dots + n \end{vmatrix} n - 1 \begin{vmatrix} x_{n-1} + n \end{vmatrix} n &= Q_n = 0; \end{aligned}$$

also let the Determinants of the principal Minors of the Block

$$\left\{ \begin{array}{ccc} 1 \begin{vmatrix} 1 & \dots & 1 \end{vmatrix} n-1 \\ \vdots & & \vdots \\ n \begin{vmatrix} 1 & \dots & n \end{vmatrix} n-1 \end{array} \right\}$$

be represented by H_1, \dots, H_n .

Now the quantity $Q_1 \cdot H_1 - Q_2 \cdot H_2 + \dots (-)^{n-1} Q_n \cdot H_n$

$$\begin{aligned} &= 1 \begin{vmatrix} 1 & x_1 & H_1 + 1 \end{vmatrix} 2 \begin{vmatrix} x_2 & H_1 + \dots + 1 \end{vmatrix} n \begin{vmatrix} H_1 \end{vmatrix} \\ &\quad - (2 \begin{vmatrix} 1 & x_1 & H_2 + 2 \end{vmatrix} 2 \begin{vmatrix} x_2 & H_2 + \dots + 2 \end{vmatrix} n \begin{vmatrix} H_2 \end{vmatrix}) \\ &\quad + \&c. \\ &\quad (-)^{n-1} (n \begin{vmatrix} 1 & x_1 & H_n + n \end{vmatrix} 2 \begin{vmatrix} x_2 & H_n + \dots + n \end{vmatrix} n \begin{vmatrix} H_n \end{vmatrix}); \end{aligned}$$

and, in this quantity, the first $\overline{n-1}$ columns vanish; (CH. II. PROP. III.

COR. 2.

and the last column is equal to $\pm B$;

$$\therefore Q_1 \cdot H_1 - Q_2 \cdot H_2 + \dots (-)^{n-1} Q_n \cdot H_n = \pm B;$$

\therefore it $\neq 0$;

\therefore whatsoever values for the Variables make Q_1, \dots, Q_{n-1} , each = 0, these cannot also make $Q_n = 0$.

Therefore, if there be, &c. Q. E. D²⁸.

Corollary to Prop. III.

If there be n Equations, not all homogeneous, containing $\overline{n-r}$ Variables, and if $|B| \neq 0$: the Equations are inconsistent.

For then there must be among them $\overline{n-r+1}$ Equations, not all homogeneous, containing $\overline{n-r}$ Variables, and such that the Determinant of their whole Block does not vanish.

Proposition IV. Th.

If there be n Equations containing n Variables, and if $V = 0$, but $|B| \neq 0$: the Equations are inconsistent.

It is evident that the Equations cannot be all homogeneous, and that they must contain actually $\overline{n-1}$ at least of the Variables.

First, let them contain actually only $\overline{n-1}$ of the Variables; (whence V must = 0).

Then, by the last Proposition, they are inconsistent.

Secondly, let them contain actually all the n Variables.

If possible, let there be a set of values for the Variables, and call them a_1, a_2 , &c.;

then it may be proved, as in Proposition I, that

$$a_1 \cdot V = (-)^n D_1, -a_2 \cdot V = (-)^n D_2, \&c.;$$

and, since $V = 0$, these Equations become

$$0 = D_1 = D_2 = \&c.;$$

$\therefore \|B\| = 0$, which is contrary to the hypothesis.

Therefore, if there be, &c. Q. E. D.

Proposition V. Th.

If there be n Equations containing $\overline{n+r}$ Variables, and if $\|V\| = 0$, but $|B| \neq 0$: the Equations are inconsistent.

It is evident that the Equations cannot be all homogeneous, and that they must contain actually $\overline{n-1}$ at least of the Variables.

First, let them contain actually only $\overline{n-1}$ of the Variables.

²⁸ Prop. III. Thus the Equations

$$\begin{array}{rclcl} x & +y & -3 & = & 0, \\ 2x & +3y & -7 & = & 0, \\ x & -y & +2 & = & 0, \end{array}$$

are inconsistent.

Then, by Proposition III, they are inconsistent.

Secondly, let them contain actually only n of the Variables.

Then, by Proposition IV, they are inconsistent.

Thirdly, let them contain actually more than n of the Variables.

Now, if possible, let them be consistent.

Since there is in the B -Block at least one principal Minor whose Determinant does not vanish, let the Variables, whose coefficients are contained in such a Minor, be placed first, and let the Equations, so arranged, be represented by

$$1 \left(1 \cdot x_1 + \dots + 1 \right) \left(n - 1 \cdot x_{n-1} + 1 \right) \left(n \cdot x_n + 1 \right) \left(n + 1 \cdot x_{n+1} + \dots + 1 \right) \left(n + r \cdot x_{n+r} + 1 \right) \left(n + r + 1 \right) = 0, \\ \text{\&c.}$$

$$n \left(1 \cdot x_1 + \dots + n \right) \left(n - 1 \cdot x_{n-1} + n \right) \left(n \cdot x_n + n \right) \left(n + 1 \cdot x_{n+1} + \dots + n \right) \left(n + r \cdot x_{n+r} + n \right) \left(n + r + 1 \right) = 0;$$

$$\text{so that } \begin{vmatrix} 1 \left(1 \dots 1 \right) \left(n - 1, \right) \left(n + r + 1 \right) \\ \vdots \qquad \qquad \qquad \vdots \qquad \qquad \qquad \vdots \\ n \left(1 \dots n \right) \left(n - 1, \right) \left(n + r + 1 \right) \end{vmatrix} \neq 0; \text{ let it} = C;$$

now let the values, belonging to the r Variables x_{n+1}, \dots, x_{n+r} , be a_{n+1}, \dots, a_{n+r} ;

then the Equations become

$$1 \left(1 \dots x_1 + \dots + 1 \right) \left(n - 1 \cdot x_{n-1} + 1 \right) \left(n \cdot x_n + (1 \left(n + 1 \cdot a_{n+1} + \dots + 1 \right) \left(n + r + 1 \right)) \right) = 0, \\ \text{\&c.}$$

$$n \left(1 \dots x_1 + \dots + n \right) \left(n - 1 \cdot x_{n-1} + n \right) \left(n \cdot x_n + (n \left(n + 1 \cdot a_{n+1} + \dots + n \right) \left(n + r + 1 \right)) \right) = 0;$$

and, in these Equations,

$$D_n = \begin{vmatrix} 1 \left(1 \dots 1 \right) \left(n - 1, \right) \left(1 \left(n + 1 \cdot a_{n+1} + \dots + 1 \right) \left(n + r + 1 \right) \right) \\ \vdots \qquad \qquad \qquad \vdots \qquad \qquad \qquad \vdots \\ n \left(1 \dots n \right) \left(n - 1, \right) \left(n \left(n + 1 \cdot a_{n+1} + \dots + n \right) \left(n + r + 1 \right) \right) \end{vmatrix},$$

$$= \begin{vmatrix} 1 \left(1 \dots 1 \right) \left(n - 1, \right) \left(n + 1 \right) \\ \vdots \qquad \qquad \qquad \vdots \qquad \qquad \qquad \vdots \\ n \left(1 \dots n \right) \left(n - 1, \right) \left(n + 1 \right) \end{vmatrix} \cdot a_{n+1} + \dots + \begin{vmatrix} 1 \left(1 \dots 1 \right) \left(n - 1, \right) \left(n + r + 1 \right) \\ \vdots \qquad \qquad \qquad \vdots \qquad \qquad \qquad \vdots \\ n \left(1 \dots n \right) \left(n - 1, \right) \left(n + r + 1 \right) \end{vmatrix};$$

(CH. II. AX. II.

and, since $\|V\| = 0$, each of these Determinants vanishes, excepting the last, which = C ;

$\therefore D_n = C$;

\therefore there are n Equations, containing n Variables, and such that, in them, $V = 0$, but $|B| \neq 0$;

\therefore they are inconsistent.

(PROP. IV.

Therefore, if there be, &c. Q. E. D.

Proposition VI. Th.

If there be 2 Equations containing Variables; and if $\|B\| = 0$: the Equations are identical.

Let the 2 Equations contain m Variables, and be represented by

$$\begin{aligned} 1 \left(1. x_1 + 1 \right) 2. x_2 + \dots + 1 \left(m. x_m + 1 \right) m + 1 &= Q_1 = 0, \\ 2 \left(1. x_1 + 2 \right) 2. x_2 + \dots + 2 \left(m. x_m + 2 \right) m + 1 &= Q_2 = 0; \end{aligned}$$

so that $\left\| \begin{array}{ccc} 1 \left(1. & \dots & 1 \right) m + 1 \\ 2 \left(1. & \dots & 2 \right) m + 1 \end{array} \right\| = 0.$

Since $\left| \begin{array}{cc} 1 \left(1. & 1 \right) 2 \\ 2 \left(1. & 2 \right) 2 \end{array} \right| = 0$

$\therefore 1 \left(1. 2 \right) 2 = 2 \left(1. 1 \right) 2;$

$\therefore 1 \left(1 : 2 \right) 1 :: 1 \left(2 : 2 \right) 2 ::$ (by symmetry) &c. $:: 1 \left(m + 1 : 2 \right) m + 1;$

$:: k : l$ (say);

\therefore whatsoever values for the Variables make $Q_1 = 0$, these also make $Q_2 = 0$; and whatsoever values make $Q_2 = 0$ these also make $Q_1 = 0$.

\therefore the Equations are identical.

Therefore, if there be, &c. Q. E. D.

Corollary to Prop. VI.

If there be n Equations containing Variables; and if there be one of them such that, when it is taken along with each of the remaining Equations successively, each pair of Equations, so formed, has its B -Block evanescent: the n Equations are identical.

Proposition VI. Th.

If there be 2 Equations containing Variables; and if $|B| \neq 0$: the Equations are not identical.

Let the Equations contain m Variables.

Now, if possible, let them be identical;

\therefore they are consistent, and there are, among the Variables, $\overline{m - 1}$ to which arbitrary values may be assigned; (AX. IV.

but, if $|V| \neq 0$, there are only $\overline{m - 2}$ Variables to which arbitrary values may be assigned; (PROP. II.

which is absurd;

and, if $\|V\| = 0$, the Equations are inconsistent; (PROPS. III, IV, V.

\therefore in either case, they are not identical.

Therefore, if there be, &c. Q. E. D.

Proposition VIII. Th.

If there be n Equations containing $\overline{n - 1}$ Variables; and if there be among them $\overline{n - 1}$ Equations, which have their V -Block not evanescent; and if $B = 0$: the Equations are consistent; and there is only one set of values for the Variables; and the remaining Equation is dependent on these $\overline{n - 1}$ Equations.

Let a set of $\overline{n - 1}$ Equations, having their V -Block not evanescent, be placed first, and let the n Equations, so arranged, be represented by

$$\begin{aligned} & 1 \left(1. x_1 + \dots + 1 \right) \left(n - 1. x_{n-1} + 1 \right) n = Q_1 = 0, \\ & \hspace{20em} \&c. \\ & n \left(1. x_1 + \dots + n \right) \left(n - 1. x_{n-1} + n \right) n = Q_n = 0; \end{aligned}$$

so that the first $\overline{n - 1}$ of these Equations are consistent; and there is only one set of values for the Variables. (PROP. I.

First, let the n Equations be all homogeneous; (whence B must = 0).

Then they may be satisfied by assigning to each Variable the value zero; (AX. I.

and these values satisfy the last Equation.

Secondly, let the n Equations be not all homogeneous.

Let the Determinants of the principal Minors of the Block

$$\begin{Bmatrix} 1 \left(1 \quad \dots \quad 1 \right) \left(n - 1 \right) \\ \vdots \\ n \left(1 \quad \dots \quad n \right) \left(n - 1 \right) \end{Bmatrix}$$

be represented by H_1, \dots, H_n ; so that $H_n \neq 0$.

Then it may be proved, as in Proposition III, that

$$Q_1. H_1 - Q_2. H_2 + \dots (-)^{n-1} Q_n. H_n = \pm B;$$

\therefore it = 0;

\therefore those values for the Variables, which make Q_1, \dots, Q_{n-1} , each = 0, the same also make $Q_n. H_n = 0$;

but $H_n \neq 0$;

\therefore these values make $Q_n = 0$;

\therefore the n Equations are consistent, and the last is dependent on the others.

Therefore, if there be, &c. Q. E. D.

Corollary to Prop. VIII.

If there be n Equations containing $\overline{n - r}$ Variables; and if there be among them $\overline{n - r}$ Equations, which have their V -Block not evanescent; and if, when these $\overline{n - r}$ Equations are taken along with each of the remaining Equations successively, each set of $\overline{n - r + 1}$ Equations, so formed, has its B -Block evanescent: the Equations are consistent; and there is only one set of values for the Variables; and the remaining Equations are dependent on these $\overline{n - 1}$ Equations.

For then those values for the Variables, which satisfy such a set of $\overline{n - r}$ Equations, satisfy also each of the remaining Equations.

Proposition IX. Th.

If there be n Equations containing n Variables; and if there be among them $\overline{n-1}$ Equations, which have their V -Block not evanescent; and if $\|B\| = 0$: the Equations are consistent; and, if any non-evanescent principal Minor of the V -Block of these $\overline{n-1}$ Equations be selected, the Variable, whose coefficients are not contained in it, may have an arbitrary value assigned to it; and, for each such arbitrary value, there is only one set of values for the other Variables; and the remaining Equation is dependent on these $\overline{n-1}$ Equations.

It is evident that the Equations must contain actually $\overline{n-1}$ at least of the Variables.

First, let them contain actually only $\overline{n-1}$ of the Variables.

Then the Equations are consistent, and there is only one set of values for the Variables. (PROP. VIII.)

Also, an arbitrary value may be given to the Variable which is not actually contained in them.

Secondly, let them contain actually all the Variables.

Let a set of $\overline{n-1}$ Equations, such as satisfy the hypothesis, be selected; and let a non-evanescent principal Minor of their V -Block be selected; and let the remaining Equation be taken along with them; and let the $\overline{n-1}$ Variables, whose coefficients are contained in this Minor, be placed first in all the n Equations, and let the n Equations, so arranged, be represented by

$$\begin{aligned} &1 \binom{1}{1} x_1 + \dots + 1 \binom{n-1}{n-1} x_{n-1} + 1 \binom{n}{n} x_n + 1 \binom{n+1}{n+1} = 0, \\ &\quad \&c. \\ &n-1 \binom{1}{1} x_1 + \dots + n-1 \binom{n-1}{n-1} x_{n-1} + n-1 \binom{n}{n} x_n + n-1 \binom{n+1}{n+1} = 0, \\ &n \binom{1}{1} x_1 + \dots + n \binom{n-1}{n-1} x_{n-1} + n \binom{n}{n} x_n + n \binom{n+1}{n+1} = 0. \end{aligned}$$

Now let an arbitrary value be assigned to the Variable x_n ; and call it " a "; then the Determinant of the B -Block of the n Equations

$$\begin{aligned} &= \begin{vmatrix} 1 \binom{1}{1} & \dots & 1 \binom{n-1}{n-1} & (1 \binom{n}{n} a + 1 \binom{n+1}{n+1}) \\ \vdots & & \vdots & \vdots \\ n \binom{1}{1} & \dots & n \binom{n-1}{n-1} & (n \binom{n}{n} a + n \binom{n+1}{n+1}) \end{vmatrix}; \\ &= \begin{vmatrix} 1 \binom{1}{1} & \dots & 1 \binom{n}{n} \\ \vdots & & \vdots \\ n \binom{1}{1} & \dots & n \binom{n}{n} \end{vmatrix} \cdot a + \begin{vmatrix} 1 \binom{1}{1} & \dots & 1 \binom{n-1}{n-1} & 1 \binom{n+1}{n+1} \\ \vdots & & \vdots & \vdots \\ n \binom{1}{1} & \dots & n \binom{n-1}{n-1} & n \binom{n+1}{n+1} \end{vmatrix} = 0, \text{ by hypothesis;} \end{aligned}$$

\therefore there are n Equations, containing $\overline{n-1}$ Variables, and such that their B -Block is evanescent, but $\overline{n-1}$ of them have their V -Block not evanescent;

\therefore they are consistent, and there is only one set of values for the Variables, and the last Equation is dependent on the others. (PROP. VIII.)

Therefore, if there be, &c. Q. E. D.

Corollary to Prop. IX.

If there be n Equations containing $\overline{n+r}$ Variables; and if there be among them $\overline{n-1}$ Equations, which have their V -Block not evanescent; and if $\|B\| = 0$: the Equations are consistent; and, if any non-evanescent principal Minor of the V -Block of these $\overline{n-1}$ Equations be selected, the $\overline{r+1}$ Variables, whose coefficients are not contained in it, may have arbitrary values assigned to them; and, for each such set of arbitrary values, there is only one set of values for the other Variables; and the remaining Equation is dependent on these $\overline{n-1}$ Equations.

Proposition X. Th.

If there be n Equations, containing n Variables; and if there be among them $\overline{n-k}$ Equations, which have their V -Block not evanescent; and if, when these $\overline{n-k}$ Equations are taken along with each of the remaining Equations successively, each set of $\overline{n-k+1}$ Equations, so formed, has its B -Block evanescent (whence also $\|B\| = 0$): the Equations are consistent; and, if any non-evanescent principal Minor of the V -Block of these $\overline{n-k}$ Equations be selected, the k Variables, whose coefficients are not contained in it, may have arbitrary values assigned to them; and, for each such set of arbitrary values, there is only one set of values for the other Variables; and the remaining Equations are dependent on these $\overline{n-k}$ Equations.

It is evident that the Equations must contain actually $\overline{n-k}$ at least of the Variables.

First, let them contain actually only $\overline{n-k}$ the Variables.

Then they are consistent; and there is only one set of values for the Variables; and the remaining k Equations are dependent on these $\overline{n-k}$ Equations; (PROP. VIII. Cor.

also arbitrary values may be given to the k Variables which are not actually contained in the given Equations.

Secondly, let them contain actually more than $\overline{n-k}$ of the Variables.

Let a set of $\overline{n-k}$ Equations, such as satisfy the hypothesis, be selected; and let a non-evanescent principal Minor of their V -Block be selected; and let one of the remaining Equations be taken along with them; and let the $\overline{n-k}$ Variables, whose coefficients are contained in this Minor, be placed first in these $\overline{n-k+1}$ Equations; and let these $\overline{n-k+1}$ Equations, so arranged, be represented by

$$1 \left(1.x_1 + \dots + 1 \right) \left(n-k.x_{n-k} + 1 \right) \left(n-k+1.x_{n-k+1} + \dots + 1 \right) \left(n.x_n + \dots + n-k \right) \left(1.x_1 + \dots + n-k \right) \left(n-k.x_{n-k} + n-k \right) \left(n-k+1.x_{n-k+1} + \dots + n-k \right) \left(n.x_n + n-k+1 \right) \left(1.x_1 + \dots + n-k+1 \right) \left(n-k.x_{n-k} + n-k+1 \right) \left(n-k+1.x_{n-k+1} + \dots + n-k+1 \right) \left(n.x_n + n-k \right)$$

Now let arbitrary values be assigned to the Variables x_{n-k+1} , &c.;

\therefore there are $\overline{n-k+1}$ Equations, containing $\overline{n-k}$ Variables, and there are among them $\overline{n-k}$ Equations, which have their V -Block not evanescent, and it may be proved, as in the last Proposition, that the Determinant of their B -Block is evanescent;

they are consistent, and there is only one set of values for the Variables; and the $\overline{n - k + 1}$ th Equation is dependent on these $\overline{n - k}$ Equations; (PROP. VIII. also, if any other of the remaining Equations be substituted for this $\overline{n - k + 1}$ th Equation, the same thing may be proved. Therefore, if there be, &c. Q. E. D.

Corollary to Prop. X.

If there be n Equations, containing $\overline{n + r}$ Variables; and if there be among them $\overline{n - k}$ Equations, which have their V -Block not evanescent; and if, when these $\overline{n - k}$ Equations are taken along with each of the remaining Equations successively, each set of $\overline{n - k + 1}$ Equations, so formed, has its B -Block evanescent (whence also $\|B\| = 0$): the Equations are consistent; and, if any non-evanescent principal Minor of the V -Block of these $\overline{n - k}$ Equations be selected, the $\overline{k + r}$ Variables, whose coefficients are not contained in it, may have arbitrary values assigned to them; and, for each such set of arbitrary values, there is only one set of values for the other Variables; and the remaining Equations are dependent on these $\overline{n - k}$ Equations.

Proposition XI. Th.

If there be n homogeneous Equations, containing n Variables; and if $\lrcorner V = 0$ ²⁹: there is, for the Variables, a set of values of which 2 at least are actual. And, of the n Equations, one at least is dependent on the rest.

For, if there be among them $\overline{n - 1}$ Equations which have their V -Block not evanescent, there is one Variable to which an arbitrary value may be assigned; (PROP. IX.

let an actual value be assigned to this Variable;

then at least one other Variable has an actual value; (AX. II.

and the remaining Equation is dependent on these $\overline{n - 1}$ Equations. (PROP. IX.

But, if every $\overline{n - 1}$ of them have their V -Block evanescent, and if the greatest number of them, which have their V -Block not evanescent, be $\overline{n - k}$ (so that $k > 1$), then there are k Variables to which arbitrary values may be assigned; (PROP. X.

that is, there are 2 at least to which actual values may be assigned;

and the remaining k Equations are dependent on these $\overline{n - k}$ Equations.

(PROP. X.

Therefore, if there be, &c. Q. E. D.

Corollary to Prop. XI.

If there be n homogeneous Equations, containing $\overline{n - r}$ Variables; and if $\lrcorner \|V\| = 0$ ³⁰: there is, for the Variables, a set of values of which 2 at least are actual. And, of the n Equations, $\overline{r + 1}$ at least are dependent on the rest.

Proposition XII. Th.

If there be n homogeneous Equations containing more than n Variables: there is, for the Variables, a set of values, of which 2 at least are actual.

²⁹Corrected from $B = 0$ according to *Corrigenda*

³⁰Corrected from $\|B\| = 0$ according to *Corrigenda*

First, let there be one of the Equations such that, when it is taken along with each of the others successively, each pair of Equations, so formed, has its V -Block evanescent;

then the n Equations are identical; (PROP. VI. COR.

\therefore there are at least n Variables, to which arbitrary values may be assigned; (AX. IV.

and one of these values may be actual;

\therefore at least one other may have an actual value. (AX. II.

Secondly, let there be k of the Equations, where k is one of the numbers $2 \dots \overline{n-1}$, which have their V -Block not evanescent, and are such that, when they are taken along with each of the others successively, the set of $\overline{k+1}$ Equations, so formed, has its V -Block evanescent;

then there are at least $\overline{n-k+1}$ Variables, to which arbitrary values may be assigned; (PROP. II.

that is, there are at least 2 such Variables;

and these values may be actual.

Thirdly, let the n Equations have their V -Block not evanescent;

then there is at least one Variable, to which an arbitrary value may be assigned; (PROP. II.

and this value may be actual;

\therefore at least one other may have an actual value. (AX. II.

Therefore, if there be, &c. Q. E. D.

Section II. Properties of Equations under given conditions of consistency.

Proposition XIII. Th.

If there be n Equations containing $\overline{n-1}$ Variables; and if they be consistent: $B = 0$.

For if not, let $B \neq 0$;

then they are inconsistent; (PROP. III.

which is contrary to the hypothesis.

Therefore, if there be, &c. Q. E. D.

Corollary to Prop. XIII.

If there be n Equations containing $\overline{n-r}$ Variables; and if they be consistent: $\|B\| = 0$.

Proposition XIV. Th.

If there be n Equations containing n Variables; and if they be consistent; and if $V = 0$: then $\|B\| = 0$.

For if not, let $|B| \neq 0$;

then the Equations are inconsistent; (PROP. IV.

which is contrary to the hypothesis.

Therefore, if there be, &c. Q. E. D.

Corollary to Prop. XIV.

If there be n homogeneous Equations containing $\overline{n+1}$ Variables; and if there be, for the Variables, a set of values of which one is actual; and if, when that column of the V -Block, which contains such a Variable, is omitted, the remaining Block be evanescent: then the whole V -Block is evanescent.

For the Variable, whose coefficients are contained in that column, may be considered as constant, and the rest as Variables.

Proposition XV. Th.

If there be n Equations containing $\overline{n+r}$ Variables; and if they be consistent; and if $\|V\| = 0$: then $\|B\| = 0$.

For if not, let $|B| \neq 0$;
then the Equations are inconsistent; (PROP. V.
which is contrary to the hypothesis.
Therefore, if there be, &c. Q. E. D.

Corollary to Prop. XV.

If there be n homogeneous Equations containing $\overline{n+r}$ Variables; and if there be, for the Variables, a set of values of which one is actual; and if, when that column of the V -Block, which contains such a Variable, is omitted, the remaining Block be evanescent: then the whole V -Block is evanescent.

For the Variable, whose coefficients are contained in that column, may be considered as constant, and the rest as Variables.

Proposition XVI. Th.

If there be 2 Equations containing Variables; and if they be identical: $\|B\| = 0$.

For if not, let $\|B\| \neq 0$;
then the Equations are not identical; (PROP. VII.
which is contrary to the hypothesis.
Therefore, if there be, &c. Q. E. D.

Proposition XVII. Th.

If there be n Equations containing n Variables; and if they be consistent, and there be one Variable to which an arbitrary value may be assigned: $\|B\| = 0$.

Let the Variable, to which an arbitrary value may be assigned, be placed last, and let the Equations, so arranged, be represented by

$$1 \left(1. x_1 + \dots + 1 \right) \left(n-1. x_{n-1} + 1 \right) \left(n. x_n + 1 \right) \left(n+1 = 0, \right. \\ \left. \text{\&c.} \right)$$

$$n \left(1. x_1 + \dots + n \right) \left(n-1. x_{n-1} + n \right) \left(n. x_n + n \right) \left(n+1 = 0; \right)$$

and call the Determinants of the principal Minors of their B -Block, D_1, \dots, D_n, V .

Now, if possible, let $|B| \neq 0$.

First, if possible, let $D_n \neq 0$;

let x_n have the arbitrary value zero assigned to it;
then there are n Equations containing $\overline{n-1}$ Variables, and such that in them
 $B \neq 0$;
 \therefore they are inconsistent; (PROP. III.
which is contrary to the hypothesis.
 $\therefore D_n = 0$.

Secondly, if possible, let $V \neq 0$;

let x_n have the arbitrary value, 1, assigned to it;
then there are n Equations containing $\overline{n-1}$ Variables, and such that the
Determinant of their B -Block

$$\begin{aligned}
&= \begin{vmatrix} 1 \binom{1}{1} & \dots & 1 \binom{1}{n-1}, & (1) \binom{1}{n+1} \binom{1}{n+1} \\ \vdots & & \vdots & \vdots \\ n \binom{1}{1} & \dots & n \binom{1}{n-1}, & (n) \binom{1}{n+n} \binom{1}{n+1} \end{vmatrix} \\
&= \begin{vmatrix} 1 \binom{1}{1} & \dots & 1 \binom{1}{n} \\ \vdots & & \vdots \\ n \binom{1}{1} & \dots & n \binom{1}{n} \end{vmatrix} + \begin{vmatrix} 1 \binom{1}{1} & \dots & 1 \binom{1}{n-1}, & 1 \binom{1}{n+1} \\ \vdots & & \vdots & \vdots \\ n \binom{1}{1} & \dots & n \binom{1}{n-1}, & n \binom{1}{n+1} \end{vmatrix}; \\
&=V + 0 = V;
\end{aligned}$$

\therefore it $\neq 0$;
 \therefore the Equations are inconsistent; (PROP. III.
which is contrary to the hypothesis;
 $\therefore V = 0$;
 $\therefore \|B\| = 0$. (PROP. XIV.
Therefore, if there be, &c. Q. E. D.

Proposition XVIII. Th.

If there be n Equations, containing $\overline{n+r}$ Variables; and if they be consistent,
and there be $\overline{r+1}$ Variables to which arbitrary values may be assigned: $\|B\| = 0$.

Let the $\overline{r+1}$ Variables, to which arbitrary values may be assigned, be placed
last, and let the Equations, so arranged, be represented by

$$\begin{aligned}
&1 \binom{1}{1} x_1 + \dots + 1 \binom{1}{n-1} x_{n-1} + 1 \binom{1}{n} x_n + \dots + 1 \binom{1}{n+r} x_{n+r} + 1 \binom{1}{n+r+1} = 0, \\
&\qquad\qquad\qquad \&c. \\
&n \binom{1}{1} x_1 + \dots + n \binom{1}{n-1} x_{n-1} + n \binom{1}{n} x_n + \dots + n \binom{1}{n+r} x_{n+r} + n \binom{1}{n+r+1} = 0.
\end{aligned}$$

Now, if possible, let $|B| \neq 0$.

First, if possible, let

$$\begin{vmatrix} 1 \binom{1}{1} & \dots & 1 \binom{1}{n-1}, & 1 \binom{1}{n+r+1} \\ \vdots & & \vdots & \vdots \\ n \binom{1}{1} & \dots & n \binom{1}{n-1}, & n \binom{1}{n+r+1} \end{vmatrix} \neq 0;$$

let x_n, \dots, x_{n+r} have the arbitrary value zero assigned to each of them;
then there are n Equations containing $\overline{n-1}$ Variables, and such that, in
them, $B \neq 0$;

\therefore the Equations are inconsistent; (PROP. III.
which is contrary to the hypothesis;
 \therefore this Determinant = 0.

$$\text{Secondly, if possible, let } \begin{vmatrix} 1 \binom{1}{1} & \dots & 1 \binom{1}{n-1}, & 1 \binom{1}{n+k} \\ \vdots & & \vdots & \vdots \\ n \binom{1}{1} & \dots & n \binom{1}{n-1}, & n \binom{1}{n+k} \end{vmatrix} \neq 0;$$

wherein k is some one of the numbers $0, 1, \dots, r$;

let x_{n+k} have the arbitrary value, 1, assigned to it; and let each other of the
Variables x_n, \dots, x_{n+r} , have the arbitrary value zero assigned to it;

then there are n Equations containing $\overline{n-1}$ Variables, and such that their

B -Block

$$\begin{aligned} &= \begin{vmatrix} 1 \binom{1}{1} & \dots & 1 \binom{1}{n-1}, & (1) \binom{1}{n+k+1} \binom{1}{n+r+1} \\ \vdots & & \vdots & \vdots \\ n \binom{1}{1} & \dots & n \binom{1}{n-1}, & (n) \binom{1}{n+k+n} \binom{1}{n+r+1} \end{vmatrix}; \\ &= \begin{vmatrix} 1 \binom{1}{1} & \dots & 1 \binom{1}{n-1}, & 1 \binom{1}{n+k} \\ \vdots & & \vdots & \vdots \\ n \binom{1}{1} & \dots & n \binom{1}{n-1}, & n \binom{1}{n+k} \end{vmatrix} + \begin{vmatrix} 1 \binom{1}{1} & \dots & 1 \binom{1}{n-1}, & 1 \binom{1}{n+r+1} \\ \vdots & & \vdots & \vdots \\ n \binom{1}{1} & \dots & n \binom{1}{n-1}, & n \binom{1}{n+r+1} \end{vmatrix}; \\ &= \begin{vmatrix} 1 \binom{1}{1} & \dots & 1 \binom{1}{n-1}, & 1 \binom{1}{n+k} \\ \vdots & & \vdots & \vdots \\ n \binom{1}{1} & \dots & n \binom{1}{n-1}, & n \binom{1}{n+k} \end{vmatrix} + 0; \end{aligned}$$

\therefore it $\neq 0$;

\therefore the Equations are inconsistent; (PROP. III.
which is contrary to the hypothesis;

\therefore the square Blocks, formed by taking the first $\overline{n-1}$ columns along with
each of the next $\overline{r+1}$ columns successively, are all evanescent;

that is, all the principal Minors of the V -Block, containing its first $\overline{n-1}$
columns, are evanescent.

$$\text{Thirdly, let } \begin{vmatrix} 1 \binom{1}{1} & \dots & 1 \binom{1}{n-2}, & 1 \binom{1}{n+k}, & 1 \binom{1}{n+r+1} \\ \vdots & & \vdots & \vdots & \vdots \\ n \binom{1}{1} & \dots & n \binom{1}{n-2}, & n \binom{1}{n+k}, & n \binom{1}{n+r+1} \end{vmatrix} \neq 0;$$

wherein k is some one of the numbers $0, 1, \dots, r$;

let each of the Variables x_n, \dots, x_{n+r} , except x_{n+k} , have the arbitrary value
zero assigned to it; and let x_{n+k} have a possible value assigned to it, and call
this value "a";

then there are n Equations containing $\overline{n-1}$ Variables, and such that their

B -Block

$$= \begin{vmatrix} 1 \binom{1}{1} & \dots & 1 \binom{1}{n-2} & 1 \binom{1}{n+k} & (1 \binom{1}{n-1} . a + 1 \binom{1}{n+r+1}) \\ \vdots & & \vdots & \vdots & \vdots \\ n \binom{1}{1} & \dots & n \binom{1}{n-2} & n \binom{1}{n+k} & (n \binom{1}{n-1} . a + n \binom{1}{n+r+1}) \end{vmatrix};$$

$$= \begin{vmatrix} 1 \binom{1}{1} & \dots & 1 \binom{1}{n-2} & 1 \binom{1}{n+k} & 1 \binom{1}{n-1} \\ \vdots & & \vdots & \vdots & \vdots \\ n \binom{1}{1} & \dots & n \binom{1}{n-2} & n \binom{1}{n+k} & n \binom{1}{n-1} \end{vmatrix} . a + \begin{vmatrix} 1 \binom{1}{1} & \dots & 1 \binom{1}{n-2} & 1 \binom{1}{n+k} & 1 \binom{1}{n+r+1} \\ \vdots & & \vdots & \vdots & \vdots \\ n \binom{1}{1} & \dots & n \binom{1}{n-2} & n \binom{1}{n+k} & n \binom{1}{n+r+1} \end{vmatrix};$$

$$= 0 + \text{do.};$$

\therefore it $\neq 0$;

\therefore the Equations are inconsistent;

(PROP. III.

which is contrary to the hypothesis;

\therefore the square Blocks, formed by taking the first $\overline{n-2}$ columns, along with one of the columns from the n^{th} to the $\overline{n+r}^{\text{th}}$, and with the last column, are all evanescent;

and the same thing may be proved for any $\overline{n-2}$ of the first $\overline{n-1}$ columns;

\therefore the square Blocks, formed by taking any $\overline{n-2}$ of the first $\overline{n-1}$ columns, along with any one of the next $\overline{r+1}$ columns, and with the last column, are all evanescent.

$$\text{Fourthly, let } \begin{vmatrix} 1 \binom{1}{1} & \dots & 1 \binom{1}{n-2} & 1 \binom{1}{n+k} & 1 \binom{1}{n+l} \\ \vdots & & \vdots & \vdots & \vdots \\ n \binom{1}{1} & \dots & n \binom{1}{n-2} & n \binom{1}{n+k} & n \binom{1}{n+l} \end{vmatrix} \neq 0;$$

wherein k and l are any 2 of the numbers $0, 1, \dots, r$;

let x_{n+l} have the arbitrary value, 1, assigned to it; and let each of the other Variables x_n, \dots, x_{n+r} , except x_{n+l} , have the arbitrary value zero assigned to it; and let the Variable x_{n-1} have a possible value assigned to it, and call this value " a ";

then there are n Equations containing $\overline{n-1}$ Variables, and such that their

B -Block

$$= \begin{vmatrix} 1 \binom{1}{1} & \dots & 1 \binom{1}{n-2} & 1 \binom{1}{n+k} & (1 \binom{1}{n-1} . a + 1 \binom{1}{n+r+1} + 1 \binom{1}{n+l}) \\ \vdots & & \vdots & \vdots & \vdots \\ n \binom{1}{1} & \dots & n \binom{1}{n-2} & n \binom{1}{n+k} & (n \binom{1}{n-1} . a + n \binom{1}{n+r+1} + n \binom{1}{n+l}) \end{vmatrix};$$

$$= \begin{vmatrix} 1 \binom{1}{1} & \dots & 1 \binom{1}{n-2} & 1 \binom{1}{n+k} & 1 \binom{1}{n-1} \\ \vdots & & \vdots & \vdots & \vdots \\ n \binom{1}{1} & \dots & n \binom{1}{n-2} & n \binom{1}{n+k} & n \binom{1}{n-1} \end{vmatrix} . a + \begin{vmatrix} 1 \binom{1}{1} & \dots & 1 \binom{1}{n-2} & 1 \binom{1}{n+k} & 1 \binom{1}{n+r+1} \\ \vdots & & \vdots & \vdots & \vdots \\ n \binom{1}{1} & \dots & n \binom{1}{n-2} & n \binom{1}{n+k} & n \binom{1}{n+r+1} \end{vmatrix} +$$

$$\begin{vmatrix} 1 \binom{1}{1} & \dots & 1 \binom{1}{n-2} & 1 \binom{1}{n+k} & 1 \binom{1}{n+l} \\ \vdots & & \vdots & \vdots & \vdots \\ n \binom{1}{1} & \dots & n \binom{1}{n-2} & n \binom{1}{n+k} & n \binom{1}{n+l} \end{vmatrix};$$

$$= 0 + 0 + \text{do.}$$

\therefore it $\neq 0$;
 \therefore the Equations are inconsistent; (PROP. III.
 which is contrary to the hypothesis;
 \therefore the square Blocks, formed by taking the first $\overline{n-2}$ columns along with
 any 2 of the columns from the n^{th} to the $\overline{n+r^{\text{th}}}$, are all evanescent;
 and the same thing may be proved for any $\overline{n-2}$ of the first $\overline{n-1}$ columns;
 \therefore the square Blocks, formed by taking any $\overline{n-2}$ of the first $\overline{n-1}$ columns
 along with any 2 of the next $\overline{r+1}$ columns, are all evanescent;
 that is, all the principal Minors of the V -Block, containing $\overline{n-2}$ of its first
 $\overline{n-1}$ columns, are evanescent.
 The same thing may be proved for $\overline{n-3}$ of these columns, for $\overline{n-4}$ of them,
 and so on; and finally for all principal Minors, of the V -Block, not containing
 any of its first $\overline{n-1}$ columns.
 Therefore $\|V\| = 0$.
 Therefore $\|B\| = 0$. (PROP. XV.
 Therefore, if there be, &c. Q. E. D.

Proposition XIX. Th.

If there be n homogeneous Equations, containing n Variables; and if there be a
 set of values, for the Variables, which are not all zero (so that at least 2 of them
 are actual): then $V = 0$.
 For if not, let $V \neq 0$;
 then the values for the Variables are all zero; (PROP. I. COR.
 which is contrary to the hypothesis.
 Therefore, if there be, &c. Q. E. D.

Corollary to Prop. XIX.

If there be n homogeneous Equations, containing $\overline{n-r}$ Variables; and if there
 be a set of values, for the Variables, which are not all zero (so that at least 2 of
 them are actual): then $\|V\| = 0$.

Chapter IV. Tests for Consistency of Equations.

Definitions.

- I.** If there be a condition, or set of conditions, such that, when it is all fulfilled,
 a certain other condition is also fulfilled: it is said to be a **sufficient test** of
 that other condition.
- II.** And if it be such that, when any part of it is not fulfilled, a certain other
 condition is not fulfilled: it is said to be a **necessary test** of that other condi-
 tion.

Convention.

When a condition, or set of conditions, is said to be a test of a certain other
 condition, let it be understood that it is sufficient and necessary, unless it be
 otherwise stated.

Proposition I. Th.

If there be 2 conditions, whereof the first is a test of the second: the second is likewise a test of the first.

Since the first is a *sufficient* test of the second;
∴ if the first be fulfilled, so is the second;
∴ if the second be not fulfilled, neither is the first;
the second is a *necessary* test of the first.
Again, since the first is a *necessary* test of the second;
∴ if the first be not fulfilled, neither is the second;
∴ if the second be fulfilled, so is the first;
∴ the second is a *sufficient* test of the first.
Therefore, if there be, &c. Q. E. D.

Proposition II. Th.

If there be given n Equations, not all homogeneous, containing Variables: a test for their being consistent is that either, first, there is one of them such that, when it is taken along with each of the remaining Equations successively, each pair of Equations, so formed, has its B -Block evanescent; or, secondly, there are m of them, where m is one of the numbers $2 \dots n$, which contain at least m Variables, and have their V -Block not evanescent, and are such that, when they are taken along with each of the remaining Equations successively, each set of Equations, so formed, has its B -Block evanescent.

Let the test be fulfilled;
in the first case, the Equations are identical; (CH. III. PROP. VI.
in the second, they are consistent; (CH. III. PROPS. I, II, IX, X.
∴ the test is *sufficient*.
Next, let it be not fulfilled;
then there are 2 or more of the Equations, which have their V -Block evanescent, but not their B -Block;
∴ these Equations are inconsistent; (CH. III. PROPS. III, IV, V.
∴ the test is *necessary*.
Therefore, if there be, &c. Q. E. D³¹.

Proposition III. Th.

If there be given 2 Equations containing Variables: a test for their being identical is that $\|B\| = 0$.

Let the test be fulfilled;
then the Equations are identical; (CH. III. PROP. VI.
∴ it is *sufficient*.
Next, let it be not fulfilled;
in the case where $\|V\| = 0$, the Equations are inconsistent; (CH. III.
PROPS. III, IV, V.
in the case where $\|V\| \neq 0$, they are not identical; (CH. III. PROP. VII.

³¹*Prop. II.* From this Proposition we may deduce a general process for analysing a set of Equations containing Variables. As, however, in the practical application of such a process, it is necessary to test the evanescence of certain Blocks, and as we have at present no convenient method of doing this, the subject is deferred till we come to the Chapter on ‘Tests of Evanescence of Blocks.’

the test is *necessary*.
Therefore, if there be, &c. Q. E. D.

Proposition IV. Th.

If there be given n homogeneous Equations, containing not more than n Variables; a test for there being, for the Variables, a set of values which are not all zero (so that at least 2 of them are actual) is that $\|V\| = 0$.

Let the test be fulfilled;
then there is such a set of values; (CH. III. PROP. XI.
∴ it is *sufficient*.
Next, let it be not fulfilled;
then there is only one set of values for the Variables; (CH. III. PROP. I.
and these must each be zero; (CH. III. AX. II.
the test is *necessary*.
Therefore, if there be, &c. Q. E. D.

Chapter V. Analysis of Blocks.

Section I. Evanescence of Blocks under given conditions.

Proposition I. Th.

If, in a square Block, the oblong Block, consisting of 2 or more of its rows or columns, be evanescent: the first Block is also evanescent.

First, let the evanescent oblong Block consist of rows.

Let the rows which constitute it be placed last;

now the Determinant of the first Block may be resolved into terms, each consisting of one of the Elements of the first row, multiplied by the Determinant of one of the principal Minors of the oblong Block formed by erasing the first row; (CH. II. PROP. I. COR. 1.

and each of these Determinants may be in like manner resolved into terms, each containing as a factor the Determinant of one of the principal Minors of the oblong Block formed by erasing the first two rows;

and this process may be repeated, until finally the Determinant of the first Block is resolved into terms, each containing as a factor the Determinant of one of the principal Minors of the evanescent oblong Block;

but each of these vanishes by hypothesis;

∴ the Determinant of the whole Block vanishes.

Similarly, if the evanescent oblong Block consists of columns.

Therefore, if in a square Block, &c. Q. E. D³².

³²Prop. I. Thus, if, in the square Block $\begin{pmatrix} a & b & c & d \\ e & f & g & h \\ j & k & l & m \\ n & p & q & r \end{pmatrix}$, it be given that

$$\begin{vmatrix} j & k & l & m \\ n & p & q & r \end{vmatrix} = 0: \text{ the whole Block is evanescent.}$$

Corollary to Prop. I.

If, in an oblong Block, the oblong Block, consisting of 2 or more of its longitudinals, be evanescent: the first Block is also evanescent.

Proposition II. Th.

If there be an oblong Block, having one of its secondary Minors not evanescent; and if, of its principal Minors, each one, which contains that secondary Minor, be evanescent: the whole Block is evanescent.

Call the length of the Block $\overline{n+r}$, and its width n .

Let the Block be placed that its laterals are rows, and let the longitudinals, which contain the non-evanescent Minor, be placed first; and let each of these longitudinals be multiplied throughout by the symbol of a Variable; and let each lateral be equated to zero; and let the $\overline{n+r}$ Equations, so formed, be represented by

$$1 \left(1.x_1 + \dots + 1 \right) \left(n-1.x_{n-1} + 1 \right) n = 0,$$

&c.

$$n+r \left(1.x_1 + \dots + n+r \right) \left(n-1.x_{n-1} + n+r \right) n = 0;$$

then there are $\overline{n+r}$ Equations, containing $\overline{n-1}$ Variables; and there are among them $\overline{n-1}$ Equations, which have their V -Block not evanescent; and, when such a set of $\overline{n-1}$ Equations is selected and taken along with each of the remaining Equations successively, each set of n Equations, so formed, has its B -Block evanescent;

∴ the $\overline{n+r}$ Equations are consistent; (CH. III. PROP. VIII. COR.)

∴ their B -Block is evanescent. (CHAP. III. PROP. XIII. COR.)

Therefore, if there be, &c. Q. E. D³³.

Proposition III. Th.

If there be a Block, having one of its Minors of the k^{th} degree, where k is less than the degree of a secondary Minor, not evanescent; and if, of the oblong Blocks formed from it by selecting $\overline{k+1}$ of its longitudinals, each one, which, contains that non-evanescent Minor, be evanescent: every other oblong Block, so formed, is evanescent. And the same is true of its laterals.

Call the two dimensions of the Block 'm' and 'n'.

$$\text{For } \begin{pmatrix} a & b & c & d \\ e & f & g & h \\ j & k & l & m \\ n & p & q & r \end{pmatrix} = a. \begin{vmatrix} f & g & h \\ k & l & m \\ p & q & r \end{vmatrix} - b. \begin{vmatrix} e & g & h \\ j & l & m \\ n & q & r \end{vmatrix} + \&c.$$

$$= af. \begin{vmatrix} l & m \\ q & r \end{vmatrix} - ag. \begin{vmatrix} k & m \\ p & r \end{vmatrix} + \&c.$$

³³Prop. II. Thus, if, in the oblong Block $\begin{pmatrix} a & b & c & d \\ e & f & g & h \\ j & k & l & m \end{pmatrix}$, it be given that $\begin{vmatrix} b & d \\ k & m \end{vmatrix} \neq 0$,

and that $\begin{vmatrix} a & b & d \\ e & f & h \\ j & k & m \end{vmatrix} = 0$, and $\begin{vmatrix} b & c & d \\ f & g & h \\ k & l & m \end{vmatrix} = 0$: the whole Block is evanescent.

Let the Block be placed in either position, and let the k rows, and also the k columns, which contain the non-evanescent Minor, be placed first; and let each of the columns, except the last, be multiplied throughout by the symbol of a Variable; and let each row be equated to zero; and let the Equations, so formed, be represented by

$$\begin{aligned}
 &1 \left(1. x_1 + \dots + 1 \right) \left(k. x_k + \dots + 1 \right) \left(m - 1. x_{m-1} + 1 \right) m = 0, \\
 &\quad \quad \quad \&c. \\
 &k \left(1. x_1 + \dots + k \right) \left(k. x_k + \dots + k \right) \left(m - 1. x_{m-1} + k \right) m = 0, \\
 &k + 1 \left(1. x_1 + \dots + k + 1 \right) \left(k. x_k + \dots + k + 1 \right) \left(m - 1. x_{m-1} + k + 1 \right) m = 0, \\
 &\quad \quad \quad \&c. \\
 &n \left(1. x_1 + \dots + n \right) \left(k. x_k + \dots + n \right) \left(m - 1. x_{m-1} + n \right) m = 0;
 \end{aligned}$$

where m is $>$, $=$, or $<$ n ; and where

$$\begin{vmatrix}
 1 \left(1 \dots 1 \right) k \\
 \vdots & & \vdots \\
 k \left(1 \dots k \right) k
 \end{vmatrix} \neq 0;$$

then the first $\overline{k+1}$ Equations contain $\overline{m-1}$ Variables, and there are among them k Equations whose V -Block is not evanescent; and the B -Block of these $\overline{k+1}$ Equations is evanescent;

also, since $\overline{m-1} > k$, $\therefore \overline{m-1} \not\leq \overline{k+1}$.

First, let $\overline{m-1} = \overline{k+1}$;

then the Equations are consistent; and the Variable x_{m-1} may have an arbitrary value assigned to it; and the $\overline{k+1}^{\text{th}}$ Equation is dependent on the first k Equations; (CH. III. PROP. IX.)

also, if any of the remaining Equations be substituted for the $\overline{k+1}^{\text{th}}$ Equation, the same thing may be proved;

\therefore the n Equations are consistent, and the Variable x_{m-1} may have an arbitrary value assigned to it;

\therefore if any set of $\overline{k+1}$ Equations be selected, the same thing is true of them;

\therefore any such set has its B -Block evanescent. (CH. III. PROP. XVII.)

Secondly, let $\overline{m-1} = \overline{k+1} + r$;

then the Equations are consistent; and the $\overline{r+1}$ Variables, x_{k+1}, \dots, x_{n-1} , may have arbitrary values assigned to them; and the $\overline{k+1}^{\text{th}}$ Equation is dependent on the first k Equations; (CH. III. PROP. IX.)

COR.

also, if any of the remaining Equations be substituted for the $\overline{k+1}^{\text{th}}$ Equation, the same thing may be proved;

\therefore the n Equations are consistent, and these $\overline{r+1}$ Variables may have arbitrary values assigned to them;

\therefore if any set of $\overline{k+1}$ Equations be selected, the same thing is true of them;

\therefore any such set has its B -Block evanescent. (CH. III. PROP. XVIII.)

Therefore, if there be, &c. Q. E. D³⁴.

Corollary to Prop. III.

If there be a Block, having one of its Minors of the k^{th} degree not evanescent, where k is less than the degree of a secondary Minor; and if, of its Minors of the $k + 1^{\text{th}}$ degree, each one, which contains that non-evanescent Minor, be evanescent: every other Minor of that degree is evanescent.

Proposition IV. Th.

If there be a Block containing 2 rows and 2 or more columns; and if, in every column, the 1st term bear to the 2nd a constant ratio: the Block is evanescent.

Let the Block be represented by

$$\begin{Bmatrix} a_1, & b_1, & \dots & a_n \\ b_1, & b_2, & \dots & b_n \end{Bmatrix}$$

and let it be given that

$$\begin{aligned} a_1 : b_1 :: a_2 : b_2 :: \&c. :: a_n : b_n; \\ &:: k : 1 \text{ (say);} \end{aligned}$$

$$\therefore a_1 = kb_1, a_2 = kb_2, \&c., a_n = kb_n;$$

now $\left\| \begin{matrix} kb_1, & kb_2, & \dots & kb_n \\ b_1, & b_2, & \dots & b_n \end{matrix} \right\| = 0$, since every principal Minor of this Block, if its first row be divided by k has 2 rows identical;

that is, $\left\| \begin{matrix} a_1, & b_1, & \dots & a_n \\ b_1, & b_2, & \dots & b_n \end{matrix} \right\| = 0$.

Therefore, if there be, &c. Q. E. D.

Proposition V. Th.

If there be a Block containing 3 rows and 3 or more columns;

and if, in every column, the difference between the 1st and 2nd terms bears to the 3rd term a constant ratio: the Block is evanescent.

Let the Block be represented by $\begin{Bmatrix} a_1, & a_2, & \dots & a_n \\ b_1, & b_2, & \dots & b_n \\ c_1, & c_2, & \dots & c_n \end{Bmatrix}$; and let it be given that

$$\begin{aligned} (a_1 - b_1) : c_1 :: (a_2 - b_2) : c_2 :: \&c. :: (a_n - b_n) : c_n; \\ &:: k : 1 \text{ (say);} \end{aligned}$$

³⁴ Prop. III. Thus, if, in the Block $\begin{Bmatrix} a & b & c & d & e \\ f & g & h & j & k \\ l & m & n & p & q \\ r & s & t & u & v \end{Bmatrix}$, it be given that $\begin{vmatrix} h & k \\ n & q \end{vmatrix} \neq 0$, and

that $\begin{vmatrix} a & b & c & d & e \\ f & g & h & j & k \\ l & m & n & p & q \end{vmatrix} = 0$, and $\begin{vmatrix} f & g & h & j & k \\ l & m & n & p & q \\ r & s & t & u & v \end{vmatrix} = 0$: then $\begin{vmatrix} a & b & c & d & e \\ f & g & h & j & k \\ r & s & t & u & v \end{vmatrix} = 0$, and $\begin{vmatrix} a & b & c & d & e \\ l & m & n & p & q \\ r & s & t & u & v \end{vmatrix} = 0$.

$$\therefore (a_1 - b_1) = kc_1, (a_2 - b_2) = kc_2, \text{ \&c.}, (a_n - b_n) = kc_n;$$

$$\text{now } \begin{vmatrix} kc_1, & kc_2, & \dots & kc_n \\ b_1, & b_2, & \dots & b_n \\ c_1, & c_2, & \dots & c_n \end{vmatrix} = 0, \text{ since every principal Minor of this Block,}$$

if its 1st row be divided by k , has 2 rows identical;

$$\text{that is, } \begin{vmatrix} (a_1 - b_1), & (a_2 - b_2), & \dots & (a_n - b_n) \\ b_1, & b_2, & \dots & b_n \\ c_1, & c_2, & \dots & c_n \end{vmatrix} = 0;$$

\therefore , adding to the terms of the 1st row those of the 2nd,

$$\begin{vmatrix} a_1, & a_2, & \dots & a_n \\ b_1, & b_2, & \dots & b_n \\ c_1, & c_2, & \dots & c_n \end{vmatrix} = 0. \quad (\text{CH. II. PROP. III. COR. 3.})$$

Therefore, if there be, &c. Q. E. D.

Proposition VI. Th.

If there be a Block containing 3 rows and 3 or more columns;

and if, in every column, the difference between the 1st and 2nd terms bears to the difference between the 2nd and 3rd a constant ratio: the Block is evanescent.

Let the Block be represented by $\begin{Bmatrix} a_1, & a_2, & \dots & a_n \\ b_1, & b_2, & \dots & b_n \\ c_1, & c_2, & \dots & c_n \end{Bmatrix}$; and let it be given

that

$$(a_1 - b_1) : (b_1 - c_1) :: (a_2 - b_2) : (b_2 - c_2) :: \text{ \&c.} :: (a_n - b_n) : (b_n - c_n); \\ :: k : 1 \text{ (say);}$$

$$\therefore (a_1 - b_1) = k(b_1 - c_1), (a_2 - b_2) = k(b_2 - c_2), \text{ \&c.}, (a_n - b_n) = k(b_n - c_n);$$

$$\text{now } \begin{vmatrix} k(b_1 - c_1), & k(b_2 - c_2), & \dots & k(b_n - c_n) \\ (b_1 - c_1), & (b_2 - c_2), & \dots & (b_n - c_n) \\ c_1, & c_2, & \dots & c_n \end{vmatrix} = 0, \text{ since every principal}$$

Minor of this Block, if its 1st row be divided by k , has 2 rows identical;

$$\text{that is, } \begin{vmatrix} (a_1 - b_1), & (a_2 - b_2), & \dots & (a_n - b_n) \\ (b_1 - c_1), & (b_2 - c_2), & \dots & (b_n - c_n) \\ c_1, & c_2, & \dots & c_n \end{vmatrix} = 0;$$

\therefore , adding to the terms of the 1st row those of the 2nd and 3rd, and to the terms of the 2nd row those of the 3rd,

$$\begin{vmatrix} a_1, & a_2, & \dots & a_n \\ b_1, & b_2, & \dots & b_n \\ c_1, & c_2, & \dots & c_n \end{vmatrix} = 0. \quad (\text{CH. II. PROP. III. COR. 3.})$$

Therefore, if there be, &c. Q. E. D.

Section II. Properties of Blocks under given conditions of evanescence.

Proposition VII. Th.

If there be a Block containing 2 rows and 2 or more columns; and if it be evanescent: then, in every column, the first term bears to the second a constant ratio.

Let the Block be represented by $\left\{ \begin{matrix} a_1, & b_1, & \dots & a_n \\ b_1, & b_2, & \dots & b_n \end{matrix} \right\};$

$$\therefore \begin{vmatrix} a_1, & b_1 \\ b_1, & b_2 \end{vmatrix} = 0;$$

$$\therefore a_1 b_2 = a_2 b_1;$$

$$\therefore \frac{a_1}{b_1} = \frac{a_2}{b_2};$$

$$\therefore a_1 : b_1 :: a_2 : b_2 :: (\text{by symmetry}) \ \&c. \ :: a_n : b_n.$$

Therefore, if there be, &c. Q. E. D.

Proposition VIII. Th.

If there be a Block containing 3 rows and 3 or more columns; and if, in one of its columns, the 1st and 2nd terms be equal and the 3rd zero; and if it be evanescent: then, in every column, the difference between the 1st and 2nd terms bears to the 3rd term a constant ratio.

Let the Block be represented by $\left\{ \begin{matrix} a_1, & a_2, & \dots & h \\ b_1, & b_2, & \dots & h \\ c_1, & c_2, & \dots & 0 \end{matrix} \right\};$

$$\therefore \begin{vmatrix} a_1, & a_2, & h \\ b_1, & b_2, & h \\ c_1, & c_2, & 0 \end{vmatrix} = 0;$$

\therefore , subtracting from the terms of the 1st row those of the 2nd,

$$\begin{vmatrix} (a_1 - b_1), & (a_2 - b_2), & 0 \\ b_1, & b_2, & h \\ c_1, & c_2, & 0 \end{vmatrix} = 0; \quad (\text{CH. II. PROP. III. COR. 3.})$$

$$\therefore \begin{vmatrix} (a_1 - b_1), & (a_2 - b_2) \\ c_1, & c_2 \end{vmatrix} = 0; \quad (\text{CH. II. PROP. I. COR. 2.})$$

$$\therefore (a_1 - b_1) : c_1 :: (a_2 - b_2) : c_2; \quad (\text{PROP. VII.})$$

$$:: (a_3 - b_3) : c_3; (\text{by symmetry})$$

$$:: \&c.$$

Therefore, if there be, &c. Q. E. D.

Proposition IX. Th.

If there be a Block containing 3 rows and 3 or more columns; and if, in one of its columns, the 3 terms be equal; and if the Block be evanescent: then, in every column, the difference between the 1st and 2nd terms bears to the difference between the 2nd and 3rd a constant ratio.

Let the Block be represented by $\left\{ \begin{matrix} a_1, & a_2, & \dots & h \\ b_1, & b_2, & \dots & h \\ c_1, & c_2, & \dots & h \end{matrix} \right\};$

$$\therefore \begin{vmatrix} a_1, & a_2, & h \\ b_1, & b_2, & h \\ c_1, & c_2, & h \end{vmatrix} = 0;$$

\therefore , subtracting from the terms of the 1st row those of the 2nd, and from the terms of the 2nd those of the third,

$$\begin{vmatrix} (a_1 - b_1), & (a_2 - b_2), & 0 \\ (b_1 - c_1), & (b_2 - c_2), & 0 \\ c_1, & c_2, & h \end{vmatrix} = 0; \quad (\text{CH. II. PROP. III. COR. 3.})$$

$$\therefore \begin{vmatrix} (a_1 - b_1), & (a_2 - b_2) \\ (b_1 - c_1), & (b_2 - c_2) \end{vmatrix} = 0; \quad (\text{CH. II. PROP. I. COR. 2.})$$

$$\begin{aligned} \therefore (a_1 - b_1) : (b_1 - c_1) &:: (a_2 - b_2) : (b_2 - c_2); \\ &:: (a_3 - b_3) : (b_3 - c_3); (\text{by symmetry}) \\ &:: \&c. \end{aligned}$$

Therefore, if there be, &c. Q. E. D.

Proposition X. Th.

If there be an oblong Block, whose length exceeds its breadth by unity; and if one of its principal Minors be non-evanescent: at least one other is also non-evanescent.

In the lateral, which is not included in the non-evanescent principal Minor, let an actual term be selected; and let the Elements of the longitudinal, which contains the selected term, be each multiplied by the Determinant of the Minor formed by erasing the lateral containing that Element;

then the sum of these products, affected with + and - alternately, is zero; (CH. II. PROP. III. COR. 2.)

\therefore if one of them be actual, at least one other is actual;

\therefore at least one other principal Minor of the oblong Block is non-evanescent.

Therefore, if there be, &c. Q. E. D.

Chapter VI. Tests for Evanescence of Blocks.

Proposition I. Th.

If there be given an oblong Block, having one of its secondary Minors not evanescent; a test of its being evanescent is that, of its principal Minors, each one, which contains that secondary Minor, is evanescent.

Let the test be fulfilled;

then the given Block is evanescent;

(CH. V. PROP. I.)

\therefore it is *sufficient*.

Next, let it be not fulfilled;

then the given Block is not evanescent;

\therefore it is *necessary*.

Therefore, if there be, &c. Q. E. D³⁵.

³⁵ Prop. I. Thus, in the oblong Block $\begin{Bmatrix} 2 & 1 & 3 & -1 & 0 \\ -1 & 3 & -5 & 4 & -7 \\ 1 & 0 & 2 & -1 & 1 \end{Bmatrix}$, we have $\begin{vmatrix} 2 & 1 \\ -1 & 3 \end{vmatrix} \neq 0$,

$$\begin{vmatrix} 2 & 1 & 3 \\ 1 & 3 & -5 \\ 1 & 0 & 2 \end{vmatrix} = 0, \quad \begin{vmatrix} 2 & 1 & -1 \\ -1 & 3 & 4 \\ 1 & 0 & -1 \end{vmatrix} = 0, \quad \begin{vmatrix} 2 & 1 & 0 \\ -1 & 3 & -7 \\ 1 & 0 & 1 \end{vmatrix} = 0. \text{ Hence the whole Block is evanescent.}$$

Proposition II. Th.

If there be given a Block: a test of its being evanescent is that either every Element of it is zero; or there are 2 or more of its longitudinals, which form a Block, having one of its secondary Minors not evanescent, and such that, of its principal Minors, each one, which contains that secondary Minor, is evanescent.

Let the test be fulfilled;

in the case where each Element of the Block is zero, it is plain that the Block is evanescent;

in the case where 2 or more of its longitudinals, but not all of them, form such a Block, the Block, so formed, is evanescent; (CH. V. PROP. II.)

∴ the given Block is evanescent; (CH. V. PROP. I.)

in the case where all the longitudinals of the given Block form such a Block, it is evanescent;

∴ the test is *sufficient*. (CH. V. PROP. II.)

Next, let it be not fulfilled;

then one of the Elements of the Block is actual;

∴ any Block, formed of 2 of the longitudinals of the given Block, has one of its principal Minors not evanescent;

for otherwise, it must have all of its principal Minors evanescent, and, since it necessarily has one of its secondary Minors not evanescent, the test would be fulfilled;

∴ every Block, formed of 2 of the longitudinals of the given Block, is not evanescent;

then it may be proved, in the same manner, that every Block formed of 3 of the longitudinals of the given Block, is not evanescent, and so on, up to the given Block itself;

∴ the given Block is not evanescent;

∴ the test is *necessary*.

Therefore, if there be, &c. Q. E. D³⁶.

Proposition III. Th.

If there be given a Block: a test for the evanescence of every oblong Block, formed from it by selecting h of its laterals, is that either every Element of it is zero, or that it has a non-evanescent Minor of the k^{th} degree, where k is less than h , such that, of the oblong Blocks formed from it by selecting $k + 1$ of its laterals, each one, which contains that non-evanescent Minor, is evanescent. And the test for the longitudinals of the given Block is similar to this.

Let the test be fulfilled;

³⁶ Prop. II. Hence the oblong Block $\left\{ \begin{array}{ccccc} 2 & 1 & 3 & -1 & 0 \\ -1 & 3 & -5 & 4 & -7 \\ 1 & 0 & 2 & -1 & 1 \\ 3 & 4 & -2 & 5 & -1 \end{array} \right\}$ is evanescent, since its first

3 longitudinals form the Block discussed in the last Note.

We are now in a position to describe, and apply, a general process for analysing a set of Equations containing Variables. This will be found in Appendix I.

in the case where every Element of the given Block is zero, it is evident that every oblong Block, formed from it by selecting h of its laterals, is evanescent; in the other ease, the same results follow; (CH. V. PROP. III.
 \therefore the test is *sufficient*.

Next, let it be not all fulfilled;

then the given Block contains one or more actual Elements, and each one of its non-evanescent Minors of the k^{th} degree, where k is less than h , is such that, among- the oblong Blocks, formed from the given Block by selecting $\overline{k+1}$ of its laterals, there is one, containing that non-evanescent Minor, which is itself non-evanescent;

\therefore this is true when $k = 1$;

\therefore among the oblong Blocks, formed from the given Block by selecting 2 of its laterals, there is one non-evanescent;

\therefore the given Block has a non-evanescent Minor of the 2nd degree;

\therefore among the oblong Block, formed from the given Blocks by selecting 3 of its laterals, there is one non-evanescent;

and the same thing may be proved for all values of k up to $\overline{h-1}$;

\therefore among the oblong Blocks, formed from the given Block by selecting h of its laterals, there is one non-evanescent.

\therefore the test is *necessary*.

Therefore this is proved to be a test for the laterals of the given Block;

and a similar set of conditions may be proved, in like manner, to be a test for its longitudinals.

Therefore, if there be, &c. Q. E. D.

Chapter VII. Geometrical Analysis.

Convention I.

When mention is made of a Point, a Line, or a Plane, let it be understood that the words "at a finite distance" are to be added, unless it be otherwise expressed.

Section I. Plane Geometry.

Definition I.

In the Trilinear System, the Equation

$$a\alpha + b\beta + c\gamma - 2M = 0$$

is called the **systematic** Equation.

Convention II.

In the Trilinear System, when the coordinates of a Point are given, let it be understood that they satisfy the Systematic Equation.

Propositton I. Th.

If there be given an Equation of the first degree;

first, in the Cartesian System, viz.—

$$Ax + By + C = 0;$$

and

- (1) If either A , or B , $\neq 0$;
then the Equation represents one real Line, and one only.
- (2) If $A = B = 0$, but $C \neq 0$;
then it does not represent a real Line.
- (3) If $A = B = C = 0$;

then it represents the Plane of reference:

secondly, in the Trilinear System, viz.—

$$A\alpha + B\beta + C\gamma + D = 0,$$

the systematic Equation being $a\alpha + b\beta + c\gamma - 2.M = 0$; and

- (1) If $|V| \neq 0$;
then the 2 Equations are consistent; (CH. III. PROP. II.)
 \therefore the given Equation represents a real Line.
also there is one Variable to which an arbitrary value may be given, and; for each such arbitrary value, there is only one value for each of the other Variables; (CH. III. PROP. II.)
 \therefore the given Equation represents one real Line, and one only.
- (2) If $\|V\| = 0$, but $|B| \neq 0$;
then the 2 Equations are inconsistent; (CH. III. PROP. V.)
 \therefore the given Equation does not represent a real Line.
- (3) If $\|B\| = 0$; (whence also $\|V\| = 0$);
then the 2 Equations are identical; (CH. III. PROP. VI.)
 \therefore the given Equation represents the Plane of reference.

Conventions (continued).

III. When an Equation to a Line is given in the form

$$Ax + By + C = 0,$$

let it be understood that either A , or B , $\neq 0$; when in the form

$$A\alpha + B\beta + C\gamma + D = 0,$$

the systematic Equation being $a\alpha + b\beta + c\gamma - 2M = 0$;

let it be understood that $|V| \neq 0$.

IV. In the Trilinear System, when mention is made of the V -Block, or B -Block, of any number of Equations to Lines: let it be understood that, in forming such Block, the systematic Equation is always taken along with them.

V. When 2 Lines are said to **intersect in a Point at an infinite distance**, let it be understood that they are parallel.

Proposition II. Th.

If the Equation to a line, passing through the origin or a vertex of reference, be given in the form

$$\frac{x}{l} = \frac{y}{m} = 0; \text{ or } \frac{\alpha}{l} = \frac{\beta}{m}:$$

this may be written in the form

$$\begin{vmatrix} x, & y \\ l, & m \end{vmatrix} = 0, \text{ or } \begin{vmatrix} \alpha, & \beta \\ l, & m \end{vmatrix} = 0. \quad (\text{CH. V. PROP. IV.})$$

Again, if the Equation to a Line, passing through a given Point, be given in the form

$$\frac{x-x'}{l} = \frac{y-y'}{m}, \text{ or } \frac{\alpha-\alpha'}{l} = \frac{\beta-\beta'}{m}:$$

this may be written in the form

$$\begin{vmatrix} x, & y, & 1 \\ x', & y', & 1 \\ l, & m, & 0 \end{vmatrix} = 0, \text{ or } \begin{vmatrix} \alpha, & \beta, & 1 \\ \alpha', & \beta', & 1 \\ l, & m, & 0 \end{vmatrix} = 0. \quad (\text{CH. V. PROP. V.})$$

Again, if the Equation to a Line, passing through 2 given Points, be given in the form

$$\frac{x-x_1}{x_1-x_2} = \frac{y-y_1}{y_1-y_2}, \text{ or } \frac{\alpha-\alpha_1}{\alpha_1-\alpha_2} = \frac{\beta-\beta_1}{\beta_1-\beta_2}:$$

this may be written in the form

$$\begin{vmatrix} x, & y, & 1 \\ x_1, & y_1, & 1 \\ x_2, & y_2, & 1 \end{vmatrix} = 0, \text{ or } \begin{vmatrix} \alpha, & \beta, & 1 \\ \alpha_1, & \beta_1, & 1 \\ \alpha_2, & \beta_2, & 1 \end{vmatrix} = 0. \quad (\text{CH. V. PROP. VI.})$$

Proposition III. Th.

If there be given 2 Lines, represented, in the Cartesian System, by

$$\begin{aligned} A_1x + B_1y + C_1 &= 0, \\ A_2x + B_2y + C_2 &= 0; \end{aligned}$$

or, in the Trilinear system, by

$$\begin{aligned} A_1\alpha + B_1\beta + C_1\gamma + D_1 &= 0, \\ A_2\alpha + B_2\beta + C_2\gamma + D_2 &= 0, \end{aligned}$$

the systematic Equation being $a\alpha + b\beta + c\gamma - 2M = 0$;

and

(1) If $V \neq 0$;

then the Equations are consistent, and there is only one set of values for the Variables; (CH. III. PROP. I.)

\therefore the 2 Lines intersect in one Point, and in one only.

(2) If $V = 0$, but $|B| \neq 0$;

then the Equations are inconsistent; (CH. III. PROP. IV.)

\therefore the 2 Lines are parallel.

(3) If $\|B\| = 0$; (whence also $V = 0$);

then, in the Cartesian System, the Equations are identical; (CH. III. PROP. VI.)

also, in the Trilinear System, since either of the Equations to the Lines, taken with the systematic Equation, have their V -Block not evanescent; (CONV. II.

\therefore the 3 Equations are consistent, and either of the Equations to the Lines is dependent on the other Equations; (CH. III. PROP. VIII.

\therefore whatsoever Point lies on one of the 2 Lines, lies also on the other; (CH. III. DEF. VI.

\therefore in either System, the 2 Lines coincide³⁷.

From (2) and (3) may be deduced

(4) If $V = 0$; the 2 Lines have the same direction.

Proposition IV. Th.

If there be given 3 Lines, represented, in the Cartesian System, by

$$\begin{aligned} A_1x + B_1y + C_1 &= 0, \\ A_2x + B_2y + C_2 &= 0, \\ A_3x + B_3y + C_3 &= 0; \end{aligned}$$

or, in the Trilinear System, by

$$\begin{aligned} A_1\alpha + B_1\beta + C_1\gamma + D_1 &= 0, \\ A_2\alpha + B_2\beta + C_2\gamma + D_2 &= 0, \\ A_3\alpha + B_3\beta + C_3\gamma + D_3 &= 0, \end{aligned}$$

the systematic Equation being $a\alpha + b\beta + c\gamma - 2M = 0$;

and

(1) If $B \neq 0$; (whence also $|V| \neq 0$, and every 2 of the Equations to the 3 Lines have their B -Block not evanescent);

then the Equations are inconsistent; (CH. III. PROP. III.

\therefore the 3 Lines do not intersect in one Point, but there are 2 of them which intersect in one Point, and in one only. (PROP. III. (1)

(2) If $B = 0$; and if there be, among the Equations to the 3 Lines, 2 which have their V -Block not evanescent;

then the Equations are consistent, and there is only one set of values for the Variables; (CH. III. PROP. VIII.

\therefore the 3 Lines intersect in one Point, and in one only³⁸.

³⁷ Prop. III. (3.) Thus, if the given Lines be

$$\begin{aligned} \alpha + \beta + 1 &= 0, \\ \alpha + 2\beta + 5\gamma - 14 &= 0; \end{aligned}$$

the systematic Equation being $3\alpha + 4\beta + 5\gamma - 12 = 0$; $\|B\| = 0$, and therefore the 2 Lines coincide.

³⁸ Prop. IV. (2.) Thus, if the given Lines be

$$\begin{aligned} \alpha - \beta + \gamma + 1 &= 0, \\ 3\alpha + \beta - 2\gamma - 4 &= 0, \\ 2\alpha + 9\beta - \gamma - 20 &= 0 \end{aligned}$$

the systematic Equation being $3\alpha + 4\beta + 5\gamma - 12 = 0$; since $B = 0$, and $\begin{vmatrix} 1 & -1, & 1 \\ 3 & 1, & -2 \\ 3 & 4, & 1 \end{vmatrix} \neq 0$,

the 3 Lines intersect in one Point, and in one only.

(3) If $B = 0$; and if every 2 of the Equations to the 3 Lines have their V -Block evanescent; and if there be among them 2 which have their B -Block not evanescent;

then 2 of the Lines are parallel; (PROP. III. (2))

and the 3 have the same direction. (PROP. III. (4))

(4) If every 2 of the Equations to the 3 Lines have their B -Block evanescent; (whence also $B = 0$);

then the 3 Lines coincide. (PROP. III. (3))

From (2), (3), and (4) may be deduced

(5) If $B = 0$;

then the 3 Lines intersect in one Point at a finite or infinite distance.

From (2) and (4) may be deduced

(6) If $B = 0$; and if either there be, among the Equations to the 3 Lines, 2 which have their V -Block not evanescent, or if every 2 have their B -Block evanescent;

then the 3 Lines intersect in one Point.

Proposition V. Th.

If there be given 2 Points, represented, in the Trilinear System, by $(\alpha_1, \beta_1, \gamma_1)$, $(\alpha_2, \beta_2, \gamma_2)$; and if

$$\begin{vmatrix} \alpha_1, & \beta_1, & \gamma_1 \\ \alpha_2, & \beta_2, & \gamma_2 \end{vmatrix} = 0;$$

then $\begin{vmatrix} \alpha_1, & \beta_1, & \gamma_1, & 1 \\ \alpha_2, & \beta_2, & \gamma_2, & 1 \end{vmatrix} = 0$.

For $a\alpha_1 + b\beta_1 + c\gamma_1 - 2M = 0$,

$a\alpha_2 + b\beta_2 + c\gamma_2 - 2M = 0$;

in these Equations, let $a, b, c, -2M$, be considered as Variables;

then there are 2 homogeneous Equations containing 4 Variables; and their

V -Block is $\begin{Bmatrix} \alpha_1, & \beta_1, & \gamma_1, & 1 \\ \alpha_2, & \beta_2, & \gamma_2, & 1 \end{Bmatrix}$; and there is a set of values, for the Variables, of which the last is actual; and, if the last column of their V -Block be omitted, the remaining Block is evanescent;

\therefore the whole Block is evanescent.

(CH. III. PROP. XV. COR.)

Therefore, if there be given, &c. Q. E. D.

Corollaries to Prop. V.

1. Hence the 2 Points are coincident.

For, since $\begin{vmatrix} \alpha_1, & 1 \\ \alpha_2, & 1 \end{vmatrix} = 0$, $\alpha_1 = \alpha_2$; and so of the others.

2. By a similar process (using CH. III. PROP. XIV. COR.), it may be proved that, if there be 3 Points, thus represented, and if

$$\begin{vmatrix} \alpha_1, & \beta_1, & \gamma_1 \\ \alpha_2, & \beta_2, & \gamma_2 \\ \alpha_3, & \beta_3, & \gamma_3 \end{vmatrix} = 0;$$

$$\text{then } \begin{vmatrix} \alpha_1, & \beta_1, & \gamma_1, & 1 \\ \alpha_2, & \beta_2, & \gamma_2, & 1 \\ \alpha_3, & \beta_3, & \gamma_3, & 1 \end{vmatrix} = 0.$$

Proposition VI. Th.

If there be given 3 Points, represented, in the Cartesian System, by (x_1, y_1) &c.; or, in the Trilinear System, by $(\alpha_1, \beta_1, \gamma_1)$, &c.; and if, in each System, the general Equation to a Line be taken, involving 3 undetermined quantities A, B, C ; and if the coordinates of the given Points be successively substituted in it; and if $A, B,$ and C be considered as Variables in the Equations so formed, viz.—

in the Cartesian System,

$$\left. \begin{array}{l} Ax_1 + By_1 + C = 0, \\ Ax_2 + By_2 + C = 0, \\ Ax_3 + By_3 + C = 0, \end{array} \right\} \text{ whose } V\text{-Block is } \begin{Bmatrix} x_1, & y_1, & 1 \\ x_2, & y_2, & 1 \\ x_3, & y_3, & 1 \end{Bmatrix};$$

or, in the Trilinear System,

$$\left. \begin{array}{l} A\alpha_1 + B\beta_1 + C\gamma_1 = 0, \\ A\alpha_2 + B\beta_2 + C\gamma_2 = 0, \\ A\alpha_3 + B\beta_3 + C\gamma_3 = 0, \end{array} \right\} \text{ whose } V\text{-Block is } \begin{Bmatrix} \alpha_1, & \beta_1, & \gamma_1 \\ \alpha_2, & \beta_2, & \gamma_2 \\ \alpha_3, & \beta_3, & \gamma_3 \end{Bmatrix};$$

and

(1) If $V \neq 0$;

then the only values for A, B, C are zero; (CH. III. PROP. I. COR.

\therefore the 3 Points do not lie on one Line.

(2) If $V = 0$; and if there be, among the 3 Equations, 2 which have their V -Block not evanescent;

then there are 2 of the Points which do not coincide, that is, which lie on one Line, and on one only;

also the 3rd Equation is dependent on the others; (CH. III. PROP. VIII.

that is, those values of $A, B,$ and $C,$ which belong to a Line passing through these 2 Points, the same belong also to a Line passing through the 3rd Point;

\therefore the 3 Points lie on one Line, and on one only³⁹.

(3) If every 2 of the 3 Equations have their V -Block evanescent; (whence also $V = 0$);

then the 3 Points coincide. (PROP. V. COR. 1.

³⁹ Prop. VI. (2.) Thus, in the Cartesian system, if the given Points be $(2, 5), (3, -1), (1, 11)$;

since $\begin{vmatrix} 2 & 5 & 1 \\ 3 & -1 & 1 \\ 1 & 11 & 1 \end{vmatrix} = 0,$ and $\begin{vmatrix} 2 & 5 & 1 \\ 3 & -1 & 1 \end{vmatrix} \neq 0,$ the three Points lie on one Line, and on one only.

Again, in the Trilinear system, if the given Points be $(1, 3, -2), (2, -1, 5), (4, 5, 1)$; since

$$\begin{vmatrix} 1 & 3 & -2 \\ 2 & -1 & 5 \\ 4 & 5 & 1 \end{vmatrix} = 0, \text{ and } \begin{vmatrix} 1 & 3 & -2 \\ 2 & -1 & 5 \end{vmatrix} \neq 0, \text{ the same result follows.}$$

From (2) and (3) may be deduced

- (4) If $V = 0$;
then the 3 Points lie on one Line.

Section II. Solid Geometry.

Definition II.

In the Quadriplanar System, the Equation

$$a\alpha + b\beta + c\gamma + d\delta - 3.M = 0$$

is called the **systematic** Equation.

Convention VI.

In the Quadriplanar System, when the coordinates of a Point are given, let it be understood that they satisfy the Systematic Equation.

Proposition VII. Th.

If there be given an Equation of the first degree;

first, in the Cartesian System, viz.—

$$Ax + By + Cz + D = 0;$$

and

- (1) If either A , or B , or C , and $\neq 0$;
then the Equation represents one real Plane, and one only.
- (2) If $A = B = C = 0$, but $D \neq 0$;
then it does not represent a real Plane,
- (3) If $A = B = C = D = 0$;
then it represents all Space:

secondly, in the Quadriplanar System, viz.—

$$A\alpha + B\beta + C\gamma + D\delta + E = 0,$$

the systematic Equation being $a\alpha + b\beta + c\gamma + d\delta - 3M = 0$;

and

- (1) If $|V| \neq 0$;
then the 2 Equations are consistent; (CH. III. PROP. II.)
 \therefore the given Equation represents a real Plane;
also there are 2 Variables to which arbitrary values may be given, and, for each such set of arbitrary values, there is only one value for each of the other Variables;
(CH. III. PROP. II.)
 \therefore the given Equation represents one real Plane, and one only.
- (2) If $\|V\| = 0$, but $|B| \neq 0$;
then the 2 Equations are inconsistent; (CH. III. PROP. V.)
 \therefore the given Equation does not represent a real Plane.
- (3) If $\|B\| = 0$; (whence also $\|V\| = 0$);
then the 2 Equations are identical; (CH. III. PROP. VI.)
 \therefore the given Equation represents all Space.

Conventions (continued).

VII. When an Equation to a Plane is given in the form

$$Ax + By + Cz + D = 0,$$

let it be understood that either A , or B , or C , $\neq 0$; when in the form

$$A\alpha + B\beta + C\gamma + D\delta + E = 0,$$

the systematic Equation being $a\alpha + b\beta + c\gamma + d\delta - 3M = 0$,

let it be understood that $|V| \neq 0$.

VIII. In the Quadriplanar System, when mention is made of the V -Block, or B -Block, of any number of Equations to Planes: let it be understood that, in forming such Block, the systematic Equation is always taken along with them.

IX. When 2 Planes are said to **intersect in a Line at an infinite distance**, let it be understood that they are parallel.

X. When 3 Planes are said to **intersect in a Point at an infinite distance**, let it be understood that either every 2 of them are parallel, or, if any 2 of them intersect, any Line, in which they intersect, is parallel to the 3rd Plane.

Proposition VIII. Th.

If the Equation to a Line, passing through the origin or a vertex of reference, be given in the form

$$\frac{x}{l} = \frac{y}{m} = \frac{z}{n}, \text{ or } \frac{\alpha}{l} = \frac{\beta}{m} = \frac{\gamma}{n};$$

this may be written in the form

$$\begin{vmatrix} x & y & z \\ l & m & n \end{vmatrix} = 0, \text{ or } \begin{vmatrix} \alpha & \beta & \gamma \\ l & m & n \end{vmatrix} = 0. \quad (\text{CH. V. PROP. IV.})$$

Again, if the Equation to a Line, passing through a given Point, be given in the form

$$\frac{x-x'}{l} = \frac{y-y'}{m} = \frac{z-z'}{n}, \text{ or } \frac{\alpha-\alpha'}{l} = \frac{\beta-\beta'}{m} = \frac{\gamma-\gamma'}{n};$$

this may be written in the form

$$\begin{vmatrix} x & y & z & 1 \\ x' & y' & z' & 1 \\ l & m & n & 0 \end{vmatrix} = 0, \text{ or } \begin{vmatrix} \alpha & \beta & \gamma & 1 \\ \alpha' & \beta' & \gamma' & 1 \\ l & m & n & 0 \end{vmatrix} = 0. \quad (\text{CH. V. PROP. V.})$$

Again, if the Equation to a Line, passing through 2 given Points, be given in the form

$$\frac{x-x_1}{x_1-x_2} = \frac{y-y_1}{y_1-y_2} = \frac{z-z_1}{z_1-z_2}, \text{ or } \frac{\alpha-\alpha_1}{\alpha_1-\alpha_2} = \frac{\beta-\beta_1}{\beta_1-\beta_2} = \frac{\gamma-\gamma_1}{\gamma_1-\gamma_2};$$

this may be written in the form

$$\begin{vmatrix} x & y & z & 1 \\ x_1 & y_1 & z_1 & 1 \\ x_2 & y_2 & z_2 & 1 \end{vmatrix} = 0, \text{ or } \begin{vmatrix} \alpha & \beta & \gamma & 1 \\ \alpha_1 & \beta_1 & \gamma_1 & 1 \\ \alpha_2 & \beta_2 & \gamma_2 & 1 \end{vmatrix} = 0. \quad (\text{CH. V. PROP. VI.})$$

Proposition IX. Th.

If there be given 2 Planes, represented, in the Cartesian System, by

$$A_1x + B_1y + C_1z + D_1 = 0,$$

$$A_2x + B_2y + C_2z + D_2 = 0;$$

or, in the Quadriplanar System, by

$$\begin{aligned} A_1\alpha + B_1\beta + C_1\gamma + D_1\delta + E_1 &= 0, \\ A_2\alpha + B_2\beta + C_2\gamma + D_2\delta + E_2 &= 0, \end{aligned}$$

the systematic Equation being $a\alpha + b\beta + c\gamma + d\delta - 3M = 0$;

and

- (1) If $|V| \neq 0$;
then the Equations are consistent, and there is one Variable to which an arbitrary value may be given; (CH. III. PROP. II.)
 \therefore the 2 Planes intersect in more than one Point;
i. e. they intersect in a Line.
also, for each such arbitrary value, there is only one value for each of the other Variables; (CH. III. PROP. II.)
 \therefore they do not coincide;
the 2 Planes intersect in one Line, and in one only.
- (2) If $\|V\| = 0$, but $|B| \neq 0$;
then the Equations are inconsistent; (CH. III. PROP. V.)
 \therefore the 2 Planes are parallel⁴⁰;
- (3) If $\|B\| = 0$; (whence also $\|V\| = 0$);
then, in the Cartesian System, the Equations are identical; (CH. III. PROP. VI.)
also, in the Quadriplanar System, since either of the Equations to the Planes, taken with the systematic Equation, are such that their V -Block is not evanescent; (CONV. VII.)
 \therefore the 3 Equations are consistent, and either of the Equations to the Planes is dependent on the other Equations; (CH. III. PROP. IX. COR.)
i. e. whatsoever Point lies on one of the 3 Planes, lies also on the other; (CH. III. DEF. VI.)
 \therefore in either System, the 2 Planes coincide.

From (2) and (3) may be deduced

- (4) If $\|V\| = 0$;
then the 2 Planes have the same direction.

⁴⁰ Prop. IX. (2.) Thus, in the Quadriplanar System, if the systematic Equation be

$$9\alpha + 9\beta + 12\gamma + 20\delta - 20 = 0;$$

and if there be 2 Planes

$$\begin{array}{rcl} 5\alpha + 4\beta & +2\gamma + 9\delta & +5 = 0, \\ \alpha - \beta & -8\gamma - 2\delta & +3 = 0 : \end{array}$$

since $\|V\| = 0$, (as may be proved by taking the 2 principal Minors of it, which contain the non-evanescent secondary Minor $\begin{Bmatrix} 9, & 9 \\ 5, & 4 \end{Bmatrix}$), but $|B| \neq 0$, the 2 Planes are parallel.

N.B. The above systematic Equation was obtained by taking, as the base of the Tetrahedron of reference, a triangle whose sides are 3, 3, 4, and erecting, at the centre of the inscribed, circle a perpendicular whose length = 1.

Proposition X. Th.

If there be given 3 Planes, represented, in the Cartesian System, by

$$\begin{aligned} A_1x + B_1y + C_1z + D_1 &= 0, \\ A_2x + B_2y + C_2z + D_2 &= 0, \\ A_3x + B_3y + C_3z + D_3 &= 0; \end{aligned}$$

or, in the Quadriplanar System, by

$$\begin{aligned} A_1\alpha + B_1\beta + C_1\gamma + D_1\delta + E_1 &= 0, \\ A_2\alpha + B_2\beta + C_2\gamma + D_2\delta + E_2 &= 0, \\ A_3\alpha + B_3\beta + C_3\gamma + D_3\delta + E_3 &= 0, \end{aligned}$$

the systematic Equation being $a\alpha + b\beta + c\gamma + d\delta - 3M = 0$;

and

- (1) If $V \neq 0$;
then the Equations are consistent, and there is only one set of values for the Variables; (CH. III. PROP. I.)
 \therefore the 3 Planes intersect in one Point, and in one only.
- (2) If $V = 0$, but $|B| \neq 0$;
then the Equations are inconsistent; (CH. III. PROP. IV.)
 \therefore the 3 Planes do not intersect in one Point.
i. e. either every 2 of them are parallel, or, if any 2 of them intersect, any Line, in which they intersect, is parallel to the 3rd Plane;
i. e. they intersect in a Point at an infinite distance.
- (3) If $\|B\| = 0$; (whence also $V = 0$); and if there be, among the Equations to the 3 Planes, 2 which have their V -Block not evanescent;
then there are 2 of the Planes which intersect in one Line, and in one only; (PROP. IX. (1))
and the Equation to the 3rd Plane is dependent on the other 3 Equations; (CH. III. PROP. VIII.)
 \therefore the 3rd Plane passes through the line of intersection;
 \therefore the 3 Planes intersect in one Line, and in one only⁴¹.
- (4) If $\|B\| = 0$; (whence also $V = 0$); and if every 2 of the Equations to the 3 Planes have their V -Block evanescent; and if there be among them 2 which have their B -Block not evanescent;
then 2 of the Planes are parallel; (PROP. IX. (2))
and the 3 have the same direction. (PROP. IX. (4))
- (5) If every 2 of the Equations to the 3 Planes have their B -Block evanescent; (whence also $\|B\| = 0$, and $V = 0$);
then the 3 Planes coincide. (PROP. IX. (3))

⁴¹ Prop. X. (3.) Thus the 3 Planes

$$\begin{aligned} 2x + y & & -2 &= 0, \\ x + 2y & & +3z &= 0, \\ x - 4y & & -11z &= 0, \end{aligned}$$

intersect in one Line, and in one only.

From (2), (3), (4), and (5) may be deduced

(6) If $V = 0$;
then the Lines of intersection, if any, have the same direction.

From (3), (4), and (5) may be deduced

(7) If $\|B\| = 0$;
then the 3 Planes intersect in one Line at a finite or infinite distance.

From (3) and (5) may be deduced

(8) If $\|B\| = 0$; and if either there be, among the Equations to the 3 Planes, 2 which have their V -Block not evanescent, or if every 2 have their B -Block evanescent;
then the 3 Planes intersect in one Line.

Proposition XI. Th.

If there be given 4 Planes, represented, in the Cartesian System, by

$$\begin{aligned} A_1x + B_1y + C_1z + D_1 &= 0, \\ &\&c. \\ A_4x + B_4y + C_4z + D_4 &= 0; \end{aligned}$$

or, in the Quadriplanar System, by

$$\begin{aligned} A_1\alpha + B_1\beta + C_1\gamma + D_1\delta + E_1 &= 0, \\ &\&c. \\ A_4\alpha + B_4\beta + C_4\gamma + D_4\delta + E_4 &= 0; \end{aligned}$$

the systematic Equation being $a\alpha + b\beta + c\gamma + d\delta - 3M = 0$;

and

(1) If $B \neq 0$; (whence also $|V| \neq 0$, and every 3 of the Equations to the 4 Planes have their B -Block not evanescent);
then the Equations are inconsistent; (CH. III. PROP. III.
 \therefore the 4 Planes do not intersect in one Point, but there are 3 of them which intersect in one Point, and in one only.

(2) If $B = 0$, and if there be, among the Equations to the 4 Planes, 3 which have their V -Block not evanescent;
then the Equations are consistent, and there is only one set of values for the Variables; (CH. III. PROP. VIII.
 \therefore the 4 Planes intersect in one Point, and in one only⁴².

⁴²Prop. XI. (2.) Thus, in the Quadriplanar System, if the systematic Equation be

$$9\alpha + 9\beta + 12\gamma + 20\delta - 20 = 0,$$

the 4 planes

$\alpha + \beta$	$-\gamma + 5\delta$	$-3 = 0,$
$5\alpha + 3\beta$	$+8\gamma + 12\delta$	$-11 = 0,$
$3\alpha + 5\beta$	$+5\gamma + \delta$	$-4 = 0,$
$\alpha + \beta$	$+3\gamma + 3\delta$	$-1 = 0,$

intersect in one Point, and in one only.

(3) If $B = 0$; and if every 3 of the Equations to the 4 Planes have their V -Block evanescent; and if there be among them 3 which have their B -Block not evanescent;

then 3 of the Planes intersect in a Point at an infinite distance; (PROP. X. (2))
and all the Lines of intersection, if any, have the same direction. (PROP. X. (6))

(4) If every 3 of the Equations to the 4 Planes have their B -Block evanescent; (whence also $B = 0$); and if there be among them 2 which have their V -Block not evanescent;

then there are 3 of the Planes which intersect in one line, and one only; (PROP. X. (3))
and the Equation of the 4th Plane is dependent on the other Equations; (CH. III.

PROP. IX.

\therefore the 4th Plane passes through the Line of intersection;

\therefore the 4 Planes intersect in one Line, and one only.

(5) If every 3 of the Equations to the 4 Planes have their B -Block evanescent; (whence also $B = 0$); and if every 2 have their V -Block evanescent; and if there be among them 2 which have their B -Block not evanescent;

then there are 2 of the Planes which are parallel; (PROP. IX. (2))

and the 4 have the same direction. (PROP. IX. (4))

(6) If every 2 of the Equations to the 4 Planes have their B -Block evanescent; (whence also every 3 have the same, and $B = 0$);

then the 4 Planes coincide. (PROP. IX. (3))

From (2), (3), (4), (5), and (6) may be deduced

(7) If $B = 0$;

then the 4 Planes intersect in one Point at a finite or infinite distance.

From (2), (4), and (6) may be deduced

(8) If $B = 0$; and if either there be, among the Equations to the 4 Planes, 3 which have their V -Block not evanescent, or if every 3 have their B -Block evanescent and there be 2 which have their V -Block not evanescent, or if every 2 have their B -Block evanescent;

then the 4 Planes intersect in one Point.

Proposition XII. Th.

If there be given 2 Points in Space, represented, in the Quadriplanar System, by $(\alpha_1, \beta_1, \gamma_1, \delta_1)$, $(\alpha_2, \beta_2, \gamma_2, \delta_2)$; and if

$$\begin{vmatrix} \alpha_1 & \beta_1 & \gamma_1 & \delta_1 \\ \alpha_2 & \beta_2 & \gamma_2 & \delta_2 \end{vmatrix} = 0;$$

then $\begin{vmatrix} \alpha_1 & \beta_1 & \gamma_1 & \delta_1 & 1 \\ \alpha_2 & \beta_2 & \gamma_2 & \delta_2 & 1 \end{vmatrix} = 0.$

For

$$a\alpha_1 + b\beta_1 + c\gamma_1 + d\delta_1 - 3M = 0,$$

$$a\alpha_2 + b\beta_2 + c\gamma_2 + d\delta_2 - 3M = 0;$$

in these Equations, let $a, b, c, d, -3M$, be considered as Variables;

then there are 2 homogeneous Equations containing 5 Variables; and their V -Block is $\left\{ \begin{array}{ccccc} \alpha_1, & \beta_1, & \gamma_1, & \delta_1, & 1 \\ \alpha_2, & \beta_2, & \gamma_2, & \delta_2, & 1 \end{array} \right\}$; and there is a set of values, for the Variables, of which the last is actual; and, if the last column of their V -Block be omitted, the remaining Block is evanescent;

\therefore the whole Block is evanescent. (CH. III. PROP. XV. COR.

Therefore, if there be given, &c. Q. E. D.

Corollaries to Prop. XII.

1. Hence the 2 Points are coincident.

For, since $\left\| \begin{array}{cc} \alpha_1, & 1 \\ \alpha_2, & 1 \end{array} \right\| = 0$, $\alpha_1 = \alpha_2$; and so of the others.

2. By a similar process it may be proved that, if there be 3 Points in Space, thus represented, and if

$$\left\| \begin{array}{cccc} \alpha_1, & \beta_1, & \gamma_1, & \delta_1 \\ \alpha_2, & \beta_2, & \gamma_2, & \delta_2 \\ \alpha_3, & \beta_3, & \gamma_3, & \delta_3 \end{array} \right\| = 0;$$

$$\text{then } \left\| \begin{array}{ccccc} \alpha_1, & \beta_1, & \gamma_1, & \delta_1, & 1 \\ \alpha_2, & \beta_2, & \gamma_2, & \delta_2, & 1 \\ \alpha_3, & \beta_3, & \gamma_3, & \delta_3, & 1 \end{array} \right\| = 0.$$

3. And similarly, (using CH. III. PROP. XIV. COR.), that if there be 4 Points in Space, thus represented, and if

$$\left\| \begin{array}{cccc} \alpha_1, & \beta_1, & \gamma_1, & \delta_1 \\ \vdots, & \vdots, & \vdots, & \vdots \\ \alpha_4, & \beta_4, & \gamma_4, & \delta_4 \end{array} \right\| = 0;$$

$$\text{then } \left\| \begin{array}{ccccc} \alpha_1, & \beta_1, & \gamma_1, & \delta_1, & 1 \\ \vdots, & \vdots, & \vdots, & \vdots, & \vdots \\ \alpha_4, & \beta_4, & \gamma_4, & \delta_4, & 1 \end{array} \right\| = 0.$$

Proposition XIII. Th.

If there be given 3 Points in Space, represented, in the Cartesian System, by (x_1, y_1, z_1) , &c.; or, in the Quadriplanar System, by $(\alpha_1, \beta_1, \gamma_1, \delta_1)$, &c.; and if, in each System, the general Equation to a Plane be taken, involving 4 undetermined quantities A, B, C, D ; and if the coordinates of the given Points be successively substituted in it; and if A, B, C , and D be considered as Variables in the Equations so formed, viz.—

in the Cartesian System,
 $\left. \begin{array}{l} Ax_1 + By_1 + Cz_1 + D = 0, \\ Ax_2 + By_2 + Cz_2 + D = 0, \\ Ax_3 + By_3 + Cz_3 + D = 0, \end{array} \right\}$, whose V -Block is $\left\{ \begin{array}{cccc} x_1, & y_1, & z_1, & 1 \\ x_2, & y_2, & z_2, & 1 \\ x_3, & y_3, & z_3, & 1 \end{array} \right\}$;
 or, in the Quadriplanar System,

$$\left. \begin{aligned} A\alpha_1 + B\beta_1 + C\gamma_1 + D\delta_1 &= 0, \\ A\alpha_2 + B\beta_2 + C\gamma_2 + D\delta_2 &= 0, \\ A\alpha_3 + B\beta_3 + C\gamma_3 + D\delta_3 &= 0, \end{aligned} \right\}, \text{ whose } V\text{-Block is } \left\{ \begin{array}{cccc} \alpha_1, & \beta_1, & \gamma_1, & \delta_1 \\ \alpha_2, & \beta_2, & \gamma_2, & \delta_2 \\ \alpha_3, & \beta_3, & \gamma_3, & \delta_3 \end{array} \right\};$$

then, in the first place, it is evident that there is a real Plane on which the 3 Points lie;

also further

(1) If $|V| \neq 0$;
then the values for the Variables bear to each other one and the same set of ratios;
(CH. III. PROP. II. COR.

\therefore there is only one such Plane;

\therefore the 3 Points lie on one Plane, and on one only.

(2) If $\|V\| = 0$; and if there be, among the 3 Equations, 2 which have their V -Block not evanescent;

then the Equations are consistent, and there are 2 Variables to which arbitrary values may be given, and for each such set of arbitrary values, there is only one value for each of the other Variables; (CH. III. PROP. IX. COR.

\therefore for each such set, there is only one Plane;

hence, by giving to these 2 Variables certain arbitrary values, and again certain others not equimultiples of these, 2 Planes may be found on each of which the 3 Points lie;

and these Planes do not coincide; (PROP. IX. (1), (2)

\therefore the 3 Points lie on one Line, and on one only.

(3) If every 2 of the 3 Equations have their V -Block evanescent; (whence also $\|V\| = 0$);

then the 3 Points coincide. (PROP. XII. COR. 1.

From (2) and (3) may be deduced

(4) If $\|V\| = 0$; the 3 Points lie on one Line⁴³.

Proposition XIV. Th.

If there be given 4 Points in Space, represented, in the Cartesian System, by (x_1, y_1, z_1) , &c.; or, in the Quadriplanar System, by $(\alpha_1, \beta_1, \gamma_1, \delta_1)$, &c.; and if, in each System, the general Equation to a Plane be taken, involving 4 undetermined quantities A, B, C, D ; and if the coordinates of the given Points be successively substituted in it; and if the quantities A, B, C , and D be considered as Variables in the Equations so formed; viz.—

in the Cartesian System,

$$\left. \begin{aligned} Ax_1 + By_1 + Cz_1 + D &= 0, \\ \&c. \\ Ax_4 + By_4 + Cz_4 + D &= 0, \end{aligned} \right\}, \text{ whose } V\text{-Block is } \left\{ \begin{array}{cccc} x_1, & y_1, & z_1, & 1 \\ \vdots & \vdots & \vdots & \vdots \\ x_4, & y_4, & z_4, & 1 \end{array} \right\};$$

⁴³Prop. XIII. (4.) Thus, in the Quadriplanar System, the 3 Points, whose coordinates are

$$\begin{aligned} (3, & 1, & 2, & -1), \\ (2, & -1, & 5, & 4), \\ (1, & -3, & 8, & 9), \end{aligned}$$

lie on one Line.

in the Quadriplanar System,

$$\left. \begin{array}{l} A\alpha_1 + B\beta_1 + C\gamma_1 + D\delta_1 = 0, \\ \&c. \\ A\alpha_4 + B\beta_4 + C\gamma_4 + D\delta_4 = 0, \end{array} \right\}, \text{ whose } V\text{-Block is } \left\{ \begin{array}{cccc} \alpha_1, & \beta_1, & \gamma_1, & \delta_1 \\ \vdots & \vdots & \vdots & \vdots \\ \alpha_4, & \beta_4, & \gamma_4, & \delta_4 \end{array} \right\};$$

and

- (1) If $V \neq 0$;
then the only values for A, B, C, D are zero; (CH. III. PROP. I. COR.
 \therefore the 4 Points do not lie on one Plane.
(2) If $V = 0$; and if there be, among the 4 Equations, 3 which have their
 V -Block not evanescent;
then there are 3 of the Points which lie on one Plane, and on one only; (PROP. XIII.
(1)
also the 4th Equation is dependent on the others; (CH. III. PROP. IX.
that is, these values of A, B, C , and D , which belong to a plane passing through
these 3 Points, the same belong also to a Plane passing through the 4th Point;
 \therefore the 4 Points lie on one Plane, and on one only⁴⁴.
(3) If every 3 of the 4 Equations have their V -Block evanescent; (whence also
 $V = 0$); and if there be among them 2 which have their V -Block not evanescent;
then there are 2 of the Points which do not coincide, that is, which lie on one Line,
and on one only;
and each of the other Points lies on the same Line; (PROP. XIII. (2)
 \therefore the 4 Points lie on one Line, and on one only.
(4) If every 2 of the 4 Equations have their V -Block evanescent; (whence
also every 3 have their V -Block evanescent; and whence also $V = 0$);
then the 4 Points coincide. (PROP. XII. COR. 1.

From (2), (3), and (4) may be deduced

- (5) If $V = 0$; the 4 Points lie on one Plane.

From (3) and (4) may be deduced

- (6) If every 3 of the 4 Equations have their V -Block evanescent; the 4 Points
lie on one Line.

Chapter VIII. Geometrical Tests.

Section I. Plane Geometry.

⁴⁴Prop. XIV. (2.) Thus, in the Cartesian System, the 4 points, whose coordinates are

$$\begin{array}{l} (2, \quad 1, \quad -1), \\ (3, \quad 2, \quad 1), \\ (1, \quad -2, \quad -3), \\ (4, \quad 5, \quad 3), \end{array}$$

lie on one Plane, and on one only.

Proposition I. Th.

Test for 2 Lines having the same direction.

If there be given 2 Lines represented, in the Cartesian System, by

$$\begin{aligned}A_1x + B_1y + C_1 &= 0, \\A_2x + B_2y + C_2 &= 0;\end{aligned}$$

or, in the Trilinear system, by

$$\begin{aligned}A_1\alpha + B_1\beta + C_1\gamma + D_1 &= 0, \\A_2\alpha + B_2\beta + C_2\gamma + D_2 &= 0;\end{aligned}$$

the systematic Equation being $a\alpha + b\beta + c\gamma - 2M = 0$:
a test for their having the same direction is that $V = 0$.

Let the test be fulfilled;

then the 2 Lines have the same direction; (CH. VII. PROP. III. (4))

\therefore the test is *sufficient*.

Next, let it be not fulfilled;

then the 2 Lines intersect in one Point, and in one only; (CH. VII.

PROP. III. (1))

that is, they have not the same direction;

\therefore the test is *necessary*.

Therefore, if there be, &c. Q. E. D.

Proposition II. Th.

Test for 3 Lines intersecting, (1) in a Point at a finite or infinite distance, (2) in one Point.

If there be given 3 Lines, represented, in the Cartesian System, by

$$\begin{aligned}A_1x + B_1y + C_1 &= 0, \\A_2x + B_2y + C_2 &= 0, \\A_3x + B_3y + C_3 &= 0;\end{aligned}$$

or, in the Trilinear System, by

$$\begin{aligned}A_1\alpha + B_1\beta + C_1\gamma + D_1 &= 0, \\A_2\alpha + B_2\beta + C_2\gamma + D_2 &= 0, \\A_3\alpha + B_3\beta + C_3\gamma + D_3 &= 0,\end{aligned}$$

the systematic Equation being $a\alpha + b\beta + c\gamma - 2M = 0$:

then, firstly,

a test for their intersecting in one Point, at a finite or infinite distance, is that $B = 0$.

Let the test be fulfilled;

then the 3 Lines do so intersect; (CH. VII. PROP. IV. (5))

\therefore the test is *sufficient*.

Next, let it be not fulfilled;
then the 3 Lines do not intersect in one Point at a finite distance; (CH. VII. PROP. IV. (1))
also there must be, among their Equations, 2 which have their *V*-Block not evanescent; for otherwise *B* would = 0;
∴ there are, among the 3 Lines, 2 which intersect in one Point and in one only;
(CH. VII. PROP. III. (1))
∴ the 3 Lines do not intersect in a Point at an infinite distance;
∴ the test is *necessary*.
Therefore, if there be, &c. Q. E. D.

Secondly,

a test for their intersecting in one Point is that $B = 0$, and that either there are, among the Equations to the 3 Lines, 2 which have their *V*-Block not evanescent, or else every 2 of them have their *B*-Block evanescent.

Let the test be fulfilled;
then the 3 Lines intersect in one Point; (CH. VII. PROP. IV. (6))
∴ the test is *sufficient*.
Next, let it be not all fulfilled;
then either $|B| \neq 0$, or else every 2 of the Equations to the 3 Lines have their *V*-Block evanescent, and 2 of them have their *B*-Block not evanescent;
in the first case, the 3 Lines do not intersect in one point; (CH. VII. PROP. IV. (1))
in the second, 2 of them are parallel; (CH. VII. PROP. III. (2))
∴ in either case, they do not intersect in one Point;
∴ the test is *necessary*.
Therefore, if there be, &c. Q. E. D.

Proposition III. Th.

Test for 3 Points lying on one Line.

If there be given, 3 Points, represented, in the Cartesian System, by (x_1, y_1) , &c.; or, in the Trilinear System, by $(\alpha_1, \beta_1, \gamma_1)$, &c.; and if, in each System, the given coordinates be formed into a Block, thus:—

$$\left\{ \begin{array}{l} x_1, \quad y_1, \quad 1 \\ x_2, \quad y_2, \quad 1 \\ x_3, \quad y_3, \quad 1 \end{array} \right\}, \left\{ \begin{array}{l} \alpha_1, \quad \beta_1, \quad \gamma_1 \\ \alpha_2, \quad \beta_2, \quad \gamma_2 \\ \alpha_3, \quad \beta_3, \quad \gamma_3 \end{array} \right\};$$

a test for the 3 Points lying on one Line is that the Block so formed is evanescent.

In each System let the general Equation to a line be taken, involving 3 undetermined quantities *A*, *B*, *C*; and let the coordinates of the given Points be successively substituted in it; and let *A*, *B*, and *C* be considered as Variables in the Equations so formed, whose *V*-Blocks are those given above.

Now let the test be fulfilled;
then the 3 Points lie on one Line; (CH. VII. PROP. VI. (4))
∴ the test is *sufficient*.
Next, let it be not fulfilled;
then they do not lie on one Line; (CH. VII. PROP. VI. (1))
∴ the test is *necessary*.
Therefore, if there be, &c. Q. E. D.

Corollaries to Prop. III.

1. If there be given 2 Points, represented, in the Cartesian System, by (x_1, y_1) , (x_2, y_2) ; or in the Trilinear System, by $(\alpha_1, \beta_1, \gamma_1)$, $(\alpha_2, \beta_2, \gamma_2)$: the Equation to the Line through them is

$$\begin{vmatrix} x, & y, & 1 \\ x_1, & y_1, & 1 \\ x_2, & y_2, & 1 \end{vmatrix} = 0, \text{ or } \begin{vmatrix} \alpha, & \beta, & \gamma \\ \alpha_1, & \beta_1, & \gamma_1 \\ \alpha_2, & \beta_2, & \gamma_2 \end{vmatrix} = 0$$

2. The Equation in the Cartesian System may also be written $\frac{x-x_1}{x_1-x_2} = \frac{y-y_1}{y_1-y_2}$. (CH. V. PROP. IX.)

3. The equation in the Trilinear System may also be written

$$\alpha \cdot \begin{vmatrix} \beta_1, & \gamma_1 \\ \beta_2, & \gamma_2 \end{vmatrix} - \beta \cdot \begin{vmatrix} \alpha_1, & \gamma_1 \\ \alpha_2, & \gamma_2 \end{vmatrix} + \gamma \cdot \begin{vmatrix} \alpha_1, & \beta_1 \\ \alpha_2, & \beta_2 \end{vmatrix} = 0.$$

Also, since it is equivalent to

$$\begin{vmatrix} \alpha, & \beta, & \gamma, & 1 \\ \alpha_1, & \beta_1, & \gamma_1, & 1 \\ \alpha_2, & \beta_2, & \gamma_2, & 1 \end{vmatrix}, \quad (\text{CH. VII. PROP. V. COR. 2.})$$

it may be written

$$\frac{\alpha-\alpha_1}{\alpha_1-\alpha_2} = \frac{\beta-\beta_1}{\beta_1-\beta_2} = \frac{\gamma-\gamma_1}{\gamma_1-\gamma_2}. \quad (\text{CH. V. PROP. IX.})$$

4. If there be 2 Points, not coincident, represented, in the Trilinear System, by $(\alpha_1, \beta_1, \gamma_1)$, $(\alpha_2, \beta_2, \gamma_2)$: the 3 ratios

$$\begin{vmatrix} \beta_1, & \gamma_1 \\ \beta_2, & \gamma_2 \end{vmatrix} : a, - \begin{vmatrix} \alpha_1, & \gamma_1 \\ \alpha_2, & \gamma_2 \end{vmatrix} : b, \begin{vmatrix} \alpha_1, & \beta_1 \\ \alpha_2, & \beta_2 \end{vmatrix} : c,$$

cannot be all equal.

For, if they were, the Equation to the Line through them might be written

$$a\alpha + b\beta + c\gamma = 0;$$

but this does not represent a real Line. (CH. VII. PROP. I. (2))

Section II. Solid Geometry.

Proposition IV. Th.

Test for 2 Planes having the same direction.

If there be given 2 Planes, represented, in the Cartesian System, by

$$\begin{aligned} A_1x + B_1y + C_1z + D_1 &= 0, \\ A_2x + B_2y + C_2z + D_2 &= 0; \end{aligned}$$

or, in the Quadriplanar System, by

$$\begin{aligned} A_1\alpha + B_1\beta + C_1\gamma + D_1\delta + E_1 &= 0, \\ A_2\alpha + B_2\beta + C_2\gamma + D_2\delta + E_2 &= 0; \end{aligned}$$

the systematic Equation being $a\alpha + b\beta + c\gamma + d\delta - 3M = 0$;
 a test for their having the same direction is that $\|V\| = 0$.

Let the test be fulfilled;

then the 2 Planes have the same direction; (CH. VII. PROP. IX. (4))

\therefore it is *sufficient*.

Next, let it be not fulfilled;

then they intersect in one Line and one only; (CH. VII. PROP. IX. (1))

that is, they have not the same direction;

\therefore it is *necessary*.

Therefore, if there be, &c. Q. E. D.

Proposition V. Th.

*Test for 3 Planes intersecting, (1) in one Line at a finite or infinite distance,
 (2) in one Line.*

If there be given 3 Planes, represented, in the Cartesian System, by

$$\begin{aligned} A_1x + B_1y + C_1z + D_1 &= 0, \\ A_2x + B_2y + C_2z + D_2 &= 0, \\ A_3x + B_3y + C_3z + D_3 &= 0; \end{aligned}$$

or, in the Quadriplanar System, by

$$\begin{aligned} A_1\alpha + B_1\beta + C_1\gamma + D_1\delta + E_1 &= 0, \\ A_2\alpha + B_2\beta + C_2\gamma + D_2\delta + E_2 &= 0, \\ A_3\alpha + B_3\beta + C_3\gamma + D_3\delta + E_3 &= 0, \end{aligned}$$

the systematic Equation being $a\alpha + b\beta + c\gamma + d\delta - 3M = 0$:

then, firstly,

a test for their intersecting in one Line, at a finite or infinite distance, is that $\|B\| = 0$.

Let the test be fulfilled;

then the 3 Planes do so intersect; (CH. VII. PROP. X. (7))

\therefore the test is *sufficient*.

Next, let it be not fulfilled;

then the 3 Planes do not intersect in one Line at a finite distance; (CH. VII. PROP. X. (1), (2))

also there must be, among their Equations, 2 which have their *V*-Block not evanescent; for otherwise, every secondary Minor of the *V*-Block would be evanescent, that is, *B* would = 0;

\therefore there are, among the 3 Planes, 2 which intersect in one Line, and in one only; (CH. VII. PROP. IX. (1))

\therefore the 3 Planes do not intersect in a Line at an infinite distance;

\therefore the test is *necessary*.

Therefore a test, &c. Q. E. D.

Secondly,

a test for their intersecting in one Line is that $\|B\| = 0$, and either there are, among the Equations to the 3 Planes, 2 which have their V -Block not evanescent, or else every 2 of them have their B -Block evanescent.

Let the test be fulfilled;

then the 3 Planes intersect in one Line; (CH. VII. PROP. X. (8))

\therefore it is *sufficient*.

Next, let it be not all fulfilled;

then either $|B| \neq 0$; or else every 2 of the Equations to the 3 Planes have their V -Block evanescent, and 2 of them have their B -Block not evanescent;

in the case where $|B| \neq 0$, the 3 Planes do not intersect in one Line; (CH. VII. PROP. X. (1))

in the second case, 2 of them are parallel; (CH. VII. PROP. IX. (2))

\therefore in either case they do not intersect in one Line;

\therefore the test is *necessary*.

Therefore, if there be, &c. Q. E. D.

Proposition VI. Th.

Test for 4 Planes intersecting, (1) in one Point at a finite or infinite distance, (2) in one Point.

If there be given 4 Planes, represented, in the Cartesian System, by

$$A_1x + B_1y + C_1z + D_1 = 0,$$

&c.;

or, in the Quadriplanar System, by

$$A_1\alpha + B_1\beta + C_1\gamma + D_1\delta + E_1 = 0,$$

&c.;

the systematic Equation being $a\alpha + b\beta + c\gamma + d\delta - 3M = 0$:

then, firstly,

a test for their intersecting in one Point, at a finite or infinite distance, is that $B = 0$.

Let the test be fulfilled;

then the 4 Planes do so intersect; (CH. VII. PROP. XI. (7))

\therefore the test is *sufficient*.

Next, let it be not fulfilled;

then the 4 Planes do not intersect in one Point at a finite distance; (CH. VII. PROP. XI. (1))

also there must be, among, their Equations, 3 which have their V -Block not evanescent; for otherwise B would = 0;

\therefore there are, among the 4 Planes, 3 which intersect in one Point and in one only; (CH. VII. PROP. X. (1))

\therefore the 4 Planes do not intersect in a Point at an infinite distance;

\therefore the test is *necessary*.

Therefore a test, &c. Q. E. D.

Secondly,

a test for their intersecting in one Point is that $B = 0$, and either there are, among the Equations to the 4 Planes, 3 which have their V -Block not evanescent, or else every 3 have their B -Block evanescent and there are 2 which have their V -Block not evanescent, or else every 2 have their B -Block evanescent.

Let the test be fulfilled;

then the 4 Planes intersect in one Point.

(CH. VII. PROP. XI. (8))

\therefore it is *sufficient*.

Next, let it be not all fulfilled;

then either $B \neq 0$; or every 3 of the Equations to the 4 Planes have their V -Block evanescent, and there are 3 among them which have their B -Block not evanescent; or every 2 have their V -Block evanescent, and there are 2 which have their B -Block not evanescent;

in the first case, the 4 Planes do not intersect in one Point;

(CH. VII.

PROP. XI. (1))

in the second, 3 of them do not so intersect;

(CH. VII. PROP. X. (2))

in the third, 2 of them are parallel;

(CH. VII. PROP. IX. (2))

\therefore in any case, they do not intersect in one Point;

\therefore the test is *necessary*.

Therefore, if there be, &c. Q. E. D.

Proposition VII. Th.

Test for 3 Points in Space lying on one Line.

If there be given 3 Points in Space, represented, in the Cartesian System, by (x_1, y_1, z_1) , &c.; or, in the Quadriplanar System, by $(\alpha_1, \beta_1, \gamma_1, \delta_1)$, &c.; and if, in each System, the given coordinates be formed into a Block, thus:—

$$\left\{ \begin{array}{cccc} x_1, & y_1, & z_1, & 1 \\ x_2, & y_2, & z_2, & 1 \\ x_3, & y_3, & z_3, & 1 \end{array} \right\}, \left\{ \begin{array}{cccc} \alpha_1, & \beta_1, & \gamma_1, & \delta_1 \\ \alpha_2, & \beta_2, & \gamma_2, & \delta_2 \\ \alpha_3, & \beta_3, & \gamma_3, & \delta_3 \end{array} \right\};$$

a test for the 3 Points lying on one Line is that the Block so formed is evanescent.

In each System let the general equation to a Plane be taken, involving 4 undetermined quantities A, B, C, D ; and let the coordinates of the given Points be successively substituted in this general Equation; and let A, B, C , and D be considered as Variables in the Equations so formed, so that their V -Blocks are those given above.

Now let the test be fulfilled;

then the 3 Points lie on one Line;

(CH. VII. PROP. XIII. (4))

\therefore it is *sufficient*.

Next, let it be not fulfilled;

then the 3 Points lie on one Plane, and one only; (CH. VII. PROP. XIII. (1))

\therefore it is *necessary*.

Therefore, if there be, &c. Q. E. D.

Corollaries to Prop. VII.

1. If there be given 2 Points in Space, represented, in the Cartesian System, by (x_1, y_1, z_1) , &c.; or, in the Quadriplanar System, by $(\alpha_1, \beta_1, \gamma_1, \delta_1)$, &c.: the

Equations to the Line through them are given by

$$\begin{vmatrix} x, & y, & z, & 1 \\ x_1, & y_1, & z_1, & 1 \\ x_2, & y_2, & z_2, & 1 \end{vmatrix} = 0, \quad \begin{vmatrix} \alpha, & \beta, & \gamma, & \delta \\ \alpha_1, & \beta_1, & \gamma_1, & \delta_1 \\ \alpha_2, & \beta_2, & \gamma_2, & \delta_2 \end{vmatrix} = 0,$$

2. The Equation in the Cartesian System may also be written

$$\frac{x-x_1}{x_1-x_2} = \frac{y-y_1}{y_1-y_2} = \frac{z-z_1}{z_1-z_2}. \quad (\text{CH. V. PROP. IX.})$$

3. The Equation in the Quadriplanar System is equivalent to

$$\begin{vmatrix} \alpha, & \beta, & \gamma, & \delta, & 1 \\ \alpha_1, & \beta_1, & \gamma_1, & \delta_1, & 1 \\ \alpha_2, & \beta_2, & \gamma_2, & \delta_2, & 1 \end{vmatrix}, \quad (\text{CH. VII. PROP. V. COR. 2.})$$

and therefore may be written

$$\frac{\alpha-\alpha_1}{\alpha_1-\alpha_2} = \frac{\beta-\beta_1}{\beta_1-\beta_2} = \frac{\gamma-\gamma_1}{\gamma_1-\gamma_2} = \frac{\delta-\delta_1}{\delta_1-\delta_2}. \quad (\text{CH. V. PROP. IX.})$$

Proposition VIII. Th.

Test for 4 Points in Space lying on one Plane.

If there be given 4 Points in Space, represented, in the Cartesian System, by (x_1, y_1, z_1) , &c.; or, in the Quadriplanar System, by $(\alpha_1, \beta_1, \gamma_1, \delta_1)$, &c.; and if, in each System, the given coordinates be formed into a Block, thus:—

$$\begin{Bmatrix} x_1, & y_1, & z_1, & 1 \\ x_2, & y_2, & z_2, & 1 \\ x_3, & y_3, & z_3, & 1 \\ x_4, & y_4, & z_4, & 1 \end{Bmatrix}, \quad \begin{Bmatrix} \alpha_1, & \beta_1, & \gamma_1, & \delta_1 \\ \alpha_2, & \beta_2, & \gamma_2, & \delta_2 \\ \alpha_3, & \beta_3, & \gamma_3, & \delta_3 \\ \alpha_4, & \beta_4, & \gamma_4, & \delta_4 \end{Bmatrix};$$

the test for the 4 Points lying on one Plane is that the Block so formed is evanescent.

In each System let the general Equation to a Plane be taken, involving 4 undetermined quantities A, B, C, D ; and let the coordinates of the given Points be successively substituted in this general Equation; and let A, B, C , and D be considered as Variables in the Equations so formed, so that their V -Blocks are those given above.

Now let the test be fulfilled;

then the 4 Points lie on one Plane; (CH. VII. PROP. XIV. (5))

\therefore it is *sufficient*.

Next, let it be not fulfilled;

then the 4 Points do not lie on one Plane; (CH. VII. PROP. XIV. (1))

\therefore it is *necessary*.

Therefore, if there be, &c. Q. E. D.

Corollaries to Prop. VIII.

1. If there be given 3 Points in space, represented, in the Cartesian System, by (x_1, y_1, z_1) , &c.; or, in the Quadriplanar System, by $(\alpha_1, \beta_1, \gamma_1, \delta_1)$, &c.: the Equation to the Plane through them is

$$\begin{vmatrix} x, & y, & z, & 1 \\ x_1, & y_1, & z_1, & 1 \\ x_2, & y_2, & z_2, & 1 \\ x_3, & y_3, & z_3, & 1 \end{vmatrix} = 0, \quad \text{or} \quad \begin{vmatrix} \alpha, & \beta, & \gamma, & \delta \\ \alpha_1, & \beta_1, & \gamma_1, & \delta_1 \\ \alpha_2, & \beta_2, & \gamma_2, & \delta_2 \\ \alpha_3, & \beta_3, & \gamma_3, & \delta_3 \end{vmatrix} = 0.$$

2. The Equation in the Quadriplanar System may be written

$$\alpha. \begin{vmatrix} \beta_1, & \gamma_1, & \delta_1 \\ \beta_2, & \gamma_2, & \delta_2 \\ \beta_3, & \gamma_3, & \delta_3 \end{vmatrix} - \beta. \begin{vmatrix} \alpha_1, & \gamma_1, & \delta_1 \\ \alpha_2, & \gamma_2, & \delta_2 \\ \alpha_3, & \gamma_3, & \delta_3 \end{vmatrix} + \gamma. \begin{vmatrix} \alpha_1, & \beta_1, & \delta_1 \\ \alpha_2, & \beta_2, & \delta_2 \\ \alpha_3, & \beta_3, & \delta_3 \end{vmatrix} - \delta. \begin{vmatrix} \alpha_1, & \beta_1, & \gamma_1 \\ \alpha_2, & \beta_2, & \gamma_2 \\ \alpha_3, & \beta_3, & \gamma_3 \end{vmatrix} = 0.$$

3. If there be 3 Points in Space, not lying in one Line, represented in the Quadriplanar System by $(\alpha_1, \beta_1, \gamma_1, \delta_1)$, &c.; then the ratios

$$\begin{vmatrix} \beta_1, & \gamma_1, & \delta_1 \\ \beta_2, & \gamma_2, & \delta_2 \\ \beta_3, & \gamma_3, & \delta_3 \end{vmatrix} : a, - \begin{vmatrix} \alpha_1, & \gamma_1, & \delta_1 \\ \alpha_2, & \gamma_2, & \delta_2 \\ \alpha_3, & \gamma_3, & \delta_3 \end{vmatrix} : b, \begin{vmatrix} \alpha_1, & \beta_1, & \delta_1 \\ \alpha_2, & \beta_2, & \delta_2 \\ \alpha_3, & \beta_3, & \delta_3 \end{vmatrix} : c, - \begin{vmatrix} \alpha_1, & \beta_1, & \gamma_1 \\ \alpha_2, & \beta_2, & \gamma_2 \\ \alpha_3, & \beta_3, & \gamma_3 \end{vmatrix} : d,$$

cannot be all equal.

For, if they were, the Equation to the Plane through these 3 Points might be written

$$a\alpha + b\beta + c\gamma + d\delta = 0;$$

but this does not represent a real Plane. (CH. VII. PROP. VII. (2))

Appendix I.

Method of analysing a given set of Simultaneous Linear Equations. (See Page 1341, note.)

1. Equations not all homogeneous.

The points, on which information is required, concern

- (1) The consistency of the Equations.
- (2) Their dependence one on another.
- (3) The Variables to which arbitrary values may be simultaneously assigned.

We begin by examining the *V*-Block and *B*-Block of the first 2 Equations; then those of the first 3; of the first 4, and so on.

If in the course of this process we find a set of Equations whose *V*-Block is evanescent, but not their *B*-Block, these are inconsistent, and the inquiry comes to an end.

If in its course we find a set whose *B*-Block is evanescent, the last may be set aside as dependent on one or more of the preceding.

This process is continued until the whole set have been thus examined, or until we have found a set, whose number is equal to the number of the Variables, and whose *V*-Block is not evanescent. In the latter case, if there be Equations still remaining, we must take each of them separately along with the set already examined, and examine the *B*-Block of each set so formed. If any such *B*-Block be not evanescent, the Equations are inconsistent; but if every such *B*-Block be evanescent, all these remaining Equations are dependent on the set already examined.

Thus in any case we either prove the inconsistency of the given Equations, or else (setting aside all that are proved to be dependent on others) we obtain a set of *independent* Equations, whose *V*-Block is not evanescent.

Now in this set of independent Equations, the number of Variables is either equal to, or else greater than, the number of Equations. In the former case, there is only one set of values for the Variables; in the latter, the excess gives the number of Variables to which arbitrary values may be simultaneously assigned, and, for every non-evanescent principal Minor of the V -Block, there is such a set of Variables, namely those whose coefficients do not enter into that principal Minor. (Hence, in this case, there are always two such sets at least. See CHAP. V. PROP. X.)

Let us take as an example the 4 Equations

$$\begin{array}{rclcl} u + v & -2x + y & -z - 6 & = 0, \\ 2u + 2v & -4x - y & +z - 9 & = 0, \\ u + v & -2x & -5 & = 0, \\ u - v & +x + y & -2z & = 0. \end{array}$$

We begin by examining the V -Block and B -Block of the first 2 Equations; and for this purpose we take the first column along with each of the others successively. Thus we have $\begin{vmatrix} 1, & 1 \\ 2, & 2 \end{vmatrix} = 0$, $\begin{vmatrix} 1, & -2 \\ 2, & -4 \end{vmatrix} = 0$, $\begin{vmatrix} 1, & 1 \\ 2, & -1 \end{vmatrix} \neq 0$.

This shows that their V -Block is not evanescent.

We now take the first 3 Equations, and combine the 2 columns, which contain the non-evanescent Minor so found, with each of the other columns successively. Thus we have

$$\begin{array}{l} \begin{vmatrix} 1, & 1, & 1 \\ 2, & -1, & 2 \\ 1, & 0, & 1 \end{vmatrix} = 0, \quad \begin{vmatrix} 1, & 1, & -2 \\ 2, & -1, & -4 \\ 1, & 0, & -2 \end{vmatrix} = 0, \\ \begin{vmatrix} 1, & 1, & -1 \\ 2, & -1, & 1 \\ 1, & 0, & 0 \end{vmatrix} = 0, \quad \begin{vmatrix} 1, & 1, & -6 \\ 2, & -1, & -9 \\ 1, & 0, & -5 \end{vmatrix} = 0, \end{array}$$

This shows that the B -Block of these 3 Equations is evanescent, so that the 3rd is dependent on one or both of the first 2.

Omitting the 3rd we take the 1st, 2nd, and 4th, and proceed as before. Thus

we have $\begin{vmatrix} 1, & 1, & 1 \\ 2, & -1, & 2 \\ 1, & 1, & -1 \end{vmatrix} \neq 0$. This shows that the V -Block of these 3 Equations

is not evanescent. Hence these Equations are consistent, and, since they contain 5 Variables, there are 2 Variables to which arbitrary values may be assigned.

To ascertain how many such sets of 2 may be selected from the 5 Variables, it is necessary to compute *all* the principal Minors of the V -Block of these 3

Equations. These are $\begin{vmatrix} 1, & 1, & -2 \\ 2, & 2, & -4 \\ 1, & -1, & 1 \end{vmatrix} = 0$, (because the oblong Block, formed of

the first 2 rows, is evanescent); next, taking columns (124) $\begin{vmatrix} 1, & 1, & 1 \\ 2, & 2, & -1 \\ 1, & -1, & 1 \end{vmatrix} \neq 0$;

for columns (125), $\begin{vmatrix} 1, & 1, & -6 \\ 2, & 2, & -9 \\ 1, & -1, & 0 \end{vmatrix} \neq 0$; for (134), $\begin{vmatrix} 1, & -2, & 1 \\ 2, & -4, & 1 \\ 1, & 1, & 1 \end{vmatrix} \neq 0$; for (135),

$$\begin{aligned} & \begin{vmatrix} 1, & -2, & -6 \\ 2, & -4, & -9 \\ 1, & -1, & 0 \end{vmatrix} \neq 0; \text{ for (145), } \begin{vmatrix} 1, & 1, & -6 \\ 2, & 1, & -9 \\ 1, & -2, & 1 \end{vmatrix} \neq 0; \text{ for (234), } \begin{vmatrix} 1, & -2, & -1 \\ 2, & -4, & 1 \\ -1, & 1, & -2 \end{vmatrix} \neq \\ & 0; \text{ for (235), } \begin{vmatrix} 1, & -2, & -6 \\ 2, & -4, & -9 \\ -1, & 1, & 0 \end{vmatrix} \neq 0; \text{ for (245), } \begin{vmatrix} 1, & 1, & -6 \\ 2, & -1, & -9 \\ -1, & 1, & 0 \end{vmatrix} \neq 0; \text{ for (345), } \\ & \begin{vmatrix} 1, & -1, & -6 \\ -1, & 1, & -9 \\ 1, & -2, & 0 \end{vmatrix} \neq 0 \end{aligned}$$

We have thus ascertained, with regard to these 4 Equations, that

- (1) They are consistent.
- (2) The 1st, 2nd, and 4th are independent, and the 3rd is dependent on one or both of the first two.
- (3) It is possible to assign arbitrary values to 2 of the Variables simultaneously; and for this purpose *any* set of 2, with the exception of (y, z) , may be taken. If, for example, we assign to y and z the values '1', '2', we obtain for u, x , and z the values '2', '-1', '1'.

Again, let us take the 5 Equations

$$\begin{aligned} 3x - y & \qquad \qquad \qquad +7 = 0, \\ 6x - 2y & \qquad \qquad \qquad +14 = 0, \\ x + y & \qquad \qquad \qquad +1 = 0, \\ x + 5y & \qquad \qquad \qquad -3 = 0, \\ 5x + y & \qquad \qquad \qquad +9 = 0. \end{aligned}$$

We begin by examining the V -Block and B -Block of the first 2 Equations; and for this purpose we take the first column along with each of the others successively. Thus we have $\begin{vmatrix} 3, & -1 \\ 6, & -2 \end{vmatrix} = 0$, $\begin{vmatrix} 3, & 7 \\ 6, & 14 \end{vmatrix} = 0$. Hence the B -Block is evanescent, and either Equation is dependent on the other.

Omitting the 2nd, we take the 1st and 3rd, and examine them in the same manner. Thus we have $\begin{vmatrix} 3, & -1 \\ 1, & 1 \end{vmatrix} \neq 0$. Hence these Equations are consistent, and there is only one set of values for the Variables.

We have now applied the general process as far as it will go, since the number of Equations, last tested, is equal to the number of Variables, All we have now to do, is to take these 2 Equations along with each of the remaining Equations successively, and examine whether the B -Block of each set, so formed, is evanescent or not.

Taking them along with the 4th, we have $\begin{vmatrix} 3, & -1, & 7 \\ 1, & 1, & 1 \\ 1, & 5, & -3 \end{vmatrix} = 0$. Hence the 4th Equation is dependent on one or both of the 1st and 3rd.

Then taking them along with the 5th, we have $\begin{vmatrix} 3, & -1, & 7 \\ 1, & 5, & -3 \\ 5, & 1, & 9 \end{vmatrix} = 0$. Hence the 5th Equation is similarly dependent.

We have thus ascertained, with regard to these 5 Equations, that

- (1) They are consistent.
- (2) The 1st and 3rd are independent, and each of the rest is dependent on one or both of these.
- (3) There are no Variables to which arbitrary values can be assigned.

2. Given Equations all homogeneous.

It must be remembered that homogeneous Equations are *always* consistent, i. e. they may be satisfied by assigning to each Variable the value zero: in some cases, the Variables admit of no other values, in others, they admit of a set of values of which one at least is (and therefore two at least are) actual. In this latter case, whatever set of values for the Variables satisfy the Equations, any equimultiples of them will do so also, so that in this case it is always possible to assign an arbitrary value to any one of those Variables which admit of actual values. Again, there are cases in which it is possible to assign arbitrary values to 2 or more of these Variables simultaneously. These properties will be the subject of our inquiry.

The points, on which information is required, concern

- (1) The possibility of assigning to the Variables a set of values which are not all zero. (In which case 2 at least of the Variables admit of actual values, and to either of them an arbitrary value may be assigned.)
- (2) The dependence of the Equations one on another.
- (3) The Variables to which arbitrary values may be simultaneously assigned.

We begin by examining the *V*-Block of the first 2 Equations; then those of the first 3; of the first 4, and so on.

If in the course of this process we find a set of Equations whose *V*-Block is evanescent, the last may be set aside as dependent on one or more of the preceding.

This process is continued until the whole set have been thus examined, or until we have found a set, whose number is less by unity than the number of the Variables, and whose *V*-Block is not evanescent. In the latter case, if there be Equations still remaining, we must take each of them separately along with the set already examined, and examine the *V*-Block of each set so formed. If any such *V*-Block be not evanescent, the Equations admit of zero values only; but if every such *V*-Block be not evanescent, all these remaining Equations are dependent on the set already examined.

Thus in any case we either prove that the given equations admit of zero values only, or else (setting aside all that are proved to be dependent on others) we obtain a set of *independent* Equations, whose *V*-Block is not evanescent.

Now in this set of independent Equations, the number of Variables exceeds the number of Equations, either by unity, or by some greater number. In the former case, there is only one set of ratios among the Variables, (see CHAP. III. PROP. II. COR.), i. e. it is not possible to assign arbitrary values to 2 of the Variables simultaneously; in the latter case, the excess gives the number of Variables

to which arbitrary values may be simultaneously assigned, and, for every non-evanescent principal Minor of the V -Block, there is such a set of Variables, namely those whose coefficients do not enter into that principal Minor. (Hence, in this case, there are always 2 such sets at least. See CHAP. V. PROP. X.)

Let us take as an instance the 3 Equations

$$\begin{array}{rcl} 2u + v & +2x + y & +3z = 0, \\ 5u + 3v & -4x + 3y & -6z = 0, \\ u + v & -8x + y & -12z = 0. \end{array}$$

Here the V -Block of the first 2 Equations is not evanescent.

But the V -Block of the whole set is evanescent; hence the 3rd Equation may be omitted as dependent on the other 2.

And, in these 2, the Variables exceed the Equations in number by 3; hence every non-evanescent principal Minor indicates a set of 3 Variables to which arbitrary values may be simultaneously assigned. The non-evanescent Minors are those belonging to (u, v) , (u, x) , (u, y) , (u, z) , (v, x) , (v, z) , (x, y) , (y, z) . Hence, with the exception of (v, x, z) , (u, v, y) , any 3 of the Variables may have arbitrary values assigned to them. If, for example, we assign to x, y, z , the values 1, 2, -1, we obtain for u and v the values 5, -11.

Appendix II.

Arithmetical Computation of Determinants.

A general method for computing the value of a Determinant has been already given (see CH. II. PROP. I. COR. 1. Note); and, when the Elements are *Algebraical*, this method is perhaps the best we can employ.

But when the Elements are *Arithmetical*, it is often possible so to rearrange, or otherwise modify, the given Block, as to make the process of computation both easier and more expeditious. Were not this the case, it would seldom be worth while to employ Determinants for any purpose where actual calculation is necessary; for instance, in the solution of a set of 3 or more simultaneous Equations, the old method of elimination would be far preferable.

In this process of simplification, much must be left to the ingenuity of the student, guided by the circumstances of the case. A few general rules are all that the teacher can supply.

1. We have seen (CH. II. AX. II.) that “if, in a square Block, the Elements of any one row or column be multiplied by v ; the Determinant of the new Block is equal to that of the first multiplied by v .” Hence conversely, if, in a square Block, the Elements of any one row, or column, contain v as a factor; it may be divided out and placed outside the Determinant. As an instance of the application of

this principle, let us take the Block $\begin{Bmatrix} 36, & 15, & -24 \\ 18, & -9, & 3 \\ 36, & 8, & 16 \end{Bmatrix}$. Here we may observe

that the 1st row contains ‘3’ as a factor, the 2nd ‘3’ also, and that the 3rd contains

‘4’: hence the Determinant may be reduced to the form $3^2 \cdot 4 \cdot \begin{vmatrix} 12, & 5, & -8 \\ 6, & -3, & 1 \\ 9, & 2, & 4 \end{vmatrix}$:

and this again, since the 1st column contains '3' as a factor, may be reduced to

$$\text{the form } 3^3 \cdot 4 \cdot \begin{vmatrix} 4, & 5, & -8 \\ 2, & -3, & 1 \\ 3, & 2, & 4 \end{vmatrix}.$$

2. We have seen (CH. II. PROP. I. COR. 2.) that "if, in a square Block, the Elements in any one row, or column, all vanish but one: the Determinant of the Block is the product produced by multiplying the Determinant of the complementary Minor of that Element by that Element itself, affected with + or -, according as the numerals in its symbol are similar or dissimilar." As an instance

of the application of this principle, let us take the Block $\begin{pmatrix} 3, & 1, & 0, & 2 \\ 2, & -1, & 0, & 1 \\ 1, & 1, & -5, & 2 \\ 4, & -2, & 0, & -1 \end{pmatrix}$,

where the Elements of the 3rd column all vanish but one, and where the symbol of that Element is 3, so that its numerals are *similar*. Hence the Determinant

of this Block may be at once reduced to the form $-5 \cdot \begin{vmatrix} 3, & 1, & 2 \\ 2, & -1, & 1 \\ 4, & -2, & -1 \end{vmatrix}$. When the

given Block does not contain any such row or column, it may be made to do so by the application of another principle, which we proceed to consider.

3. We have seen (CH. II. PROP. III. COR. 3.) that "if, in a square Block, there be added to the several Elements of any row, or column, the corresponding Elements of any other row, or column, multiplied by any number: the Determinant of the new Block is the same as that of the first." As an instance of

the application of this principle, let us take the Block $\begin{pmatrix} 7, & 2, & 1, & -3 \\ 2, & -1, & 3, & 6 \\ 1, & 4, & -3, & 2 \\ -6, & 4, & 1, & 5 \end{pmatrix}$,

and let us select the 3rd column as the one to be reduced to the required form, and its first Element, "1," as the one which is not to vanish. Now to the Elements of the 2nd row add those of the 3rd. To the Elements of the 3rd row add those of the 4th, multiplied by 3. To the Elements of the 4th row add those of the 1st, multiplied by -1. The Determinant of the Block is thus reduced to

the form $\begin{vmatrix} 7, & 2, & 1, & -3 \\ 3, & 3, & 0, & 8 \\ -17, & 10, & 0, & 17 \\ -13, & 2, & 0, & 8 \end{vmatrix}$, which again is reduced, by the former rule, to

$$\begin{vmatrix} 3, & 3, & 8 \\ -17, & 10, & 17 \\ -13, & 2, & 8 \end{vmatrix}.$$

In employing this Rule, we must observe that each modification is a *separate* application of the principle, so that if we employ, in any stage of the process, the Elements of a row, or column, which has been already modified, we must employ them as so modified, and not in their original state. Failing to observe this, we

might imagine that, in the Block $\begin{pmatrix} 3, & 5, & 2 \\ 2, & 1, & 3 \\ 4, & -1, & -2 \end{pmatrix}$, it would be legitimate to

add to the Elements of the 2nd row those of the 3rd, and at the same time to add to the Elements of the 3rd row those of the 2nd, and thus to reduce the

Determinant to the form $\begin{vmatrix} 3, & 5, & 2 \\ 6, & 0, & 1 \\ 6, & 0, & 1 \end{vmatrix}$: whereas the first modification reduces the
 Determinant to the form $\begin{vmatrix} 3, & 5, & 2 \\ 6, & 0, & 1 \\ 4, & -1, & -2 \end{vmatrix}$, and thus the second proposed modification is impossible. To guard against this error it is always best to employ, in each stage of the process, the Elements of some row, or column, which has not yet been modified.

Other version:
 → 7.1, p. 1220

4. The process of computation, which I now proceed to explain, and for which “Condensation” appears to be an appropriate name, was communicated by me to the Royal Society in the year 1866, and an account of it is to be found in their “Proceedings,” No. 84.

In the following remarks I shall use the phrase “interior of a Block” to denote the Block which remains when the first and last rows and columns are erased.

The process of “Condensation” is exhibited in the following rules, in which the given block is supposed to consist of n rows and n columns:—

(1) Arrange the given Block, if necessary, so that no ciphers occur in its interior. This may be done either by transposing rows or columns, or by adding to certain rows the several terms of other rows multiplied by certain multipliers.

(2) Compute the Determinant of every Minor consisting of four adjacent terms. These values will constitute a second Block, consisting of $\overline{n-1}$ rows and $\overline{n-1}$ columns.

(3) Condense this second Block in the same manner, dividing each term, when found, by the corresponding term in the interior of the first Block.

(4) Repeat this process as often as may be necessary (observing that in condensing any Block of the series, the r^{th} for example, the terms so found must be divided by the corresponding terms in the interior of the $\overline{r-1}^{\text{th}}$ Block), until the Block is condensed to a single term, which will be the required value.

As an instance of the foregoing rules, let us take the Block

$$\begin{vmatrix} -2 & -1 & -1 & -2 \\ -1 & -2 & -1 & -3 \\ -1 & -1 & 2 & 2 \\ 2 & 1 & -3 & -4 \end{vmatrix}.$$

By rule (2) this is condensed into $\begin{vmatrix} 3 & -1 & 1 \\ -1 & -5 & 4 \\ 1 & 1 & -2 \end{vmatrix}$; this, again, by rule (3), is condensed into $\begin{vmatrix} 8 & -1 \\ -4 & 3 \end{vmatrix}$; and this, by rule (4), into -4 , which is the required value.

The simplest method of working this rule appears to be to arrange the series of Blocks one under another, as here exhibited; it will then be found very easy to pick out the divisors required in rules (3) and (4).

$$\begin{vmatrix} -2 & -1 & -1 & -2 \\ -1 & -2 & -1 & -3 \\ -1 & -1 & 2 & 2 \\ 2 & 1 & -3 & -4 \end{vmatrix}$$

$$\begin{vmatrix} 3 & -1 & 1 \\ -1 & -5 & 4 \\ 1 & 1 & -2 \end{vmatrix}$$

$$\begin{vmatrix} 8 & -1 \\ -4 & 3 \end{vmatrix}$$

–4.

This process cannot be continued when ciphers occur in the interior of any one of the Blocks, since infinite values would be introduced by employing them as divisors. When they occur in the given Block itself, it may be re-arranged as has been already mentioned; but this cannot be done when they occur in any one of the derived Blocks; in such a case the given Block must be rearranged as circumstances require, and the operation commenced anew.

The best way of doing this is as follows:—

Suppose a cipher to occur in the h^{th} row and k^{th} column of one of the derived Blocks (reckoning both row and column from the *nearest* corner of the Block); find the term in the h^{th} row and k^{th} column of the given Block (reckoning from the corresponding corner), and transpose rows or columns cyclically until it is left in an outside row or column. When the necessary alterations have been made in the derived Blocks, it will be found that the cipher now occurs in an outside row or column, and therefore need no longer be used as a divisor.

The advantage of *cyclical* transposition is, that most of the terms in the new Blocks will have been computed already, and need only be copied; in no case will it be necessary to compute more than *one* new row or column for each Block of the series. We must of course observe, in any such transposition, whether or no the *sign* of the Determinant is changed.

In the following instance it will be seen that in the first series of Blocks a cipher occurs in the interior of the third. We therefore abandon the process at that point and begin again, re-arranging the given Block by transferring the top row to the bottom; and the cipher, when it occurs, is now found in an exterior row. It will be observed that in each Block of the new series, there is only one new row to be computed; the other rows are simply copied from the work already done.

$$\begin{vmatrix} 2 & -1 & 2 & 1 & -3 \\ 1 & 2 & 1 & -1 & 2 \\ 1 & -1 & -2 & -1 & -1 \\ 2 & 1 & -1 & -2 & -1 \\ 1 & -2 & -1 & -1 & 2 \end{vmatrix} \begin{vmatrix} 1 & 2 & 1 & -1 & 2 \\ 1 & -1 & -2 & -1 & -1 \\ 2 & 1 & -1 & -2 & -1 \\ 1 & -2 & -1 & -1 & 2 \\ 2 & -1 & 2 & 1 & -3 \end{vmatrix}$$

$$\begin{vmatrix} 5 & -5 & -3 & -1 \\ -3 & -3 & -3 & 3 \\ 3 & 3 & 3 & -1 \\ -5 & -3 & -1 & -5 \end{vmatrix} \begin{vmatrix} -3 & -3 & -3 & 3 \\ 3 & 3 & 3 & -1 \\ -5 & -3 & -1 & -5 \\ 3 & -5 & 1 & 1 \end{vmatrix}$$

$$\begin{vmatrix} -30 & 6 & -12 \\ 0 & 0 & 6 \\ 6 & -6 & 8 \end{vmatrix} \begin{vmatrix} 0 & 0 & 6 \\ 6 & -6 & 8 \\ -17 & 8 & -4 \end{vmatrix}$$

$$\begin{vmatrix} 0 & 12 \\ 18 & 40 \end{vmatrix}$$

36.

The fact that, whenever ciphers occur in the interior of a derived Block, it is necessary to recommence the operation, may be thought a great obstacle to the use of this method; but I believe it will be found in practice that, even though this should occur several times in the course of one operation, the whole amount of labour will still be much less than that involved in the old process of computation.

Appendix III.

Algebraical Proof of the method of 'Condensation.'

We have seen (CH. II. PROP. VII.) that "if there be a square Block of the n^{th} degree, and if in it any Minor of the m^{th} degree be selected: the Determinant of the corresponding Minor in the adjugate Block is equal, in absolute magnitude, to the product of the $m-1^{\text{th}}$ power of the Determinant of the first Block, multiplied by the Determinant of the Minor complementary to the one selected. Also, if the numerals, indicating the selected rows, be represented by α, β, \dots , and those indicating the selected columns by κ, λ, \dots , and their respective sums by $\sum(\alpha), \sum(\kappa)$: the relationship of sign between the equal magnitudes will be secured by multiplying either of them by $(-1)^{m \cdot (\sum(\alpha) + \sum(\kappa))}$."

Let us first take a Block of 9 terms, and represent it by $\begin{Bmatrix} 1(1 & \dots & 1)3 \\ \vdots & & \vdots \\ 3(1 & \dots & 3)3 \end{Bmatrix}_a$,

and the adjugate Block by $\begin{Bmatrix} 1(1 & \dots & 1)3 \\ \vdots & & \vdots \\ 3(1 & \dots & 3)3 \end{Bmatrix}_A$.

If we 'condense' this, by the method already given, we get the Block $\begin{Bmatrix} 3(3_A, & -3(1_A) \\ -1(3_A, & 1(1_A) \end{Bmatrix}$,

and the Determinant of this will remain unchanged if we transpose the columns, and also the rows, and then multiply the first row and first column by -1 ;

hence it = $\begin{vmatrix} 1(1_A, & 1(3_A) \\ 3(1_A, & 3(3_A) \end{vmatrix}$;

and this, by the theorem above cited,

$$= D_a^{2-1} \cdot 2(2_a \cdot (-1)^{2 \cdot (4+4)} = D_a \cdot 2(2;$$

$$\therefore D_a = \frac{\begin{vmatrix} 3(3_A, & -3(1_A) \\ -1(3_A, & 1(1_A) \end{vmatrix}}{2(2_a};$$

which proves the method for a Block of 9 terms.

Next, let us take a Block of 16 terms; and represent it by $\left\{ \begin{array}{ccc} 1(1) & \dots & 1(4) \\ \vdots & & \vdots \\ 4(1) & \dots & 4(4) \end{array} \right\}_a$,

and the adjugate Block by $\left\{ \begin{array}{ccc} 1(1) & \dots & 1(4) \\ \vdots & & \vdots \\ 4(1) & \dots & 4(4) \end{array} \right\}_A$.

If we 'condense' this, we get a Block of 9 terms; let us represent it by

$$\left\{ \begin{array}{ccc} 1(1) & \dots & 1(3) \\ \vdots & & \vdots \\ 3(1) & \dots & 3(3) \end{array} \right\}_b,$$

so that $1(1)_b = \begin{vmatrix} 1(1) & 1(2) \\ 2(1) & 2(2) \end{vmatrix}_a$, $1(2)_b = \begin{vmatrix} 1(2) & 1(3) \\ 2(2) & 2(3) \end{vmatrix}_a$, &c.

If we 'condense' this Block again, we get a Block of 4 terms, each of which is, by the preceding paragraph, the Determinant of 9 terms of the Block of 16 terms;

that is, we get the Block $\left\{ \begin{array}{cc} 4(4_A) & -4(1_A) \\ -4(1_A) & 1(1_A) \end{array} \right\}$;

and the Determinant of this will remain unchanged if we transpose the columns, and also the rows, and then multiply the first row and column by -1 ;

hence it = $\begin{vmatrix} 1(1_A) & 1(4_A) \\ 4(1_A) & 4(4_A) \end{vmatrix}$;

and this, by the theorem above cited,

$$= D_a^{2-1} \cdot \begin{vmatrix} 2(2_a) & 2(3_a) \\ 3(2_a) & 3(3_a) \end{vmatrix} \cdot (-1)^{2 \cdot (5+5)};$$

$$= D_a \cdot 2(2_b);$$

$$\therefore D_a = \frac{\begin{vmatrix} 1(1_A) & 1(4_A) \\ 4(1_A) & 4(4_A) \end{vmatrix}}{2(2_b)}$$

which proves the method for a Block of 16 terms, and similar proofs might be given for larger Blocks.

Appendix IV.

Application of the Method of 'Condensation' to the Solution of Simultaneous Linear Equations.

If we take a Block containing n rows and $\overline{n+1}$ columns, and ‘condense’ it, we reduce it at last to 2 terms, the first of which is the Determinant of the first n columns, the other of the last n columns.

Hence, if we take the n simultaneous Equations

$$1 \left(1. x_1 + 1 \right) 2. x_2 + \dots + 1 \left(n. x_n + 1 \right) n + 1 = 0,$$

&c.

$$n \left(1. x_1 + n \right) 2. x_2 + \dots + n \left(n. x_n + n \right) n + 1 = 0;$$

and if we ‘condense’ their B -Block, we reduce it to 2 terms, the first of which is V , the other D_1 .

Now we know that $x_1 = (-)^n \cdot \frac{D_1}{V}$; that is, $(-)^n V \cdot x_1 = D_1$.

Hence the 2 terms obtained by the process of condensation may be converted into an Equation for x_1 , by multiplying the first of them by x_1 , affected with $+$ or $-$, according as n is even or odd. The latter part of the rule may be simply expressed thus:—“place the signs $+$ and $-$ alternately over the several columns, beginning with the last, and the sign which occurs over the column containing x_1 is the sign with which x_1 is to be afflicted.”

When the value of x_1 has been thus found, it may be substituted in the first $\overline{n-1}$ Equations, and the same operation repeated on the new Block, which will now consist of $\overline{n-1}$ rows and n columns. But in calculating the second series of Blocks, it will be found that most of the work has been already done; in fact, of the 2 Determinants required in the new Block, one has been already computed isorrectly, and the other so nearly so that it is only necessary to correct the *last* column in each of the derived Blocks.

In the example given opposite, after writing $+$ and $-$ alternately over the columns, beginning with the last, we first condense the whole Block, and thus obtain the 2 terms 36 and -72 . Observing that the x -column has the sign $-$ placed over it, we multiply the 36 by $-x$, and so form the Equation $-36x = -72$, which gives $x = 2$.

Hence the x -terms in the first four Equations become respectively 2, 2, 4, and 2; adding these values to the constant terms in the same Equations, we obtain a Block of which we need only write down the last two columns, viz.

$$\begin{vmatrix} 2 & 4 \\ -1 & -2 \\ -1 & -2 \\ 2 & 6 \end{vmatrix}.$$

We then condense these into the column $\begin{vmatrix} 0 \\ 0 \\ 2 \end{vmatrix}$, and, supplying from the second

Block of the first series the column $\begin{vmatrix} 3 \\ -1 \\ -5 \end{vmatrix}$, we obtain $\begin{vmatrix} 3 & 0 \\ -1 & 0 \\ -5 & 2 \end{vmatrix}$ as the last two

columns of the *second* Block of the new series; and proceeding thus we ultimately obtain the two terms 12, 12. Observing that the y -column has the sign $+$ placed over it, we multiply the first 12 by $+y$, and so form the Equation $12y = 12$, which gives $y = 1$. The values of z , u , and v are similarly found.

It will be seen that when once the given Block has been successfully condensed, and the value of the first unknown obtained, there is no further danger

of the operation being interrupted by the occurrence of ciphers.

$$\begin{array}{rcccccc}
 - & & + & & - & & + \\
 x & + & 2y & + & z & - & u & + & 2v & +2 & = & 0 \\
 x & - & y & - & 2z & - & u & - & v & -4 & = & 0 \\
 2x & + & y & - & z & - & 2u & - & v & -6 & = & 0 \\
 x & - & 2y & - & z & - & u & + & 2v & +4 & = & 0 \\
 2x & - & y & + & 2z & + & u & - & 3v & -8 & = & 0
 \end{array}$$

$$\left| \begin{array}{cccccc} 1 & 2 & 1 & -1 & 2 & 2 \\ 1 & -1 & -2 & -1 & -1 & -4 \\ 2 & 1 & -1 & -2 & -1 & -6 \\ 1 & -2 & -1 & -1 & 2 & 4 \\ 2 & -1 & 2 & 1 & -3 & -8 \end{array} \right| \left| \begin{array}{cc} 2 & 4 \\ -1 & -2 \\ -1 & -2 \\ 2 & 6 \end{array} \right| \left| \begin{array}{cc} 2 & 6 \\ -1 & -3 \\ -1 & -1 \end{array} \right| \left| \begin{array}{cc} 2 & 5 \\ -1 & -1 \end{array} \right| \left| \begin{array}{cc} 2 & 4 \end{array} \right| \therefore -2v = 4 \dots v = -2$$

$$\left| \begin{array}{ccccc} -3 & -3 & -3 & 3 & -6 \\ 3 & 3 & 3 & -1 & 2 \\ -5 & -3 & -1 & -5 & 8 \\ 3 & -5 & 1 & 1 & -4 \end{array} \right| \left| \begin{array}{cc} 3 & 0 \\ -1 & 0 \\ -5 & -2 \end{array} \right| \left| \begin{array}{cc} 3 & 0 \\ -1 & -2 \end{array} \right| \left| \begin{array}{cc} 3 & 3 \end{array} \right| \therefore 3u = 3 \dots u = 1$$

$$\left| \begin{array}{cccc} 0 & 0 & 6 & 0 \\ 6 & -6 & 8 & -2 \\ -17 & 8 & -4 & 6 \end{array} \right| \left| \begin{array}{cc} 6 & 0 \\ 8 & -2 \end{array} \right| \left| \begin{array}{cc} 6 & 6 \end{array} \right| \therefore -6z = 6 \dots z = -1$$

$$\left| \begin{array}{ccc} 0 & 12 & 12 \\ 18 & 40 & -8 \end{array} \right| \left| \begin{array}{cc} 12 & 12 \end{array} \right| \therefore 12y = 12 \dots y = 1$$

$$\left| \begin{array}{cc} 36 & -72 \end{array} \right| \therefore -36x = -72 \dots x = 2$$

$$\begin{array}{rcccc}
 - & & + & & - & & + \\
 5x & + & 2y & - & 3z & +3 & = & 0 \\
 3x & - & y & - & 2z & +7 & = & 0 \\
 2x & + & 3y & + & z & -12 & = & 0
 \end{array}$$

$$\left| \begin{array}{cccc} 5 & 2 & -3 & 3 \\ 3 & -1 & -2 & 7 \\ 2 & 3 & 1 & -12 \end{array} \right| \left| \begin{array}{cc} -3 & 8 \\ -2 & 10 \end{array} \right| \left| \begin{array}{cc} -3 & 12 \end{array} \right| \therefore 3z = 12 \dots z = 4$$

$$\left| \begin{array}{ccc} -11 & -7 & -15 \\ 11 & 5 & 17 \end{array} \right| \left| \begin{array}{cc} -7 & -14 \end{array} \right| \therefore -7y = -14 \dots y = 2$$

$$\left| \begin{array}{cc} -22 & 22 \end{array} \right| \therefore 22x = 22 \dots x = 1$$

Appendix V.

Solution of the Problem "Given an algebraic function of 2 or more terms; to construct a square Block, whose Elements are all monomial, and whose Determinant vanishes simultaneously with the given function."

In what follows we shall use the word 'complemental' in a somewhat extended sense: its definition may be given as follows: "If, in a Block, any rows and any columns be selected: the Block formed of their common Elements, and the Block formed of the Elements common to the other rows and columns, are said to be complemental to each other." The definition previously given (CH. II. DEF. VII.) is evidently a particular case of this.

We have now to prove the following Theorem: "If, in a square Block, any rows and any columns be selected; and if the Block formed of their common Elements be multiplied throughout by any quantity, and the complemental Block divided throughout by the same quantity: the Determinant of the new Block vanishes simultaneously with that of the first."

Call the degree of the first Block 'n', its Determinant 'D', the number of selected rows 'p', of columns 'q', and the quantity used for the processes of multiplication and division 'v'.

First, let the selected p rows be multiplied throughout by v; then the Determinant of the new Block, so formed, = $D \cdot v^p$. (CH. II. AX. II.)

Next, let the $\overline{n - q}$ columns, which were not selected, be divided throughout by v; then the Determinant of the new Block, so formed, = $D \cdot v^{p+q-n}$; and therefore it vanishes simultaneously with D.

But, by the first process, the selected Block was multiplied throughout by v, as were also all the Elements common to the p selected rows and the $\overline{n - q}$ columns which were not selected; and, by the second process, these latter Elements were again divided by v, as was also the Block complemental to the one selected.

Thus, by the two processes, the selected Block was multiplied throughout, and the complemental Block divided throughout, by v.

Hence this Theorem has been proved true.

Now in the square Block $\begin{Bmatrix} 1 \{ 1 & 1 \{ 2 & 1 \{ 3 \\ 2 \{ 1 & 2 \{ 2 & 2 \{ 3 \\ 3 \{ 1 & 3 \{ 2 & 3 \{ 3 \end{Bmatrix}$, let each of the Elements $2 \{ 2$, $3 \{ 3$, be divided, and its complemental Minor multiplied, by the Element itself. We thus obtain (neglecting exterior factors, which do not affect its evanescence)

the Block $\begin{Bmatrix} 1 \{ 1. 2 \{ 2. 3 \{ 3, & 1 \{ 2. 3 \{ 3, & 1 \{ 3. 2 \{ 2 \\ 2 \{ 1. 3 \{ 3, & 3 \{ 3, & 2 \{ 3 \\ 2 \{ 3. 3 \{ 1, & 3 \{ 2, & 2 \{ 2 \end{Bmatrix}$. Then multiplying the 2nd row by $1 \{ 2$, the 3rd row by $1 \{ 3$, the 2nd columns by $2 \{ 1$, and the 3rd by $3 \{ 1$, we

obtain $\left\{ \begin{array}{l} 1 \left\{ \begin{array}{l} 1.2 \\ 2.3 \end{array} \right\} 3, \quad 1 \left\{ \begin{array}{l} 2.2 \\ 1.3 \end{array} \right\} 3, \quad 1 \left\{ \begin{array}{l} 3.2 \\ 2.3 \end{array} \right\} 1 \\ 1 \left\{ \begin{array}{l} 2.2 \\ 1.3 \end{array} \right\} 3, \quad 1 \left\{ \begin{array}{l} 2.2 \\ 3.3 \end{array} \right\} 1 \\ 1 \left\{ \begin{array}{l} 3.2 \\ 2.3 \end{array} \right\} 1, \quad 1 \left\{ \begin{array}{l} 3.2 \\ 1.3 \end{array} \right\} 2, \quad 1 \left\{ \begin{array}{l} 3.2 \\ 2.3 \end{array} \right\} 1 \end{array} \right\}$, every Element of which is a Constituent of the first Block.

Now let it be given that A, B, C, D, E, F are the 6 Constituents of a certain square Block of 9 terms: then we have the 6 Equations

$$\begin{aligned} A &= 1 \left\{ \begin{array}{l} 1.2 \\ 2.3 \end{array} \right\} 3, & -D &= 1 \left\{ \begin{array}{l} 1.2 \\ 3.3 \end{array} \right\} 2, \\ B &= 1 \left\{ \begin{array}{l} 2.2 \\ 3.3 \end{array} \right\} 1, & -E &= 1 \left\{ \begin{array}{l} 2.2 \\ 1.3 \end{array} \right\} 3, \\ C &= 1 \left\{ \begin{array}{l} 3.2 \\ 1.3 \end{array} \right\} 2, & -F &= 1 \left\{ \begin{array}{l} 3.2 \\ 2.3 \end{array} \right\} 1 \end{aligned}$$

then, substituting in the Block just found, we obtain $\left\{ \begin{array}{ccc} A, & -E, & -F \\ -E, & -E, & B \\ -F, & C, & -F \end{array} \right\}$, or

multiplying the 1st row and 1st column by -1 , $\left\{ \begin{array}{ccc} A, & E, & F \\ E, & -E, & B \\ F, & C, & -F \end{array} \right\}$.

The Determinant of this Block = $EF \cdot \left\{ A - \frac{ABC}{EF} + E + B + F + C \right\}$, and this, since $-\frac{ABC}{EF} = D$, becomes $EF \cdot \{A + B + C + D + E + F\}$, and so is evanescent simultaneously with the unknown Block. And this condition, $ABC = -DEF$, is the only one which the 6 given quantities must fulfil, that the problem may be possible.

If the given Algebraical function contain 6 terms, we have only to apply this test, by grouping them into sets of 3, and if they satisfy the test, the Determinant can be written out at once: this may be done by multiplying together the 6 terms, taking the square root of their product, and finding, if possible, a set of three terms, whose product is equal to that square root, and whose sign is contrary to that of the product of the other 3 terms. Let us take as an example

$$5ab^2 + 3a^2 - 3abc - 2ab + 10a - 4c;$$

here the continued product is 2. 2. 4. 3. 3. 5. $5a^6b^4c^2$, whose square root is $60a^3b^2c$, and this may be made up of the 3 terms $5ab^2, 3a^2, -4c$; and as the sign of this product is $-$, and the sign of the product of the other 3 terms is $+$, the problem is possible. Hence, calling these 3 terms ' A, B, C ,' and the terms $10a, -2ab, 'E, F'$, we obtain the Block

$$\left\{ \begin{array}{ccc} 5ab^2, & 10a, & -2ab \\ 10a, & 10a, & 3a^2 \\ -2ab, & -4c, & 2ab \end{array} \right\},$$

which, if we divide rows by common factors, reduces to $\left\{ \begin{array}{ccc} 5b^2, & 10, & -2b \\ 10, & -10, & 3a \\ -ab, & -2c, & ab \end{array} \right\}$,

that is, dividing the 2nd column, to $\left\{ \begin{array}{ccc} 5b^2, & 5, & -2b \\ 10, & -5, & 3a \\ -ab, & -c, & ab \end{array} \right\}$, that is, multiplying the central term, and dividing its complementary Minor, by ' b ,' and also multiplying

the last term in the 3rd row, and dividing its complementary Minor, by '5,' and changing the signs of the last term in the 1st row and of its complementary Minor

$$\begin{pmatrix} b, & 1, & 2 \\ -2, & b, & 3a \\ a, & c, & 5a \end{pmatrix}.$$

If the given function contain 5 terms only, it will be necessary to break up one of them into 2 portions. In this case we ought to find 4 terms whose continuous product is such that the Algebraical portion of it is a square, and form them into 2 groups, each of which furnishes the square root of this product. We then break the 5th term into 2 portions, assigning one to each group, and in doing so we have only to attend to the numerical coefficients. As an example of this let us take

$$5a^4b - 4a^3c + 3a^2bc + 2ac^3 + 11b^2;$$

here the continued product of the first 4 terms is $8.3.5.a^4b^2c^4$, and the square root of the Algebraical portion of this is a^2bc^2 , and this is furnished by the product of $5a^4b$ and $2ac^2$: hence, arranging the terms in 2 groups, $5a^4b.2ac^2$ and $-4a^3c.3a^2bc$, we find by inspection that the last term must be broken into the 2 portions $6b^2$ and $5b^2$. Thus the two products, taken 3 and 3, become $5a^4b.2ac^2.6b^2$ and $-4a^3c.3a^2bc.5b^2$. Thus the required test is fulfilled and the

Block may be written $\begin{pmatrix} 5a^4b, & -4a^3c, & 3a^2bc \\ -4a^3c, & 4a^3c, & 2ac^2 \\ 3a^2bc, & 6b^2, & -3a^2bc \end{pmatrix}$, which, dividing rows by

common factors, becomes $\begin{pmatrix} 5a^2b, & -4ac, & 3bc \\ -2a^2, & 2a^2, & c \\ a^2c, & 2b, & -a^2c \end{pmatrix}$; and this again, dividing

columns, becomes $\begin{pmatrix} 5b, & -2ac, & 3b \\ -2, & a^2, & 1 \\ c, & b, & -a^2 \end{pmatrix}$.

If the given function contain 4 terms only, we may proceed as in the case of 6, and append two equal terms with opposite signs: +1 and -1 are most convenient. For example, if the given function be

$$3a^2bc^2 - 4ab^4c - 6ac^3 + 8b^2;$$

the continued product is $4.2.8.3.3.a^4b^8c^4$, whose square root is $24.a^2b^4c^2$, and this may be made up by the 2 terms $3a^2bc^2$ and $8b^3$. Hence the 6 terms may be taken to be $3a^2bc^2, 8b^3, 1$, and $-4ab^4c, -6ac, -1$. Thus the test is fulfilled,

and the Block may be written $\begin{pmatrix} 3a^2bc^2, & -6ac, & -1 \\ -6ac, & 6ac, & 8b^3 \\ -1, & 1, & 1 \end{pmatrix}$, that is. multiplying

the 3rd term of the 3rd row, and dividing its complementary Minor, by $3ac$, and also dividing the 2nd row by 2, and changing the signs of the 1st row and 1st

column, $\begin{pmatrix} abc, & 2, & 1 \\ 1, & 1, & 4b^3 \\ 1, & 1, & 3ac \end{pmatrix}$.

A Block of 16 terms may be constructed by a process similar to that employed for 9 terms.

Thus, in the Block $\left\{ \begin{array}{cccc} 1 \{ 1 \ 1 \ 2 \ 1 \ 3 \ 1 \ 4 \} \\ 2 \{ 1 \ 2 \ 2 \ 2 \ 3 \ 2 \ 4 \} \\ 3 \{ 1 \ 3 \ 2 \ 3 \ 3 \ 3 \ 4 \} \\ 4 \{ 1 \ 4 \ 2 \ 4 \ 3 \ 4 \ 4 \} \end{array} \right\}$, let each of the Elements $2 \{ 2, 3 \ 3, 4 \} 4$,

be divided, and its complementary Minor multiplied, by the Element itself. We thus obtain the Block

$$\left\{ \begin{array}{cccc} 1 \{ 1.2 \ 2.3 \ 3.4 \} 4, & 1 \{ 2.3 \ 3.4 \} 4, & 1 \{ 3.2 \ 2.4 \} 4, & 1 \{ 4.2 \ 2.3 \} 3 \\ 2 \{ 1.3 \ 3.4 \} 4, & 3 \{ 3.4 \} 4, & 2 \{ 3.4 \} 4, & 2 \{ 4.3 \} 3 \\ 2 \{ 2.3 \ 1.4 \} 4, & 3 \{ 2.4 \} 4, & 2 \{ 2.4 \} 4, & 2 \{ 2.3 \} 4 \\ 2 \{ 2.3 \ 3.4 \} 1, & 3 \{ 3.4 \} 2, & 2 \{ 2.4 \} 3, & 2 \{ 2.3 \} 3 \end{array} \right\}.$$

Then, multiplying the 2nd row by $1 \{ 2$, the 3rd by $1 \{ 3$, the 4th by $1 \{ 4$, the 2nd column by $2 \{ 1$, the 3rd by $3 \{ 1$, and the 4th by $4 \{ 1$, we obtain the Block

$$\left\{ \begin{array}{cccc} 1 \{ 1.2 \ 2.3 \ 3.4 \} 4, & 1 \{ 2.2 \ 1.3 \ 3.4 \} 4, & 1 \{ 3.2 \ 2.3 \ 1.4 \} 4, & 1 \{ 4.2 \ 2.3 \ 3.4 \} 1 \\ 1 \{ 2.2 \ 1.3 \ 3.4 \} 4, & 1 \{ 2.2 \ 1.3 \ 3.4 \} 4, & 1 \{ 2.2 \ 3.3 \ 1.4 \} 4, & 1 \{ 2.2 \ 4.3 \ 3.4 \} 1 \\ 1 \{ 3.2 \ 2.3 \ 1.4 \} 4, & 1 \{ 3.2 \ 1.3 \ 2.4 \} 4, & 1 \{ 3.2 \ 2.3 \ 1.4 \} 4, & 1 \{ 3.2 \ 2.3 \ 4.4 \} 1 \\ 1 \{ 4.2 \ 2.3 \ 3.4 \} 1, & 1 \{ 4.2 \ 1.3 \ 3.4 \} 2, & 1 \{ 4.2 \ 2.3 \ 1.4 \} 3, & 1 \{ 4.2 \ 2.3 \ 3.4 \} 1 \end{array} \right\},$$

every Element of which is a Constituent of the 1st Block.

Now let it be given that A, B, C , &c. are the 24 Constituents of a certain square Block of 16 terms: then we have the 24 Equations

$$\left. \begin{array}{l} A = 1 \{ 1.2 \ 2.3 \ 3.4 \} 4 \\ B = 1 \{ 2.2 \ 1.3 \ 4.4 \} 3 \\ C = 1 \{ 3.2 \ 4.3 \ 1.4 \} 2 \\ D = 1 \{ 4.2 \ 3.3 \ 2.4 \} 1 \\ N = 1 \{ 1.2 \ 2.3 \ 4.4 \} 3 \\ P = 1 \{ 2.2 \ 1.3 \ 3.4 \} 4 \\ -Q = 1 \{ 3.2 \ 4.3 \ 2.4 \} 1 \\ -R = 1 \{ 4.2 \ 3.3 \ 1.4 \} 2 \end{array} \right\}, \quad \left. \begin{array}{l} E = 1 \{ 1.2 \ 3.3 \ 4.4 \} 2 \\ F = 1 \{ 2.2 \ 4.3 \ 3.4 \} 1 \\ G = 1 \{ 3.2 \ 1.3 \ 2.4 \} 4 \\ H = 1 \{ 4.2 \ 2.3 \ 1.4 \} 3 \\ -S = 1 \{ 1.2 \ 4.3 \ 3.4 \} 2 \\ -T = 1 \{ 2.2 \ 3.3 \ 4.4 \} 1 \\ -U = 1 \{ 3.2 \ 2.3 \ 1.4 \} 4 \\ -V = 1 \{ 4.2 \ 1.3 \ 2.4 \} 3 \end{array} \right\}, \quad \left. \begin{array}{l} J = 1 \{ 1.2 \ 4.3 \ 2.4 \} 3 \\ K = 1 \{ 2.2 \ 3.3 \ 1.4 \} 4 \\ L = 1 \{ 3.2 \ 2.3 \ 4.4 \} 1 \\ M = 1 \{ 4.2 \ 1.3 \ 3.4 \} 2 \\ -W = 1 \{ 1.2 \ 3.3 \ 2.4 \} 4 \\ -X = 1 \{ 2.2 \ 4.3 \ 1.4 \} 3 \\ -V = 1 \{ 3.2 \ 1.3 \ 4.4 \} 2 \\ -Z = 1 \{ 4.2 \ 2.3 \ 3.4 \} 1 \end{array} \right\},$$

thus, substituting in the Block just found, we obtain $\left\{ \begin{array}{cccc} A, & -P, & -U, & -Z \\ -P, & -P, & K, & F \\ -U, & G, & -U, & L \\ -Z, & M, & H, & Z \end{array} \right\}$,

which, if we change the signs of the 1st row and 1st column, becomes

$$\begin{Bmatrix} A, & P, & U, & Z \\ P, & -P, & K, & F \\ U, & G, & -U, & L \\ Z, & M, & H, & -Z \end{Bmatrix}.$$

This contains 10 only of the given 24 quantities, so that, in order to prove that its Determinant contains $(A + B + \&c. + Z)$ as a factor, we must have 14 independent relations among the given quantities.

The 10 quantities which enter into the above Block are

$$A, F, G, H, K, L, M, P, U, Z;$$

and the following Equations give the remaining 14 quantities in terms of these:—

$$\left. \begin{array}{l} B = -\frac{HLP}{UZ} \\ C = -\frac{FMU}{PZ} \\ D = -\frac{GKZ}{PU} \end{array} \right\}, \left. \begin{array}{l} E = -\frac{AKLM}{PUZ} \\ J = -\frac{AFGH}{PUZ} \end{array} \right\}, \left. \begin{array}{l} N = -\frac{AHL}{UZ} \\ Q = -\frac{FG}{P} \\ R = -\frac{KM}{P} \end{array} \right\}, \left. \begin{array}{l} S = -\frac{AFM}{PZ} \\ T = -\frac{KL}{U} \\ V = -\frac{GH}{U} \end{array} \right\}, \left. \begin{array}{l} W = -\frac{AGK}{PU} \\ X = -\frac{FH}{Z} \\ Y = -\frac{LM}{Z} \end{array} \right\}.$$

9.5 The Fifth Book of Euclid Treated Algebraically

Source: The Fifth Book of Euclid Treated Algebraically

Currently only preface

So Far as it Relates to Commensurable Magnitudes, with Notes

Preface

The theory of Incommensurable Magnitudes, without which the whole subject of Geometrical Proportion is so incomplete as to be, from a logical point of view, utterly valueless, is nevertheless omitted, as far as possible, from the following treatise.

My reasons for this omission are two: first, that I believe it to be much too abstruse a subject for the ordinary Pass Examination; secondly, that it is not required in it. The exemption is a most necessary one, though the effect of it is to reduce the Vth and VIth Books, in the form in which they are now learned and accepted in the Schools, to a logical absurdity.

Whether it would not be preferable to substitute for these Books an equivalent quantity of Algebra, perhaps as far as Permutations and Combinations, is a question I do not here enter on. To supply, in its shortest form, that knowledge of the subject which is at present required and accepted in the Schools, is my object in putting forth this treatise. I hope that it may not be long wanted.

9.6 Euclid, Book V.

Source: Euclid, Book V

Currently only preface and appendix

Proved Algebraically so far as it relates to Commensurable Magnitudes to which is prefixed a Summary of all the necessary algebraical operations.

Preface

The student is recommended to go through this treatise in the following order:—

First, to master the ‘Preliminary Algebra,’ and not to go further until he finds that, when covering up the right-hand column and setting himself any question in the left-hand column, he can at once *work out* (not merely supply from memory) the required answer.

Secondly, taking the Algebraical Enunciation which stands at the top of the right-hand column in each Proposition, to learn to supply the proof which follows it. To do this, he should cover the rest of the right-hand column, and try to work out the proof for himself, with the help of the directions in the left-hand column. As every step of the work has been already done in the ‘Preliminary Algebra,’ this ought to be possible without any reference to the right-hand column: but if any difficulty *should* occur, there will usually be found a marginal reference to the ‘Preliminary Algebra,’ and it will be better to turn back to the section referred to, and so refresh the memory, than to look at the right-hand column, which should only be uncovered, when the proof has been written out, as a test of the correctness of the work.

Thirdly, to practise himself in working out the same proofs, without the help of the directions in the left-hand column, from the Algebraical Enunciations only. These are given by themselves at p. 49.

Fourthly, taking the Enunciation printed in *small* type in each Proposition, and covering up all below it, to learn to express it algebraically, as given in the first sentence of the right-hand column.

Fifthly, taking the Enunciation printed in *large* type in each Proposition, and covering up all below it, to learn to repeat it with the addition of algebraical symbols for the magnitudes, as given in the small-type Enunciation.

Sixthly, to learn Euclid’s Definitions and Axioms, given at p. 53.

Appendix

Euclid’s Definition of Proportion is not used in the Fifth Book, when proved algebraically, since this method of Proof applies to commensurable Magnitudes only, for which a much simpler Definition is sufficient: but it is required for Prop. I of the Sixth Book, on which the rest of that Book depends, so that some explanation of it may fitly be given here.

The Student should pay particular attention to the word “*whatsoever*.” Four magnitudes are said to be Proportionals, not merely when “*any* equimultiples” fulfil certain conditions (in which case *one* successful instance would be enough to justify the use of the name, in spite of many unsuccessful instances being found), but when “*any whatsoever*” fulfil them (in which case *all* instances must

be successful to justify the use of the name, and a *single* unsuccessful instance would be enough to destroy our right to use it). To take an illustration from Chemistry, a drug might fairly be called “dangerous to life,” if *any* instance could be found of a person having died from swallowing it, but it could not be called “*certainly* fatal to life,” unless it could be shown that *any person whatsoever*, who swallowed it, must die in consequence; and a *single* proved case of a person having survived it would destroy our right to use the name.

In other words, before we have a right to call certain Magnitudes “Proportionals” in Euclid’s sense of the word, we must first have proved what is called in Logic “a Universal Proposition” (whose typical form is “All A are B”); that is, we must have proved that *all* equimultiples of these Magnitudes fulfil certain conditions.

Now a Universal Proposition may be proved by two totally distinct methods. One may be defined as “the enumeration of all instances,” the other as “the establishment of a general law.” Before explaining these phrases as applied to Euclid’s Definition, let us illustrate them by examples from another subject.

Suppose we wish to establish the Universal Proposition that “All English Queens who have reigned since the Conquest have had the letter ‘A’ in their names.” This may be proved true by enumerating all the names, and pointing out that *each* fulfils the condition stated. But, inasmuch as the circumstance is merely an *accident* as to each name, no “general law” can be shown to exist. In this case, then, we are restricted to the *first* method of proof.

Next, suppose the Proposition to be “All English Queens who have reigned since the Conquest have been of royal descent.” In this case we have a choice of methods: we may either enumerate all the names, giving the genealogy of each: or we may show that, by the principles of our Constitution, such royal descent is essential to a Queen. In many cases of this kind, it would be quite a matter for consideration, *which* method to employ: sometimes the one would be found the more convenient, sometimes the other.

Thirdly, suppose the Proposition to be “All English Queens, who have reigned since the Conquest, or who ever will reign, have had, or will have, weight.” In this case, since some of the instances referred to do not yet exist, so that no evidence, concerning them individually, can be given, we are restricted to the use of the *second* method: that is, we can only prove the Proposition by showing that all English Queens, past, present, and future, are necessarily human beings; and that human beings, by a law of Nature, have weight.

Now which of these two methods does Euclid mean us to employ, when he tells us, before we can use the name “Proportionals” of certain Magnitudes, to prove the Universal Proposition that “*all* equimultiples” fulfil certain conditions?

The number of equimultiples we may take of the magnitudes is infinite: hence “the enumeration of all instances” is *impossible* in this case, and the only method left us is “the establishment of a general law.”

To take the actual instance in which the Definition is used by Euclid—Prop. I of the Sixth Book. Euclid wishes to show that if two Triangles be of the same altitude, the two bases and the two Triangles constitute four “Proportionals.” To do this, out of the infinite number of *possible* equimultiples of the first and third, he chooses a single instance; and out of the infinite number of *possible* equimultiples of the second and fourth, he also chooses a single instance. He does not assume it to be enough for his purpose to show that, in this particular pair of instances, the test of “if greater, greater; if equal, equal; if less, less” is

fulfilled. The essence of his argument consists in showing that what is true in the particular instances chosen would *also*, from the nature of the case, be true in *every other* conceivable instance which could be taken.

This part of the proof depends on two theorems—first, Prop. XXXYII of the First Book, namely “Triangles on equal bases, and between the same parallels, are equal”; secondly, on an easy deduction from this (which is not explicitly stated by Euclid, and so is often overlooked), namely, “Triangles between the same parallels, but on unequal bases, are unequal, that which is on the greater base being the greater.” Both Prop. XXXVII and this deduction from it are clearly of *universal* applicability. Hence Euclid’s proof of the Universal Proposition, that “*all* equimultiples” fulfil the requisite conditions, is complete, and his conclusion, that the original four Magnitudes are “Proportionals,” is legitimate.

9.7 An Inconceivable Conversation

Source: manuscript written 1874 (heavily edited, here only “final” variant)

Between S. and D. on Indivisibility of Time and Space

S. And thus your favourite paradox, my dear D., is finally disposed of, and Achilles & the Tortoise may walk off hand in hand. No argument of any sort can be maintained, which would prove him *not* to overtake it.

D. No *mathematical* argument, you mean; for, if you permit me a *classical* one, I will contend that the Tortoise was nothing but the “*testudo*” of the ancients, a machine of common use in sieges—that it was at that moment moving against the walls of Troy—and that the true reason why Achilles did not overtake it was simply that he was sulking in his tent & never went near it.

S. I beg to limit this discussion to *mathematical* argument.

D. Be it so. And the mathematical argument you dispose of, as I understand you, by the assertion that we find ourselves at last among Indivisible distances & Indivisible periods of time, & thus you propose to plunge us, however reluctant we may be to take the leap, into the dark abyss of the Inconceivable?

S. That is my solution of the paradox.

D. Granting, for argument’s sake, that the paradox is thus finally disposed of, let me ask you a question or two. These indivisible distances—are they equal, or unequal?

S. Am I bound to choose one or other of these categories?

D. I fear I can offer you no third alternative.

S. Well then, as I do not clearly see what you are aiming at, I will, for the present, say “unequal,” reserving to myself however the right of substituting “equal,” should I see reason to do so.

D. The privilege is an unusual one, but I will not object to your exercising it. Let them then be unequal. Now take two of these unequal distances: lay them side by side, so as to coincide at one end: will they coincide at the other end also?

S. Surely not.

D. There will therefore be a difference between them: and this difference, being homogenous with the things differing, will itself be a distance?

S. I cannot deny it.

D. Divisible, shall we say? Or indivisible?

S. (laughing) Indivisible, of course. You would not wish me to imagine a divisible distance less than an indivisible one?

D. You shall please yourself in that matter. Let me now add together these two lesser indivisible distances. Will their sum total be divisible or indivisible, think you?

S. (after a pause) It occurs to me that I would rather take the other horn of your dilemma, & say that these indivisible distances are all equal.

D. With all my heart. They shall now be all equal. And we will suppose that Achilles has just passed over one of these indivisible distances. What time would you say that he occupied in doing so?

S. An indivisible time, clearly.

D. But the Tortoise had previously passed over the same indivisible distance: how long do you suppose *he* took to do it?

S. As he travelled at only half the pace of Achilles, it is evident that he required *two* of our indivisible periods of time.

D. No doubt. But now tell me—at the end of the *first* of these indivisible periods of time, *where had the Tortoise got to?*

S. I will trouble you to pass the wine. I think I should like another half-glass of sherry.

9.8 Algebra (13)

Source: cyclostyled 1877

1. Define *Factor* and *Index*.
2. Multiply $\frac{2x}{3} - \frac{1}{2}$ by $\frac{x^2}{2} - \frac{x}{3} + \frac{1}{4}$.
3. Solve $ax - b = a + \frac{b^2x}{a}$.
4. What sum of money exceeds four-ninths of it by $4s.$, $9d$?
5. Resolve into factors $2a^5 - 2ab^2$.
6. Find G. C. M. of $a^3bc^2d^4$, $a^5c^3d^2$, $a^4b^3d^3$. Also of $x^2 - y^2 + ax + ay$, and $x^2 + y^2 + ax - ay - 2xy$.
7. Find L. C. M. of x^5y , x^3y^4 , a^2y^2 . Also of $(x-1)^2$, $x^2 - 1$, $(x+1)^3$, $x^3 + 1$.
8. Simplify $\frac{1}{x + \frac{1}{x - \frac{x}{x+1}}}$; and $\left\{\frac{1}{3} + \frac{2a}{3(1-a)}\right\} \times \left\{\frac{1}{4} - \frac{a}{2(1+a)}\right\}$.
9. Solve $3x + \frac{y}{2} = 7x - y = 13$.
10. A is twice as old as B, and 3 times as old as C. One year ago, B was twice as old as C. Find A's age.
11. Find $\left(\frac{1}{x^2} - \frac{3}{y^2}\right)^3$; and the square root of $\frac{a^2}{b^4} + \frac{b^4}{a^2} - 2$.
12. Simplify $\frac{x^{1-m}}{x^{1-n}}$; $\sqrt[3]{x^{9a^3} \cdot a^3}$; and $\frac{x^{-1}}{y^0}$.

Solutions:

1. In $a \times b$, a and b are the factors, in a^b , b is the index.
2. $\frac{x^3}{3} - \frac{17x^2}{36} + \frac{x}{3} - \frac{1}{8}$
3. $x = \frac{a}{a-b}$
4. approximately $8s\ 6\frac{1}{2}d$
5. $2 \times a \times (a^2 + b) \times (a^2 - b)$
6. a^3d^2 ; $x - y + a$
7. $a^2x^5y^4$; $x^7 - 2x^5 + x^4 + x^3 - 2x^2 + 1$
8. $\frac{x^2}{x^3+x+1}$; $\frac{1}{12}$
9. $x = 3$, $y = 8$
10. 6
11. $\frac{1}{x^6} - \frac{9}{x^4y^2} + \frac{27}{x^2y^4} - \frac{27}{y^6}$; $\left|\frac{a}{b^2} - \frac{b^2}{a}\right|$
12. x^{n-m} ; $x^{3a^3} \cdot a$; $\frac{1}{x}$

9.9 The Cats and Rats Again

Source: The Monthly Packet, February 1880

This is an answer to an earlier “Spider Question”, which Carroll obviously saw and wanted to comment on. This probably led to the “Knots” published in the following years. By the way, a similar comment is made by Sam Loyd in his *Cyclopedia of 5000 Puzzles, Tricks and Conundrums with Answers*

(<https://archive.org/details/CyclopediaOfPuzzlesLoyd/page/n120/mode/1up>).

Since he obviously knew well the work of Lewis Carroll (including lesser known texts), his comment might be based on this text.

‘If 6 cats kill 6 rats in 6 minutes, how many will be needed to kill 100 rats in 50 minutes?’

This is a good example of a phenomenon that often occurs in working problems in double proportion; the answer looks all right at first, but, when we come to test it, we find that, owing to peculiar circumstances in the case, the solution is either impossible or else indefinite, and needing further data. The ‘peculiar circumstance’ here is that fractional cats or rats are excluded from consideration, and in consequence of this the solution is, as we shall see, indefinite.

The solution, by the ordinary rules of Double Proportion, is as follows:—

$$\left. \begin{array}{l} 6 \text{ rats} : 100 \text{ rats} \\ 50 \text{ min.} : 6 \text{ min.} \end{array} \right\} :: 6 \text{ cats} : \text{ans.}$$

$$\therefore \text{ans.} = \frac{100 \cdot 6 \cdot 6}{6 \cdot 50} = 12$$

But when we come to trace the history of this sanguinary scene through all its horrid details, we find that at the end of 48 minutes 96 rats are dead, and that there remain 4 live rats and 2 minutes to kill them in: the question is, can this be done?

Now there are at least *four* different ways in which the original feat, of 6 cats killing 6 rats in 6 minutes, may be achieved. For the sake of clearness let us tabulate them:—

- A. All 6 cats are needed to kill a rat; and this they do in one minute, the other rats standing meekly by, waiting for their turn.
- B. 3 cats are needed to kill a rat, and they do it in 2 minutes.
- C. 2 cats are needed, and do it in 3 minutes.
- D. Each cat kills a rat all by itself, and takes 6 minutes to do it.

In cases A and B it is clear that the 12 cats (who are assumed to come quite fresh from their 48 minutes of slaughter) can finish the affair in the required time; but, in case C, it can only be done by supposing that 2 cats could kill two-thirds of a rat in 2 minutes; and in case D, by supposing that a cat could kill one-third of a rat in 2 minutes. Neither supposition is warranted by the data; nor could the fractional rats (even if endowed with equal vitality) be fairly assigned to the different cats. For my part, if I were a cat in case D, and did not find my claws in good working order, I should certainly prefer to have my one-third-rat cut off from the tail end.

In cases C and D, then, it is clear that we must provide extra cat-power. In case C *less* than 2 extra cats would be of no use. If 2 were supplied, and if they began killing their 4 rats at the beginning of the time, they would finish them

in 12 minutes, and have 36 minutes to spare, during which they might weep, like Alexander, because there were not 12 more rats to kill. In case D, one extra cat would suffice; it would kill its 4 rats in 24 minutes, and have 24 minutes to spare, during which it could have killed another 4. But in neither case could any use be made of the last 2 minutes, except to half-kill rats—a barbarity we need not take into consideration.

To sum up our results. If the 6 cats kill the 6 rats by method A or B, the answer is '12;' if by method C, '14;' if by method D, '13.'

This, then, is an instance of a solution made 'indefinite' by the circumstances of the case. If an instance of the 'impossible' be desired, take the following:—'If a cat can kill a rat in a minute, how many would be needed to kill it in the thousandth part of a second?' The *mathematical* answer, of course, is '60,000,' and no doubt less than this would *not* suffice; but would 60,000 suffice? I doubt it very much. I fancy that at least 50,000 of the cats would never even see the rat, or have any idea of what was going on.

Or take this:—'If a cat can kill a rat in a minute, how long would it be killing 60,000 rats?' Ah, how long, indeed! My privat opinion is, that the rats would kill the cat.

Lewis Carroll.

9.10 A Tangled Tale

Source: The Monthly Packet (April 1880–May 1885, originally as “Romantic Problems, A Tangled Tale”, with minor differences as noted, without images, all Knots and solutions are signed “Lewis Carroll”, this is omitted here unless some more text appears); A Tangled Tale

“Goblin, lead them up and down.”

Quoted from *A Midsummer Night's Dream* by William Shakespeare

The ruddy glow of sunset was already fading into the sombre shadows of night, when two travellers might have been observed swiftly—at a pace of six miles in the hour—descending the rugged side of a mountain; the younger bounding from crag to crag with the agility of a fawn, while his companion, whose aged limbs seemed ill at ease in the heavy chain armour habitually worn by tourists in that `district`¹, toiled on painfully at his side.

As is always the case `under`² such circumstances, the younger knight was the first to break the silence.

“A goodly pace, I trow!” he exclaimed. “We sped not thus in the ascent!”

“Goodly, indeed!” the other echoed with a groan. “We clomb it but at three miles in the hour.”

“And on the dead level our pace is——?” the younger suggested; for he was weak in statistics, and left all such details to his aged `companion`³.

“Four miles in the hour,” the other wearily replied. “Not an ounce more,” he added, with that love of metaphor so common in old age, “and not a farthing less!”

“’Twas three hours past high noon when we left our hostelry,” the young man said, musingly. “We shall scarce be back by supper-time. Perchance mine host will roundly deny us all food!”

“He will chide our tardy return,” was the grave reply, “and such a rebuke will be meet.”

“A brave conceit!” cried the other, with a merry laugh. “And should we bid him bring us yet another course, I trow his answer will be tart!”

“We shall but get our deserts,” sighed the elder knight, who had never seen a joke in his life, and was somewhat displeased at his companion’s untimely levity. “’Twill be nine of the clock,” he added in an undertone, “by the time we regain our hostelry. Full many a mile shall we have plodded this day!”

“How many? How many?” cried the eager youth, ever athirst for knowledge.

The old man was silent.

“Tell me,” he answered, after a moment’s thought, “what time it was when we stood together on yonder peak. Not exact to the minute!” he added hastily,

reading a protest in the young man's face. "An' thy guess be within one poor half-hour of the mark, 'tis all I ask of thy mother's son! Then will I tell thee, true to the last inch, how far we shall have trudged betwixt three and nine of the clock."

A groan was the young man's only reply; while his convulsed features and the deep wrinkles that chased each other across his manly brow, revealed the abyss of arithmetical agony into which one chance question had plunged him.⁷⁴

Knot II. Eligible Apartments

Source: The Monthly Packet, April 1881 (as "Knot V. Eligible Apartments", with minor differences as noted, without image); A Tangled Tale

*"Straight down the crooked lane,
And all round the square."*

Quoted from *A Plain
Direction* by Thomas
Hood

"Let's ask Balbus about it," said Hugh.

"All right," said Lambert.

"*He* can guess it," said Hugh.

"Rather," said Lambert.

No more words were needed: the two brothers understood each other perfectly.

Balbus was waiting for them at the hotel: the journey down had tired him, he said: so his two pupils had been the round of the place, in search of lodgings, without the old tutor who had been their inseparable companion from their childhood. They had named him after the hero of their Latin exercise-book, which overflowed with anecdotes of that versatile genius—anecdotes whose vagueness in detail was more than compensated by their sensational brilliance. "Balbus has overcome all his enemies" had been marked by their tutor, in the margin of the book, "Successful Bravery." In this way he had tried to extract a moral from every anecdote about Balbus—sometimes one of warning, as in "Balbus had borrowed a healthy dragon," against which he had written "Rashness in Speculation"—sometimes of encouragement, as in the words "Influence of Sympathy in United Action," which stood opposite to the anecdote "Balbus was assisting his mother-in-law to convince the dragon"—and sometimes it dwindled down to a single word, such as "Prudence," which was all he could extract from the touching record that "Balbus, having scorched the tail of the dragon, went away." His pupils liked the short morals best, as it left them more room for marginal illustrations, and in this instance they required all the space they could get to exhibit the rapidity of the hero's departure.

Their report of the state of things was discouraging. That most fashionable of watering-places, Little Mendip, was "chockfull" (as the boys expressed it) from end to end. But in one Square they had seen no less than four cards, in different houses, all announcing in flaming capitals "ELIGIBLE APARTMENTS." "So there's plenty of choice, after all, you see"⁷⁵, said spokesman Hugh in conclusion.

⁴In the *Monthly Packet* this is followed by "Lewis Carroll. Answers are invited. The right one will be inserted after the Spider answers."

⁵(missing in the *Monthly Packet*)

“Balbus was assisting his mother-in-law to convince the dragon.”

“That doesn’t follow from the data,” said Balbus, as he rose from the easy chair, where he had been dozing over *The Little Mendip Gazette*. “They may be all single rooms. However, we may as well see them. I shall be glad to stretch my legs a bit.”

An unprejudiced bystander might have objected that the operation was needless, and that this long, lank creature would have been all the better with even shorter legs: but no such thought occurred to his loving pupils. One on each side, they did their best to keep up with his gigantic strides, while Hugh repeated the sentence in their father’s letter, just received from abroad, over which he and Lambert had been puzzling. “He says a friend of his, the Governor of—*what* was that name again, Lambert?” (“Kgovjni,” said Lambert.) “Well, yes. The Governor of—*what-you-may-call-it*—wants to give a very small dinner-party, and he means to ask his father’s brother-in-law, his brother’s father-in-law, his father-in-law’s brother, and his brother-in-law’s father: and we’re to guess how many guests there will be.”

There was an anxious pause. “*How* large did he say the pudding was to be?” Balbus said at last. “Take its cubical contents, $_divide$ ⁶ by the cubical contents of what each man can eat, and the quotient—”

“He didn’t say anything about pudding,” said Hugh, “—and here’s the Square,” as they turned a corner and came into sight of the “eligible apartments.”

“It *is* a Square!” was Balbus’ first cry of delight, as he gazed around him. “Beautiful! Beau-ti-ful! Equilateral! *And* rectangular!”

The boys looked round with less enthusiasm. “Number nine is the first with a card,” said prosaic Lambert; but Balbus would not so soon awake from his dream of beauty.

“See, boys!” he cried. “Twenty doors on a side! What symmetry! Each side divided into twenty-one equal parts! It’s delicious!”

“Shall I knock, or ring?” said Hugh, looking in some perplexity at a $_square$ ⁷ brass plate which bore the simple inscription “RING ALSO.”

“Both,” said Balbus. “That’s an Ellipsis, my boy. Did you never see an Ellipsis before?”

“I couldn’t hardly read it,” said Hugh, evasively. “It’s no good having an Ellipsis, if they don’t keep it clean.”

“Which there is *one* room, gentlemen,” said the smiling landlady. “And a sweet room too! As snug a little back-room—”

“We will see it,” said Balbus gloomily, as they followed her in. “I knew how it would be! One room in each house! No view, I suppose?”

“Which indeed there *is*, gentlemen!” the landlady indignantly protested, as she drew up the blind, and indicated the back garden.

“Cabbages, I perceive,” said Balbus. “Well, they’re green, at any rate.”

“Which the greens at the shops,” their hostess explained, “are by no means dependable upon. Here you has them on the premises, *and* of the best.”

“Does the window open?” was always Balbus’ first question in testing a lodging: and “Does the chimney smoke?” his second. Satisfied on all points, he secured the refusal of the room, and they moved on to Number Twenty-five.

This landlady was grave and stern. “I’ve nobbut one room left,” she told them: “and it gives on the back-gyardin.”

⁶and divide

⁷dingy

“But there are cabbages?” Balbus suggested⁸.

The landlady visibly relented. “There is, sir,” she said: “and good ones, though I say it as shouldn’t. We can’t rely on the shops for greens. So we grows them ourselves.”

“A singular advantage,” said Balbus: and, after the usual questions, they went⁹ on to Fifty-two.

“And I’d gladly accommodate you all, if I could,” was the greeting that met them. “We are but mortal,” (“Irrelevant!” muttered Balbus) “and I’ve let all my rooms but one.”

“Which one is a back-room, I perceive¹⁰,” said Balbus: “and looking out on—on cabbages, I presume¹¹?”

“Yes, indeed, sir!” said their hostess. “Whatever *other* folks may do, *we* grows our own. For the shops——”

“An excellent arrangement!” Balbus interrupted. “Then one can really depend on their being good. Does the window open?”

The usual questions were answered satisfactorily: but this time Hugh added one of his own invention—“Does the cat scratch?”

The landlady looked round suspiciously, as if to make sure the cat was not listening, “I will not deceive you, gentlemen,” she said. “It *do* scratch, but not without¹² you pulls its whiskers!”¹³ It’ll never do it,” she repeated slowly, with a visible effort to recall the exact words of some written agreement between herself and the cat, “without you pulls its whiskers!”

“Much may be excused in a cat so treated,” said Balbus, as they left the house and crossed to Number Seventy-three, leaving the landlady curtsying on the doorstep, and still murmuring to herself her parting words, as if they were a form of blessing, “——not without you pulls its whiskers!”

At Number Seventy-three they found only a small shy girl to show the house, who said “yes’m” in answer to all questions.

“The usual room,” said Balbus, as they marched in: “the usual back-garden, the usual cabbages. I suppose you can’t get them good at the shops?”

“Yes’m,” said the girl.

“Well, you may tell your mistress we will take the room, and that her plan of growing her own cabbages is simply *admirable!*”

“Yes’m,” said the girl, as she showed them out.

“One day-room and three bed-rooms,” said Balbus, as they returned to the hotel. “We will take as our day-room the one that gives us the least walking to do to get to it.”

“Must we walk from door to door, and count the steps?” said Lambert.

“No, no! Figure it out, my boys, figure it out!” Balbus gaily exclaimed, as he put pens, ink, and paper before his hapless pupils, and left the room.

“I say! It’ll be a job!” said Hugh.

“Rather!” said Lambert.¹⁴

“I waited for the train.”

Quoted from *Godiva*
by Alfred Lord
Tennyson

“Well, they call me so because I *am* a little mad, I suppose,” she said, good-humouredly, in answer to Clara’s cautiously-worded question as to how she came by so strange a nick-name. “You see, I never do what sane people¹⁵ are expected to do now-a-days¹⁶. I never wear long trains, (talking of trains, that’s the Charing Cross Metropolitan Station—I’ve something to tell you about *that*), and I never play lawn-tennis. I can’t cook an omelette. I can’t even set a broken limb! *There’s* an ignoramus for you!”

Clara was her niece, and full twenty years her junior; in fact, she was still attending a High School—an institution of which Mad Mathesis spoke with undisguised aversion. “Let a woman be meek and lowly!” she would say. “None of your High Schools for me!” But it was vacation-time just now, and Clara was her guest, and Mad Mathesis was showing her the sights of that Eighth Wonder of the world—London.

“The Charing Cross Metropolitan Station!” she resumed, waving her hand towards the entrance as if she were introducing her niece to a friend. “The Bayswater and Birmingham Extension is just completed, and the trains now run round and round continuously—skirting the border of Wales, just touching at York, and so round by the east coast back to London. The way the trains run is *most* peculiar. The westerly ones go round in two hours; the easterly ones take three; but they always manage to start two trains from here, opposite ways, punctually every quarter-of-an-hour.”

“They part to meet again,” said Clara, her eyes filling with tears at the romantic thought.

“No need to cry about it!” her aunt grimly remarked. “They don’t meet on the same line of rails, you know. Talking of meeting, an idea strikes me!” she added, changing the subject with her usual abruptness. “Let’s go opposite ways round, and see which can meet most trains. No need for a chaperon—ladies’ saloon, you know. You shall go whichever way you like, and we’ll have a bet about it!”

“I never make bets,” Clara said very gravely. “Our excellent preceptress has often warned us——”

“You’d be none the worse if you did!” Mad Mathesis interrupted. “In fact, you’d be the better, I’m certain!”

“Neither does our excellent preceptress approve of puns,” said Clara. “But we’ll have a match, if you like. Let me choose my train,” she added after a brief mental calculation, “and I’ll engage to meet exactly half as many again as you do.”

have justified his conclusion that the problem is ‘self-contradictory.’ But no such condition is laid down, True, Mad Mathesis says ‘I want you to fill them’ (the three columns) ‘with oughts and crosses.’ But she could not mean ‘fill them *full*,’ for *that* would require that *every* picture in the room should be marked, which was clearly not intended. L. C.

¹⁵ladies

¹⁶to do

“Not if you count fair,” Mad Mathesis bluntly interrupted. “Remember, we only count the trains we meet *on the way*. You mustn’t count the one that starts as you start, nor the one that arrives as you arrive.”

“That will only make the difference of *one* train¹⁷,” said Clara, as they turned and entered the station. “But I never travelled alone before. There’ll be no one to help me to alight. However, I don’t mind. Let’s have a match.”¹⁸

A ragged little boy overheard her remark, and came running after her.¹⁹ “Buy a box of cigar-lights, Miss!” he pleaded²⁰, pulling her²¹ shawl to attract her attention²². Clara²³ stopped to explain.

“I never smoke cigars,” she said in a meekly apologetic tone. “Our excellent preceptress—,” but Mad Mathesis impatiently hurried²⁴ her on, and the little boy was left gazing after her with round eyes of amazement.

The two ladies bought their tickets and moved slowly down the central platform, Mad Mathesis prattling on as usual—Clara silent, anxiously reconsidering the calculation on which she rested her hopes of winning the match.

“Mind where you go, dear!” cried her aunt, checking her just in time. “One step more, and you’d have been in that pail of cold water!”

“I know, I know,” Clara said, dreamily. “The pale, the cold, and the moony—”

“Take your places on the spring-boards!” shouted a porter.

“What are *they* for!” Clara asked in a terrified whisper.

“Merely to help us into the trains.” The elder lady spoke with the nonchalance of one quite used to the process. “Very few people can get into a carriage without help in less than three seconds, and the trains only stop for one second.” At this moment the whistle was heard, and two trains rushed into the station. A moment’s pause, and they were gone again; but in that brief interval several hundred passengers had been shot into them, each flying straight to his place with the accuracy of a Minie bullet—while an equal number were showered out upon the side-platforms.

Three hours had passed away, and the two friends met again on the Charing Cross platform, and eagerly compared notes. Then Clara turned away with a sigh. To young impulsive hearts, like hers, disappointment is always a bitter pill. Mad Mathesis followed her, full of kindly sympathy.

“Try again, my love!” she said, cheerily. “Let us vary the experiment. We will start as we did before, but not to begin counting till our trains meet. When we see each other, we will say ‘One!’ and so count on till we come here again.”

Clara brightened up. “I shall win *that*,” she exclaimed eagerly, “if I may choose my train²⁵!”

Another shriek of engine whistles, another upheaving of spring-boards, another living avalanche plunging into two trains as they flashed by: and the travellers were off again.

Two trains shot past each other in a tunnel, and two travellers leaned back in their corners with a sigh—or rather with *two* sighs—of relief. “One!” Clara murmured to herself. “Won! It’s a word of good omen. *This* time, at any rate, the victory will be mine!”

But was it?²⁷

Knot IV. The Dead Reckoning

Source: The Monthly Packet, October 1880 (as “Knot III. The Dead Reckoning”, with minor differences as noted, without image); A Tangled Tale

“I did dream of money-bags to-night.”

Quoted from *The Merchant of Venice*
by William Shakespeare

Noonday on the open sea within a few degrees of the Equator is apt to be oppressively warm; and our two travellers were now airily clad in suits of dazzling white linen, having laid aside the chain-armor which they had found not only endurable in the cold mountain air they had lately been breathing, but a necessary precaution against the daggers of the banditti who infested the heights. Their holiday-trip was over, and they were now on their way home, in the monthly packet which plied between the two great ports of the island they had been exploring.

Along with their armor, the tourists had laid aside the antiquated speech it had pleased them to affect while in knightly disguise, and had returned to the ordinary style of two country gentlemen of the Twentieth Century.

Stretched on a pile of cushions, under the shade of a huge umbrella, they were lazily watching some native fishermen, who had come on board at the last landing-place, each carrying over his shoulder a small but heavy sack. A large weighing-machine, that had been used for cargo at the last port, stood on the deck; and round this the fishermen had gathered, and, with much unintelligible jabber, seemed to be weighing their sacks.

“More like sparrows in a tree than human talk, isn’t it?” the elder tourist remarked to his son, who smiled feebly, but would not exert himself so far as to speak. The old man tried another listener.

“What have they got in those sacks, Captain?” he inquired, as that great being passed them in his never ending parade to and fro on the deck.

The Captain paused in his march, and towered over the travellers—tall, grave, and serenely self-satisfied.

“Fishermen,” he explained, “are often passengers in My ship. These five are from Mhruxi—the place we last touched at—and that’s the way they carry their money. The money of this island is heavy, gentlemen, but it costs little, as you may guess. We buy it from them by weight—about five shillings a pound. I fancy a ten pound-note would buy all those sacks.”

By this time the old man had closed his eyes—in order, no doubt, to concentrate his thoughts on these interesting facts; but the Captain failed to realise his motive, and with a grunt resumed his monotonous march.

²⁶and waved

²⁷Followed by “Lewis Carroll. Note.—Answers to be sent in before July 30th.” in the *Monthly Packet*

Meanwhile the fishermen were getting so noisy over the weighing-machine that one of the sailors took the precaution of carrying off all the weights, leaving them to amuse themselves with such substitutes in the form of winch-handles, belaying-pins, &c., as they could find. This brought their excitement to a speedy end: they carefully hid their sacks in the folds of the jib that lay on the deck near the tourists, and strolled away.

When next the Captain's heavy footfall passed, the younger man roused²⁸ himself to speak.

"What did you call the place those fellows came from, Captain?" he asked.

"Mhruxi, sir."

"And the one we are bound for?"

The Captain took a long breath, plunged into the word, and came out of it nobly. "They call it Kgovjni, sir."

"K—I give it up!" the young man faintly said.

He stretched out his hand for a glass of iced water which the compassionate steward had brought him a minute ago, and had set down, unluckily, just outside the shadow of the umbrella. It was scalding hot, and he decided not to drink it. The effort of making this resolution, coming close on the fatiguing conversation he had just gone through, was too much for him: he sank back among the cushions in silence.

His father courteously tried to make amends for his *nonchalance*.

"Whereabouts are we now, Captain?" said he, "Have you any idea?"

The Captain cast a pitying look on the ignorant landsman. "I could tell you that, sir," he said, in a tone of lofty condescension, "to an inch!"

"You don't say so!" the old man remarked, in a tone of languid surprise.

"And mean so," persisted the Captain. "Why, what do you suppose would become of My ship, if I were to lose My Longitude and My Latitude? Could you make anything of My Dead Reckoning?"

"Nobody could, I'm sure!" the other heartily rejoined.

But he had overdone it.

"It's *perfectly* intelligible," the Captain said, in an offended tone, "to any one that understands such things." With these words²⁹ he moved away, and began giving orders to the men, who were preparing to hoist the jib.

Our tourists watched the operation with such interest that neither of them remembered the five money-bags, which in another moment, as the wind filled out the jib, were whirled overboard and fell heavily into the sea.

But the poor fishermen had not so easily forgotten their property. In a moment they had rushed to the spot, and stood uttering cries of fury, and pointing, now to the sea, and now to the sailors who had caused the disaster.

The old man explained it to the Captain.

"Let us make it up among us," he added in conclusion. "Ten pounds will do it, I think you said?"

But the Captain put aside the suggestion with a wave of the hand.

"No, sir!" he said, in his grandest manner. "You will excuse Me, I am sure; but these are My passengers. The accident has happened on board My ship, and under My orders. It is for Me to make compensation." He turned to the

²⁸it was the younger man who roused

²⁹And so saying

angry fishermen. “Come here, my men!” he said, in the Mhruxian dialect. “Tell me the weight of each sack. I saw you weighing them just now.”

Then ensued a perfect Babel of noise, as the five natives explained, all screaming together, how the sailors had carried off the weights, and they had done what they could with whatever came handy.

Two iron belaying-pins, three blocks, six holystones, four winch-handles, and a large hammer, were now carefully weighed, the Captain superintending and noting the results. But the matter did not seem to be settled, even then: an angry discussion followed, in which the sailors³⁰ and the five natives all joined: and at last the Captain approached our tourists with a disconcerted look, which he tried to conceal under a laugh.

“It’s an absurd difficulty,” he said. “Perhaps one of you gentlemen can suggest something. It seems they weighed the sacks two at a time!”

“If they didn’t have five separate weighings, of course you can’t value them separately,” the youth hastily decided.

“Let’s hear all about it,” was the old man’s more cautious remark.

“They *did* have five separate weighings,” the Captain said, “but—Well, it beats *me* entirely!” he added, in a sudden burst of candour. “Here’s the result. First and second sack weighed twelve pounds; second and third, thirteen and a half; third and fourth, eleven and a half; fourth and fifth, eight: and then they say they had only the large hammer left, and it took *three* sacks to weigh it down—that’s the first, third and fifth—and *they* weighed sixteen pounds. There, gentlemen! Did you ever hear anything like *that*?”

The old man³¹ muttered under his breath “If only my sister were here!” and looked helplessly at his son. His son looked at the five natives. The five natives looked at the Captain. The Captain looked at nobody: his eyes were cast down, and he seemed to be saying softly to himself “Contemplate one another, gentlemen, if such be your good pleasure. *I* contemplate *Myself*!”

Knot V. Oughts and Crosses

Source: The Monthly Packet, January 1881 (as “Knot IV. Oughts and Crosses”, with minor differences as noted); A Tangled Tale

“Look here, upon this picture, and on this.”

Quoted from *Hamlet*
by William
Shakespeare

“And what made you choose the first train, Goosey?” said Mad Mathesis, as they got into the cab. “Couldn’t you count better than *that*?”

“I took an extreme case,” was the tearful reply. “Our excellent preceptress always says ‘When in doubt, my dears, take an extreme case.’ And I *was* in doubt.”

“Does it always succeed?” her aunt enquired.

Clara sighed. “Not *always*,” she reluctantly admitted. “And I can’t make out why. One day she was telling the little girls—they make such a noise at tea, you know—‘The more noise you make, the less jam you will have, and *vice versa*.’ And I thought they wouldn’t know what ‘*vice versa*’ meant: so I explained it to them. I said ‘If you make an infinite noise, you’ll get no jam: and if you make

³⁰the Captain, the sailors

³¹older tourist

no noise, you'll get an infinite lot of jam.' But our excellent preceptress said that wasn't a good instance. *Why* wasn't it?" she added plaintively.

Her aunt evaded the question. "One sees certain objections to it," she said. "But how did you work it with the Metropolitan trains? None of them go infinitely fast, I believe."

"I called them hares and tortoises," Clara said—a little timidly, for she dreaded being laughed at. "And I thought there couldn't be so many hares as tortoises on the Line: so I took an extreme case—one hare and an infinite number of tortoises."

"An extreme case, indeed," her aunt remarked with admirable gravity: "and a most dangerous state of things!"

"And I thought, if I went with a tortoise, there would be only *one* hare to meet: but if I went with the hare—you know there were *crowds* of tortoises!"

"It wasn't a bad idea," said the elder lady, as they left the cab, at the entrance of Burlington House. "You shall have another chance to-day. We'll have a match in marking pictures."

Clara brightened up. "I should like to try again, very much," she said. "I'll take more care this time. How are we to play?"

To this question Mad Mathesis made no reply: she was busy drawing lines down the margins of the catalogue. "See," she said after a minute, "I've drawn three columns against the names of the pictures in the long room, and I want you to fill them with oughts and crosses—crosses for good marks and oughts for bad. The first column is for choice of subject, the second for arrangement, the third for colouring. And these are the conditions of the match. You must give three crosses to two or three pictures. You must give two crosses to four or five——"

"Do you mean *only* two crosses?" said Clara. "Or may I count the three-cross pictures among the two-cross pictures?"

"Of course you may," said her aunt. "Any one, ³²that has *three* eyes, may be said _{to have}³³ *two* eyes, I suppose?"

Clara followed her aunt's dreamy gaze across the crowded gallery, half-dreading to find that there was a three-eyed person in sight.

"And you must give one cross to nine or ten."

"And which wins the match?" Clara asked, as she carefully entered these conditions on a blank leaf in her catalogue.

"Whichever marks fewest pictures."

"But suppose we marked the same number?"

"Then whichever uses most marks."

Clara considered. "I don't think it's much of a match," she said. "I shall mark nine pictures, and give three crosses to three of them, two crosses to two more, and one cross each to all the rest."

"Will you, indeed?" said her aunt. "Wait till you've heard all the conditions, my impetuous child. You must give three oughts to one or two pictures, two oughts to three or four, and one ought to eight or nine. I don't want you to be *too* hard on the R.A.'s."

Clara quite gasped as she wrote down all these fresh conditions. "It's a great deal worse than Circulating Decimals!" she said. "But I'm determined to win,

³²that's got

³³has got

all the same!”

Her aunt smiled grimly. “We can begin *here*,” she said, as they paused before a gigantic picture, which the catalogue informed them was the “Portrait of Lieutenant Brown, mounted on his favorite elephant.”

“He looks awfully conceited!” said Clara. “I don’t think he was the elephant’s favorite Lieutenant. What a hideous picture it is! And it takes up room enough for twenty!”

“Mind what you say, my dear!” her aunt interposed. “It’s by an R.A.!”

But Clara was quite reckless. “I don’t care who it’s by!” she cried. “And I shall give it three bad marks!”

Aunt and niece soon drifted away from each other in the crowd, and for the next half-hour Clara was hard at work, putting in marks and rubbing them out again, and hunting up and down for suitable pictures. This she found the hardest part of all. “I *can’t* find the one I want!” she exclaimed at last, almost crying with vexation.

“What is it you want to find, my dear?” The voice was strange to Clara, but so sweet and gentle that she felt attracted to the owner of it, even before she had seen her; and when she turned, and met the smiling looks of two little old ladies, whose round dimpled faces, exactly alike, seemed never to have known a care, it was as much as she could do—as she confessed to Aunt Mattie afterwards—to keep herself from hugging them both.

“I was looking for a picture,” she said, “that has a good subject—and that’s well arranged—but badly coloured.”

The little old ladies glanced at each other in some alarm. “Calm yourself, my dear,” said the one who had spoken first, “and try to remember which it was. What *was* the subject?”

“Was it an elephant, for instance?” the other sister suggested. They were still in sight of Lieutenant Brown.

“I don’t know, indeed!” Clara impetuously replied. “You know it doesn’t matter a bit what the subject *is*, so long as it’s a good one!”

Once more the sisters exchanged looks of alarm, and one of them whispered something to the other, of which Clara caught only the one word “mad.”

“They mean Aunt Mattie, of course,” she said to herself—fancying, in her innocence, that London was like her native town, where everybody knew everybody else. “If you mean my aunt,” she added aloud, “she’s *there*—just three pictures beyond Lieutenant Brown.”

“Ah, well! Then you’d better go to her, my dear!” her new friend said, soothingly. “*She’ll* find you the picture you want. Good-bye, dear!”

“Good-bye, dear!” echoed the other sister, “Mind you don’t lose sight of your aunt!” And the pair trotted off into another room, leaving Clara rather perplexed at their manner.

“They’re real darlings!” she soliloquised. “I wonder why they pity me so!” And she wandered on, murmuring to herself “It must have two good marks, and——”³⁴

Knot VI. Her Radiancy

Source: The Monthly Packet, July 1881 (with minor differences as noted, without

³⁴Followed by “Lewis Carroll. Note.—Answers to be sent to the care of the Editor before February 1st. They will be noticed on March 1st.” in the *Monthly Packet*

image); A Tangled Tale

*“One piecee thing that my have got,
Maskee³⁵ that thing my no can do.
You talkee you no sabey what?
Bamboo.”*

Quoted from *John
Chinaman’s Lignum
Vitæ* by Arthur T.
Bingham Wright

They landed, and were at once conducted to the Palace. About half way they were met by the Governor, who welcomed them in English—a great relief to our travellers, whose guide could speak nothing but Kgovjnian.

“I don’t half like the way they grin³⁶ at us as we go by!” the old man whispered to his son. “And why do they say ‘Bamboo!’ so often?”

“It alludes to a local custom,” replied the Governor, who had overheard the question. “Such persons as happen in any way to displease Her Radiancy are usually beaten with rods.”

The old man shuddered. “A most objectional local custom!” he remarked with strong emphasis. “I wish we had never landed! Did you notice that black fellow, Norman, opening his great mouth at us? I verily believe he would like to eat us!”

Norman appealed to the Governor, who was walking at his other side. “Do they often eat distinguished strangers here?” he said, in as indifferent a tone as he could assume.

“Not often—not ever!” was the welcome reply. “They are not good for it. Pigs we eat, for they are fat. This old man is thin.”

“And thankful to be so!” muttered the elder traveller. “Beaten we shall be without a doubt. It’s a comfort to know it won’t be Beaten without the B! My dear boy, just look at the peacocks!”

They were now walking between two unbroken lines of those gorgeous birds, each held in check, by means of a golden collar and chain, by a black slave, who stood well behind, so as not to interrupt the view of the glittering tail, with its network of rustling feathers and its hundred eyes.

The Governor smiled proudly. “In your honour,” he said, “Her Radiancy has ordered up ten thousand additional peacocks. She will, no doubt, decorate you, before you go, with the usual Star and Feathers.”

“It’ll be Star without the S!” faltered one of his hearers.

“Come, come! Don’t lose heart!” said the other. “All this is full of charm for me.”

“You are young, Norman,” sighed his father; “young and light-hearted. For me, it is Charm without the C.”

“The old one is sad,” the Governor remarked with some anxiety. “He has, without doubt, effected some fearful crime?”

“But I haven’t!” the poor old gentleman hastily exclaimed. “Tell him I haven’t, Norman!”

“He has not, as yet,” Norman gently explained. And the Governor repeated, in a satisfied tone, “Not as yet.”

“Yours is a wondrous country!” the Governor resumed, after a pause. “Now here is a letter from a friend of mine, a merchant, in London. He and his brother

³⁵“*Maskee*,” in Pigeon-English, means “*without*.”

³⁶everybody grins

“Why do they say ‘Bamboo!’ so often?”

went there a year ago, with a thousand pounds apiece; and on New-Year's-day they had sixty thousand pounds between them!"

"How did they do it?" Norman eagerly exclaimed. Even the elder traveller looked excited.

The Governor handed him the open letter. "Anybody can do it, when once they know how," so ran this oracular document. "We borrowed nought: we stole nought. We began the year with only a thousand pounds apiece: and last New-Year's-day we had sixty thousand pounds between us—sixty thousand golden sovereigns!"

Norman looked grave and thoughtful as he handed back the letter. His father hazarded one guess. "Was it by gambling?"

"A Kgovjnian never gambles," said the Governor gravely, as he ushered them through the palace gates. They followed him in silence down a long passage, and soon found themselves in a lofty hall, lined entirely with peacocks' feathers. In the centre was a pile of crimson cushions, which almost concealed the figure of Her Radiancy—a plump little damsel, in a robe of green satin dotted with silver stars, whose pale round face lit up for a moment with a half-smile as the travellers bowed before her, and then relapsed into the exact expression of a wax doll, while she languidly murmured a word or two in the Kgovjnian dialect.

The Governor interpreted. "Her Radiancy welcomes you. She notes the Impenetrable Placidity of the old one, and the Imperceptible Acuteness of the youth."

Here the little potentate clapped her hands, and a troop of slaves instantly appeared, carrying trays of coffee and sweetmeats, which they offered to the guests, who had, at a signal from the Governor, seated themselves on the carpet.

"Sugar-plums!" muttered the old man. "One might as well be at a confectioner's! Ask for a penny bun, Norman!"

"Not so loud!" his son whispered. "Say something complimentary!" For the Governor was evidently expecting a speech.

"We thank Her Exalted Potency," the old man timidly began. "We bask in the light of her smile, which——"

"The words of old men are weak!" the Governor interrupted angrily. "Let the youth speak!"

"Tell her," cried Norman, in a wild burst of eloquence, "that, like two grasshoppers in a volcano, we are shrivelled up in the presence of Her Spangled Vehemence!"

"It is well," said the Governor, and translated this into Kgovjnian. "I am now to tell you," he proceeded, "what Her Radiancy requires of you before you go. The yearly competition for the post of Imperial Scarf-maker is just ended; you are the judges. You will take account of the rate of work, the lightness of the scarves, and their warmth. Usually the competitors differ in one point only. Thus, last year, Fifi and Gogo made the same number of scarves in the trial-week, and they were equally light; but Fifi's were twice as warm as Gogo's and she was pronounced twice as good. But this year, woe is me, who can judge it? Three competitors are here, and they differ in all points! While you settle their claims, you shall be lodged, Her Radiancy bids me say, free of expense—in the best dungeon, and abundantly fed on the best bread and water."

The old man groaned. "All is lost!" he wildly exclaimed. But Norman heeded him not: he had taken out his note-book, and was calmly jotting down the particulars.

“Three they be,” the Governor proceeded, “Lolo, Mimi, and Zuzu. Lolo makes 5 scarves while Mimi makes 2; but Zuzu makes 4 while Lolo makes 3! Again, so fairylike is Zuzu’s handiwork, 5 of her scarves weigh no more than one of Lolo’s; yet Mimi’s is lighter still—5 of hers will but balance 3 of Zuzu’s! And for warmth one of Mimi’s is equal to 4 of Zuzu’s; yet one of Lolo’s is as warm as 3 of Mimi’s!”

Here the little lady once more clapped her hands.

“It is our signal of dismissal!” the Governor hastily said. “Pay Her Radiancy your farewell compliments—and walk out backwards.”

The walking part was all the elder tourist could manage. Norman simply said “Tell Her Radiancy we are transfixed by the spectacle of Her Serene Brilliance, and bid an agonized³⁷ farewell to her Condensed Milkiness!”

“Her Radiancy is pleased,” the Governor reported, after duly translating this. “She casts on you a glance from Her Imperial Eyes, and is confident that you will catch it!”

“That I warrant we shall!” the elder traveller moaned to himself distractedly.

Once more they bowed low, and then followed the Governor down a winding staircase to the Imperial Dungeon, which they found to be lined with coloured marble, lighted from the roof, and splendidly though not luxuriously furnished with a bench of polished malachite. “I trust you will not delay the calculation,” the Governor said, ushering them in with much ceremony. “I have known great inconvenience—great and serious inconvenience—result to those unhappy ones who have delayed to execute the commands of Her Radiancy! And on this occasion she is resolute: she says the thing must and shall be done: and she has ordered up ten thousand additional bamboos!” With these words he left them, and they heard him lock and bar the door on the outside.

“I told you how it would end!” moaned the elder traveller, wringing his hands, and quite forgetting in his anguish that he had himself proposed the expedition, and had never predicted anything of the sort. “Oh that we were well out of this miserable business!”

“Courage!” cried the younger cheerily. “*Hæc olim meminisse juvabit!* The end of all this will be glory!”

“Glory without the L!” was all the poor old man could say, as he rocked himself to and fro on the malachite bench. “Glory without the L!”

Knot VII. Petty Cash

Source: The Monthly Packet, April 1882 (with different punctuation and spelling, without image); A Tangled Tale

“Base is the slave that pays.”

“Aunt Mattie!”

“My child?”

“*Would* you mind writing it down at once? I shall be quite *certain* to forget it if you don’t!”

“My dear, we really must wait till the cab stops. How can I possibly write anything in the midst of all this jolting?”

³⁷agonised

Quoted from *Henry V* by William Shakespeare

“But *really* I shall be forgetting it!”

Clara’s voice took the plaintive tone that her aunt never knew how to resist, and with a sigh the old lady drew forth her ivory tablets and prepared to record the amount that Clara had just spent at the confectioner’s shop. Her expenditure was always made out of her aunt’s purse, but the poor girl knew, by bitter experience, that sooner or later “Mad Mathesis” would expect an exact account of every penny that had gone, and she waited, with ill-concealed impatience, while the old lady turned the tablets over and over, till she had found the one headed “PETTY CASH.”

“Here’s the place,” she said at last, “and here we have yesterday’s luncheon duly entered. *One glass lemonade* (Why can’t you drink water, like me?) *three sandwiches* (They never put in half mustard enough. I told the young woman so, to her face; and she tossed her head—like her impudence!) *and seven biscuits. Total one-and-two-pence.* Well, now for to-day’s?”

“One glass of lemonade——” Clara was beginning to say, when suddenly the cab drew up, and a courteous railway-porter was handing out the bewildered girl before she had had time to finish her sentence.

Her aunt pocketed the tablets instantly. “Business first,” she said: “petty cash—which is a form of pleasure, whatever *you* may think—afterwards.” And she proceeded to pay the driver, and to give voluminous orders about the luggage, quite deaf to the entreaties of her unhappy niece that she would enter the rest of the luncheon account. “My dear, you really must cultivate a more capacious mind!” was all the consolation she vouchsafed to the poor girl. “Are not the tablets of your memory wide enough to contain the record of one single luncheon?”

“Not wide enough! Not half wide enough!” was the passionate reply.

The words came in aptly enough, but the voice was not that of Clara, and both ladies turned in some surprise to see who *it*³⁸ was that had so suddenly struck into their conversation. A fat little old lady was standing at the door of a cab, helping the driver to extricate what seemed an exact duplicate of herself: it would have been no easy task to decide which was the fatter, or which looked the more good-humoured of the two sisters.

“I tell you the cab-door isn’t half wide enough!” she repeated, as her sister finally emerged, somewhat after the fashion of a pellet from a pop-gun, and she turned to appeal to Clara. “Is it, dear?” she said, trying hard to bring a frown into a face that dimpled all over with smiles.

“Some folks is too wide for ’em,” growled the cab-driver.

“Don’t provoke me, man!” cried the little old lady, in what she meant for a tempest of fury. “Say another word and I’ll put you into the County Court, and sue you for a *Habeas Corpus!*” The cabman touched his hat, and marched off, grinning.

“Nothing like a little Law to cow the ruffians, my dear!” she remarked confidentially to Clara. “You saw how he quailed when I mentioned the *Habeas Corpus*? Not that I’ve any idea what it means, but it sounds very grand, doesn’t it?”

“It’s very provoking,” Clara replied, a little vaguely.

“Very!” the little old lady eagerly repeated. “And we’re very much provoked indeed. Aren’t we, sister?”

³⁸mistakenly “is” in the *Monthly Packet*

"I tell you the cab-door isn't half wide enough!"

"I never was so provoked in all my life!" the fatter sister assented, radiantly.

By this time Clara had recognised her picture-gallery acquaintances, and, drawing her aunt aside, she hastily whispered her reminiscences. "I met them first in the Royal Academy—and they were very kind to me—and they were lunching at the next table to us, just now, you know—and they tried to help me to find the picture I wanted—and I'm sure they're dear old things!"

"Friends of yours, are they?" said Mad Mathesis. "Well, I like their looks. You can be civil to them, while I get the tickets. But do try and arrange your ideas a little more chronologically!"

And so it came to pass that the four ladies found themselves seated side by side on the same bench waiting for the train, and chatting as if they had known one another for years.

"Now this I call quite a remarkable coincidence!" exclaimed the smaller and more talkative of the two sisters—the one whose legal knowledge had annihilated the cab-driver. "Not only that we should be waiting for the same train, and at the same station—*that* would be curious enough—but actually on the same day, and the same hour of the day! That's what strikes *me* so forcibly!" She glanced at the fatter and more silent sister, whose chief function in life seemed to be to support the family opinion, and who meekly responded—

"And me too, sister!"

"Those are not *independent* coincidences——" Mad Mathesis was just beginning, when Clara ventured to interpose.

"There's no jolting here," she pleaded meekly. "*Would* you mind writing it down now?"

Out came the ivory tablets once more. "What was it, then?" said her aunt.

"One glass of lemonade, one sandwich, one biscuit—Oh dear me!" cried poor Clara, the historical tone suddenly changing to a wail of agony.

"Toothache?" said her aunt calmly, as she wrote down the items. The two sisters instantly opened their reticules and produced two different remedies for neuralgia, each marked "unequalled."

"It isn't that!" said poor Clara. "Thank you very much. It's only that I *can't* remember how much I paid!"

"Well, try and make it out, then," said her aunt. "You've got yesterday's luncheon to help you, you know. And here's the luncheon we had the day before—the first day we went to that shop—*one glass lemonade, four sandwiches, ten biscuits. Total, one-and-fivepence.*" She handed the tablets to Clara, who gazed at them with eyes so dim with tears that she did not at first notice that she was holding them upside down.

The two sisters had been listening to all this with the deepest interest, and at this juncture the smaller one softly laid her hand on Clara's arm.

"Do you know, my dear," she said coaxingly, "my sister and I are in the very same predicament! Quite identically the very same predicament! Aren't we, sister?"

"Quite identically and absolutely the very——" began the fatter sister, but she was constructing her sentence on too large a scale, and the little one would not wait for her to finish it.

"Yes, my dear," she resumed; "we were lunching at the very same shop as you were—and we had two glasses of lemonade and three sandwiches and five biscuits—and neither of us has the least idea what we paid. Have we, sister?"

“Quite identically and absolutely——” murmured the other, who evidently considered that she was now a whole sentence in arrears, and that she ought to discharge one obligation before contracting any fresh liabilities; but the little lady broke in again, and she retired from the conversation a bankrupt.

“*Would* you make it out for us, my dear?” pleaded the little old lady.

“You can do Arithmetic, I trust?” her aunt said, a little anxiously, as Clara turned from one tablet to another, vainly trying to collect her thoughts. Her mind was a blank, and all human expression was rapidly fading out of her face.

A gloomy silence ensued.

Knot VIII. De Omnibus Rebus

Source: The Monthly Packet, August 1883 (as “Knot IX. De Omnibus Rebus”, with minor differences as noted); A Tangled Tale

*“This little pig went to market:
This little pig staid at home.”*

Quoted from nursery rhyme

“By Her Radiancy’s express command,” said the Governor, as he conducted the travellers, for the last time, from the Imperial presence, “I shall now have the ecstasy of escorting you as far as the outer gate of the Military Quarter, where the agony of parting—if indeed Nature can survive the shock—must be endured! From that gate grurmstipths start every quarter of an hour, both ways——”

“Would you mind repeating that word?³⁹” said Norman. “Grurm——?”

“Grurmstipths,” the Governor repeated. “You call them omnibuses in England. They run both ways, and you can travel by one of them all the way down to the harbour.”

The old man breathed a sigh of relief; four hours of courtly ceremony had wearied him, and he had been in constant terror lest something should call into use the ten thousand additional bamboos.

In another minute they were crossing a large quadrangle, paved with marble, and tastefully decorated with a pigsty in each corner. Soldiers, carrying pigs, were marching in all directions: and in the middle stood a gigantic officer giving orders in a voice of thunder, which made itself heard above all the uproar of the pigs.

“It is the Commander-in-Chief!” the Governor hurriedly whispered to his companions, who at once followed his example in prostrating themselves before the great man. The Commander gravely bowed in return. He was covered with gold lace from head to foot: his face wore an expression of deep misery: and he had a little black pig under each arm. Still the gallant fellow did his best, in the midst of the orders he was every moment issuing to his men, to bid a courteous farewell to the departing guests.

“Farewell, oh old one—carry these three to the South corner—and farewell to thee, thou young one—put this fat one on the top of the others in the Western sty—may your shadows never be less—woe is me, it is wrongly done! Empty out all the sties, and begin again!” And the soldier leant upon his sword, and wiped away a tear.

³⁹I beg your pardon

"He is in distress," the Governor explained as they left the court. "Her Radiancy has commanded him to place twenty-four pigs in those four sties, so that, as she goes round the court, she may always find the number in each sty nearer to ten than the number in the last."

"Does she call ten nearer to ten than nine is?" said Norman.

"Surely," said the Governor. "Her Radiancy would admit that ten is nearer to ten than nine is—and also nearer than eleven is."

"Then I think it can be done," said Norman.

The Governor shook his head. "The Commander has been transferring them in vain for four months," he said. "What hope remains? And Her Radiancy has ordered up ten thousand additional——"

"The pigs don't seem to enjoy being transferred," the old man hastily interrupted. He did not like the subject of bamboos.

"They are only *provisionally* transferred, you know," said the Governor. "In most cases they are immediately carried back again: so they need not mind it. And all is done with the greatest care, under the personal superintendence of the Commander-in-Chief."

"Of course she would only go *once* round?" said Norman.

"Alas, no!" sighed their conductor. "Round and round. Round and round. These are Her Radiancy's own words. But oh, agony! Here is the outer gate, and we must part!" He sobbed as he shook hands with them, and the next moment was briskly walking away.

"He *might* have waited to see us off!" said the old man, piteously.

"And he needn't have begun whistling the very *moment* he left us!" said the young one, severely. "But look sharp—here are two what's-his-names in the act of starting!"

Unluckily, the sea-bound omnibus was full. "Never mind!" said Norman, cheerily. "We'll walk on till the next one overtakes us."

They trudged on in silence, both thinking over the military problem, till they met an omnibus coming from the sea. The elder traveller took out his watch. "Just twelve minutes and a half since we started," he remarked in an absent manner. Suddenly the vacant face brightened; the old man had an idea. "My boy!" he shouted, bringing his hand down upon Norman's shoulder so suddenly as for a moment to transfer his centre of gravity beyond the base of support.

Thus taken off his guard, the young man wildly staggered forwards, and seemed about to plunge into space: but in another moment he had gracefully recovered himself. "Problem in Precession and Nutation," he remarked—in tones where filial respect only just managed to conceal a shade of annoyance. "What is it?" he hastily added, fearing his father might have been taken ill. "Will you have some brandy?"

"When will the next omnibus overtake us? When? When?" the old man cried, growing more excited every moment.

Norman looked gloomy. "Give me time," he said. "I must think it over." And once more the travellers passed on in silence—a silence only broken by the distant squeals of the unfortunate little pigs, who were still being provisionally transferred from sty to sty, under the personal superintendence of the Commander-in-Chief.

Knot IX. A Serpent with Corners

Source: The Monthly Packet, January 1883 (as “Knot VIII. A Serpent with Corners”, with minor differences as noted, without image); A Tangled Tale

*“Water, water, every where,
Nor any drop to drink.”*

Quoted from *The Rime of the Ancient Mariner* by Samuel Taylor Coleridge

“It’ll just take one more pebble.”

“What ever *are* you doing with those buckets?”

The speakers were Hugh and Lambert. Place, the beach of Little Mendip. Time, 1.30, P.M. Hugh was floating a bucket in another a size larger, and trying how many pebbles it would carry without sinking. Lambert was lying on his back, doing nothing.

For the next minute or two Hugh was silent, evidently deep in thought. Suddenly he started. “I say, look here, Lambert!” he cried.

“If it’s alive, and slimy, and with legs, I don’t care to,” said Lambert.

“Didn’t Balbus say this morning that, if a body is immersed in liquid, it displaces as much liquid as is equal to its own bulk?” said Hugh.

“He said things of that sort,” Lambert vaguely replied.

“Well, just look here a minute. Here’s the little bucket almost quite immersed: so the water displaced ought to be just about the same bulk. And now just look at it!” He took out the little bucket as he spoke, and handed the big one to Lambert. “Why, there’s hardly a teacupful! Do you mean to say *that* water is the same bulk as the little bucket?”

“Course it is,” said Lambert.

“Well, look here again!” cried Hugh, triumphantly, as he poured the water from the big bucket into the little one. “Why, it doesn’t half fill it!”

“That’s its business,” said Lambert. “If Balbus says it’s the same bulk, why, it is the same bulk, you know.”

“Well, I don’t believe it,” said Hugh.

“You needn’t,” said Lambert. “Besides, it’s dinner-time. Come along.”

They found Balbus waiting dinner for them, and to him Hugh at once propounded his difficulty.

“Let’s get you helped first,” said Balbus, briskly cutting away at the joint. “You know the old proverb ‘Mutton first, mechanics afterwards’?”

The boys did *not* know the proverb, but they accepted it in perfect good faith, as they did every piece of information, however startling, that came from so infallible an authority as their tutor. They ate on steadily in silence, and, when dinner was over, Hugh set out the usual array of pens, ink, and paper, while Balbus repeated to them the problem he had prepared for their afternoon’s task.

“A friend of mine has a flower-garden—a very pretty one, though no great size—”

“How big is it?” said Hugh.

“That’s what *you* have to find out!” Balbus gaily replied. “All I tell you is that it is oblong in shape—just half a yard longer than its width—and that a gravel-walk, one yard wide, begins at one corner and runs all round it.”

“Joining into itself?” said Hugh.

“*Not* joining into itself, young man. Just before doing *that*, it turns a corner, and runs round the garden again, alongside of the first portion, and then inside that again, winding in and in, and each lap touching the last one, till it has used up the whole of the area.”

“Like a serpent with corners?” said Lambert.

“Exactly so. And if you walk the whole length of it, to the last inch, keeping in the centre of the path, it’s exactly two miles and half a furlong. Now, while you find out the length and breadth⁴⁰ of the garden, I’ll see if I can think⁴¹ out that sea-water puzzle.”

“You said it was a flower-garden?” Hugh inquired, as Balbus was leaving the room.

“I did,” said Balbus.

“Where do the flowers grow?” said Hugh. But Balbus thought it best not to hear the question. He left the boys to their problem, and, in the silence of his own room, set himself to unravel Hugh’s mechanical paradox.

“To fix our thoughts,” he murmured to himself, as, with hands deep-buried in his pockets, he paced up and down the room, “we will take a cylindrical glass jar, with a scale of inches marked up the side, and fill it with water up to the 10-inch mark: and we will assume that every inch depth of jar contains a pint of water. We will now take a solid cylinder, such that every inch of it is equal in bulk to *half* a pint of water, and plunge 4 inches of it into the water, so that the end of the cylinder comes down to the 6-inch mark. Well, that displaces 2 pints of water. What becomes of them? Why, if there were no more cylinder, they would lie comfortably on the top, and fill the jar up to the 12-inch mark. But unfortunately there is more cylinder, occupying half the space between the 10-inch and the 12-inch marks, so that only *one* pint of water can be accommodated there. What becomes of the other pint? Why, if there were no more cylinder, it would lie on the top, and fill the jar up to the 13-inch mark. But unfortunately—Shade of Newton!” he exclaimed, in sudden accents of terror. “When *does* the water stop rising?”

A bright idea struck him. “I’ll write a little essay on it,” he said.

Balbus’s Essay

“When a solid is immersed in a liquid, it is well known that it displaces a portion of the liquid equal to itself in bulk, and that the level of the liquid rises just so much as it would rise if a quantity of liquid had been added to it, equal in bulk to the solid. Lardner says, precisely the same process occurs when a solid is *partially* immersed: the quantity of liquid displaced, in this case, equalling the portion of the solid which is immersed, and the rise of the level being in proportion.

“Suppose a solid held above the surface of a liquid and partially immersed: a portion of the liquid is displaced, and the level of the liquid rises. But, by this rise of level, a little bit more of the solid is of course immersed, and so there is a new displacement of a second portion of the liquid, and a consequent rise of level. Again, this second rise of level causes a yet further immersion, and by consequence another displacement of liquid and another rise. It is self-evident that this process must continue till the entire solid is immersed, and that the liquid will then begin to immerse whatever holds the solid, which, being

⁴⁰dimensions

⁴¹go and think

connected with it, must for the time be considered a part of it. If you hold a stick, six feet long, with its end in a tumbler of water, and wait long enough, you must eventually be immersed. The question as to the source from which the water is supplied—which belongs to a high branch of mathematics, and is therefore beyond our present scope—does not apply to the sea. Let us therefore take the familiar instance of a man standing at the edge of the sea, at ebb-tide, with a solid in his hand, which he partially immerses: he remains steadfast and unmoved, and we all know that he must be drowned. The multitudes who daily perish in this manner to attest a philosophical truth, and whose bodies the unreasoning wave casts sullenly upon our thankless shores, have a truer claim to be called the martyrs of science than a Galileo or a Kepler. To use Kossuth's eloquent phrase, they are the unnamed demigods of the nineteenth century."⁴²

"There's a fallacy *somewhere*," he murmured drowsily, as he stretched his long legs upon the sofa. "I must think it over again." He closed his eyes, in order to concentrate his attention more perfectly, and for the next hour or so his slow and regular breathing bore witness to the careful deliberation with which he was investigating this new and perplexing view of the subject.

Knot X. Chelsea Buns

Source: The Monthly Packet, November 1884 (as "Knot X and Last. Chelsea Buns", with minor differences as noted); A Tangled Tale

*"Yea, buns, and buns, and buns!"
Old Song.*

"How very, very sad!" exclaimed Clara; and the eyes of the gentle girl filled with tears as she spoke.

"Sad—but very curious when you come to look at it arithmetically," was her aunt's less romantic reply. "Some of them have lost an arm in their country's service, some a leg, some an ear, some an eye——"

"And some, perhaps, *all!*" Clara murmured dreamily, as they passed the long rows of weather-beaten heroes basking in the sun. "Did you notice that very old one, with a red face, who was drawing a map in the dust with his wooden leg, and all the others watching? I *think* it was a plan of a battle——"

"The battle of Trafalgar, no doubt," her aunt interrupted, briskly.

"Hardly that, I think," Clara ventured to say. "You see, in that case, he couldn't well be alive——"

"Couldn't well be alive!" the old lady contemptuously repeated. "He's as lively as you and me put together! Why, if drawing a map in the dust—with one's wooden leg—doesn't prove one to be alive, perhaps you'll kindly mention what *does* prove it!"

Clara did not see her way out of it. Logic had never been her *forte*.

"To return to the arithmetic," Mad Mathesis resumed—the eccentric old lady never let slip an opportunity of driving her niece into a calculation—"what percentage do you suppose must have lost all four—a leg, an arm, an eye, and an ear?"

⁴²Note by the writer.—For the above Essay I am indebted to a dear friend, now deceased.

“He remains steadfast and unmoved.”

“How *can* I tell?” gasped the terrified girl. She knew well what was coming.

“You can’t, of course, without *data*,” her aunt replied: “but I’m just going to give you——”

“Give her a Chelsea bun, Miss! That’s what most young ladies likes best!” The voice was rich and musical, and the speaker dexterously whipped back the snowy cloth that covered his basket, and disclosed a tempting array of the familiar square buns, joined together in rows, richly egged and browned, and glistening in the sun.

“No, sir! I shall give her nothing so indigestible! Be off!” The old lady waved her parasol threateningly: but nothing seemed to disturb the good-humour of the jolly old man, who marched on, chanting his melodious refrain:—

“Far too indigestible, my love!” said the old lady. “Percentages will agree with you ever so much better!”

Clara sighed, and there was a hungry look in her eyes as she watched the basket lessening in the distance: but she meekly listened to the relentless old lady, who at once proceeded to count off the *data* on her fingers.

“Say that 70 per cent. have lost an eye—75 per cent. an ear—80 per cent. an arm—85 per cent. a leg—that’ll do it beautifully. ⁴³Now, my dear, what percentage, *at least*, must have lost all four?”

No more conversation occurred—unless a smothered exclamation of “Piping hot!” which escaped from Clara’s lips as the basket vanished round a corner could be counted as such—until they reached the old Chelsea mansion, where Clara’s ⁴⁴father was then staying, with his three sons and their old tutor.

Balbus, Lambert, and Hugh had entered the house only a few minutes before them. They had been out walking, and Hugh had been propounding a difficulty which had reduced Lambert to the depths of gloom, and had even puzzled Balbus.

“It changes from Wednesday to Thursday at midnight, doesn’t it?” Hugh had begun.

“Sometimes,” said Balbus, cautiously.

“Always,” said Lambert, decisively.

“*Sometimes*,” Balbus gently insisted. “Six midnights out of seven, it changes to some other name.”

“I meant, of course,” Hugh corrected himself, “when it *does* change from Wednesday to Thursday, it does it at midnight—and *only* at midnight.”

“Surely,” said Balbus. Lambert was silent.

“Well, now, suppose it’s midnight here in Chelsea. Then it’s Wednesday *west* of Chelsea (say in Ireland or America) where midnight hasn’t arrived yet: and

⁴³Now then

⁴⁴uncle

it's Thursday *east* of Chelsea (say in Germany or Russia) where midnight has just passed by?"

"Surely," Balbus said again. Even Lambert nodded this time.

"But it isn't midnight, anywhere else; so it can't be changing from one day to another anywhere else. And yet, if Ireland and America and so on call it Wednesday, and Germany and Russia and so on call it Thursday, there *must* be some place—not Chelsea—that has different days on the two sides of it. And the worst of it is, the people *there* get their days in the wrong order: they've got Wednesday *east* of them, and Thursday *west*—just as if their day had changed from Thursday to Wednesday!"

"I've heard that puzzle before!" cried Lambert. "And I'll tell you the explanation. When a ship goes round the world from east to west, we know that it loses a day in its reckoning: so that when it gets home, and calls its day Wednesday, it finds people here calling it Thursday, because we've had one more midnight than the ship has had. And when you go the other way round you gain a day."

"I know all that," said Hugh, in reply to this not very lucid explanation: "but it doesn't help me, because the ship hasn't proper days. One way round, you get more than twenty-four hours to the day, and the other way you get less: so of course the names get wrong: but people that live on in one place always get twenty-four hours to the day."

"I suppose there is such a place," Balbus said, meditatively, "though I never heard of it. And the people must find it very queer, as Hugh says, to have the old day *east* of them, and the new one *west*: because, when midnight comes round to them, with the new day in front of it and the old one behind it, one doesn't see exactly what happens. I must think it over."

So they had entered the house in the state I have described—Balbus puzzled, and Lambert buried in gloomy thought.

"Yes, m'm, Master is at home, m'm," said the stately old butler. (N.B.—It is only a butler of experience who can manage a series of three M's *ṭ*'gether⁴⁵, without any interjacent vowels.) "And the *ole* party is a-waiting for you in the libery."

"I don't like his calling your father an *old* party," Mad Mathesis whispered to her niece, as they crossed the hall. And Clara had only just time to whisper in reply "he meant the *whole* party," before they were ushered into the library, and the sight of the five solemn faces there assembled chilled her into silence.

Her father sat at the head of the table, and mutely signed to the ladies to take the two vacant chairs, one on each side of him. His three sons and Balbus completed the party. Writing materials had been arranged round the table, after the fashion of a ghostly banquet: the butler had evidently bestowed much thought on the grim device. Sheets of quarto paper, each flanked by a pen on one side and a pencil on the other, represented the plates—penwipers did duty for rolls of bread—while ink-bottles stood in the places usually occupied by wine-glasses. The *pièce de resistance* was a large green baize bag, which gave forth, as the old man restlessly lifted it from side to side, a charming jingle, as of innumerable golden guineas.

"Sister, daughter, sons—and Balbus—," the old man began, so nervously, that Balbus put in a gentle "Hear, hear!" while Hugh drummed on the table with his fists. This disconcerted the unpractised orator. "Sister—" he began

⁴⁵together

again, then paused a moment, moved the bag to the other side, and went on with a rush, "I mean—this being—a critical occasion—more or less—being the year when one of my sons comes of age—" he paused again in some confusion, having evidently got into the middle of his speech sooner than he intended: but it was too late to go back. "Hear, hear!" cried Balbus. "Quite so," said the old gentleman, recovering his self-possession a little: "when first I began this annual custom—my friend Balbus will correct me if I am wrong—" (Hugh whispered "with a strap!" but nobody heard him except Lambert, who only frowned and shook his head at him) "—this annual custom of giving each of my sons as many guineas as would represent his age—it was a critical time—so Balbus informed me—as the ages of two of you were together equal to that of the third—so on that occasion I made a speech—" He paused so long that Balbus thought it well to come to the rescue with the words "It was a most—" but the old man checked him with a warning look: "yes, made a speech," he repeated. "A few years after that, Balbus pointed out—I say pointed out—" ("Hear, hear!" cried Balbus. "Quite so," said the grateful old man.) "—that it was *another* critical occasion. The ages of two of you were together *double* that of the third. So I made another speech—another speech. And now again it's a critical occasion—so Balbus says—and I am making—" (Here Mad Mathesis pointedly referred to her watch) "all the haste I can!" the old man cried, with wonderful presence of mind. "Indeed, sister, I'm coming to the point now! The number of years that have passed since that first occasion is just two-thirds of the number of guineas I then gave you. Now, my boys, calculate your ages from the *data*, and you shall have the money!"

"But we *know* our ages!" cried Hugh.

"Silence, sir!" thundered the old man, rising to his full height (he was exactly five-foot five) in his indignation. "I say you must use the *data* only! You mustn't even assume *which* it is that comes of age!" He clutched the bag as he spoke, and with tottering steps (it was about as much as he could do to carry it) he left the room.

"And *you* shall have a similar *cadeau*," the old lady whispered to her niece, "when you've calculated that percentage!" And she followed her brother.

Nothing could exceed the solemnity with which the old couple had risen from the table, and yet was it—was it a *grin* with which the father turned away from his unhappy sons? Could it be—could it be a *wink* with which the aunt abandoned her despairing niece? And were those—were those sounds of suppressed *chuckling* which floated into the room, just before Balbus (who had followed them out) closed the door? Surely not: and yet the butler told the cook—but no, that was merely idle gossip, and I will not repeat it.

The shades of evening granted their unuttered petition, and "closed not o'er" them (for the butler brought in the lamp): the same obliging shades left them a "lonely bark" (the wail of a dog, in the back-yard, baying the moon) for "awhile": but neither "morn, alas," (nor any other epoch) seemed likely to "restore" them—to that peace of mind which had once been theirs ere ever these problems had swooped upon them, and crushed them with a load of unfathomable mystery!

"It's hardly fair," muttered Hugh, "to give us such a jumble as ⁷⁴⁶this to work out!"

"Fair?" Clara echoed, bitterly. "Well!"

⁴⁶that

And to all my readers I can but repeat the last words of gentle Clara—
Farewell!⁴⁷

Appendix

“A knot!” said Alice. “Oh, do let me help to undo it!”

Quoted from *Alice’s Adventures in Wonderland* by Lewis Carroll

Answers to Knot I

Source: The Monthly Packet, June 1880 (as “Answers to ‘Romantic Problems. Knot I.’”, with minor differences as noted); A Tangled Tale

Problem.—“Two travellers spend from 3 o’clock till 9 in walking along a level road, up a hill, and home again: their pace on the level being 4 miles an hour, up hill 3, and down hill 6. Find distance walked: also (within half an hour) time of reaching top of hill.”

Answer.—“24 miles: half-past 6.”

Solution.—A level mile takes $\frac{1}{4}$ of an hour, up hill $\frac{1}{3}$, down hill $\frac{1}{6}$. Hence to go and return over the same mile, whether on the level or on the hill-side, takes $\frac{1}{2}$ an hour. Hence in 6 hours they went 12 miles out and 12 back. If the 12 miles out had been nearly all level, they would have taken a little over 3 hours; if nearly all up hill, a little under 4. Hence $3\frac{1}{2}$ hours must be within $\frac{1}{2}$ an hour of the time taken in reaching the peak; thus, as they started at 3, they got there within $\frac{1}{2}$ an hour of $\frac{1}{2}$ past 6.⁴⁸

Twenty-seven answers have come in. Of these, 9 are right, 16 partially right, and ²⁴⁹ wrong. The 16 give the *distance* correctly, but they have failed to grasp the fact that the top of the hill might have been reached at *any* moment between 6 o’clock and 7.

The two wrong answers are from GERTY VERNON and A NIHILIST. The former makes the distance “23 miles,” while her revolutionary companion puts it at “27.” GERTY VERNON says “they had to go 4 miles along the plain, and got to the foot of the hill at 4 o’clock.” They *might* have done so, I grant; but you have no ground for saying they *did* so. “It was $7\frac{1}{2}$ miles to the top of the hill, and they reached that at $\frac{1}{4}$ before 7 o’clock.” Here you go wrong in your arithmetic, and I must, however reluctantly, bid you farewell. $7\frac{1}{2}$ miles, at 3 miles an hour, would *not* require $2\frac{3}{4}$ hours. A NIHILIST says “Let x denote the whole number of miles; y the number of hours to hill-top; $\therefore 3y =$ number of miles to hill-top, and $x - 3y =$ number of miles on the other side.” You bewilder me. The other side of *what*? “Of the hill,” you say. But then, how did they get home again? However, to accommodate your views we will build a new hostelry at the foot of the hill on the opposite side, and also assume (what I grant you is *possible*, though it is not *necessarily* true) that there was no level road at all. Even then you go wrong.

⁴⁷In the *Monthly Packet* followed by “Lewis Carroll. Answers will be received up to the end of November.”

⁴⁸Solution missing in the *Monthly Packet*

⁴⁹3

You say

$$\begin{aligned} & \text{“}y = 6 - \frac{x-3y}{6}, \dots\dots\dots\text{(i);} \\ & \frac{x}{4\frac{1}{2}} = 6 \dots\dots\dots\text{(ii).”} \end{aligned}$$

I grant you (i), but I deny (ii): it rests on the assumption that to go *part* of the time at 3 miles an hour, and the rest at 6 miles an hour, comes to the same result as going the *whole* time at $4\frac{1}{2}$ miles an hour. But this would only be true if the “*part*” were an exact *half*, i. e., if they went up hill for 3 hours, and down hill for the other 3: which they certainly did *not* do.

The sixteen, who are partially right, are AGNES BAILEY, F. K., FIFEE, G. E. B., H. P., KIT, M. E. T., MYSIE, A MOTHER’S SON, NAIRAM, A REDRUTHIAN, A SOCIALIST, SPEAR MAIDEN, T. B. C, VIS INERTIÆ, and YAK. Of these, F. K., FIFEE, T. B. C, and VIS INERTIÆ do not attempt the second part at all. F. K. and H. P. give no working. The _rest ⁵⁰ make particular assumptions, such as that there was no level road—that there were 6 miles of level road—and so on, all leading to *particular* times being fixed for reaching the hill-top. The most curious assumption is that of AGNES BAILEY, who says “Let x = number of hours occupied in ascent; then $\frac{x}{2}$ = hours occupied in descent; and $\frac{4x}{3}$ = hours occupied on the level.” I suppose you were thinking of the relative *rates*, up hill and on the level; which we might express by saying that, if they went x miles up hill in a certain time, they would go $\frac{4x}{3}$ miles on the level *in the same time*. You have, in fact, assumed that they took *the same time* on the level that they took in ascending the hill. FIFEE assumes that, when the aged knight said they had gone “four miles in the hour” on the level, he meant that four miles was the *distance* gone, not merely the rate. This would have been—if FIFEE will excuse the slang expression—a “sell,” ill-suited to the dignity of the hero.

And now “descend, ye classic Nine!” who have solved the whole problem, and let me sing your praises. Your names are BLITHE, E. W., L. B., A MARLBOROUGH BOY, O. V. L., PUTNEY WALKER, ROSE, SEA BREEZE, SIMPLE SUSAN, and MONEY SPINNER. (These last two I count as one, as they send a joint answer.) ROSE and SIMPLE SUSAN and Co. do not actually state that the hill-top was reached some time between 6 and 7, but, as they have clearly grasped the fact that a mile, ascended and descended, took the same time as two level miles, I mark them as “right.” A MARLBOROUGH BOY and PUTNEY WALKER deserve honourable mention for their algebraical solutions being the only two who have perceived that the question leads to *an indeterminate equation*. E. W. brings a charge of untruthfulness against the aged knight—a serious charge, for he was the very pink of chivalry! She says “According to the data given, the time at the summit affords no clue to the total distance. It does not enable us to state precisely to an inch how much level and how much hill there was on the road.” “Fair damsel,” the aged knight replies, “—if, as I surmise, thy initials denote Early Womanhood—bethink thee that the word ‘enable’ is thine, not mine. I did but ask the time of reaching the hill-top as my *condition* for further parley. If *now* thou wilt not grant that I am a truth-loving man, then will I affirm that those same initials denote Envenomed Wickedness!”

{ SIMPLE SUSAN.
{ MONEY-SPINNER.

BLITHE has made so ingenious an addition to the problem, and SIMPLE SUSAN and Co. have solved it in such tuneful verse, that I record both their answers in full⁵². I have altered a word or two in BLITHE'S—which I trust she will excuse; it did not seem quite clear as it stood.

“Yet stay,” said the youth, as a gleam of inspiration lighted up the relaxing muscles of his quiescent features. “Stay. Methinks it matters little *when* we reached that summit, the crown of our toil. For in the space of time wherein we clambered up one mile and bounded down the same on our return, we could have trudged the *twain* on the level. We have plodded, then, four-and-twenty miles in these six mortal hours; for never a moment did we stop for catching of fleeting breath or for gazing on the scene around!”

“Very good,” said the old man. “Twelve miles out and twelve miles in. And we reached the top some time between six and seven of the clock. Now mark me! For every five minutes that had fled since six of the clock when we stood on yonder peak, so many miles had we toiled upwards on the dreary mountainside!”

The youth moaned and rushed into the hostel.

BLITHE.

The elder and the younger knight,
They sallied forth at three;
How far they went on level ground
It matters not to me;
What time they reached the foot of hill,
When they began to mount,
Are problems which I hold to be
Of very small account.

The moment that each waved his hat
Upon the topmost peak—
To trivial query such as this
No answer will I seek.

⁵¹In the *Monthly Packet* this list appears with the answers to Knot IV (which is Knot III there)

⁵²trust the Editor will find space for both their answers

Yet can I tell the distance well
 They must have travelled o'er:
 On hill and plain, 'twixt three and nine,
 The miles were twenty-four.
 Four miles an hour their steady pace
 Along the level track,
 Three when they climbed—but six when they
 Came swiftly striding back
 Adown the hill; and little skill
 It needs, methinks, to show,
 Up hill and down together told,
 Four miles an hour they go.
 For whether long or short the time
 Upon the hill they spent,
 Two thirds were passed in going up,
 One third in the descent.
 Two thirds at three, one third at six,
 If rightly reckoned o'er,
 Will make one whole at four—the tale
 Is tangled now no more.

Answers to Knot II

Source: The Monthly Packet, June 1881 (as “Answers to Knot V”, with minor differences as noted); A Tangled Tale

§ 1. The Dinner Party *Problem.*—“The Governor of Kgovjni wants to give a very small dinner party, and invites his father’s brother-in-law, his brother’s father-in-law, his father-in-law’s brother, and his brother-in-law’s father. Find the number of guests.”

Answer.—“One.”

In this genealogy, males are denoted by capitals, and females by small letters. The Governor is E and his guest is C.

⁵³Followed by “The Muffin Man and L. G. also answered.” in the *Monthly Packet*

Ten answers have been received. Of these, one is wrong, GALANTHUS NIVALIS MAJOR, who insists on inviting *two* guests, one being the Governor's *wife's brother's father*. If she had taken his *sister's husband's father* instead, she would have found it possible to reduce the guests to *one*.

Of the nine who send right answers, SEA-BREEZE is the very faintest breath that ever bore the name! She simply states that the Governor's uncle might fulfill all the conditions "by intermarriages"! "Wind of the western sea," you have had a very narrow escape! Be thankful to appear in the Class-list at all! BOG-OAK and BRADSHAW OF THE FUTURE use genealogies which require 16 people instead of 14, by inviting the Governor's *father's sister's husband* instead of his *father's wife's brother*. I cannot think this so good a solution as one that requires only 14. CAIUS and VALENTINE deserve special mention as the only two who have supplied genealogies.

§ 2. The Lodgings *Problem.*—"A Square has 20 doors on each side, which contains 21 equal parts. They are numbered all round, beginning at one corner. From which of the four, Nos. 9, 25, 52, 73, is the sum of the distances, to the other three, least?"

Answer.—"From No. 9."

Let A be No. 9, B No. 25, C No. 52, and D No. 73.

$$\text{Then } AB = \sqrt{(12^2 + 5^2)} = \sqrt{169} = 13;$$

$$AC = 21;$$

$$AD = \sqrt{(9^2 + 8^2)} = \sqrt{145} = 12+$$

(N.B. *i. e.* "between 12 and 13.")

$$BC = \sqrt{(16^2 + 12^2)} = \sqrt{400} = 20;$$

$$BD = \sqrt{(3^2 + 21^2)} = \sqrt{450} = 21+;$$

$$CD = \sqrt{(9^2 + 13^2)} = \sqrt{250} = 15+;$$

Hence sum of distances from A is between 46 and 47; from B, between 54 and 55; from C, between 56 and 57; from D, between 48 and 51. (Why not "between 48 and 49"? Make this out for yourselves.) Hence the sum is least for A.

Twenty-five solutions have been received. Of these, 15 must be marked "0," 5 are partly right, and 5 right. Of the 15, I may dismiss ALPHABETICAL PHANTOM, BOG-OAK, DINAH MITE, FIFEE, GALANTHUS NIVALIS MAJOR (I fear the cold spring has blighted our SNOWDROP), GUY, H.M.S. PINAFORE, JANET, and VALENTINE with the simple remark that they insist on the unfortunate lodgers *keeping to the pavement*. (I used the words "crossed to Number Seventy-three" for the special purpose of showing that *short cuts* were possible.) SEA-BREEZE does the same, and adds that "the result would be the same" even if they crossed the Square, but gives no proof of this. M. M. draws a diagram, and says that No. 9 is the house, "as the diagram shows." I cannot see *how* it does so. OLD CAT assumes that the house *must* be No. 9 or No. 73. She does not explain how she estimates the distances. BEE'S Arithmetic is faulty: she makes $\sqrt{169} + \sqrt{442} + \sqrt{130} = 741$. (I suppose you mean $\sqrt{741}$, which would be a little nearer the truth. But roots cannot be added in this manner. Do you think $\sqrt{9} + \sqrt{16}$ is 25, or even $\sqrt{25}$?) But AYR'S state is more perilous still: she draws illogical conclusions with a frightful calmness. After pointing out (rightly) that AC is less than BD she says, "therefore the nearest house to the other three must be A or C." And again, after pointing out (rightly) that B and D are both within the half-square containing A, she says "therefore" $AB + AD$ must be less than $BC + CD$. (There is no logical force in either "therefore." For the first, try Nos. 1, 21, 60, 70: this will make your premiss true, and your conclusion false. Similarly, for the second, try Nos. 1, 30, 51, 71.)

Of the five partly-right solutions, RAGS AND TATTERS and MAD HATTER (who send one answer between them) make No. 25 6 units from the corner instead of 5. CHEAM, E. R. D. L., and MEGGY POTTS leave openings at the corners of the Square, which are not in the *data*: moreover CHEAM gives values for the distances without any hint that they are only *approximations*. CROPHI AND MOPHI make the bold and unfounded assumption that there were really 21 houses on each side, instead of 20 as stated by Balbus. "We may assume," they add, "that the doors of Nos. 21, 42, 63, 84, are invisible from the centre of the Square"! What is there, I wonder, that CROPHI AND MOPHI would *not* assume?

Of the five who are wholly right, I think BRADSHAW OF THE FUTURE, CAIUS, CLIFTON C., and MARTREB deserve special praise for their full *analytical* solutions. MATTHEW MATTICKS picks out No. 9, and proves it to be the right house in two ways, very neatly and ingeniously, but *why* he picks it out does not appear. It is an excellent *synthetical* proof, but lacks the analysis which the other four supply.

⌊A remonstrance has reached me from SCRUTATOR on the subject of KNOT I., which he declares was “no problem at all.” “Two questions,” he says, “are put. To solve one there is no data: the other answers itself.” As to the first point, SCRUTATOR is mistaken; there *are* (not “is”) data sufficient to answer the question. As to the other, it is interesting to know that the question “answers itself,” and I am sure it does the question great credit: still I fear I cannot enter it on the list of winners, as this competition is only open to human beings.⁷⁵⁵

Answers to Knot III

Source: The Monthly Packet, September 1880 (as “Answers to ‘Romantic Problems. Knot II’”, with minor differences as noted); A Tangled Tale

Problem.—(1) “Two travellers, starting at the same time, went opposite ways round a circular railway. Trains start each way every 15 minutes, the easterly ones going round in 3 hours, the westerly in 2. How many trains did each meet on the way, not counting trains met at the terminus itself?” (2) “They went round, as before, each traveller counting as ‘one’ the train containing the other traveller. How many did each meet?”

Answers.—(1) 19. (2) The easterly traveller met 12; the other 8.

The trains one way took 180 minutes, the other way 120. Let us take the L. C. M., 360, and divide the railway into 360 units. Then one set of trains went at the rate of 2 units a minute and at intervals of 30 units; the other at the rate of 3 units a minute and at intervals of 45 units. An easterly train starting

⁵⁴In the *Monthly Packet*, this is followed by the signature “Lewis Carroll”, the remark which here comes after the answers to Knot VI., and some remarks on Lanrick (→ 10.14, p. 1592).

⁵⁵In the *Monthly Packet*, this comes after the answers to Knot III (which is Knot II there), and is followed by the signature “Lewis Carroll.”

has 45 units between it and the first train it will meet: it does 2-5ths of this while the other does 3-5ths, and thus meets it at the end of 18 units, and so all the way round. A westerly train starting has 30 units between it and the first train it will meet: it does 3-5ths of this while the other does 2-5ths, and thus meets it at the end of 18 units, and so all the way round. Hence if the railway be divided, by 19 posts, into 20 parts, each containing 18 units, trains meet at every post, and, in (1), each traveller passes 19 posts in going round, and so meets 19 trains. But, in (2), the easterly traveller only begins to count after traversing 2-5ths of the journey, *i. e.*, on reaching the 8th post, and so counts 12 posts: similarly the other counts 8. They meet at the end of 2-5ths of 3 hours, or 3-5ths of 2 hours, *i. e.*, 72 minutes.

Forty-five answers have been received. Of these $\lrcorner 12$ ⁵⁶ are beyond the reach of discussion, as they give no working. I can but enumerate their names. ARDMORE, E. A., F. A. D., L. D., MATTHEW MATTICKS, M. E. T., POO-POO, and THE RED QUEEN are all wrong. \lrcorner BETA⁵⁷ and ROWENA have got (1) right and (2) wrong. CHEEKY BOB and NAIRAM give the right answers, but it may perhaps make the one less cheeky, and induce the other to take a less inverted view of things, to be informed that, if this had been a competition for a prize, they would have got no marks. [N.B.—I have not ventured to put E. A.'s name in full, as she only gave it provisionally, in case her answer should prove right.]

Of the 33 answers for which the working is given, 10 are wrong; 11 half-wrong and half-right; 3 right, except that they cherish the delusion that it was *Clara* who travelled in the easterly train—a point which the data do not enable us to settle; and 9 wholly right.

The 10 wrong answers are from BO-PEEP, FINANCIER, I. W. T., KATE B., M. A. H., Q. Y. Z., SEA-GULL, THISTLEDOWN, TOM-QUAD, and an unsigned one. BO-PEEP rightly says that the easterly traveller met all trains which started during the 3 hours of her trip, as well as all which started during the previous 2 hours, *i. e.*, all which started at the commencements of 20 periods of 15 minutes each; and she is right in striking out the one she met at the moment of starting; but wrong in striking out the *last* train, for she did not meet this at the terminus, but 15 minutes before she got there. She makes the same mistake in (2). FINANCIER thinks that any train, met for the second time, is not to be counted. I. W. T. finds, by a process which is not stated, that the travellers met at the end of 71 minutes and $26\frac{1}{2}$ seconds. KATE B. thinks the trains which are met on starting and on arriving are *never* to be counted, even when met \lrcorner elsewhere.⁵⁸ Q. Y. Z. tries a rather complex algebraical solution, and succeeds in finding the time of meeting correctly: all else is wrong. SEA-GULL seems to think that, in (1), the easterly train *stood still* for 3 hours; and says that, in (2), the travellers met at the end of 71 minutes 40 seconds. THISTLEDOWN nobly confesses to having tried no calculation, but merely having drawn a picture of the railway and counted the trains; in (1), she counts wrong; in (2) she makes

⁵⁶13

⁵⁷AYR, BETA

⁵⁸Followed by "M. A. H. gets the right answer for (1), by making two mistakes which cancel each other: so of course I mark her 'wrong.' She rightly takes, as BO-PEEP does, 20 periods of 15 minutes each; but omits (what she should have counted) the train which starts at the commencement of the *first* period; and she afterwards counts (what she should have omitted) the train which starts as the traveller starts. And in (2) she makes the travellers count 'one' *after* they met, not *when* they met." in the *Monthly Packet*

them meet in 75 minutes. TOM-QUAD omits (1): in (2) he makes Clara count the train she met on her arrival. The unsigned one is also unintelligible; it states that the travellers go “1-24th more than the total distance to be traversed”! The “Clara” theory, already referred to, is adopted by 5 of these, viz., BO-PEEP, FINANCIER, KATE B., TOM-QUAD, and the nameless writer.

The 11 half-right answers are from BOG-OAK, BRIDGET, CASTOR, \perp CHESHIRE CAT,⁷⁵⁹ G. E. B., GUY, MARY, \perp M. A. H.,⁷⁶⁰ OLD MAID, R. W., and VENDREDI. All \perp these⁷⁶¹ adopt the “Clara” theory. CASTOR omits (1). VENDREDI gets (1) right, but in (2) makes the same mistake as BO-PEEP. I notice in your solution a marvellous proportion-sum:—“300 miles: 2 hours :: one mile: 24 seconds.” May I venture to advise your acquiring, as soon as possible, an utter disbelief in the possibility of a ratio existing between *miles* and *hours*? Do not be disheartened by your two friends’ sarcastic remarks on your “roundabout ways.” Their short method, of adding 12 and 8, has the slight disadvantage of bringing the answer wrong: even a “roundabout” method is better than *that!* \perp M. A. H., in (2), makes the travellers count “one” *after* they met, not *when* they met.⁷⁶² CHESHIRE CAT and OLD MAID get “20” as answer for (1), by forgetting to strike out the train met on arrival. The others all get “18” in various ways. BOG-OAK, GUY, and R. W. divide the trains which the westerly traveller has to meet into 2 sets, viz., those already on the line, which they (rightly) make “11,” and those which started during her 2 hours’ journey (exclusive of train met on arrival), which they (wrongly) make “7”; and they make a similar mistake with the easterly train. BRIDGET (rightly) says that the westerly traveller met a train every 6 minutes for 2 hours, but (wrongly) makes the number “20”; it should be “21.” G. E. B. adopts BO-PEEP’s method, but (wrongly) strikes out (for the easterly traveller) the train which started at the *commencement* of the previous 2 hours. MARY thinks a train, met on arrival, must not be counted, even when met on a *previous* occasion.

The 3, who are wholly right but for the unfortunate “Clara” theory, are F. LEE, G. S. C., and X. A. B.

And now “descend, ye \perp classic Ten!”⁷⁶³ who have solved the whole problem. Your names are AIX-LES-BAINS, ALGERNON BRAY (thanks for a friendly remark, which comes with a heart-warmth that not even the Atlantic could chill), ARVON, BRADSHAW OF THE FUTURE, \perp FIFEE,⁷⁶⁴ H. L. R., J. L. O., OMEGA, S. S. G., and WAITING FOR THE TRAIN. Several of these have put Clara, provisionally, into the easterly train: but they seem to have understood that the data do not decide that point.

Answers to Knot IV

Source: The Monthly Packet, December 1880 (as “Answers to Knot III”, with minor differences as noted); A Tangled Tale

*Problem.*⁶⁶—“There are 5 sacks, of which Nos. 1, 2, weigh 12 lbs.; Nos. 2, 3, $13\frac{1}{2}$ lbs.; Nos. 3, 4, $11\frac{1}{2}$ lbs.; Nos. 4, 5, 8 lbs.; Nos. 1, 3, 5, 16 lbs. Required the weight of each sack.”

Answer.—“ $5\frac{1}{2}$, $6\frac{1}{2}$, 7, $4\frac{1}{2}$, $3\frac{1}{2}$.”

The sum of all the weighings, 61 lbs., includes sack No. 3 *thrice* and each other *twice*. Deducting twice the sum of the 1st and 4th weighings, we get 21 lbs. for *thrice* No. 3, *i. e.*, 7 lbs. for No. 3. Hence, the 2nd and 3rd weighings give $6\frac{1}{2}$ lbs., $4\frac{1}{2}$ lbs. for Nos. 2, 4; and hence again, the 1st and 4th weighings give $5\frac{1}{2}$ lbs., $3\frac{1}{2}$ lbs., for Nos. 1, 5.

Ninety-seven answers have been received. Of these, 15 are beyond the reach of discussion, as they give no working. I can but enumerate their names, and I take this opportunity of saying that this is the last time I shall put on record the names of competitors who give no sort of clue to the process by which their answers were obtained. In guessing a conundrum, or in catching a flea, we do not expect the breathless victor to give us afterwards, in cold blood, a history of the mental or muscular efforts by which he achieved success; but a mathematical calculation is another thing. The names of this “mute inglorious”

⁶⁶In the *Monthly Packet* preceded by:

In the House of Commons a *personal explanation* always takes precedence of all other matters of debate. Following that lofty precedent, I beg to express to FIFEE and to M. A. H. my sincere regret that I misunderstood their replies to Knot II, and so marked them wrongly. They enumerated the 19 starting-times of the trains met by the fast train (supposed to start at 4), and as they included in the list, 4.0, I supposed they were counting a meeting *at the terminus*. I see now that they were counting its *second* meeting with the fast train, which I was putting to the credit of the train starting at 1.0. Their method is quite right, and better than mine. M. A. H. ought to have been included among the ‘half-right’ answers, while FIFEE’S proper place was along with the ‘classic Nine,’ thus making them the *unclassical* (but, let us hope, the all-the-more mathematical) Ten. Let us now turn to Knot III.

Quoted from *Elegy
written in a Country
Churchyard* by
Thomas Gray

band are COMMON SENSE, D. E. R., DOUGLAS, E. L., ELLEN, I. M. T., J. M. C., JOSEPH, KNOT I, LUCY, MEEK, M. F. C., PYRAMUS, SHAH, VERITAS.

Of the eighty-two answers with which the working, or some approach to it, is supplied, one is wrong: seventeen have given solutions which are (from one cause or another) practically valueless: the remaining sixty-four I shall try to arrange in a Class-list, according to the varying degrees of shortness and neatness to which they seem to have attained.

The solitary wrong answer is from NELL. To be thus “alone in the crowd” is a distinction—a painful one, no doubt, but still a distinction. I am sorry for you, my dear young lady, and I seem to hear your tearful exclamation, when you read these lines, “Ah! This is the knell of all my hopes!” Why, oh why, did you assume that the 4th and 5th bags weighed 4 lbs. each? And why did you not test your answers? However, please try again: and please don’t change your *nom-de-plume*: let us have NELL in the First Class next time!

The seventeen whose solutions are practically valueless are ARDMORE, A READY RECKONER, ARTHUR, BOG-LARK, BOG-OAK, BRIDGET, FIRST ATTEMPT, J. L. C., M. E. T., ROSE, ROWENA, SEA-BREEZE, SYLVIA, THISTLE-DOWN, THREE-FIFTHS ASLEEP, VENDREDI, and WINIFRED. BOG-LARK tries it by a sort of “rule of false,” assuming experimentally that Nos. 1, 2, weigh 6 lbs. each, and having thus produced $17\frac{1}{2}$, instead of 16, as the weight of 1, 3, and 5, she removes “the superfluous pound and a half,” but does not explain how she knows from which to take it. THREE-FIFTHS ASLEEP says that (when in that peculiar state) “it seemed perfectly clear” to her that, “3 out of the 5 sacks being weighed twice over, $\frac{3}{5}$ of $45 = 27$, must be the total weight of the 5 sacks.” As to which I can only say, with the Captain, “it beats me entirely!” WINIFRED, on the plea that “one must have a starting-point,” assumes (what I fear is a mere guess) that No. 1 weighed $5\frac{1}{2}$ lbs. The rest all do it, wholly or partly, by guess-work.⁷⁶⁷

The problem⁷⁶⁸ is of course (as any Algebraist sees at once) a case of “simultaneous simple equations.” It is, however, easily soluble by Arithmetic only; and, when this is the case, I hold that it is bad workmanship to use the more complex method. I have not, this time, given more credit to arithmetical solutions; but in future problems I shall (other things being equal) give the highest marks to those who use the simplest machinery. I have put into Class I. those whose answers seemed specially short and neat, and into Class III. those that seemed specially long or clumsy. Of this last set, A. C. M., FURZE-BUSH, JAMES, PARTRIDGE, R. W., and WAITING FOR THE TRAIN, have sent long wandering solutions, the substitutions having no definite method, but seeming to have been made to see what would come of it. CHILPOME and DUBLIN BOY omit some of the working. ARVON MARLBOROUGH BOY only finds the weight of *one sack*.⁷⁶⁹

⁷⁶⁷In the *Monthly Packet* followed by:

We now come to the sixty-four who deserve (more or less) ‘honourable mention,’ and, as Class-lists are now the order of the day, we may as well go back to Knots I. and II., and make the thing complete. In assigning classes for Knot III., I can only *hope* that I have done justice all round; but the enormous number of solutions sent in has been such as to exhaust all possible methods of solving the question and the brains of the unfortunate reviewer.

Answers to Knot V

Source: The Monthly Packet, March 1881 (as “Answers to Knot IV”, with different punctuation); A Tangled Tale

Problem.—To mark pictures, giving 3 x’s to 2 or 3, 2 to 4 or 5, and 1 to 9 or 10; also giving 3 o’s to 1 or 2, 2 to 3 or 4 and 1 to 8 or 9; so as to mark the smallest possible number of pictures, and to give them the largest possible number of marks.

Answer.—10 pictures; 29 marks; arranged thus:—

x	x	x	x	x	x	x	x	x	x	o
x	x	x	x	x			o	o	o	o
x	x	o	o	o	o	o	o	o	o	o

Solution.—By giving all the x’s possible, putting into brackets the optional ones, we get 10 pictures marked thus:—

⁷¹In the *Monthly Packet* followed by the following paragraph and an entry about *Lanrick* (→ 10.14, p. 1590):

A remonstrance has reached me from ALGERNON BRAY on the subject of Knot III., which he complains of as too easy and commonplace, and he kindly offers me a problem on numbers, where the difficulty consists in finding the digits. As to the first point, the great increase in the number and variety of solutions shows, I think, that Knot III. is better adapted than either of its predecessors to the class of readers for whom ‘A Tangled Tale’ is intended. As to the problem suggested, the writer is no doubt aware that in *Algebra* such a question is very common and easy; without *Algebra* I doubt if it could be done at all. But what I am seeking to supply for the fair readers of the *Monthly Packet* is practice in *hard Arithmetic* rather than in *easy Algebra*.

x x x x x x x x x (x)
x x x x (x)
x x (x)

By then assigning o's in the same way, beginning at the other end, we get 9 pictures marked thus:—

(o) o
(o) o o o
(o) o o o o o o o o

All we have now to do is to run these two wedges as close together as they will go, so as to get the minimum number of pictures—erasing optional marks where by so doing we can run them closer, but otherwise letting them stand. There are 10 necessary marks in the 1st row, and in the 3rd; but only 7 in the 2nd. Hence we erase all optional marks in the 1st and 3rd rows, but let them stand in the 2nd.

Twenty-two answers have been received. Of these 11 give no working; so, in accordance with what I announced in my last review of answers, I leave them unnamed, merely mentioning that 5 are right and 6 wrong.

Of the eleven answers with which some working is supplied, 3 are wrong. C. H. begins with the rash assertion that under the given conditions “the sum is impossible. For,” he or she adds (these initialed correspondents are dismally vague beings to deal with: perhaps “it” would be a better pronoun), “10 is the least possible number of pictures” (granted): “therefore we must either give 2 x’s to 6, or 2 o’s to 5.” Why “must,” oh alphabetical phantom? It is nowhere ordained that every picture “must” have 3 marks! FIFEE sends a folio page of solution, which deserved a better fate: she offers 3 answers, in each of which 10 pictures are marked, with 30 marks; in one she gives 2 x’s to 6 pictures; in another to 7; in the 3rd she gives 2 o’s to 5; thus in every case ignoring the conditions. (I pause to remark that the condition “2 x’s to 4 or 5 pictures” can only mean “*either* to 4 *or else* to 5”: if, as one competitor holds, it might mean *any* number not less than 4, the words “*or* 5” would be superfluous.) I. E. A. (I am happy to say that none of these bloodless phantoms appear this time in the class-list. Is it IDEA with the “D” left out?) gives 2 x’s to 6 pictures. She then takes me to task for using the word “ought” instead of “nought.” No doubt, to one who thus rebels against the rules laid down for her guidance, the word must be distasteful. But does not I. E. A. remember the parallel case of “adder”? That creature was originally “a nadder”: then the two words took to bandying the poor “n” backwards and forwards like a shuttlecock, the final state of the game being “an adder.” May not “a nought” have similarly become “an ought”? Anyhow, “oughts and crosses” is a very old game. I don’t think I ever heard it called “noughts and crosses.”

In the following Class-list, I hope the solitary occupant of III. will sheathe her claws when she hears how narrow an escape she has had of not being named at all. Her account of the process by which she got the answer is so meagre that, like the nursery tale of “Jack-a-Minory” (I trust I. E. A. will be merciful to the spelling), it is scarcely to be distinguished from “zero.”

Answers to Knot VI

Source: The Monthly Packet, September 1881 (with minor differences as noted); A Tangled Tale

Problem 1.—*A* and *B* began the year with only 1,000*l.* a-piece. They borrowed nought; they stole nought. On the next New-Year's Day they had 60,000*l.* between them. How did they do it?

Solution.—They went that day to the Bank of England. *A* stood in front of it, while *B* went round and stood behind it.

Two answers have been received, both worthy of much honour. ADDLEPATE makes them borrow “0” and steal “0,” and uses both cyphers by putting them at the right-hand end of the 1,000*l.*, thus producing 100,000*l.*, which is well over the mark. But (or to express it in Latin) AT SPES INFRACTA has solved it even more ingeniously: with the first cypher she turns the “1” of the 1,000*l.* into a “9,” and adds the result to the original sum, thus getting 10,000*l.*: and in this, by means of the other “0,” she turns the “1” into a “6,” thus hitting the exact 60,000*l.*

Class List I

AT SPES INFRACTA.

II

ADDLEPATE.

Problem 2.—*L* makes 5 scarves, while *M* makes 2: *Z* makes 4 while *L* makes 3. Five scarves of *Z*'s weigh one of *L*'s; 5 of *M*'s weigh 3 of *Z*'s. One of *M*'s is as warm as 4 of *Z*'s: and one of *L*'s as warm as 3 of *M*'s. Which is best, giving equal weight in the result to rapidity of work, lightness, and warmth?

⁷²Followed by the signature “Lewis Carroll” and some remarks about Lanrick in the *Monthly Packet* (→ 10.14, p. 1591)

Answer.—The order is M, L, Z .⁷³

Solution.—As to rapidity (other things being constant) L 's merit is to M 's in the ratio of 5 to 2: Z 's to L 's in the ratio of 4 to 3. In order to get one set of 3 numbers fulfilling these conditions, it is perhaps simplest to take the one that occurs twice as unity, and reduce the others to fractions: this gives, for L, M , and Z ,⁷⁴ the marks $1, \frac{2}{5}, \frac{4}{3}$. In estimating for *lightness*, we observe that the greater the weight, the less the merit, so that Z 's merit is to L 's as 5 to 1. Thus the marks for *lightness* are $\frac{1}{5}, \frac{5}{3}, 1$. And similarly, the marks for warmth are $3, 1, \frac{1}{4}$. To get the total result, we must multiply L 's 3 marks together, and do the same for M and for Z . The final numbers are $1 \times \frac{1}{5} \times 3, \frac{2}{5} \times \frac{5}{3} \times 1, \frac{4}{3} \times 1 \times \frac{1}{4}$; *i. e.* $\frac{3}{5}, \frac{2}{3}, \frac{1}{3}$; *i. e.* multiplying throughout by 15 (which will not alter the proportion), 9, 10, 5; showing the order of merit to be M, L, Z .

Twenty-nine answers have been received, of which five are right, and twenty-four wrong. These hapless ones have all (with three exceptions) fallen into the error of *adding* the proportional numbers together, for each candidate, instead of *multiplying*. Why the latter is right, rather than the former, is fully proved in text-books, so I will not occupy space by stating it here: but it can be *illustrated* very easily by the case of length, breadth, and depth. Suppose A and B are rival diggers of rectangular tanks: the amount of work done is evidently measured by the number of *cubical feet* dug out. Let A dig a tank 10 feet long, 10 wide, 2 deep: let B dig one 6 feet long, 5 wide, 10 deep. The cubical contents are 200, 300; *i. e.* B is best digger in the ratio of 3 to 2. Now try marking for length, width, and depth, separately; giving a maximum mark of 10 to the best in each contest, and then *adding* the results!

Of the twenty-four malefactors, one gives no working, and so has no real claim to be named; but I break the rule for once, in deference to its success in Problem 1: he, she, or it, is ADDLEPATE. The other twenty-three may be divided into five groups.

First and worst are, I take it, those who put the rightful winner *last*; arranging them as "Lolo, Zuzu, Mimi." The names of these desperate wrong-doers are AYR, BRADSHAW OF THE FUTURE, FURZE-BUSH and POLLUX (who send a joint answer), GREYSTEAD, GUY, OLD HEN, and SIMPLE SUSAN. The latter was *once* best of all; the Old Hen has taken advantage of her simplicity, and beguiled her with the chaff which was the bane of her own chickenhood.

Secondly, I point the finger of scorn at those who have put the worst candidate at the top; arranging them as "Zuzu, Mimi, Lolo." They are GRAECIA, M. M., OLD CAT, and R. E. X. "Tis Greece, but——"

The third set have avoided both these enormities, and have even succeeded in putting the worst last, their answer being "Lolo, Mimi, Zuzu." Their names are AYR (who also appears among the "quite too too"), CLIFTON C., F. B., FIFEE, GRIG, JANET, and MRS. SAIREY GAMP. F. B. has not fallen into the common error; she *multiplies* together the proportionate numbers she gets, but in getting them she goes wrong, by reckoning warmth as a *de*-merit. Possibly she is "Freshly Burnt," or comes "From Bombay." JANET and MRS. SAIREY GAMP have also avoided this error: the method they have adopted is shrouded in mystery—I scarcely feel competent to criticize it. MRS. GAMP says "if Zuzu

Quoted from *The Giaour* by George Gordon Byron

⁷³missing in the *Monthly Packet*

⁷⁴mistakenly "N" in the *Monthly Packet*

makes 4 while Lolo makes 3, Zuzu makes 6 while Lolo makes 5 (bad reasoning), while Mimi makes 2." From this she concludes "therefore Zuzu excels in speed by 1" (*i. e.* when compared with Lolo; but what about Mimi?). She then compares the 3 kinds of excellence, measured on this mystic scale. JANET takes the statement, that "Lolo makes 5 while Mimi makes 2," to prove that "Lolo makes 3 while Mimi makes 1 and Zuzu 4" (worse reasoning than MRS. GAMP'S), and thence concludes that "Zuzu excels in speed by $\frac{1}{8}$!" JANET should have been ADELINE, "mystery of mysteries!"

The fourth set actually put Mimi at the top, arranging them as "Mimi, Zuzu, Lolo." They are MARQUIS AND CO., MARTREB, S. B. B. (first initial scarcely legible: may be meant for "J"), and STANZA.

The fifth set consist of AN ANCIENT FISH and CAMEL. These ill-assorted comrades, by dint of foot and fin, have scrambled into the right answer, but, as their method is wrong, of course it counts for nothing. Also AN ANCIENT FISH has very ancient and fishlike ideas as to *how* numbers represent merit: she says "Lolo gains $2\frac{1}{2}$ on Mimi." Two and a half *what?* Fish, fish, art thou in thy duty?

Of the five winners I put BALBUS and THE ELDER TRAVELLER slightly below the other three—BALBUS for defective reasoning, the other for scanty working. BALBUS gives two reasons for saying that *addition* of marks is *not* the right method, and then adds "it follows that the decision must be made by *multiplying* the marks together." This is hardly more logical than to say "This is not Spring: *therefore* it must be Autumn."

Class List I

DINAH MITE.

II

BALBUS.
THE ELDER TRAVELLER.

⌋With regard to Knot V., I beg to express to VIS INERTIÆ and to any others who, like her, understood the condition to be that *every* marked picture must have *three* marks, my sincere regret that the unfortunate phrase "*fill* the columns with oughts and crosses" should have caused them to waste so much time and trouble. I can only repeat that a *literal* interpretation of "fill" would seem to *me* to require that *every* picture in the gallery should be marked. VIS INERTIÆ would have been in the First Class if she had sent in the solution she now offers.⁷⁵

⁷⁵In the *Monthly Packet*, this comes—starting with "P.S." and "Knot IV." instead of "Knot V."—after the answers to Knot II (which is Knot V there), instead, here follows:

P.S.—I beg to thank BALBUS for his suggestion about 'Mischmasch' (which will be a help for the next edition), and to say, in that a 'false extract' (*i. e.* one for which no word is known) *may* be proposed—and that, if an extract be set a second time, one ought to be allowed to give the old answer.

Lewis Carroll.

Answers to Knot VII

Source: The Monthly Packet, June 1882 (with minor differences as noted); A Tangled Tale

Problem.—Given that one glass of lemonade, 3 sandwiches, and 7 biscuits, cost 1s. 2d.; and that one glass of lemonade, 4 sandwiches, and 10 biscuits, cost 1s. 5d.: find the cost of (1) a glass of lemonade, a sandwich, and a biscuit; and (2) 2 glasses of lemonade, 3 sandwiches, and 5 biscuits.

⌊*Answer.*—(1) 8d.; (2) 1s. 7d.⁷⁶

Solution.—This is best treated algebraically. Let x = the cost (in pence) of a glass of lemonade, y of a sandwich, and z of a biscuit. Then we have $x + 3y + 7z = 14$, and $x + 4y + 10z = 17$. And we require the values of $x + y + z$, and of $2x + 3y + 5z$. Now, from *two* equations only, we cannot find, *separately*, the values of *three* unknowns: certain *combinations* of them may, however, be found. Also we know that we can, by the help of the given equations, eliminate 2 of the 3 unknowns from the quantity whose value is required, which will then contain one only. If, then, the required value is ascertainable at all, it can only be by the 3rd unknown vanishing of itself: otherwise the problem is impossible.

Let us then eliminate lemonade and sandwiches, and reduce everything to biscuits—a state of things even more depressing than “if all the world were apple-
pie”—by subtracting the 1st equation from the 2nd, which eliminates lemonade, and gives $y + 3z = 3$, or $y = 3 - 3z$; and then substituting this value of y in the 1st, which gives $x - 2z = 5$, *i. e.* $x = 5 + 2z$. Now if we substitute these values of x , y , in the quantities whose values are required, the ⌊*first*⁷⁷ becomes $(5 + 2z) + (3 - 3z) + z$, *i. e.* 8: and the ⌊*second*⁷⁸ becomes $2(5 + 2z) + 3(3 - 3z) + 5z$, *i. e.* 19. Hence the answers are (1) 8d., (2) 1s. 7d.

Quoted from nursery rhyme

The above is a *universal* method: that is, it is absolutely certain either to produce the answer, or to prove that no answer is possible. The question may also be solved by combining the quantities whose values are given, so as to form those whose values are required. This is merely a matter of ingenuity and good luck: and as it *may* fail, even when the thing is possible, and is of no use in proving it *impossible*, I cannot rank this method as equal in value with the other. Even when it succeeds, it may prove a very tedious process. Suppose the 26 competitors, who have sent in what I may call *accidental* solutions, had had a question to deal with where every number contained 8 or 10 digits! I suspect it would have been a case of “silvered is the raven hair” (see “Patience”) before any solution would have been hit on by the most ingenious of them.

Quoted from *Patience* by Gilbert and Sullivan

Forty-five answers have come in, of which 44 give, I am happy to say, some sort of *working*, and therefore deserve to be mentioned by name, and to have their virtues, or vices as the case may be, discussed. Thirteen have made assumptions to which they have no right, and so cannot figure in the Class-list, even though, in 10 of the ⌊*13*⁷⁹ cases, the answer is right. Of the remaining 28, no less than 26 have sent in *accidental* solutions, and therefore fall short of the highest honours.

⁷⁶missing in the *Monthly Packet*

⁷⁷1st

⁷⁸2nd

⁷⁹mistakenly “12”

I will now discuss individual cases, taking the worst first, as my custom is.

FROGGY gives no working—at least this is all he gives: after stating the given equations, he says “therefore the difference, 1 sandwich + 3 biscuits, = $3d.$ ”: then follow the amounts of the unknown bills, with no further hint as to how he got them. FROGGY has had a *very* narrow escape of not being named at all!

Of those who are wrong, VIS INERTIÆ has sent in a piece of incorrect working. Peruse the horrid details, and shudder! „She⁷⁸⁰ takes x (call it “ y ”) as the cost of a sandwich, and concludes (rightly enough) that a biscuit will cost $\frac{3-y}{3}$. „She⁷⁸¹ then subtracts the second equation from the first, and deduces $3y + 7 \times \frac{3-y}{3} - 4y + 10 \times \frac{3-y}{3} = 3$. By making two mistakes in this line, „she⁷⁸² brings out $y = \frac{3}{2}$. Try it again, oh VIS INERTIÆ! Away with INERTIÆ: infuse a little more VIS: and you will bring out the correct (though uninteresting) result, $0 = 0$! This will show you that it is hopeless to try to coax any one of these 3 unknowns to reveal „its⁷⁸³ *separate* value. The other competitor, who is wrong throughout, is either J. M. C. or T. M. C.: but, whether he be a Juvenile Mis-Calculator or a True Mathematician Confused, he makes the answers $7d.$ and $1s. 5d.$ He assumes, with Too Much Confidence, that biscuits were $\frac{1}{2}d.$ each, and that Clara paid for 8, though she only ate 7!

We will now consider the 13 whose working is wrong, though the answer is right: and, not to measure their demerits too exactly, I will take them in alphabetical order. ANITA finds (rightly) that “1 sandwich and 3 biscuits cost $3d.$,” and proceeds “therefore 1 sandwich = $1\frac{1}{2}d.$, 3 biscuits = $1\frac{1}{2}d.$, 1 lemonade = $6d.$ ” DINAH MITE begins like ANITA: and thence proves (rightly) that a biscuit costs less than a $1d.$: whence she concludes (wrongly) that it *must* cost $\frac{1}{2}d.$ F. C. W. is so beautifully resigned to the certainty of a verdict of “guilty,” that I have hardly the heart to utter the word, without adding a “recommended to mercy owing to extenuating circumstances.” But really, you know, where *are* the extenuating circumstances? She begins by assuming that lemonade is $4d.$ a glass, and sandwiches $3d.$ each, (making with the 2 given equations, *four* conditions to be fulfilled by *three* miserable unknowns!). And, having (naturally) developed this into a contradiction, she then tries $5d.$ and $2d.$ with a similar result. (N.B. *This* process might have been carried on through the whole of the Tertiary Period, without gratifying one single Megatherium.) She then, by a “happy thought,” tries half-penny biscuits, and so obtains a consistent result. This may be a good solution, viewing the problem as a conundrum: but it is *not* scientific. JANET identifies sandwiches with biscuits! “One sandwich + 3 biscuits” she makes equal to “4.” Four *what?* MAYFAIR makes the astounding assertion that the equation, $s + 3b = 3$, “is evidently only satisfied by $s = \frac{3}{2}$, $b = \frac{1}{2}$!” OLD CAT believes that the assumption that a sandwich costs $1\frac{1}{2}d.$ is “the only way to avoid unmanageable fractions.” But *why* avoid them? Is there not a certain glow of triumph in taming such a fraction? “Ladies and gentlemen, the fraction now before you is one that for years defied all efforts of a refining nature: it was, in a word, hopelessly vulgar. Treating it as a circulating decimal (the treadmill of fractions) only made matters worse. As a last resource, I reduced it to its lowest terms, and extracted its square root!” Joking apart, let me thank

⁸⁰He

⁸¹He

⁸²he

⁸³his

OLD CAT for some very kind words of sympathy, in reference to a correspondent (whose name I am happy to say I have now forgotten) who had found fault with me as a discourteous critic. O. V. L. is beyond my comprehension. He takes the given equations as (1) and (2): thence, by the process [(2) – (1)] deduces (rightly) equation (3) viz. $s + 3b = 3$: and thence again, by the process [$\times 3$] (a hopeless mystery), deduces $3s + 4b = 4$. I have nothing to say about it: I give it up. SEA-BREEZE says “it is immaterial to the answer” (why?) “in what proportion $3d$. is divided between the sandwich and the 3 biscuits”: so she assumes $s = 1\frac{1}{2}d$, $b = \frac{1}{2}d$. STANZA is one of a very irregular metre. At first she (like JANET) identifies sandwiches with biscuits. She then tries two assumptions ($s = 1$, $b = \frac{2}{3}$, and $s = \frac{1}{2}$, $b = \frac{5}{6}$), and (naturally) ends in contradictions. Then she returns to the first assumption, and finds the 3 unknowns separately: *quod est absurdum*. STILETTO identifies sandwiches and biscuits, as “articles.” Is the word ever used by confectioners? I fancied “What is the next article, Ma’am?” was limited to linendrapers. TWO SISTERS first assume that biscuits are 4 a penny, and then that they are 2 a penny, adding that “the answer will of course be the same in both cases.” It is a dreamy remark, making one feel something like Macbeth grasping at the spectral dagger. “Is this a statement that I see before me?” If you were to say “we both walked the same way this morning,” and I were to say “one of you walked the same way, but the other didn’t,” which of the three would be the most hopelessly confused? TURTLE PYATE (what is a Turtle Pyate, please?) and OLD CROW, who send a joint answer, and Y. Y., adopt the same method. Y. Y. gets the equation $s + 3b = 3$: and then says “this sum must be apportioned in one of the three following ways.” It *may* be, I grant you: but Y. Y. do you say “must”? I fear it is *possible* for Y. Y. to be *two* Y’s. The other two conspirators are less positive: they say it “can” be so divided: but they add “either of the three prices being right”! This is bad grammar and bad arithmetic at once, oh mysterious birds!

Quoted from *Macbeth*
by William
Shakespeare
(modified)

Of those who win honours, THE SHETLAND SNARK must have the 3rd class all to himself. He has only answered half the question, viz. the amount of Clara’s luncheon: the two little old ladies he pitilessly leaves in the midst of their “difficulty.” I beg to assure him (with thanks for his friendly remarks) that entrance-fees and subscriptions are things unknown in that most economical of clubs, “The Knot-Untiers.”

The authors of the 26 “accidental” solutions differ only in the number of steps they have taken between the *data* and the answers. In order to do them full justice I have arranged the 2nd class in sections, according to the number of steps. The two Kings are fearfully deliberate! I suppose walking quick, or taking short cuts, is inconsistent with kingly dignity: but really, in reading THESEUS’ solution, one almost fancied he was “marking time,” and making no advance at all! The other King will, I hope, pardon me for having altered “Coal” into “Cole.” King Coilus, or Coil, seems to have reigned soon after Arthur’s time. Henry of Huntingdon identifies him with the King Coël who first built walls round Colchester, which was named after him. In the Chronicle of Robert of Gloucester we read:—

“Aftur Kyng Aruirag, of wam we habbeth y told,
Marius ys sone was kyng, quoynte mon & bold.
And ys sone was aftur hym, Coil was ys name,
Bothe it were quoynte men, & of noble fame.”

Quoted from *Robert of Gloucester’s Chronicle*, edited by Thomas Hearne

BALBUS lays it down as a general principle that “in order to ascertain the cost of any one luncheon, it must come to the same amount upon two different assumptions.” (*Query*. Should not “it” be “we”? Otherwise the *luncheon* is represented as wishing to ascertain its own cost!) He then makes two assumptions—one, that sandwiches cost nothing; the other, that biscuits cost nothing, (either arrangement would lead to the shop being inconveniently crowded!)—and brings out the unknown luncheons as 8*d.* and 19*d.*, on each assumption. He then concludes that this agreement of results “shows that the answers are correct.” Now I propose to disprove his general law by simply giving *one* instance of its failing. One instance is quite enough. In logical language, in order to disprove a “universal affirmative,” it is enough to prove its contradictory, which is a “particular negative.” (I must pause for a digression on Logic, and especially on Ladies’ Logic. The universal affirmative “everybody says he’s a duck” is crushed instantly by proving the particular negative “Peter says he’s a goose,” which is equivalent to “Peter does *not* say he’s a duck.” And the universal negative “nobody calls on her” is well met by the particular affirmative “*I* called yesterday.” In short, either of two contradictories disproves the other: and the moral is that, since a particular proposition is much more easily proved than a universal one, it is the wisest course, in arguing with a Lady, to limit one’s *own* assertions to “particulars,” and leave *her* to prove the “universal” contradictory, if she can. You will thus generally secure a *logical* victory: a *practical* victory is not to be hoped for, since she can always fall back upon the crushing remark “*that* has nothing to do with it!”—a move for which Man has not yet discovered any satisfactory answer.⁸⁴ Now let us return to BALBUS.) Here is my “particular negative,” on which to test his rule. Suppose the two recorded luncheons to have been “2 buns, one queen-cake, 2 sausage-rolls, and a bottle of Zoëdone: total, one-and-ninepence,” and “one bun, 2 queen-cakes, a sausage-roll, and a bottle of Zoëdone: total, one-and-fourpence.” And suppose Clara’s unknown luncheon to have been “3 buns, one queen-cake, one sausage-roll, and 2 bottles of Zoëdone:” while the two little sisters had been indulging in “8 buns, 4 queen-cakes, 2 sausage-rolls, and 6 bottles of Zoëdone.” (Poor souls, how thirsty they must have been!) If BALBUS will kindly try this by his principle of “two assumptions,” first assuming that a bun is 1*d.* and a queen-cake 2*d.*, and then that a bun is 3*d.* and a queen-cake 3*d.*, he will bring out the other two luncheons, on each assumption, as “one-and-nine-pence” and “four-and-ten-pence” respectively, which harmony of results, he will say, “shows that the answers are correct.” And yet, as a matter of fact, the buns were 2*d.* each, the queen-cakes 3*d.*, the sausage-rolls 6*d.*, and the Zoëdone 2*d.* a bottle: so that Clara’s third luncheon had cost one-and-sevenpence, and her thirsty friends had spent four-and-fourpence!

Another remark of BALBUS I will quote and discuss: for I think that it also may yield a moral for some of my readers. He says “it is the same thing in substance whether in solving this problem we use words and call it Arithmetic, or use letters and signs and call it Algebra.” Now this does not appear to me a correct description of the two methods: the Arithmetical method is that of “synthesis” only; it goes from one known fact to another, till it reaches its goal: whereas the Algebraical method is that of “analysis”: it begins with the goal, symbolically represented, and so goes backwards, dragging its veiled victim with

⁸⁴In the *Monthly Packet* followed by: By the way, I think it might be a good thing to try a *logical* knot in the next chapter, instead of an *arithmetical* one. All who would like it, please hold up their hand.

it, till it has reached the full daylight of known facts, in which it can tear off the veil and say "I know you!"

Take an illustration. Your house has been broken into and robbed, and you appeal to the policeman who was on duty that night. "Well, Mum, I did see a chap getting out over your garden-wall: but I was a good bit off, so I didn't chase him, like. I just cut down the short way to the Chequers, and who should I meet but Bill Sykes, coming full split round the corner. So I just ups and says 'My lad, you're wanted.' That's all I says. And he says 'I'll go along quiet, Bobby,' he says, 'without the darbies,' he says." There's your *Arithmetical* policeman. Now try the other method. "I seed somebody a running, but he was well gone or ever I got nigh the place. So I just took a look round in the garden. And I noticed the foot-marks, where the chap had come right across your flower-beds. They was good big foot-marks sure-ly. And I noticed as the left foot went down at the heel, ever so much deeper than the other. And I says to myself 'The chap's been a big hulking chap: and he goes lame on his left foot.' And I rubs my hand on the wall where he got over, and there was soot on it, and no mistake. So I says to myself 'Now where can I light on a big man, in the chimbley-sweep line, what's lame of one foot?' And I flashes up permiscuous: and I says 'It's Bill Sykes!' says I." There is your *Algebraical* policeman—a higher intellectual type, to my thinking, than the other.

LITTLE JACK's solution calls for a word of praise, as he has written out what really is an algebraical proof *in words*, without representing any of his facts as equations. If it is all his own, he will make a good algebraist in the time to come. I beg to thank SIMPLE SUSAN for some kind words of sympathy, to the same effect as those received from OLD CAT.

HECLA and MARTREB are the only two who have used a method *certain* either to produce the answer, or else to prove it impossible: so they must share between them the highest honours.

THE SHETLAND SHARK.⁷⁸⁶

Answers to Correspondents

Source: The Monthly Packet, November 1881 (with minor differences as noted); A Tangled Tale

I have received several letters on the subjects of Knots II.⁷⁸⁷ and VI., which lead me to think some further explanation desirable.

In Knot II.⁷⁸⁸, I had intended the numbering of the houses to begin at one corner of the Square, and this was assumed by most, if not all, of the competitors. TROJANUS however says "assuming, in default of any information, that the street enters the square in the middle of each side, it may be supposed that the numbering begins at a street." But surely the other is the more natural assumption?⁷⁸⁹

⁷⁸⁵missing in the *Monthly Packet*, instead at the end:

P.S.—I am sorry that S. S. G.'s answer was accidentally mislaid, and did not reach me in time to be included with the others. His proper place is in § 3 of the second class. I beg to thank him for an algebraical problem, leading to a quadratic equation, but I fear it is hardly suitable for my purpose, as it does not admit of any choice of method, that I can see.

L. C.

⁷⁸⁶Missing in *A Tangled Tale*; in the *Monthly Packet* followed (still before the above P.S.) by a note about "Shakespeare for Girls", → 16.30, p. 1978

⁷⁸⁷V.

⁷⁸⁸V.

⁷⁸⁹In the *Monthly Packet* followed by: One more word to TROJANUS: the brass door-plate at No. 9 was *not* 'elliptical': it was oblong.

In Knot VI., the first Problem was of course a mere *jeu de mots*, whose presence I thought excusable in a series of Problems whose aim is to entertain rather than to instruct: but it has not escaped the contemptuous criticisms of two of my correspondents, who seem to think that Apollo is in duty bound to keep his bow always on the stretch. Neither of them has guessed it: and this is true human nature. Only the other day—the 31st of September, to be quite exact—I met my old friend Brown, and gave him a riddle I had just heard. With one great effort of his colossal mind, Brown guessed it. “Right!” said I. “Ah,” said he, “it’s very neat—very neat. And it isn’t an answer that would occur to everybody. Very neat indeed.” A few yards further on, I fell in with Smith and to him I propounded the same riddle. He frowned over it for a minute, and then gave it up. Meekly I faltered out the answer. “A poor thing, sir!” Smith growled, as he turned away. “A very poor thing! I wonder you care to repeat such rubbish!” Yet Smith’s mind is, if possible, even more colossal than Brown’s.

The second Problem of Knot VI. is an example in ordinary Double Rule of Three, whose essential feature is that the result depends on the variation of several elements, which are so related to it that, if all but one be constant, it varies as that one: hence, if none be constant, it varies as their product. Thus, for example, the cubical contents of a rectangular tank vary as its length, if breadth and depth be constant, and so on; hence, if none be constant, it varies as the product of the length, breadth, and depth.

When the result is not thus connected with the varying elements, the Problem ceases to be Double Rule of Three and often becomes one of great complexity.

To illustrate this, let us take two candidates for a prize, *A* and *B*, who are to compete in French, German, and Italian:

(*a*) Let it be laid down that the result is to depend on their *relative* knowledge of each subject, so that, whether their marks, for French, be “1, 2” or “100, 200,” the result will be the same: and let it also be laid down that, if they get equal marks on 2 papers, the final marks are to have the same ratio as those of the 3rd paper. This is a case of ordinary Double Rule of Three. We multiply *A*’s 3 marks together, and do the same for *B*. Note that, if *A* gets a single “0,” his final mark is “0,” even if he gets full marks for 2 papers while *B* gets only one mark for each paper. This of course would be very unfair on *A*, though a correct solution under the given conditions.

(*b*) The result is to depend, as before, on *relative* knowledge; but French is to have twice as much weight as German or Italian. This is an unusual form of question. I should be inclined to say “the resulting ratio is to be nearer to the French ratio than if we multiplied as in (*a*), and so much nearer that it would be necessary to use the other multipliers *twice* to produce the same result as in (*a*):” *e. g.* if the French Ratio were $\frac{9}{10}$, and the others $\frac{4}{9}, \frac{1}{9}$ so that the ultimate ratio, by method (*a*), would be $\frac{2}{45}$, I should multiply instead by $\frac{2}{3}, \frac{1}{3}$,⁹⁰ giving the result, $\frac{1}{5}$ which is nearer to $\frac{9}{10}$ than if he had used method (*a*).

(*c*) The result is to depend on *actual*⁹¹ amount of knowledge of the \lrcorner 3⁹² subjects collectively. Here we have to ask two questions. (1) What is to be the “unit” (*i. e.* “standard to measure by”) in each subject? (2) Are these units

⁹⁰by the *square roots* of the other ratios, *i. e.* by $\frac{2}{3}, \frac{1}{3}$

⁹¹mistakenly “relative” in the *Monthly Packet*

⁹²three

to be of equal, or unequal value? The usual “unit” is the knowledge shown by answering the whole paper correctly; calling this “100,” all lower amounts are represented by numbers between “0” and “100.” Then, if these units are to be of equal value, we simply add *A*’s 3 marks together, and do the same for *B*.

(*d*) The conditions are the same as (*c*), but French is to have double weight. Here we simply double the French marks, and add as before.

(*e*) French is to have such weight, that, if other marks be equal, the ultimate ratio is to be that of the French paper, so that a “0” in this would swamp the candidate⁹³: but⁹⁴ the other two subjects are only to affect the result collectively, by the amount of knowledge shown, the two being reckoned of equal value. Here I should add *A*’s German and Italian marks together, and multiply by his French mark.

But I need not go on: the problem may evidently be set with many varying conditions, each requiring its own method of solution. The Problem in Knot VI. was meant to belong to variety (*a*), and to make this clear, I inserted the following passage:

“Usually the competitors differ in one point only. Thus, last year, Fifi and Gogo made the same number of scarves in the trial week, and they were equally light; but Fifi’s were twice as warm as Gogo’s, and she was pronounced twice as good.”

What I have said will suffice, I hope, as an answer to BALBUS, who holds that (*a*) and (*c*) are the only possible varieties of the problem, and that to say “We cannot use addition, therefore we must be intended to use multiplication,” is “no more illogical than, from knowledge that one was not born in the night, to infer that he was born in the daytime”; and also to FIFEE, who says “I think a little more consideration will show you that our ‘error of *adding* the proportional numbers together for each candidate instead of *multiplying*’ is no error at all.” Why, even if addition *had* been the right method to use, not one of the writers (I speak from memory) showed any consciousness of the necessity of fixing a “unit” for each subject. “No error at all!” They were positively steeped in error!

One correspondent (I do not name him, as the communication is not quite friendly in tone) writes thus:—“I wish to add, very respectfully, that I think it would be in better taste if you were to abstain from the very trenchant expressions which you are accustomed to indulge in when criticising the answer. That such a tone must not be” (“be not”?) “agreeable to the persons concerned who have made mistakes may possibly have no great weight with you, but I hope you will feel that it would be as well not to employ it, *unless you are quite certain of being correct yourself*.” The only instances the writer gives of the “trenchant expressions” are “hapless” and “malefactors.” I beg to assure him (and any others who may need the assurance: I trust there are none) that all such words have been used in jest, and with no idea that they could possibly annoy any one, and that I sincerely regret any annoyance I may have thus inadvertently given. May I hope that in future they will recognise the distinction between severe language used in sober earnest, and the “words of unmeant bitterness,” which Coleridge has alluded to in that lovely passage beginning “A little child, a limber elf”? If the writer will refer to that passage, or to the preface to “Fire, Famine, and Slaughter,” he will find the distinction, for which I plead, far better drawn out

⁹³(missing in the *Monthly Packet*)

⁹⁴but, if the French marks be equal

than I could hope to do in any words of mine.

The writer's insinuation that I care not how much annoyance I give to my readers I think it best to pass over in silence; but to his concluding remark I must entirely demur. I hold that to use language likely to annoy any of my correspondents would not be in the least justified by the plea that I was "quite certain of being correct." I trust that the knot-untiers and I are not on such terms as those!

I beg to thank *G. B.* for the offer of a puzzle—which, however, is too like the old one "Make four 9's into 100."

Answers to Knot VIII

§ 1. **The Pigs**⁷⁹⁵ ¶*Problem.*⁷⁹⁶—Place twenty-four pigs in four sties so that, as you go round and round, you may always find the number in each sty nearer to ten than the number in the last.

¶*Answer.*⁷⁹⁷—Place 8 pigs in the first sty, 10 in the second, nothing in the third, and 6 in the fourth: 10 is nearer ten than 8; nothing is nearer ten than 10; 6 is nearer ten than nothing; and 8 is nearer ten than 6.

This problem is noticed by only two correspondents. BALBUS says "it certainly cannot be solved mathematically, nor do I see how to solve it by any verbal quibble." NOLENS VOLENS makes Her Radiancy change the direction of going round; and even then is obliged to add "the pigs must be carried in front of her"!

§ 2. **The Grumstipths**⁷⁹⁸ ¶*Problem.*⁷⁹⁹—Omnibuses start from a certain point, both ways, every $12\frac{1}{2}$ minutes. A traveller, starting on foot along with one of them, meets one in $12\frac{1}{2}$ minutes: when will he be overtaken by one?

¶*Answer.*⁷⁹⁹—In $6\frac{1}{4}$ minutes.

Solution.—Let "*a*" be the distance an omnibus goes in 15 minutes, and "*x*" the distance from the starting-point to where the traveller is overtaken. Since the omnibus met is due at the starting-point in $2\frac{1}{2}$ minutes, it goes in that time as far as the traveller walks in $12\frac{1}{2}$; *i. e.* it goes 5 times as fast. Now the overtaking omnibus is "*a*" behind the traveller when he starts, and therefore goes "*a + x*" while he goes "*x*." Hence $a + x = 5x$; *i. e.* $4x = a$, and $x = \frac{a}{4}$. This distance would be traversed by an omnibus in $\frac{15}{4}$ minutes, and therefore by the traveller in $5 \times \frac{15}{4}$. Hence he is overtaken in $18\frac{3}{4}$ minutes after starting, *i. e.* in $6\frac{1}{4}$ minutes after meeting the omnibus.

⁹⁵missing in the *Monthly Packet*

⁹⁶*Problem 1*

⁹⁷*Solution*

⁹⁸missing in the *Monthly Packet*

⁹⁹*Problem 2*

¹⁰⁰*Ans.*

Four answers have been received, of which two are wrong. DINAH MITE rightly states that the overtaking omnibus reached the point where they met the other omnibus 5 minutes after they left, but wrongly concludes that, going 5 times as fast, it would overtake them in another minute. The travellers are 5-minutes-walk ahead of the omnibus, and must walk 1-4th of this distance farther before the omnibus overtakes them, which will be 1-5th of the distance traversed by the omnibus in the same time: this will require $1\frac{1}{4}$ minutes more. NOLENS VOLENS tries it by a process like "Achilles and the Tortoise." He rightly states that, when the overtaking omnibus leaves the gate, the travellers are 1-5th of "a" ahead, and that it will take the omnibus 3 minutes to traverse this distance; "during which time" the travellers, he tells us, go 1-15th of "a" (this should be 1-25th). The travellers being now 1-15th of "a" ahead, he concludes that the work remaining to be done is for the travellers to go 1-60th of "a," while the omnibus goes 1-12th. The *principle* is correct, and might have been applied earlier.

Answers to Knot IX

Source: The Monthly Packet, April 1883 (as "Answers to Knot VIII", with minor differences as noted); A Tangled Tale

§ 1. The Buckets Problem.—Lardner states that a solid, immersed in a fluid, displaces an amount equal to itself in bulk. How can this be true of a small bucket floating in a larger one?

Solution.—Lardner means, by "displaces," "occupies a space which might be filled with water without any change in the surroundings." If the portion of the floating bucket, which is above the water, could be annihilated, and the rest of it transformed into water, the surrounding water would not change its position: which agrees with Lardner's statement.

Five answers have been received, none of which explains the difficulty arising from the well-known fact that a floating body is the same weight as the displaced fluid. HECLA says that "only that portion of the smaller bucket which descends below the original level of the water can be properly said to be immersed, and only an equal bulk of water is displaced." Hence, according to HECLA, a solid, whose weight was equal to that of an equal bulk of water, would not float till the whole of it was below "the original level" of the water: but, as a matter of fact, it would float as soon as it was all under water. MAGPIE says the fallacy is "the assumption that one body can displace another from a place where it isn't," and that Lardner's assertion is incorrect, except when the containing vessel "was originally full to the brim." But the question of floating depends on the present state of things, not on past history. OLD KING COLE takes the same view as HECLA. TYMPANUM and VINDEX assume that "displaced" means "raised above its original level," and merely explain how it comes to pass that

the water, so raised, is less in bulk than the immersed portion of bucket, and thus land themselves—or rather set themselves floating—in the same boat as HECLA.

I regret that there is no Class-list to publish for this Problem.

§ 2. Balbus' Essay *Problem.*—Balbus states that if a certain solid be immersed in a certain vessel of water, the water will rise through a series of distances, two inches, one inch, half an inch, &c., which series has no end. He concludes that the water will rise without limit. Is this true?

Solution.—No. This series can never reach 4 inches, since, however many terms we take, we are always short of 4 inches by an amount equal to the last term taken.

Three answers have been received—but only two seem to me worthy of honours.

TYMPANUM says that the statement about the stick “is merely a blind, to which the old answer may well be applied, *solvitur ambulando*, or rather *mergendo*.” I trust TYMPANUM will not test this in his own person, by taking the place of the man in Balbus' Essay! He would infallibly be drowned.

OLD KING COLE rightly points out that the series, 2, 1, &c., is a decreasing Geometrical Progression: while VINDEK rightly identifies the fallacy as that of “Achilles and the Tortoise.”

Class List I

OLD KING COLE.

VINDEK.

§ 3. The Garden *Problem.*—An oblong garden, half a yard longer than wide, consists entirely of a gravel-walk, spirally arranged, a yard wide and 3,630 yards long. Find the dimensions of the garden.

Answer.—60, $60\frac{1}{2}$.¹⁰¹

Solution.—The number of yards and fractions of a yard traversed in walking along a straight piece of walk, is evidently the same as the number of square-yards and fractions of a square-yard, contained in that piece of walk: and the distance, traversed in passing through a square-yard at a corner, is evidently a yard. Hence the area of the garden is 3,630 square-yards: *i. e.*, if x be the width, $x(x + \frac{1}{2}) = 3,630$. Solving this Quadratic, we find $x = 60$. Hence the dimensions are 60, $60\frac{1}{2}$.

Twelve answers have been received—seven right and five wrong.

C. G. L., NABOB, OLD CROW, and TYMPANUM assume that the number of yards in the length of the path is equal to the number of square-yards in the garden. This is true, but should have been proved. But each is guilty of darker deeds. C. G. L.'s “working” consists of dividing 3,630 by 60. Whence came this divisor, oh Segiel? Divination? Or was it a dream? I fear this solution is worth nothing. OLD CROW's is shorter, and so (if possible) worth rather less. He says the answer “is at once seen to be $60 \times 60\frac{1}{2}$ ”! NABOB's calculation is short, but

¹⁰¹Answer missing in the *Monthly Packet*

“as rich as a Nabob” in error. He says that the square root of 3,630, multiplied by 2, equals the length plus the breadth. That is $60.25 \times 2 = 120\frac{1}{2}$. His first assertion is only true of a *square* garden. His second is irrelevant, since 60.25 is *not* the square-root of 3,630! Nay, Bob, this will *not* do! TYMPANUM says that, by extracting the square-root of 3,630, we get 60 yards with a remainder of $\frac{30}{60}$, or half-a-yard, which we add so as to make the oblong $60 \times 60\frac{1}{2}$. This is very terrible: but worse remains behind. TYMPANUM proceeds thus:—“But why should there be the half-yard at all? Because without it there would be no space at all for flowers. By means of it, we find reserved in the very centre a small plot of ground, two yards long by half-a-yard wide, the only space not occupied by walk.” But Balbus expressly said that the walk “used up the whole of the area.” Oh, TYMPANUM! My tympana is exhausted: my brain is num! I can say no more.

HECLA indulges, again and again, in that most fatal of all habits in computation—the making *two* mistakes which cancel each other. She takes x as the width of the garden, in yards, and $x + \frac{1}{2}$ as its length, and makes her first “coil” the sum of $x - \frac{1}{2}$, $x - \frac{1}{2}$, $x - 1$, $x - 1$, *i. e.* $4x - 3$: but the fourth term should be $x - 1\frac{1}{2}$, so that her first coil is $\frac{1}{2}$ a yard too long. Her second coil is the sum of $x - 2\frac{1}{2}$, $x - 2\frac{1}{2}$, $x - 3$, $x - 3$: here the first term should be $x - 2$ and the last $x - 3\frac{1}{2}$: these two mistakes cancel, and this coil is therefore right. And the same thing is true of every other coil but the last, which needs an extra half-yard to reach the *end* of the path: and this exactly balances the mistake in the first coil. Thus the sum total of the coils comes right though the working is all wrong.

Of the seven who are right, DINAH MITE, JANET, MAGPIE, and TAFFY make the same assumption as C. G. L. and Co. They then solve by a Quadratic. MAGPIE also tries it by Arithmetical Progression, but fails to notice that the first and last “coils” have special values.

ALUMNUS ETONÆ attempts to prove what C. G. L. assumes by a particular instance, taking a garden 6 by $5\frac{1}{2}$. He ought to have proved it generally: what is true of one number is not always true of others. OLD KING COLE solves it by an Arithmetical Progression. It is right, but too lengthy to be worth as much as a Quadratic.

VINDEX proves it very neatly, by pointing out that a yard of walk measured along the middle represents a square yard of garden, “whether we consider the straight stretches of walk or the square yards at the angles, in which the middle line goes half a yard in one direction and then turns a right angle and goes half a yard in another direction.”

§ 1. The Chelsea Pensioners

Problem.—If 70 per cent. have lost an eye, 75 per cent. an ear, 80 per cent. an arm, 85 per cent. a leg: what percentage, *at least*, must have lost all four?

Answer.—Ten.¹⁰²

*Solution.*¹⁰³—(I adopt that of POLAR STAR, as being better than my own). Adding the wounds together, we get $70 + 75 + 80 + 85 = 310$, among 100 men; which gives 3 to each, and 4 to 10 men. Therefore the least percentage is 10.

Nineteen answers have been received. One is “5,” but, as no working is given with it, it must, in accordance with the rule, remain “a deed without a name.” JANET makes it “35 and $\frac{7}{10}$ ths.” I am sorry she has misunderstood the question, and has supposed that those who had lost an ear were 75 per cent. *of those who had lost an eye*; and so on. Of course, on this supposition, the percentages must all be multiplied together. This she has done correctly, but I can give her no honours, as I do not think the question will fairly bear her interpretation, THREE SCORE AND TEN makes it “19 and $\frac{3}{8}$ ths.” Her solution has given me—I will not say “many anxious days and sleepless nights,” for I wish to be strictly truthful, but—some trouble in making any sense at all of it. She makes the number of “pensioners wounded once” to be 310 (“per cent.,” I suppose!): dividing by 4, she gets 77 and a half as “average percentage:” again dividing by 4, she gets 19 and $\frac{3}{8}$ ths as “percentage wounded four times.” Does she suppose wounds of different kinds to “absorb” each other, so to speak? Then, no doubt, the *data* are equivalent to 77 pensioners with one wound each, and a half-pensioner with a half-wound. And does she then suppose these concentrated wounds to be *transferable*, so that $\frac{3}{4}$ ths of these unfortunates can obtain perfect health by handing over their wounds to the remaining $\frac{1}{4}$ th? Granting these suppositions, her answer is right; or rather, *if* the question had been “A road is covered with one inch of gravel, along 77 and a half per cent. of it. How much of it could be covered 4 inches deep with the same material?” her answer *would* have been right. But alas, that *wasn't* the question! DELTA makes some most amazing assumptions: “let every one who has not lost an eye have lost an ear,” “let every one who has not lost both eyes and ears have lost an arm.”¹⁰⁴ Her ideas of a battle-field are grim indeed. Fancy a warrior who would continue fighting after losing both eyes, both ears, and both arms! This is a case which she (or “it?”) evidently considers *possible*.

Next come eight writers who have made the unwarrantable assumption that, because 70 per cent. have lost an eye, *therefore* 30 per cent. have *not* lost one, so that they have *both* eyes. This is illogical¹⁰⁵. If you give me a bag containing 100 sovereigns, and if in an hour I come to you (my face *not* beaming with

gratitude nearly so much as when I received the bag) to say “I am sorry to tell you that 70 of these sovereigns are bad,” do I thereby guarantee the other 30 to be good? Perhaps I have not tested them yet. The sides of this illogical octagon are as follows, in alphabetical order:—ALGERNON BRAY, DINAH MITE, G. S. C., JANE E., J. D. W., MAGPIE (who makes the delightful remark “therefore 90 per cent. have two of something,” recalling to one’s memory that fortunate monarch, with whom Xerxes was so much pleased that “he gave him ten of everything”), S. S. G., and TOKIO.

Quoted from *Book IX*
by Herodotus

BRADSHAW OF THE FUTURE and T. R. do the question in a piecemeal fashion—on the principle that the 70 per cent. and the 75 per cent., though commenced at opposite ends of the 100, must overlap by *at least* 45 per cent.; and so on. This is quite correct working, but not, I think, quite the best way of doing it.

The other five competitors will, I hope, feel themselves sufficiently glorified by being placed in the first class, without my composing a Triumphal Ode for each!

§ 2. Change of Day¹⁰⁷

¹⁰⁶In the *Monthly Packet* followed by these two paragraphs and the concluding one:

The other two problems—‘where does the day begin?’ and the ages of the old man’s three sons—I must leave to another time. The first has always been a puzzle to me, and, often as it has been brought forward in scientific periodicals, I have never seen its difficulties successfully explained. I am trying to get some definite statistics which will, I hope, shed a new light on it. Meanwhile, if any fresh competitors like to try their hands at it, or at the ages of the three sons, so as to appear in the final Class List, there is yet time to send in their answers.

ALGERNON BRAY enquires for copies of the original edition of *The Hunting of the Snark*. There are still a few on hand, which may be obtained from Messrs. Macmillan & Co., 29, Bedford Street, Covent Garden, London.

¹⁰⁷Part 2 in the *Monthly Packet* starts here, but omits this headline.

Other versions:

→ 16.8, p. 1936

→ 16.11, p. 1945

⌊I must postpone, *sine die*,¹⁰⁸ the geographical problem—partly because I have not yet received the statistics I am hoping for, and partly because I am myself so entirely puzzled by it; and when an examiner is himself dimly hovering between a second class and a third how is he to decide the position of ⌊others?¹⁰⁹

§ 3. The Sons' Ages *Problem.*—“At first, two of the ages are together equal to the third. A few years afterwards, two of them are together double of the third. When the number of years since the first occasion is two-thirds of the sum of the ages on that occasion, one age is 21. What are the other two?”

Answer.—“15 and 18.”

⌊*Solution.*¹¹⁰—Let the ages at first be x , y , $(x + y)$. Now, if $a + b = 2c$, then $(a - n) + (b - n) = 2(c - n)$, whatever be the value of n . Hence the second relationship, if *ever* true, was *always* true. Hence it was true at first. But it cannot be true that x and y are together double of $(x + y)$. Hence it must be true of $(x + y)$, together with x or y ; and it does not matter which we take. We assume, then, $(x + y) + x = 2y$; *i. e.* $y = 2x$. Hence the three ages were, at first, x , $2x$, $3x$; and the number of years, since that time is two-thirds of $6x$, *i. e.* is $4x$. Hence the present ages are $5x$, $6x$, $7x$. The ages are clearly *integers*, since this is only “the year when one of my sons comes of age.” Hence $7x = 21$, $x = 3$, and the other ages are 15, 18.

⌊Eighteen¹¹¹ answers have been received. One of the writers merely asserts that the first occasion was 12 years ago, that the ages were then 9, 6, and 3; and that on the second occasion they were 14, 11, and 8! As a Roman father, I *ought* to withhold the name of the rash writer; but respect for age makes me break the rule: it is THREE SCORE AND TEN. JANE E. also asserts that the ages at first were 9, 6, 3: then she calculates the present ages, leaving the *second* occasion unnoticed. OLD HEN is nearly as bad; she “tried various numbers till I found one that fitted *all* the conditions”; but merely scratching up the earth, and pecking about, is not the way to solve a problem, oh venerable bird! And close after OLD HEN prowls, with hungry eyes, OLD CAT, who calmly assumes, to begin with, that the son who comes of age is the *eldest*. Eat your bird, Puss, for you will get nothing from me!

There are yet two zeroes to dispose of. MINERVA assumes that, on *every* occasion, a son comes of age; and that it is only such a son who is “tipped with gold.” Is it wise thus to interpret “now, my boys, calculate your ages, and you shall have the money”? BRADSHAW OF THE FUTURE says “let” the ages at first be 9, 6, 3, then assumes that the second occasion was 6 years afterwards, and on these baseless assumptions brings out the right answers. Guide *future* travellers, an thou wilt: thou art no Bradshaw for *this* Age!

Of those who win honours, the merely “honourable” are two. DINAH MITE ascertains (rightly) the relationship between the three ages at first, but then *assumes* one of them to be “6,” thus making the rest of her solution tentative. M. F. C. does the algebra all right up to the conclusion that the present ages are $5z$, $6z$, and $7z$; it then assumes, without giving any reason, that $7z = 21$.

¹⁰⁸Once more I must postpone

¹⁰⁹Followed by “So I proceed to” in the *Monthly Packet*

¹¹⁰Missing in the *Monthly Packet*

¹¹¹Twenty

Of the more honourable, DELTA attempts a novelty—to discover *which* son comes of age by elimination: it assumes, successively, that it is the middle one, and that it is the youngest; and in each case it *apparently* brings out an absurdity. Still, as the proof contains the following bit of algebra, “ $63 = 7x + 4y$; $\therefore 21 = x + 4$ sevenths of y ,” I trust it will admit that its proof is not *quite* conclusive. The rest of its work is good. MAGPIE betrays the deplorable tendency of her tribe—to appropriate any stray conclusion she comes across, without having any *strict* logical right to it. Assuming A, B, C , as the ages at first, and D as the number of the years that have elapsed since then, she finds (rightly) the 3 equations, $2A = B, C = B + A, D = 2B$. She then says “supposing that $A = 1$, then $B = 2, C = 3$, and $D = 4$. Therefore for A, B, C, D , four numbers are wanted which shall be to each other as $1 : 2 : 3 : 4$.” It is in the “therefore” that I detect the unconscientiousness of this bird. The conclusion *is* true, but this is only because the equations are “homogeneous” (*i. e.* having one “unknown” in each term), a fact which I strongly suspect had not been grasped—I beg pardon, clawed—by her. Were I to lay this little pitfall, “ $A + 1 = B, B + 1 = C$; supposing $A = 1$, then $B = 2$ and $C = 3$. Therefore for A, B, C , three numbers are wanted which shall be to one another as $1 : 2 : 3$,” would you not flutter down into it, oh Magpie, as amiably as a Dove? SIMPLE SUSAN is anything but simple to *me*. After ascertaining that the 3 ages at first are as $3 : 2 : 1$, she says “then, as two-thirds of their sum, added to one of them, = 21, the sum cannot exceed 30, and consequently the highest cannot exceed 15.” I suppose her (mental) argument is something like this:—“two-thirds of sum, + one age, = 21; \therefore sum, + 3 halves of one age, = 31 and a half. But 3 halves of one age cannot be less than 1 and-a-half (here I perceive that SIMPLE SUSAN would on no account present a guinea to a new-born baby!)¹¹² hence the sum cannot exceed 30.” This is ingenious, but her proof, after that, is (as she candidly admits) “clumsy and roundabout.” She finds that there are 5 possible sets of ages, and eliminates four of them. Suppose that, instead of 5, there had been 5 million possible sets? Would SIMPLE SUSAN have courageously ordered in the necessary gallon of ink and ream of paper?

The solution sent in by C. R. is, like that of SIMPLE SUSAN, partly tentative, and so does not rise higher than being Clumsily Right.

Among those who have earned the highest honours, ALGERNON BRAY solves the problem quite correctly, but adds that there is nothing to exclude the supposition that all the ages were *fractional*. This would make the number of answers infinite. Let me meekly protest that I *never* intended my readers to devote the rest of their lives to writing out answers! E. M. RIX points out that, if fractional ages be admissible, any one of the three sons might be the one “come of age”; but she rightly rejects this supposition on the ground that it would make the problem indeterminate. WHITE SUGAR is the only one who has detected an oversight of mine: I had forgotten the possibility (which of course ought to be allowed for) that the son, who came of age that *year*, need not have done so by that *day*, so that he *might* be only 20. This gives a second solution, viz., 20, 24, 28. Well said, pure Crystal! Verily, thy “fair discourse hath been as sugar”!

I have received more than one remonstrance on my assertion, in the Chelsea Pensioners' problem, that it was illogical to assume, from the *datum* "70 p.c. have lost an eye," that 30 p.c. have *not*. ALGERNON BRAY states, as a parallel case, "suppose Tommy's father gives him 4 apples, and he eats one of them, how many has he left?" and says "I think we are justified in answering, 3." I think so too. There is no "must" here, and the *data* are evidently meant to fix the answer *exactly*: but, if the question were set me "how many *must* he have left?", I should understand the *data* to be that his father gave him 4 *at least*, but *may* have given him *more*.¹¹³

I take this opportunity of thanking those who have sent, along with their answers to the Tenth Knot, regrets that there are no more Knots to come, or petitions that I should recall my resolution to bring them to an end. I am most grateful for their kind words; but I think it wisest to end what, at best, was but a lame attempt. "The stretched metre of an antique song" is beyond my compass; and my puppets were neither distinctly *in* my life (like those I now address), nor yet (like Alice and the Mock Turtle) distinctly *out* of it. Yet let me at least fancy, as I lay down the pen, that I carry with me into my silent life, dear reader, a farewell smile from your unseen face, and a kindly farewell pressure from your unfelt hand! And so, good night! Parting is such sweet sorrow, that I shall say "good night!" till it be *tomorrow*.¹¹⁴

Quoted from *Sonnet XVII* by William Shakespeare

¹¹³In the *Monthly Packet* followed by:

ALGERNON BRAY asks for 'a separate illustrated edition of the Lang Coortin.' (I misquoted this in my last.) It is to be had, and illustrated, in the volume of 'Rhyme? And Reason?' but a *separate* edition I fear I cannot promise.

Lewis Carroll.

¹¹⁴This paragraph comes at the end of the first part in the *Monthly Packet* and is followed by the signature "Lewis Carroll".

9.11 To Find the Day of the Week for Any Given Date

Source: Nature, March 31, 1887

Having hit upon the following method of mentally computing the day of the week for any given date, I send it you in the hope that it may interest some of your readers. I am not a rapid computer myself, and as I find my average time for doing any such question is about 20 seconds, I have little doubt that a rapid computer would not need 15.

Take the given date in 4 portions, viz. the number of centuries, the number of years over, the month, the day of the month.

Compute the following 4 items, adding each, when found, to the total of the previous items. When an item or total exceeds 7, divide by 7, and keep the remainder only.

The Century-Item.—For Old Style (which ended September 2, 1752) subtract from 18. For New Style (which began September 14) divide by 4, take overplus from 3, multiply remainder by 2.

The Year-Item.—Add together the number of dozens, the overplus, and the number of 4's in the overplus.

The Month-Item.—If it begins or ends with a vowel, subtract the number, denoting its place in the year, from 10. This, plus its number of days, gives the item for the following month. The item for January is "0"; for February or March (the 3rd month), "3"; for December (the 12th month), "12."

The Day-Item is the day of the month.

The total, thus reached, must be corrected, by deducting "1" (first adding 7, if the total be "0"), if the date be January or February in a Leap Year: remembering that every year, divisible by 4, is a Leap Year, excepting only the century-years, in New Style, when the number of centuries is *not* so divisible (*e. g.* 1800).

The final result gives the day of the week, "0" meaning Sunday, "1" Monday, and so on.

Examples

1783, *September 18*

17, divided by 4, leaves "1" over; 1 from 3 gives "2"; twice 2 is "4."

83 is 6 dozen and 11, giving 17; plus 2 gives 19, *i. e.* (dividing by 7) "5." Total 9, *i. e.* "2."

The item for August is "8 from 10," *i. e.* "2"; so, for September, it is "2 plus 3," *i. e.* "5." Total 7, *i. e.* "0," which goes out.

18 gives "4." Answer, "*Thursday.*"

1676, *February 23*

16 from 18 gives "2."

76 is 6 dozen and 4, giving 10; plus 1 gives 11, *i. e.* "4." Total "6."

The item for February is "3." Total 9, *i. e.* "2."

23 gives "2." Total "4."

Correction for Leap Year gives “3.” Answer, “*Wednesday.*”

Lewis Carroll

9.12 Note on Question 7695

Source: Mathematical Questions and Solutions, from the "Educational Times", XLIII, 1885; shorter version also in Educational Times, May 1885

The question this refers to is

(By J. O'Regan.)—Two persons play for a stake, each throwing two dice. They throw in turn, A commencing. A wins if he throws 6, B if he throws 7: the game ceasing as soon as either event happens. Show that A's chance is to B's as 30 to 31. MQS XL, 1885,

<https://archive.org/details/mathematicalque05unkngoog/page/n270>

The solution by D. Biddle, W. J. Greenstreet, and others correctly states that "[t]he probability that B will have a throw after A is [...] $\frac{31}{36}$ "; but that A will throw again after B, only $\frac{30}{36}$ ", but wrongly concludes the result from that by simply dividing the two chances.

by C. L. Dodgson, M.A.

The solution given to this question on p. 75 of Vol. 42, is one of the most curious instances I have met with of the pitfalls to be found in Mathematics: the answer is right, but the method of solution, beautifully simple as it looks, is entirely wrong.

This can be most easily demonstrated by a *reductio ad absurdum*. Let the winning throw, for A and B alike, be 6. Then, by this method of solution, their chances are equal, since "the probability that B will have a throw after A is $\frac{31}{36}$ "; which is also the probability "that A will throw again after B." Yet it is obvious that, as A begins, his "expectation" is better than B's.

The true solution will be best given, first, in the general form; and the formula, so obtained, can then be applied to the particular case.

Let A's chance of making his winning throw, each time he throws, be k ; and similarly let B's chance be l .

Then A's chance of winning, in his first throw, is k ; in his second, $(1-k) \cdot (1-l) \cdot k$; in his third, $(1-k)^2 \cdot (1-l)^2 \cdot k$; and so on for ever. Hence the limit, to which his "expectation" approaches, is the limit of

$$k \cdot [1 + (1-k) \cdot (1-l) + (1-k)^2 \cdot (1-l)^2 + \&c.];$$

$$i. e., \quad k \cdot \frac{1}{1 - (1-k) \cdot (1-l)}; \quad i. e., \quad \frac{k}{k + l - kl}.$$

Similarly, B's chance of winning, in his first throw, is $(1-k) \cdot l$; in his second, $(1-k) \cdot (1-l) \cdot (1-k) \cdot l$; in his third, $(1-k)^2 \cdot (1-l)^2 \cdot (1-k) \cdot l$; and so on for ever. Hence his "expectation" approaches the limit of

$$(1-k) \cdot l \cdot [1 + (1-k) \cdot (1-l) + (1-k)^2 \cdot (1-l)^2 + \&c.]; \quad i. e. \quad \frac{(1-k) \cdot l}{k + l - kl}.$$

Hence the ratio, of A's expectation to B's, is approximately $\frac{k}{(1-k) \cdot l}$.

In the given case, $k = \frac{5}{36}$, $l = \frac{6}{36} = \frac{1}{6}$; hence the required ratio = $\frac{30}{31}$. By a mere accident this happens to be the same as $\frac{1-l}{1-k}$, which accident has misled all the solvers into adopting this as a true formula.

In my “*reductio ad absurdum*” case, $k = l = \frac{5}{36}$; hence the required ratio = $\frac{36}{31}$.

It is worth noting that the ratio, $\frac{30}{31}$, is only *approximative*, the expectations of A and B being just *less* than the fractions $\frac{30}{61}$, $\frac{31}{61}$. If this were not so, the sum total of their expectations would equal 1; *i. e.*, it would be absolutely certain that one or other of them would win—whereas there is clearly a chance, though an indefinite small one, that the game might go on for ever without either winning.

A comment by Mr. Simmons follows, criticizing Carroll’s point of view in this last paragraph.

9.13 Infinitesimal or Zero?

Source: Mathematical Questions and Solutions, from the “Educational Times”, XLIV, 1885; shorter version also in Educational Times, July 1885

The controversy above is treated on the example “A random point being taken on a given line, what is the chance of its coinciding with a previously assigned point?”

Only the two sections by Carroll included here, one section is by Mr. Simmons, three by other writers.

It is surely too late, in A.D. 1885, to seriously discuss the question whether a converging series does or does not reach its limit—in other words, whether an infinitesimal is or is not equal to zero. If the ordinary text-books have not shown Mr. Simmons the difference between them, how can I hope to do it? I will, however, try a *reductio ad absurdum*. I present Mr. Simmons with a line AB in which I have selected a certain point C; and I ask him to take a point at random in AB, and to estimate its chance of coinciding with C. He will reply, ‘If its chance of falling on one side of C be k , its chance of falling on the other side is, *with perfect accuracy*, $1 - k$. Hence its chance of missing C is *absolutely* 1; and its chance of coinciding with it is *absolutely zero*.’ But the very same thing is true of *any other* point I might select in AB. Hence the new point *has no chance of falling anywhere!* If Mr. Simmons is partial to pitfalls, let me recommend this one to his notice; it is nice soft falling, and not very deep.

1. I re-affirm that the question whether a converging series does or does not reach its limit *is*, in other words, whether an infinitesimal is or is not equal to zero. *E. g.*—The converging series 2^{-1} , 2^{-2} , &c., 2^{-n} , has for its limit, unity. Also its sum is $1 - 2^{-n}$. Hence, if when n is infinite, the series reaches its limit, the infinitesimal 2^{-n} must be equal to zero.

2. I never assumed that ‘a line may be considered as wholly made up of points which can all previously be assigned,’ nor of points of any kind. A point, having no magnitude, can form no portion of a line.

3. I admit that, if the length of AC, one portion of a line AB, be k , the length of the other portion CB will *with perfect accuracy* be $1 - k$. And I *am* ‘prepared to deny that the two chances (of a point falling *in* the two portions) are represented quite accurately by k and $1 - k$.’ For this would omit the 3 chances of its falling at A, at B, and at C. Suppose that, when the point falls at C, it is reckoned as falling in AB, and not in BC. Then, to deal fairly with the two portions, we must exclude A, and make unity represent the chance of the point falling somewhere in the line AB, excluding A, but including B. Then k is the chance of its falling between A and C, or else at C; and $1 - k$ the chance of its falling between C and B, or else at B.

4. I re-affirm, as absolutely axiomatic, that, when an event is *possible*, its chance of happening is *not* zero.

In January 1886, a “final” note on this topic appeared by Rev. T. C. Simmons on 7695, see <https://archive.org/details/educationaltimes3941educ/page/n40>, but the discussion continued, see below.

9.14 “Something or Nothing?”

Source: The Educational Times, June 1888

By Charles L. Dodgson, M.A.

In the years 1885, 1886, there appeared in regard to a Solution of Quest. 7695 (see Vol. XLIII., p. 86, and XLIV., p. 24) a discussion about a difficulty in the Theory of Chances, of which the following question was treated as a typical example:—“A random point being taken on a given line, what is the chance of its coinciding with a previously assigned point?” On one side it was maintained that the chance is *absolute zero*: on the other side it was maintained, by myself and others, that it is some sort of *infinitesimal*, and *not* absolute zero. The arguments on both sides were fully stated, and my only excuse, for re-opening the discussion, is that I have a *new* view of the difficulty to offer to the supporters of the “absolute zero” theory.

I assume that both sides accept the following axioms:—(1) that no aggregate, however infinitely numerous, of *absolute zeroes* can constitute a *magnitude*, however infinitely small; (2) (an example of the preceding) that no aggregate, however infinitely numerous, of *points* can constitute any portion, however infinitely short, of a *line*; and hence (3) that, if the chance of a random point on a line coinciding with a *single selected point* be absolute zero, so also is its chance of coinciding with one or other of a *selected aggregate of points*, however infinitely numerous.

I now propose two questions:—

I. “A random point being taken on a given line, what is the chance of its dividing the line into two *commensurable* parts?” It seems clear that we are here dealing with a *selected aggregate of points*, since it is impossible to mark off any portion of the *line*, and to say “Wherever, in this portion, the random point shall fall, it will divide the whole line into two commensurable parts.” I assume, then, that my opponents would answer “It is *absolute zero*.”

II. “And what is its chance of dividing the line into two *incommensurable* parts?” Here again they must answer “It is *absolute zero*.”

And yet *one or other* of these two events *must* happen! Hence, the sum of the two chances must be mathematically represented by unity; that is, one or other (though we cannot say which) must be—not only “*something*,” not only a certain *infinitesimal*, of some inconceivably high order—but must actually reach, if not exceed, the *finite* value of *one-half*!

9.15 Questions for Solution: 9588

Source: The Educational Times, June 1888

Solution by Rev. T. C. Simmons was published in July 1888, see

<https://archive.org/details/educationaltimes3941educ/page/278>

Solutions by Rev. T. C. Simmons and Prof. Tanner, M.A. with Carroll's comments in Mathematical Questions and Solutions, from the "Educational Times" L, 1889

9588. (CHARLES L. DODGSON, M.A.)—A random point being taken on a given line, find the chance of its dividing the line into two parts (1) commensurable, (2) incommensurable.

Comment on Solutions

(1) In reply to the Rev. T. C. SIMMONS, if, instead of dividing his line by 2, 3, &c., he will divide it by $\sqrt{2}$, $\sqrt{3}$, &c., and if, where he has written "commensurable," he will write "incommensurable," he will find his argument quite as sound as before, and, instead of proving the two chances to be "zero" and "unity," he will prove them to be "unity" and "zero." An argument that proves with equal ease either of two contradictories, needs very cautious handling.

(2) In reply to Professor TANNER, I must respectfully decline to explain how a thing can happen which I say cannot happen at all! No "aggregate of points," as I believe, can ever "make up the whole of a line," or any portion of it: so I must refer him, for the explanation he desires, to the "opposition," who are so ready to explain how "an aggregate of absolute zeros may be unity." While their hand is in, they may as well do the other little job. In the latter part of his letter he asserts, unless I misunderstand him, that, if the chance of a random point coinciding with one assigned point be δ , then its chance of coinciding with one or other of $1/\delta$ such points is unity. I suppose he would say, taking 10 bags, each containing 1 white counter and 9 black, that, since the chance of drawing a white from one bag is $\frac{1}{10}$, the chance of drawing a white from one or other of the 10 bags is unity. Does he accept this as a fair instance of the theorem?

9.16 Questions for Solution: 9636

Source: The Educational Times, July 1888; Solution by Professor G. B. M. Zerr with Carroll's comment in Mathematical Questions and Solutions, from the "Educational Times" LIX, 1893

A correct solution by W. S. Foster, Professor Nash, and others was published 1894, see <https://archive.org/details/mathematicalque00unkngoog/page/n226> (MQS LX)

9636. (CHARLES L. DODGSON, M.A.)—If 3 numbers, not in Arithmetical Progression, be such that their sum is a multiple of 3: prove that the sum of their squares is also the sum of another set of 3 squares, the two sets having no common term.

Comment on Solution

Mr. Dodgson states that, in this solution, Prof. ZERR "takes a single special instance of 3 numbers, and seems to think that the theorem, since it is true in this single instance, is thereby proved to be true universally." He submits the following theorem, and asks whether Professor ZERR would consider the appended proof a sound logical one.

Other version:
→ 9.21, p. 1467

"(*Theorem.*) If 3 numbers be such that their sum is a multiple of 7, the sum of their squares is a multiple of 9.

"(*Proof.*) Let m , $2m$, $11m$ be the 3 numbers. Then $m + 2m + 11m = 7 \times 2m$. Also, $m^2 + (2m)^2 + (11m)^2 = 126m^2 = 9 \times 14m^2$."

We shall be glad to have a further solution of the Question.

9.17 Questions for Solution: 9995

Source: The Educational Times, February 1889

Solution by J. C. St. Clair, L. Wiener, and others was published in May 1889, see <https://archive.org/details/educationaltimes4243educ/page/n227>

9995. (C. L. DODGSON, M.A.)—A certain school contains not less than 90 boys nor more than 130. Latin, Greek, and French are taught, but no other languages. For every boy learning Latin, at least two learn Greek, but not French; for every three learning Greek, at least one learns French, but not Latin; and, for every two learning French, at least three learn Latin, but not Greek. Exactly half the school learn no languages. Find how many boys are learning each language.

9.18 Questions for Solution: 11530

Source: The Educational Times, May 1892

Solution by H. J. Woodall, A.R.C.S. was published in March 1893, see

<https://archive.org/details/educationaltimes46educ/page/156>, an expanded version in MQS LIX,

<https://archive.org/details/mathematicalque64unkngoog/page/n72>

11530. (Rev. C. L. DODGSON, M.A.)—Required a general investigation of the following trigonometrical formula, which, so far as I know, is new, and very useful in calculating limits for the value of π . The problem, which I set myself, was to break up $\tan^{-1} 1/a$ into two angles of the same form. Let

$$\tan^{-1} \frac{1}{a} = \tan^{-1} \frac{1}{a+x} + \tan^{-1} \frac{1}{a+y}.$$

Then it is also

$$= \tan^{-1} \frac{\frac{1}{a+x} + \frac{1}{a+y}}{1 - \frac{1}{a+x} \cdot \frac{1}{a+y}} = \tan^{-1} \frac{2a+x+y}{a^2 + a(x+y) + xy - 1}.$$

Then it occurred to me that, if $(xy-1)$ were made equal to a^2 , the denominator would become $a(2a+x+y)$; *i. e.*, the fraction would become $1/a$. Hence we get the rule: Let $(a^2+1) = xy$; *i. e.*, break up (a^2+1) into any two factors, call them x and y , and use them in the formula with which we began. Thus, if $a = 3$, $a^2+1 = 10 = 2 \times 5$. Hence $\tan^{-1} \frac{1}{3} = \tan^{-1} \frac{1}{5} + \tan^{-1} \frac{1}{8}$. By the use of this formula, I have obtained 3.141597 and 3.141583 as limits for π .

9.19 Questions for Solution: 12650

Source: The Educational Times, February 1895

Solutions by D. Biddle, Professor Radhakishuan, and others were published in Mathematical Questions and Solutions, from the "Educational Times", LXIII, 1895, from where the question is taken here, too. But they all miss the much simpler approach (which Carroll probably had in mind) of writing the number as $9n + r$ with $0 \leq r < 9$. Then r can be easily calculated from the two digits tacked on and the two remainders, while the third figure of the last number is just n .

12650. (C. L. Dodgson, M.A.)—To discover the rule by which the following puzzle is worked. It is best exhibited as a dialogue.

A. Think of a number less than 90.—B. I have done so.

A. Tack on to it any digit you like, from 0 to 9. Which shall it be?—B. I have tacked on a 7.

A. Now divide by 3. What is the remainder?—B. It is 2.

A. Tack on to the quotient any digit you like.—B. I have tacked on 4.

A. Divide by 3. What is the remainder?—B. It is 1.

A. And what is the third figure from the end?—B. It is 8.

A. (Instantly rejoins) Then the number you thought of was 76.

9.20 Questions for Solution: 13614

Source: The Educational Times, September 1897

13614. (C. L. DODGSON, M.A.)—ZELLER's formula for the day of the week corresponding to any given date, viz., the p th day of the q th month of the year N , „New Style”¹, is

$$p + 2q + \{3(q + 1)/5\} + N + \{N/4\} - \{N/100\} + \{N/400\} + 2,$$

where $\{N/4\}$ means the integral number of 4's contained in N . Taking a hint from this, I have succeeded in evolving an *algebraical formula for the number of days in the q th month*. I take a certain algebraical function of q , and divide it by 5, and call the remainder r . Then a certain algebraical function of r will give the number of days in the q th month. This works correctly for March and all following months; and even for January, by calling it the 13th month of the preceding year; but I cannot manage *February*.

¹mistakenly “Old Style”

Thought Out during Wakeful Hours

Preface to Fourth Edition

Other version:
→ 4.3, p. 696

I take this opportunity of explaining *why* it is that (as stated in the Note to p. 1471) I have used the symbols \cap and \sqcup to represent the words ‘sine’ and ‘cosine’.

The use of *some* symbols needs, I suppose, no more justification than the use of + and – to represent ‘plus’ and ‘minus’.

These particular symbols are derived from the old theory of Trigonometry, in which sines, cosines, &c. were actual *lines*.

In this diagram, OP being taken as the unit of length, PN is the *sine* of the angle NOP , on ON its *cosine*.

In each of my two symbols I have retained the semi-circle: in the symbol \cap , I have merely moved PN to the middle; and, in the symbol \sqcup , I have lengthened ON , taking it a little *beyond* the curve, in order to avoid confusion with the existing symbol for ‘semicircle’.

I also take this opportunity of adding a sort of Corollary (lately thought out) to the solution of Problem 59 (see p. 1526).

If a, b, c be given lengths, they must, in order that the Tetrahedron may be *possible*, fulfil certain conditions, as follows:—

(1) they have to form the sides of a Triangle: hence any two of them must be greater than the third;

(2) the three angles of this Triangle have to form a *solid* angle: hence any two of these angles must be together greater than the third: hence any two of them must be together greater than 90° : hence any *one* of them must be *less* than 90° : hence the *cosine* of any one of them must be greater than 0: i. e. $b^2 + c^2 - a^2$ must be greater than 0, &c.; hence a, b, c must be such that the *squares* of any two of them are together greater than the *square* of the third.

For example, the lengths 2, 3, 4 would *not* do as the given lengths, since, although fulfilling the *first* condition, by having $2 + 3 > 4$, they fail to fulfil the *second*, as $2^2 + 3^2$ is *not* $> 4^2$.

C. L. D.
Ch. Ch., Oxford.
March, 1895.

Preface to Second Edition

The principal changes, made in this Second Edition of “Pillow-Problems”, are as follows:—

(1) After the numeral, which precedes each Question, Answer, or Solution, references are given to the pages at which the corresponding matter may be found.

(2) Some of the Solutions have been re-arranged, and duplicate-diagrams have been inserted, in order that every portion of text may have its illustrative diagram visible along with it, and that the reader may thus be saved the trouble, and the strain on his temper, involved in turning a leaf backwards and forwards while referring from the one to the other.

(3) In the title of the book, the words “sleepless nights” have been replaced by “wakeful hours”.

This last change has been made in order to allay the anxiety of kind friends, who have written to me to express their sympathy in my broken-down state of health, believing that I am a sufferer from chronic “insomnia”, and that it is as a remedy for that exhausting malady that I have recommended mathematical calculation.

The title was not, I fear, wisely chosen; and it certainly *was* liable to suggest a meaning I did not intend to convey, viz. that my “nights” are very often *wholly* “sleepless”. This is by no means the case: I have never suffered from “insomnia”: and the over-wakeful hours, that I have had to spend at night, have often been simply the result of the over-sleepy hours I have spent during the preceding evening! Nor is it as a remedy for *wakefulness* that I have suggested mathematical calculation; but as a remedy for the *harassing thoughts* that are apt to invade a wholly-unoccupied mind. I hope the new title will express my meaning more lucidly.

To state the matter logically, the dilemma which my friends *suppose* me to be in has, for its two horns, the endurance of a sleepless night, and the adoption of some recipe for inducing sleep. Now, so far as *my* experience goes, no such recipe has any effect, unless when you are sleepy: and mathematical calculation would be more likely to delay, than to hasten, the advent of sleep.

The *real* dilemma, which I have had to face, is this: given that the brain is in so wakeful a condition that, do what I will, I am *certain* to remain awake for the next hour or so, I must choose between two courses, viz. either to submit to the fruitless self-torture of going through some worrying topic, over and over again, or else to dictate to myself some topic sufficiently absorbing to keep the worry at bay. A mathematical problem *is*, for me, such a topic; and is a benefit, even if it lengthens the wakeful period a little. I believe that an hour of calculation is much better for me than half-an-hour of worry.

Other version:

→ 9.16, p. 1461

The reader will, I think, be interested to see a curiously illogical solution which has been proposed, by a correspondent of the *Educational Times*, for Problem 61, viz. “Prove that, if any 3 Numbers be taken, which cannot be arranged in *A.P.*, and whose sum is a multiple of 3, the sum of their squares is also the sum of another set of 3 squares, the 2 sets having no common term.”

The proposed solution is as follows:—

“Let $3m$, $21m$, $30m$ be the three Numbers: then

$$3m + 21m + 30m = 3 \times 18m.$$

Also $(3m)^2 + (21m)^2 + (30m)^2 = (6m)^2 + (15m)^2 + (33m)^2 = (5m)^2 + (13m)^2 + (34m)^2 = (10m)^2 + (17m)^2 + (31m)^2 = (14m)^2 + (23m)^2 + (25m)^2$.”

Now, if we denote, by ‘ α ’, the property “which cannot be arranged in *A.P.*, and whose sum is a multiple of 3,” and, by ‘ β ’, the property “the sum of whose squares is also the sum of another set of 3 squares, the 2 sets having no common term,” we see that all, that this writer has succeeded in proving, is that *certain selected Numbers*, which have property ‘ α ’, have also property ‘ β ’: but this does not prove my Theorem, viz. that *any Numbers whatever*, which have property ‘ α ’, have also property ‘ β ’. If his argument were arranged in a syllogistic form, it would be found to assume a quite untenable Major Premiss, viz. “that, which is true of *certain selected Numbers* which have property ‘ α ’, is true of *any Numbers whatever*, which have property ‘ α ’.”

Introduction

Nearly all of the following seventy-two Problems are veritable “Pillow-Problems”, having been solved, in the head, while lying awake at night. (I have put on record the exact dates of some.) No. 37 and one or two others belong to the daylight, having been solved while taking a solitary walk; but every one of them was worked out, to the very end, before drawing any diagram or writing down a single word of the solution. I generally wrote down the *answer*, first of all: and *afterwards* the question and its solution. For example, in No. 70, the very first words I wrote down were as follows:—“(1) down back-edge; up again; down again; and so on; (2) about $\cdot 7$ of the way down the back-edge; (3) about $18^\circ 18'$; (4) about 14° .” These answers are not quite correct; but at least they are *genuine*, as the results of *mental work only*. “A poor thing, Sir, but mine own!”

Quoted from *As You Like It* by William Shakespeare

My motive, for publishing these Problems, with their mentally-worked solutions, is most certainly *not* any desire to display powers of mental calculation. Mine, I feel sure, are nothing out-of-the-way; and I have no doubt there are many mathematicians who could produce, mentally, much shorter and better solutions. It is not for such persons that I intend my little book; but rather for the much larger class of *ordinary* mathematicians, who perhaps have never tried this resource, when mental occupation was needed, and who will, I hope, feel encouraged—by seeing what can be done, after a little practice, by one of *average* mathematical powers—to try the experiment for themselves, and find in it as much advantage and comfort as I have done.

The word “comfort” may perhaps sound out of place, in connection with so entirely *intellectual* an occupation; but it will, I think, come home to many who have known what it is to be haunted by some worrying subject of thought, which no effort of will is able to banish. Again and again I have said to myself, on lying down at night, after a day embittered by some vexatious matter, “I will *not* think of it any more! I have gone through it all, thoroughly. It can do no good whatever to go through it again. I *will* think of something else!” And in another ten minutes I have found myself, once more, in the very thick of the miserable business, and torturing myself, to no purpose, with all the old troubles.

Now it is not possible—this, I think, all psychologists will admit—by any effort of volition, to carry out the resolution “I will *not* think of so-and-so.” (Witness the common trick, played on a child, of saying “I’ll give you a penny,

if you'll stand in that corner for five minutes, and *not once* think of strawberry-jam." No human child ever yet won the tempting wager!) But it *is* possible—as I am most thankful to know—to carry out the resolution "I *will* think of so-and-so." Once fasten the attention upon a subject so chosen, and you will find that the worrying subject, which you desire to banish, is *practically* annulled. It may recur, from time to time—just looking in at the door, so to speak; but it will find itself so coldly received, and will get so little attention paid to it, that it will, after a while, cease to be any worry at all.

Perhaps I may venture, for a moment, to use a more serious tone, and to point out that there are mental troubles, much worse than mere worry, for which an absorbing subject of thought may serve as a remedy. There are sceptical thoughts, which seem for the moment to uproot the firmest faith; there are blasphemous thoughts, which dart unbidden into the most reverent souls; there are unholy thoughts, which torture, with their hateful presence, the fancy that would fain be pure. Against all these some real mental *work* is a most helpful ally. That "unclean spirit" of the parable, who brought back with him seven others more wicked than himself, only did so because he found the chamber "swept and garnished", and its owner sitting with folded hands: had he found it all alive with the "busy hum" of active *work*, there would have been scant welcome for him and his seven!

Quoted from Luke
11:25

My purpose—of giving this encouragement to others—would not be so well fulfilled had I allowed myself, in writing out my solutions, to *improve* on the work done in my head. I felt it to be much more important to set down *what had actually been done in the head*, than to supply shorter or neater solutions, which perhaps would be much harder to do without paper. For example, a Long-Multiplication sum (say the multiplying together of two numbers of 7 digits) is no doubt best done, on *paper*, by beginning at the unit-end, and writing out 7 rows of figures, and adding up the columns in the usual way. But it would be very difficult indeed—to *me* quite impossible—to do such a thing in the *head*. The only chance seems to be to begin with the *millions*, and get *them* properly grouped; then the hundred-thousands, adding the results to the previous one; and so on. Very often it seems to happen, that the easiest *mental* process looks decidedly lengthy and round-about when committed to paper.

When I first tried this plan, easy geometrical problems were all I could manage; and, even in these, I had to pause from time to time, in order to re-draw the diagram, which *would* persist in getting 'rubbed-out'. Algebraical problems I avoided at first, owing to the provoking fact that, if one single coefficient escaped the memory, there was no resource but to begin the calculation all over again. But I soon got over both these difficulties, and found myself able to remember fairly large numerical co-efficients, and also to retain, in the mind's eye, fairly complex diagrams, even to the extent of *finding my way* from one part of the diagram to another. The *lettering* of the diagrams proved such a troublesome thing to keep in the memory, that I almost gave up using it, and learned to recognise Points by their *situation* only. In my MS. of No. 53, I find the following memorandum:—

"I had never set myself this Problem before the week ending Ap. 6, 1889. I tried it, two or three nights, lying awake; and finally worked it out on the night of Ap. 9. All the conclusions were worked out mentally before any use was made of pen and paper. While working it, I did not give *names* to any Points, except *A*, *B*, *C*, and *P*: I merely thought of them by their positions (e. g. 'the foot of

the perpendicular from P on BC ’).”

If any of my readers should feel inclined to reproach me with having worked too uniformly in the region of Common-place, and with never having ventured to wander out of the beaten tracks, I can proudly point to my one Problem in ‘Transcendental Probabilities’—a subject in which, I believe, *very* little has yet been done by even the most enterprising of mathematical explorers. To the casual reader it may seem abnormal, and even paradoxical; but I would have such a reader ask himself, candidly, the question “Is not Life itself a Paradox?”

To give the Reader some idea of the process of construction of these Problems, I will give the biography of No. 63. The history of one is, to a great extent, the history of all.

It was begun during the night of Sept. $\frac{3}{4}$, 1890, and completed during the following night. The idea had occurred to me, a short time previously, that something interesting might be found in the subject of what I may call ‘partially-regular’ Solids. The ‘regular’ Solids are provokingly few in number; and it would be hopeless to find any question, connected with them, that has not already been exhaustively analysed: some also of the ‘partially-regular’ Solids (e.g. rhomboidal crystals) have probably been similarly treated; but there seemed to be room for the invention of other such Solids.

Accordingly, I devised a Solid enclosed, above and below, by 2 equal and parallel Squares, having their centres in the same vertical line, and the upper one twisted round so that its sides should be parallel to the diagonals of the lower Square. Then I imagined the upper one raised until its corners formed the vertices of 4 equilateral Triangles, whose bases were the sides of the lower one. The Solid, thus obtained, was evidently enclosed by 2 Squares and 8 equilateral Triangles: and the Problem I set myself was to obtain its *Volume*.

There was no great difficulty in proving that the distance between the 2 Squares (taking each side as equal to ‘2’) was $2^{\frac{3}{4}}$. But, when I looked about for some Trigonometrical method for calculating the Volume, despair soon seized upon me! A calculable Prism could be cut out of the *middle* of the Solid, I saw: but the outlying projections completely baffled me. After a while, the happy idea occurred to me of trying Algebraical Geometry, and regarding each facet as the base of a Pyramid, having its vertex at the centre of the Solid, which I decided to take as the Origin. I saw at once that I could calculate the co-ordinates of all the vertical Points, thence obtain equations to the Planes containing the facets, and thence calculate their distance from the Origin, which would be the altitudes of the Pyramids. Also it was evident that a sample Pyramid would suffice. I worked out a value for the Volume, that first night; but the thing got into a tangle, and I felt pretty sure I had got it wrong.

The next night I began again, and worked it all through from the beginning. In the morning the *answer* was clear in my memory, and I wrote it down at once; and did not write out the Problem, and its solution, until later in the day, when I was well pleased to find the written proof confirm the result I had arrived at in the hours of darkness.

It is not, perhaps, much to be wondered at that, when these Problems came to be re-written and arranged for publication, a good many mistakes were discovered. Some were so bad as quite to spoil the solutions in which they occurred: these Problems I have omitted altogether. The others I have corrected, in the solutions as given in Chapter III: but, that I may not be credited with an amount of accuracy, as a computator, which I am well aware I do not possess, I here

append a list of them.

In No. 7, in the denominator ' $2 \cap A$ ', I forgot the '2'.¹

In No. 10, I failed to notice that the 3 coins might *also* be a half-crown and 2 shillings.

In No. 13, in the last line but one, I put ' $2bc.ca$ ', instead of ' $4bc.ca$ '.

In No. 32, I brought out the arithmetical value as '358520', instead of '358550'.

In No. 38, I got the decimal wrong, making it .476 instead of .478, and thus brought out the answer as .042 instead of .044.

In No. 44, I said that the denominator would be of the form $(10^n - 1) \cdot 10^m$. This last factor is superfluous: i. e. $m = 0$.

In No. 50, I made a mistake near the end, bringing out $\frac{41}{108}$, instead of $\frac{50}{108}$.

In No. 55, I put 'tan' for 'sin'.

In No. 57, in the last paragraph, I replaced the denominator ' $a \cap B \cap C$ ' by (what I imagined to be its equivalent) ' $2m$ '. Apparently I was under the delusion that ' $a \cap B \cap C$ ' was the same thing as ' $\cap A.bc$ '!

In No. 70, section (3), I forgot to add in the .45, thus making the answer half a degree wrong. And, in section (4), I forgot to add in the 53, thus again making the answer half a degree wrong.

Let me, in conclusion, gratefully acknowledge the valuable assistance I have received from Mr. F. G. Brabant, M.A., of Corpus Christi College, Oxford, who has most patiently and carefully gone through my proofs, first working out each result independently, and has thus detected many mistakes which had escaped my notice. He has also supplied, for No. 59, a much neater answer than mine, viz. $\frac{abc}{3} \cdot \sqrt{\square A \square B \square C}$.

Other mistakes may perchance, having eluded us both, await the penetrating glance of some critical reader, to whom the joy of discovery, and the intellectual superiority which he will thus discern, in himself, to the auther of this little book, will, I hope, repay to some extent the time and trouble its perusal may have cost him!

Chapter I.

Questions

1. (1488)²

Find a general formula for two squares whose sum = 2. [24/3/84]

2. (1489)

In a given Triangle to place a line parallel to the base, such that the portions of sides, intercepted between it and the base, shall be together equal to the base.

3. (1490)

If the sides of a Tetragon pass through the vertices of a Parallelogram, and if three of them are bisected at those vertices: prove that the fourth is so also.

4. (1490)

In a given acute-angled Triangle inscribe a Triangle, whose sides make, at each of the vertices, equal angles with the sides of the given Triangle. [19/4/76]

5. (1482, 1491)

A bag contains one counter, known to be either white or black. A white counter is put in, the bag shaken, and a counter drawn out, which proves to be white. What is now the chance of drawing a white counter? [8/9/87]

6. (1482, 1491)

Given lengths of lines drawn, from vertices of Triangle, to middle points of opposite sides, to find its sides and angles.

7. (1483, 1492)

Given 2 adjacent sides, and the included angle, of a Tetragon; and that the angles, at the other ends of these 2 sides, are right: find (1) remaining sides, (2) area. [4 or 5/89]

²The numerals, placed in parentheses, indicate the pages where the corresponding matter may be found.

8. (1483, 1492)

Some men sat in a circle, so that each had 2 neighbours; and each had a certain number of shillings. The first had 1/ more than the second, who had 1/ more than the third, and so on. The first gave 1/ to the second, who gave 2/ to the third, and so on, each giving 1/ more than he received, as long as possible. There were then 2 neighbours, one of whom had 4 times as much as the other. How many men were there? And how much had the poorest man at first? [3/89]

9. (1493)

Given two Lines meeting at a Point, and given a Point lying within the angle contained by them: draw, from the given Point, two lines, at right angles to each other, and forming with the given Lines and the line joining their intersection to the given Point, two equal Triangles. [11/76]

10. (1483, 1494)

A triangular billiard-table has 3 pockets, one in each corner, one of which will hold only one ball, while each of the others will hold two. There are 3 balls on the table, each containing a single coin. The table is tilted up, so that the balls run into one corner, it is not known which. The ‘expectation’, as to the contents of the pocket, is 2/6. What are the coins? [8/90]

11. (1483, 1494)

A Triangle ABC has another $A'B'C'$ inscribed in it, so that $\angle BA'C' = \angle CB'A' = \angle AC'B' = \theta$; thus making it similar to the first Triangle. Find ratio between homologous sides. And solve for “ $\theta = 90^\circ$ ”.

The Triangles can be proved similar thus:—

$$\angle C'A'B' + \angle B'A'C = \text{supp. of } \theta,$$

$$\angle B'A'C + \angle A'CB' = \text{supp. of } \theta;$$

\therefore these pairs are equal; $\therefore \angle C'A'B' = C$.

Hence $\angle A'B'C' = A$, and $\angle B'C'A' = B$.

Let $C'A' = ka$; $\therefore A'B' = kb$, and $B'C' = kc$. We have to find k . [31/3/82]

12. (1483, 1495)

Given the semi-perimeter and the area of a Triangle, and also the volume of the cuboid whose edges are equal to the sides of the Triangle: find the sum of the squares of its sides. [23/1/91]

13. (1483, 1495)

Given the lengths of the radii of two intersecting Circles, and the distance between their centres: find the area of the Tetragon formed by the tangents at the points of intersection. [3/89]

14. (1496)

Prove that 3 times the sum of 3 squares is also the sum of 4 squares. [2/12/81]

15. (1496)

If a Figure be such that the opposite angles of every inscribed Tetragon are supplementary: the Figure is a Circle. [3/91]

16. (1483, 1497)

There are two bags, one containing a counter, known to be either white or black; the other containing 1 white and 2 black. A white is put into the first, the bag shaken, and a counter drawn out, which proves to be white. Which course will now give the best chance of drawing a white—to draw from one the two bags without knowing which it is, or to empty one bag into the other and then draw? [10/87]

17. (1497)

In a given Triangle place a line parallel to the base, such that if, from its ends, lines be drawn, parallel to the sides and terminated by the base, they shall be together equal to the first line. [3/89]

18. (1484, 1498)

Find a Point, in the base of a given Triangle, such that, if from it perpendiculars be dropped upon the sides, the line joining their extremities shall be parallel to the base. (1) Trigonometrically. (2) Geometrically [11/89]

19. (1484, 1498)

There are 3 bags; one containing a white counter and a black one, another two white and a black, and the third 3 white and a black. It is not known in what order the bags are placed. A white counter is drawn from one of them, and a black from another. What is the chance of drawing a white counter from the remaining bag?

20. (1499)

In the base of a given Triangle find a Point such that if from it two lines be drawn, terminated by the sides, one being perpendicular to the base and one to the left-hand side, they shall be equal. [5/88]

21. (1484, 1500)

Sum, (1) to n terms, (2) to 100 terms, the series

$$1.3.5 + 2.4.6 + \&c.$$

[7/4/89]

22. (1484, 1500)

Given the 3 'altitudes' of a Triangle: find its (1) sides, (2) angles, (3) area.

[4/6/89]

23. (1484, 1501)

A bag contains 2 counters, each of which is known to be black or white. 2 white and a black are put in, and 2 white and a black drawn out. Then a white is put in, and a white drawn out. What is the chance that it now contains 2 white?

[25/9/87]

24. (1484, 1502)

If, from the vertices of a triangle ABC , the lines AD , BE , CF be drawn, intersecting at O : find the ratio $\frac{DO}{OA}$ in terms of the two ratios $\frac{EO}{OB}$, $\frac{FO}{OC}$. [5/86]

25. (1484, 1502)

If ' ϵ ', ' α ', ' λ ' represent proper fractions; and if, in a certain hospital, ' ϵ ' of the patients have lost an eye, ' α ' an arm, and ' λ ' a leg: what is the least possible number who have lost all three? [7/2/76]

Other version:
→ 9.10, p. 1449

26. (1503)

Within a given Triangle place a similar Triangle, whose area shall have to its area a given ratio less than unity, whose sides shall be parallel to its sides, and whose vertices shall be equidistant from its vertices. [4/89]

27. (1484, 1504)

There are 3 bags, each containing 6 counters; one contains 5 white and one black; another, 4 white and 2 black; the third, 3 white and 3 black. From two of the bags (it is not known which) 2 counters are drawn, and prove to be black and white. What is the chance of drawing a white counter from the remaining bag? [4/3/80]

28. (1484, 1504)

If the sides of a given Triangle, taken cyclically, be divided in extreme and mean ratio; and if the Points be joined: find the ratio which the area of the Triangle, so formed, has to the area of the given Triangle. [12/78]

29. (1505)

Prove that the sum of 2 different squares, multiplied by the sum of 2 different squares, gives the sum of 2 squares in 2 different ways. [3/12/81]

30. (1505)

In a given Triangle, to place a line parallel to the base, such that if from its extremities lines be drawn, to the base, parallel to the sides, they shall be together double of the inscribed Line. [15/3/89]

31. (1484, 1506)

On July 1, at 8 a.m. by my watch, it was 8*h.* 4*m.* by my clock. I took the watch to Greenwich, and, when it said 'noon', the true time was 12*h.* 5*m.* That evening, when the watch said '6*h.*', the clock said '5*h.* 59*m.*'

On July 30, at 9 a.m. by my watch, it was 8*h.* 57*m.* by my clock. At Greenwich, when the watch said '12*h.* 10*m.*', the true time was 12*h.* 5*m.* That evening, when the watch said '7*h.*', the clock said '6*h.* 58*m.*'

My watch is only wound up for each journey, and goes uniformly during any one day: the clock is always going, and goes uniformly.

How am I to know when it is *true* noon on July 31? [14/3/89]

32. (1484, 1506)

Sum the series 1.5 + 2.6 + &c. (1) to n terms; (2) to 100 terms. [7/4/89]

33. (1506)

Inscribe in a given Circle the maximum Tetragon having 2 parallel sides, one double the other.

34. (1507)

From a given Point draw 2 Lines, one to the centre of a given Circle, and the other cutting off from it a Segment containing an angle equal to that between the Lines. [21/12/74]

35. (1508)

With a given Triangle, to describe a Circle, cutting each side in two points, such that, if radii be drawn perpendicular to the sides, they are divided by the sides in given ratios. [11/76]

36. (1509)

In a given Triangle, to draw a line, from a Point on one side of it, to a Point on the other side, perpendicular to one of these sides, and equal to the sum of the portions, of these sides, intercepted between it and the base. [3/89]

37. (1485, 1509)

Two given Circles intersect, so that their common chord subtends angles of 30° and 60° at their centres. What fraction of the smaller Circle is within the larger? [12/91]

38. (1485, 1510)

There are 3 bags, 'A', 'B', and 'C'. 'A' contains 3 red counters, 'B' 2 red and one white, 'C' one red and 2 white. Two bags are taken at random, and a counter drawn from each: both prove to be red. The counters are replaced, and the experiment is repeated with the same two bags: one proves to be red. What is the chance of the other being red? [3/76]

39. (1485, 1510)

A and B begin, at 6 a. m. on the same day, to walk along a road in the same direction, B having a start of 14 miles, and each walking from 6 a. m. to 6 p. m. daily. A walks 10 miles, at a uniform pace, the first day, 9 the second, 8 the third and so on: B walks 2 miles, at a uniform pace, the first day, 4 the second, 6 the third, and so on. When and where are they together? [16/3/78]

40. (1511)

In a given Triangle, whose base-angles are acute, draw two lines, at right angles to the base, and together equal to the line drawn, from the vertex, at right angles to the base, and such that

- (1) they are equidistant from the line drawn from the vertex;
- (2) they are equidistant from the ends of the base. [5/76]

41. (1485, 1512)

My friend brings me a bag containing four counters, each of which is either black or white. He bids me draw two, both of which prove to be white. He then says "I meant to tell you, before you began, that there was at least *one* white counter in the bag. However, you know it now, without my telling you. Draw again."

- (1) What is now my chance of drawing white?
- (2) What would it have been, if he had not spoken? [9/87]

42. (1485, 1512)

If the angles of a given Triangle be bisected, and if lines be drawn, through its vertices, at right angles to the bisectors, so as to form a fresh Triangle: find the ratio of the area of this Triangle to the area of the given Triangle.

43. (1513)

From the ends of the base of a given Triangle draw two lines, intersecting, terminated by the sides, and forming an isosceles Triangle at the base, and a Tetragon, equal to it, at the vertex. [2/82]

44. (1513)

If a, b be two numbers prime to each other, a value may be found for n which will make $(a^n - 1)$ a multiple of b . [18/3/81]

45. (1485, 1514)

If an infinite number of rods be broken: find the chance that one at least is broken in the middle. [5/84]

46. (1515)

In a given Triangle, whose base is divided at a given Point, inscribe a Triangle, having its angles equal to given angles, and having an assigned vertex at the given Point. [19/11/87]

47. (1485, 1516)

Solve the 2 Indeterminate Equations

$$\left. \begin{array}{l} \frac{x}{y} = x - z; \\ \frac{x}{z} = x - y; \end{array} \right\} \begin{array}{l} (1) \\ (2) \end{array}$$

and find the limits, if any, between which the *real* values lie. [12/90]

48. (1517)

If semicircles be described, externally, on the sides of a given Triangle; and if their common tangents be drawn; and if their lengths be α, β, γ : prove that

$$\left(\frac{\beta\gamma}{\alpha} + \frac{\gamma\alpha}{\beta} + \frac{\alpha\beta}{\gamma} \right)$$

is equal to the semiperimeter of the Triangle. [9/2/81]

49. (1485, 1517)

If four equilateral Triangles be made the sides of a square Pyramid: find the ratio which its volume has to that of a Tetrahedron made of the Triangles. [16/11/86]

50. (1485, 1518)

There are 2 bags, H and K , each containing 2 counters: and it is known that each counter is either black or white. A white counter is added to bag H , the bag is shaken up, and one counter transferred (without looking at it) to bag K , where the process is repeated, a counter being transferred to bag H . What is now the chance of drawing a white counter from bag H ?

51. (1519)

From a given Point, in one side of a given Triangle, to draw a line, terminated by the other side, so that, if from its ends lines be drawn at right angles to the base, their sum shall be equal to the first line. [12/81]

52. (1485, 1520)

Five beggars sat down in a circle, and each piled up, in a heap before him, the pennies he had received that day: and the five heaps were equal.

Then spake the eldest and wisest of them, unfolding, as he spake, an empty sack.

“My friends, let me teach you a pretty little game! First, I name myself ‘Number One,’ my left-hand neighbour ‘Number Two,’ and so on to ‘Number Five.’ I then pour into this sack the whole of my earnings for the day, and hand it on to him who sits next but one on my left, that is, ‘Number Three.’ *His* part in the game is to take out of it, and give to his two neighbours, so many pennies as represent their names (that is, he must give four to ‘Number Four’ and two to ‘Number Two’); he must then put *into* the sack half as much as it contained when he received it; and he must then hand it on just as I did, that is, he must hand it to him who sits next but one on his left—who will of course be ‘Number Five.’ *He* must proceed in the same way, and hand it on to ‘Number Two,’ from whom the sack will find its way to ‘Number Four,’ and so to me again. If any player cannot furnish, from his own heap, the whole of what he has to put into the sack, he is at liberty to draw upon any of the other heaps, *except mine!*”

The other beggars entered into the game with much enthusiasm: and in due time the sack returned to ‘Number One,’ who put into it the two pennies he had received during the game, and carefully tied up the mouth of it with a string. Then, remarking “it is a *very* pretty little game,” he rose to his feet, and hastily quitted the spot. The other four beggars gazed at each other with rueful countenances. Not one of them had a penny left!

How much had each at first? [16/2/89]

53. (1485, 1520)

In a triangular billiard-table, a Point is given by its trilinear co-ordinates. A ball, starting from the given Point, strikes the three sides, and returns to the starting-point. Find, in terms of the trilinear co-ordinates and of the angles of the Triangle, the Point where the ball strikes the second side. [6/4/89]

54. (1486, 1522)

Cut off, from a given Triangle, by lines parallel to the sides, 3 Triangles, so that the remaining Hexagon may be equilateral. Also find the lengths of its sides in terms of the sides of the given Triangle: and the ratios in which the sides of the given Triangle are divided. [18/4/86]

55. (1522)

Given three cylindrical towers on a Plane: find a Point, on the Plane, from which they shall look the same width. [20/12/74]

56. (1486, 1523)

Given the 3 altitudes of a Triangle: construct it. [27/6/84]

57. (1486, 1523)

In a given Triangle describe three Squares, whose bases shall lie along the sides of the Triangle, and whose upper edges shall form a Triangle;

(1) geometrically; (2) trigonometrically. [27/1/91]

58. (1487, 1525)

Three Points are taken at random on an infinite Plane. Find the chance of their being the vertices of an obtuse-angled Triangle. [20/1/84]

59. (1487, 1526)

Given a Tetrahedron, having every edge equal to the opposite edge, so that its facets are all (when looked at from the outside) identically equal: find its volume in terms of its edges. [8/90]

60. (1487, 1528)

Given a Triangle ABC , and that its base BC is divided at D in the ratio m to n : find the angles BAD , CAD . [21/3/90]

61. (1529)

Prove that, if any 3 Numbers be taken, which cannot be arranged in $A.P.$, and whose sum is a multiple of 3, the sum of their squares is also the sum of another set of 3 squares, the 2 sets having no common term. [1/12/81]

Other version:
→ 9.16, p. 1461

62. (1530)

Given two Lines meeting at a Point, and given a Point lying within the angle contained by them: draw a line, through the given Point, and forming, with the given Lines, the least possible Triangle. [12/76]

63. (1487, 1531)

Given 2 equal Squares, in different horizontal planes, having their centres in the same vertical line, and so placed that the sides of each are parallel to the diagonals of the other, and at such a distance apart that, by joining neighbouring vertices, 8 equilateral Triangles are formed: find the volume of the solid thus enclosed. [3, 4/9/90]

64. (1532)

Given a Triangle, and a Point within it such that its distance from one of the sides is less than its distance from either of the others: describe a Circle, with given Point as centre, such that its intercepts on the sides may be equal to the sides of a right-angled Triangle. [18/12/74]

65. (1532)

How many shapes are there for Triangles which have all their angles aliquot parts of 360° ? [5/89]

66. (1487, 1534)

Given that there are 2 counters in a bag, as to which all that was originally known was that each was either white or black. Also given that the experiment has been tried, a certain number of times, of drawing a counter, looking at it, and replacing it; that it has been white every time; and that, as a result, the chance of drawing white, next time, is $\frac{\alpha}{\alpha+\beta}$. Also given that the same experiment is repeated m times more, and that it still continues to be white every time. What would then be the chance of drawing white? [9/89]

67. (1487, 1536)

If a regular Tetrahedron be placed, with one vertex downwards, in a socket which exactly fits it, and be turned round its vertical axis, through an angle of 120° , raising it only so much as is necessary, until it again fits the socket: find the Locus of one of the revolving vertices. [27/1/72]

68. (1487, 1537)

Five friends agreed to form themselves into a Wine-Company (Limited). They contributed equal amounts of wine, which had been bought at the same price. They then elected one of themselves to act as Treasurer; and another of them undertook to act as Salesman, and to sell the wine at 10% over cost-price.

The first day the Salesman drank one bottle, sold some, and handed over the receipts to the Treasurer.

The second day he drank none, but pocketed the profits on one bottle sold, and handed over the rest of the receipts to the Treasurer.

That night the Treasurer visited the Cellars, and counted the remaining wine. "It will fetch just £11," he muttered to himself as he left the Cellars.

The third day the Salesman drank one bottle, pocketed the profits on another, and handed over the rest of the receipts to the Treasurer.

The wine was now all gone: the Company held a Meeting, and found to their chagrin that their profits (i. e. the Treasurer's receipts, less the original value of the wine) only cleared $6d.$ a bottle on the whole stock. These profits had accrued in 3 equal sums on the 3 days (i. e. the Treasurer's receipts for the day, less the original value of the wine taken out during the day, had come to the same amount every time); but of course only the Salesman knew this

(1) How much wine had they bought? (2) At what price? [28/2/89]

69. (1487, 1537)

If, from each of the angles of a given Triangle ABC , taken cyclically, a certain proper fraction of it be cut off, the arithmetical values of the 3 fractions being represented by ' k, l, m '; and if it be given that the Triangle, formed by the lines so drawn, is similar to the given one, the angle, formed by the lines drawn from B and C , being equal to A , and so on: find k, l, m , as similar functions of a

single variable. Also find the ratio which each side of the second Triangle bears to the corresponding side of the first. [8/89]

70. (1488, 1539)

Let an equilateral and equiangular Tetrahedron be placed with one facet in front: and suppose a series of triangles, equal to that facet, constructed in the Plane containing that facet, and having a base common with it; and that they are all wrapped round the Tetrahedron as far as they will go. Find (1) the locus of their vertices; (2) the situation of the vertex of the one whose left-hand base-angle is 15° ; (3) the left-hand base-angle of the one which (wrapped round towards the right) covers portions of all four facets of the Tetrahedron, and whose vertex coincides with *its* vertex; (4) the left-hand base-angle of the one which (similarly treated) occupies all four facets, and then the front and right-hand facet for the second time, and whose vertex coincides with the distal vertex of the base of the Tetrahedron.

71. (1540)

In a given Triangle place a Hexagon having its opposite sides equal and parallel, and three of them lying along the sides of the Triangle, and such that its diagonals intersect in a given Point. [14/12/74]

72. (1488, 1541)

A bag contains 2 counters, as to which nothing is known except that each is either black or white. Ascertain their colours without taking them out of the bag. [8/9/87]

Chapter II.

Answers

5. (1472, 1491)

Two-thirds.

6. (1472, 1491)

Calling the sides ' $2a$ ', ' $2b$ ', ' $2c$ ', and the lines ' α ', ' β ', ' γ ', we have

$$a^2 = \frac{-\alpha^2 + 2\beta^2 + 2\gamma^2}{9},$$

$$\sphericalangle A = \frac{5\alpha^2 - \beta^2 - \gamma^2}{2\sqrt{2\alpha^2 - \beta^2 + 2\gamma^2} \cdot \sqrt{2\alpha^2 + 2\beta^2 - \gamma^2}}.$$

7. (1472, 1492)

Let AB, AD be given sides, and B, D the right \angle s; and let $AB = b, AD = d$.

$$(1) BC = \frac{d - b \cos A}{\sin A}; CD = \frac{b - d \cos A}{\sin A};$$

$$(2) \text{area} = \frac{2bd - (b^2 + d^2) \cos A}{2 \sin A}.$$

8. (1473, 1492)

7 men; 2 shillings.

10. (1473, 1494)

Either 2 florins and a sixpence; or else a half-crown and 2 shillings.

11. (1473, 1494)

The required ratio is equal to

$$\frac{\cos A \cos B \cos C}{\cos \theta (1 + \cos A \cos B \cos C) + \cos \theta \cos A \cos B \cos C}.$$

If $\theta = 90^\circ$, this = $\frac{\cos A \cos B \cos C}{1 + \cos A \cos B \cos C}$.

12. (1473, 1495)

If s = semi-perimeter, m = area, v = volume; then

$$a^2 + b^2 + c^2 = 2 \left(s^2 - \frac{v}{s} - \frac{m^2}{s^2} \right).$$

13. (1474, 1495)

If '2M' = area of Tetragon whose vertices are the Centres and the Points of intersection; and if its sides be 'a', 'b', and its diagonal, joining the Centres, 'c': required area

$$= \frac{32M^3}{(b^2 + c^2 - a^2) \cdot (c^2 + a^2 - b^2)}.$$

16. (1474, 1497)

The first course gives chance = $\frac{1}{2}$, the second, $\frac{5}{12}$. Hence the first is best.

18. (1474, 1498)

(1) Divide base BC , at E , so that $\frac{BE}{EC} = \frac{\cap 2C}{\cap 2B}$.

(2) At B, C , make right angles ABD, ACD ; and join AD cutting BC at E , which is the required Point.

19. (1474, 1498)

Eleven-seventeenths.

21. (1475, 1500)

(1) $\frac{n \cdot \overline{n+1} \cdot \overline{n+4} \cdot \overline{n+5}}{4}$; (2) 27,573,000.

22. (1475, 1500)

Calling the given altitudes ' α, β, γ '; and the fraction $\frac{2\alpha^2\beta^2\gamma^2 \cdot (\alpha^2 + \beta^2 + \gamma^2) - (\beta^4\gamma^4 + \gamma^4\alpha^4 + \alpha^4\beta^4)}{4\alpha^4\beta^4\gamma^4}$

' k^2 ,

(1) $a = \frac{1}{k\alpha}$, &c.;

(2) $\cap A = k\beta\gamma$, &c.;

(3) area = $\frac{1}{2k}$

23. (1475, 1501)

Two-fifths.

24. (1475, 1502)

$\frac{DO}{DA} + \frac{EO}{EB} + \frac{FO}{FC} = 1$; whence any one can be found in terms of the other two.

25. (1475, 1502)

$\epsilon + \alpha + \lambda - 2$.

27. (1475, 1504)

Seventeen-twentyfifths.

28. (1476, 1504)

$7 - 3\sqrt{5}$.

31. (1476, 1506)

When the clock says '12h. 2m. 29 $\frac{277}{288}$ sec.'

32. (1476, 1506)

(1) $\frac{n \cdot (n+1) \cdot (2n+13)}{6}$;

(2) 358550.

37. (1477, 1509)

$\frac{4+\sqrt{3}}{12} - \frac{1+\sqrt{3}}{2\pi}$; i. e. about .044.

38. (1477, 1510)

Fortynine-seventytwoths.

39. (1477, 1510)

They meet at end of $2d$. $6h.$, and at end of $4d.$: and the distances are 23 miles, and 34 miles.

41. (1477, 1512)

(1) Seven-twelfths. (2) One-half.

42. (1477, 1512)

$$\frac{abc}{2(s-a).(s-b).(s-c)}$$

45. (1478, 1514)

.6321207 &c.

47. (1478, 1516)

One set of values is 0, 0, 0.

A 2nd set is $x = y = 0$; z has any value.

A 3rd is $x = z = 0$; y has any value.

And the 4th set is $x = \frac{k^2}{k-1}$, $y = z = k$; where k has any value.

If x has any positive value less than 4, y and z are unreal.

49. (1478, 1517)

Two.

50. (1478, 1518)

Seventeen-twentysevenths.

52. (1479, 1520)

$2l$. $18s$. $0d$.

53. (1479, 1520)

The portion, cut off from the second side, is equal to

$$\frac{(\alpha \cap C + \gamma \cap A)(2\gamma \sqcup A + \beta)}{\alpha \sqcup C + \gamma \sqcup A + \beta} + \frac{\beta \sqcup A + \gamma \sqcup 2A}{\cap A}.$$

54. (1479, 1522)

Side AB must be divided at D, G , so that

$$AD : DG : GB :: \frac{1}{a} : \frac{1}{c} : \frac{1}{b};$$

and similarly for the other sides. Also each side of the Hexagon = $\frac{1}{\frac{1}{a} + \frac{1}{b} + \frac{1}{c}}$.

56. (1480, 1523)

Draw BC, CE, BD equal to the given altitudes, so as to form right \angle s at B and C : and produce DB, EC . Join DC , and draw $CF \perp$ to it. Join EB , and draw $BG \perp$ to it. With centre B , and distance BF , describe a circle: with centre C , and distance CG describe another: let them meet at A : and join AB, AC . Triangle ABC may be proved to be similar to required Triangle. The rest of the construction is obvious.

57. (1480, 1523)

(1) *Geometrically.*

If Squares be described externally on the sides of the given Triangle; and if their outer edges be produced to form a new Triangle; and if the sides of the given Triangle be divided similarly to those of the new Triangle: their cenral portions will be the bases of the required Squares.

(2) *Trigonometrically.*

If a, b, c be the sides of the given Triangle, and m its area; and if x, y, z be the sides of the required Squares: then

$$\frac{a}{x} = \frac{b}{y} = \frac{c}{z} = \frac{a^2 + b^2 + c^2}{2m} + 1.$$

58. (1480, 1525)

$$\frac{3}{8 - \frac{6\sqrt{3}}{\pi}}$$

59. (1480, 1526)

Calling lengths of the 3 pairs of edges 'a, b, c', and the corresponding \angle s, in each facet, 'A, B, C'; volume =

$$\frac{abc}{6} \cdot \sqrt{1 - (\Delta^2 A + \Delta^2 B + \Delta^2 C) + 2\Delta A \Delta B \Delta C}$$

60. (1480, 1528)

$\cot BAD = \frac{(m+n)\cot A + n\cot B}{m}$; similarly, $\cot CAD = \frac{(m+n)\cot A + m\cot C}{n}$.

63. (1480, 1531)

If each side of each Square = 2, the volume =

$$\frac{8 \cdot 2^{\frac{1}{4}} \cdot (\sqrt{2} + 1)}{3}$$

66. (1481, 1534)

$$\frac{2^m \cdot (\alpha - \beta) + \beta}{2^m \cdot (\alpha - \beta) + 2\beta}$$

67. (1481, 1536)

If the centre of the horizontal facet be taken as the Origin, and if the X-axis pass through one of the vertices of that facet, and the Y-axis be parallel to the opposite edge of that facet, and the Z-axis be perpendicular to that facet: and if the altitude (measured downwards) of the Tetrahedron be called 'h', and the intercept on the X-axis be called 'a': the Equations to the Locus are

$$(x + \sqrt{3} \cdot y) \cdot (h - z) = ah;$$

$$x^2 + y^2 = a^2.$$

68. (1481, 1537)

(1) 5 dozen; (2) 8/4 a bottle.

69. (1481, 1537)

(1) $k = \frac{\theta - B}{A}$; $l = \frac{\theta - C}{B}$; $m = \frac{\theta - A}{C}$.
 (2) Calling new Triangle 'A'B'C',

$$\frac{a'}{a} = \frac{b'}{b} = \frac{c'}{c} = 2 \Delta \theta.$$

70. (1482, 1539)

(1) Down the back-edge; up again; and so on. (2) about .7 of the way down the back-edge. (3) About 18.65° . (4) About 14.53° .

72. (1482, 1541)

One is black, and the other white.

Chapter III.

Solutions

1. (1472)

Let u, v be the Nos.

$$\text{Then } u^2 + v^2 = 2.$$

Evidently ' $(1+k), (1-k)$ ' is a form for the squares.

Also, if we write ' $2m^2$ ' for ' 2 ' (which will not interfere with the problem, as we can divide by m^2 , and get $\frac{u^2}{m^2} + \frac{v^2}{m^2} = 2$), the above form becomes ' $(m^2+k), (m^2-k)$ '.

Now, as these are *squares*, their resemblance to

$$'(a^2 + b^2 + 2ab), (a^2 + b^2 - 2ab)'$$

at once suggests itself; so that the problem depends on the known one of finding a, b , such that $(a^2 + b^2)$ is a square; and we can then take $2ab$ as k .

A general form for this is

$$\begin{aligned} a &= x^2 - y^2, \\ b &= 2xy; \\ \therefore a^2 + b^2 &= (x^2 + y^2)^2; \end{aligned}$$

\therefore the formula ' $u^2 + v^2 = 2m^2$ ' becomes

$$(x^2 - y^2 + 2xy)^2 + (x^2 - y^2 - 2xy)^2 = 2(x^2 + y^2)^2;$$

i. e. $(\frac{x^2 - y^2 + 2xy}{x^2 + y^2})^2 + (\frac{x^2 - y^2 - 2xy}{x^2 + y^2})^2 = 2.$

Q. E. F.

2. (1472)

(Analysis.)

Let ABC be the Triangle, and DE the required line, so that $BD+CE = BC$.
From BC cut off BF equal to BD ; then $CF = CE$.

Join DF, EF .

Now $\angle BDF = \angle BFD =$ [by I. 29] $\angle FDE$;

Similarly $\angle CEF = \angle FED$;

$\therefore \angle s BDE, CED$, are bisected by DF, EF , and F is centre of \odot escribed to $\triangle ADE$.

Drop, from F , $\perp s$ on BD, DE, EC ; then these $\perp s$ are equal.

Hence, if AF be joined, it bisects $\angle A$.

Hence construction.

(Synthesis.)

Bisect $\angle A$ by AF : from F draw $FB', FC', \perp AC, AB$: also draw $FA' \perp BC$ and equal to FB' : and through A' draw $DE \perp FA'$, i. e. $\parallel BC$. Then DE shall be line required.

$\therefore \angle s$ at A', B', C' , are right, and $FA' = FB' = FC'$,

$\therefore \angle s BDE, CED$, are bisected by DF, EF .

Now $\angle BFD = \angle FDA'$; \therefore it = $\angle BDF$; $\therefore BF = BD$;

Similarly $CF = CE$; $\therefore BC = BD + CE$.

Q. E. F.

3. (1472)

Let $ABCD$ be the Tetragon; and let the 3 sides, AB , BC , CD , be bisected by vertices of the Parallelogram $EFGH$.

Join BD .

\therefore in Triangle BCD , sides BC , CD are bisected at F and G ,

$\therefore FG$ is parallel to BD ;

but EH is parallel to FG ;

$\therefore EH$ is parallel to BD ;

\therefore Triangles AEH , ABD are similar;

now AE is half of AB ;

$\therefore AH$ is half of AD .

Q. E. D.

4. (1472)

Let ABC be the given Triangle, and $A'B'C'$ the required Triangle, so that $\angle BA'C' = \angle CA'B'$, &c.

Evidently $A'C'$, $A'B'$ are equally inclined to a line drawn, from A' , $\perp BC$;

and so of the others; i. e. these \perp s bisect the \angle s at A' , B' , C' ;

\therefore they meet in the same Point. Draw them; let them meet at O ; and call the $\angle C'A'B'$ ' 2α ', and so on.

Now $(\beta + \gamma) = \pi - \angle B'OC' = A$;

$\therefore 2A = 2(\beta + \gamma) = \pi - 2\alpha$;

$\therefore \alpha = 90^\circ - A$;
 $\therefore \angle BA'C' = A$.
 Similarly, $\angle BC'A' = C$.
 \therefore Triangle $BC'A'$ is similar to Triangle BCA ; and so of the others;

$$\begin{aligned}
 \therefore BA' &= \frac{c}{a} \cdot BC' = \frac{c}{a} \cdot (c - AC'), \\
 &= \frac{c}{a} \cdot (c - \frac{b}{c} \cdot AB'), \\
 &= \frac{c^2}{a} - \frac{b}{a} \cdot (b - CB'), \\
 &= \frac{c^2}{a} - \frac{b^2}{a} + \frac{b}{a} \cdot \frac{a}{b} \cdot CA', \\
 &= \frac{c^2}{a} - \frac{b^2}{a} + a - BA'; \\
 \therefore 2BA' &= \frac{c^2 + a^2 - b^2}{a} = \frac{2ca \triangle B}{a}; \\
 \therefore BA' &= c \triangle B;
 \end{aligned}$$

$\therefore A'$ is foot of \perp dran, from A , to BC . Hence the construction is obvious.
 Q. E. F.

5. (1472, 1482)

At first sight, it would appear that, as the state of the bag, *after* the operation, is necessarily identical with its state *before* it, the chance is just what it was, viz. $\frac{1}{2}$. This, however, is an error.

The chances, *before* the addition, that the bag contains (a) 1 white (b) 1 black, are (a) $\frac{1}{2}$ (b) $\frac{1}{2}$. Hence the chances *after* the addition, that it contains (a) 2 white (b) 1 white, 1 black, are the same, viz. (a) $\frac{1}{2}$ (b) $\frac{1}{2}$. Now the probabilities, which these 2 states give to the observed event, of drawing a white counter, are (a) certainty (b) $\frac{1}{2}$. Hence the chances, after drawing the white counter, that the bag, before drawing, contained (a) 2 white (b) 1 white, 1 black, are proportional to (a) $\frac{1}{2} \cdot 1$ (b) $\frac{1}{2} \cdot \frac{1}{2}$; i. e. (a) $\frac{1}{2}$ (b) $\frac{1}{4}$; i. e. (a) 2 (b) 1. Hence the chances are (a) $\frac{2}{3}$ (b) $\frac{1}{3}$. Hence, after the removal of a white counter, the chances, that the bag now contains (a) 1 white (b) 1 black, are for (a) $\frac{2}{3}$ and for (b) $\frac{1}{3}$.

Thus the chance, of now drawing a white counter, is $\frac{2}{3}$. Q. E. F.

6. (1472, 1482)

Call sides '2a, 2b, 2c', and lines in question ' α, β, γ '.

Now $\sphericalangle ADB + \sphericalangle ADC = 0$;
 $\therefore \frac{a^2+a^2-4c^2}{2\alpha a} + \frac{a^2+a^2-4b^2}{2\alpha a} = 0$;
 $\therefore 2\alpha^2 + 2a^2 - 4b^2 - 4c^2 = 0$;
 $\therefore \alpha^2 = -a^2 + 2b^2 + 2c^2$.
 Similarly, $\beta^2 = 2a^2 - b^2 + 2c^2$;

$\gamma^2 = 2a^2 + 2b^2 - c^2$.
 To eliminate b, c , let us multiply by k, l, m , so taken that

$$2k - l + 2m = 0,$$

$$\text{and } 2k + 2l - m = 0;$$

$$\therefore 3(l - m) = 0; \text{ i. e. } l = m;$$

$$\therefore 2k = -l = -m;$$

hence we may make $k = -1, l = 2, m = 2$;

$$\therefore -\alpha^2 + 2\beta^2 + 2\gamma^2 = 9a^2;$$

$$\text{i. e. } a^2 = \frac{-\alpha^2 + 2\beta^2 + 2\gamma^2}{9};$$

$$\therefore BC \text{ (which } = 2a) = \frac{2}{3}\sqrt{-\alpha^2 + 2\beta^2 + 2\gamma^2}, \&c.,$$

which gives lengths of sides.

$$\text{Also } \sphericalangle A = \frac{b^2+c^2-a^2}{2bc}$$

$$= \frac{2\alpha^2 - \beta^2 + 2\gamma^2 + 2\alpha^2 + 2\beta^2 - \gamma^2 + \alpha^2 - 2\beta^2 - 2\gamma^2}{2 \cdot \sqrt{2\alpha^2 - \beta^2 + 2\gamma^2} \cdot \sqrt{2\alpha^2 + 2\beta^2 - \gamma^2}}$$

$$= \frac{5\alpha^2 - \beta^2 - \gamma^2}{\text{den.}}; \text{ and so for other angles.}$$

Q. E. F.

7. (1472, 1483)

Let AB, AD be given sides, and B, D the right \sphericalangle s; and let $AB = b, AD = d$.

Produce DC to meet AB -produced at E .

Now $AE = AD \cdot \sec A = d \sec A$;

$\therefore BE = d \sec A - b$.

$$\text{Also } BC = BE \cdot \tan E = (d \sec A - b) \cot A,$$

$$= \frac{d-b \sphericalangle A}{\sphericalangle A};$$

similarly, $CD = \frac{b-d \sphericalangle A}{\sphericalangle A}$, which answers (1).

Also area = $\frac{1}{2} \cdot (AB \cdot BC + AD \cdot DC)$,

$$= \frac{1}{2} \cdot \frac{b \cdot (d-b \sphericalangle A) + d \cdot (b-d \sphericalangle A)}{\sphericalangle A},$$

$$= \frac{2bd - (b^2 + d^2) \sphericalangle A}{2 \sphericalangle A}; \text{ which answers (2).}$$

Q. E. F.

8. (1473, 1483)

Let $m =$ No. of men, $k =$ No. of shillings possessed by the last (i. e. the poorest) man. After one circuit, each is a shilling poorer, and the moving heap contains

m shillings. Hence, after k circuits, each is k shillings poorer, the last man now having nothing, and the moving heap contains mk shillings. Hence the thing ends when the last man is again called on to hand on the heap, which then contains $(mk + m - 1)$ shillings, the penultimate man now having nothing, and the first man having $(m - 2)$ shillings.

It is evident that the first and the last man are the only 2 neighbours whose possessions can be in the ratio '4 to 1'. Hence either

$$mk + m - 1 = 4(m - 2),$$

ore else

$$4(mk + m - 1) = m - 2.$$

The first equation gives $mk = 3m - 7$, i. e. $k = 3 - \frac{7}{m}$, which evidently gives no integral values other than $m = 7, k = 2$.

The second gives $4mk = 2 - 3m$, which evidently gives no positive integral values.

Hence the answer is '7 men; 2 shillings'.

9. (1473)

Let AB, AC , be the given Lines, and P the given Point; and join AP .

Through A draw $EAF, \perp AP$, and bisected at A ; from E, F , draw EG, FH , parallel to AP , and meeting AB, AC , at G, H ; join GH , and on it describe a semicircle cutting AP at K ; and join KG, KH . Then $\angle GKH$ is a right angle. From P draw PL, PM , parallel to KG, KH .

Now Triangle APL has, to Triangle AKG , the duplicate ratio of AP to AK ; but so also has triangle APM to Triangle AKH ;

also Triangles AKG, AKH , are equal, being on the same base AK , and having equal altitudes AE, AF ;

\therefore Triangles APL, APM are equal: and $\angle LPM$ is evidently equal to $\angle GKH$; \therefore it is a right angle. Q. E. F.

10. (1473, 1483)

Call them x, y, z ; and let $x + y + z = s$.

The chance, that the pocket contains 2 balls, is $\frac{2}{3}$; and, if it does, the 'expectation' is the average value of

$$(y + z), (z + x), (x + y); \text{ i. e. it is } \frac{2s}{3}.$$

Also the chance, that it contains only one, is $\frac{1}{3}$; and, if it does, the 'expectation' is $\frac{s}{3}$.

$$\text{Hence total 'expectation' } = \frac{4s}{9} + \frac{s}{9} = \frac{5s}{9}.$$

$$\therefore \frac{5s}{9} = 30d.; \therefore s = 54d. = 4/6.$$

Hence the coins must be 2 florins and a sixpence; or else a half-crown and 2 shillings. Q. E. F.

11. (1473, 1483)

$$\text{Now } \frac{BA'}{A'C'} = \frac{\sin(B+\theta)}{\sin B}; \text{ and } \frac{A'C}{A'B'} = \frac{\sin \theta}{\sin C}.$$

$$\therefore BA = \frac{\sin(B+\theta)}{\sin B} \cdot ka; \text{ and } A'C = \frac{\sin \theta}{\sin C} \cdot kb$$

$$\text{but } BA' + A'C = a; \therefore k$$

$$\begin{aligned} &= \frac{a}{\frac{a \cdot \sin(B+\theta)}{\sin B} + \frac{b \sin \theta}{\sin C}} = \frac{\sin A}{\frac{\sin A \sin(B+\theta)}{\sin B} + \frac{\sin B \sin \theta}{\sin C}} \\ &= \frac{\sin A \sin B \sin C}{\sin A \sin(B+\theta) \sin C + \sin^2 B \sin \theta} \\ &= \frac{\sin A \sin B \sin C}{\sin A \sin C (\sin B \cos \theta + \cos B \sin \theta) + (1 - \sin^2 B) \sin \theta} \\ &= \frac{\sin A \sin B \sin C}{\sin \theta + \sin \theta (\sin A \sin C \cos B - \sin^2 B) + \cos \theta \sin A \sin B \sin C} \\ &= \frac{\sin A \sin B \sin C}{\sin \theta + \sin \theta \cos B (\sin A \sin C + \cos(A+C)) + \cos \theta \sin A \sin B \sin C} \\ &= \frac{\sin A \sin B \sin C}{\sin \theta (1 + \cos A \cos B \cos C) + \cos \theta \sin A \sin B \sin C}. \end{aligned}$$

Q. E. F.

$$\text{COR. Let } \theta = 90^\circ; \text{ then } k = \frac{\sin A \sin B \sin C}{1 + \cos A \cos B \cos C}.$$

12. (1473, 1483)

Let s = semi-perimeter, m = area, v = volume.

We know that $m = \sqrt{s \cdot (s - a) \cdot (s - b) \cdot (s - c)}$;

$$\therefore m^2 = s \cdot (s - a) \cdot (s - b) \cdot (s - c);$$

$$\begin{aligned} \therefore \frac{m^2}{s} &= s^2 - s^2 \cdot (a + b + c) + s \cdot (bc + ca + ab) - abc; \\ &= s^2 - 2s^2 + s \cdot (bc + ca + ab) - v; \end{aligned}$$

$$\therefore \frac{m^2}{s} + \frac{v}{s} + s^2 = bc + ca + ab;$$

$$\begin{aligned} \therefore 2 \cdot \left(\frac{m^2}{s} + \frac{v}{s} + s^2 \right) &= (a + b + c)^2 - (a^2 + b^2 + c^2); \\ &= 4s^2 - (a^2 + b^2 + c^2); \end{aligned}$$

$$\therefore a^2 + b^2 + c^2 = 2 \cdot \left(s^2 - \frac{v}{s} - \frac{m^2}{s^2} \right).$$

Q. E. F.

13. (1474, 1483)

Let A, B , be the centres of the Circles; C, D , their points of intersection; and $CFDE$ the Tetragon whose area is required.

Let the sides of the Triangle ABC be a, b, c ; and its $\angle s \alpha, \beta, \gamma$.

Then $CE = b \cdot \tan \alpha$, and $CF = a \cdot \tan \beta$.

Also $\angle FCE = \angle ACE + \angle FCB - \gamma = \pi - \gamma$;

$\therefore \cap FCE = \cap \gamma$.

Hence area of Triangle $FCE = \frac{1}{2} \cdot ab \cdot \tan \alpha \cdot \tan \beta \cdot \cap \gamma$;

\therefore area of Tetragon $= \frac{ab \cap \alpha \cap \beta \cap \gamma}{\cap \alpha \cap \beta}$.

Now, writing ' M ' for the area of Triangle ABC , we have

$$\cap \alpha = \frac{2M}{bc}, \cap \beta = \frac{2M}{ca}, \cap \gamma = \frac{2M}{ab};$$

$$\begin{aligned} \therefore \text{area of Tetragon} &= ab \cdot \frac{8M^3}{a^2b^2c^2} \cdot \frac{4bc.ca}{(b^2+c^2-a^2)(c^2+a^2-b^2)}; \\ &= \frac{32M^3}{(b^2+c^2-a^2) \cdot (c^2+a^2-b^2)}. \end{aligned}$$

Q. E. F.

14. (1474)

This simply expresses the identity

$$\begin{aligned} &3(a^2 + b^2 + c^2) \\ &= (a + b + c)^2 + (b^2 - 2bc + c^2) + (c^2 - 2ca + a^2) + (a^2 - 2ab + b^2) : \\ &= (a + b + c)^2 + (b - c)^2 + (c - a)^2 + (a - b)^2. \end{aligned}$$

Q. E. D.

Numerical Examples (not thought out).

$$\begin{aligned} 3(1^2 + 2^2 + 3^2) &= 6^2 + 1^2 + 2^2 + 1^2. \\ 3(1^2 + 3^2 + 7^2) &= 11^2 + 4^2 + 6^2 + 2^2. \end{aligned}$$

15. (1474)

Let $ABCD$ be an inscribed Tetragon. Join AC : and about Triangle ACD describe a Circle.

Now, if this Circle does not pass through B , let it cut CB , or CB produced, in B' or B'' . Join AB' , AB'' .

Then $\angle AB'C$, or $\angle AB''C$, is supplementary to $\angle ADC$;

\therefore it = $\angle ABC$; which is absurd;

\therefore this Circle does pass through B .

The same thing may be proved for any other Point on that portion, of the perimeter of the given Figure, which lies on the same side of AC as the Point D .

Similarly for the other portion.

Hence the Figure is a Circle.

Q. E. D.

16. (1474, 1483)

The 'a priori' chances of possible states of first bag are ' $W, \frac{1}{2}; B, \frac{1}{2}$ '. Hence chances, after putting W in, are ' $WW, \frac{1}{2}; WB, \frac{1}{2}$ '. The chances, which these give to the 'observed event', are $1, \frac{1}{2}$. Hence chances of possible states ' W, B ', after the event, are proportional to $1, \frac{1}{2}$; i. e. to $2, 1$; i. e. their actual values are $\frac{2}{3}, \frac{1}{3}$.

Now, in first course, chance of drawing W is $\frac{1}{2} \cdot \frac{2}{3} + \frac{1}{2} \cdot \frac{1}{3}$; i. e. $\frac{1}{2}$.

And, in second course, chances of possible states ' $WWBB, WBBB$ ' are $\frac{2}{3}, \frac{1}{3}$: hence chance of drawing W is $\frac{2}{3} \cdot \frac{1}{2} + \frac{1}{3} \cdot \frac{3}{4}$; i. e. $\frac{5}{12}$.

Hence *first* course gives best chance.

Q. E. F.

17. (1474)

(Analysis.)

Let ABC be the given Triangle, and DE the line required.

From D, E , draw DF, EG , parallel to the sides. Then $DF + EG = DE$.

Because BE is a Parallelogram, $\therefore DB = EG$;

similarly $EC = DF$;

$\therefore DB + EC = DE$.

Hence construction.

(Synthesis.)

Bisect $\angle s B, C$, by BH, CH , meeting at H ; through H draw DE parallel to BC ; and from D, E , draw DF, EG , parallel to AC, AB .

Because DE is parallel to BC ,

$\therefore \angle DHB = \text{alternate } \angle HBF = \angle DBH$;

$\therefore DB = DH$.

Similarly $EC = EH$.

$\therefore DB + EC = DE$.

Because BE, DC are Parallelograms,

$\therefore EG = DB$, and $DF = EC$;

$\therefore DF + EG = DE$.

Q. E. F.

18. (1474, 1484)

(1) Call required Point E . From E draw EF, EG *perp* sides. Join FG . From F, G , draw FH, GK *perp* BC . Call BE ' x ', and EC ' y '.

Now FH must = GK .

Also $EF = x \cap B$; and $FH = EF \cap FEH$,
 $= EF \cap B$,
 $= x \cap B \cap B$;

similarly, $GK = y \cap C \cap C$.

But $FH = GK$; $\therefore x \cap B \cap B = y \cap C \cap C$;

$$\therefore \frac{x}{y} = \frac{\cap 2C}{\cap 2B}.$$

Q. E. F.

(2) At B, C , make right angles ABD, ACD ; and join AD , cutting BC at E . From E draw $EF, EG \perp$ sides; and join FG .

$\therefore BD, FE$ are $\perp AB$, \therefore they are \parallel ; $\therefore AF : FB :: AE : ED$;

$\therefore CD, GE$ are $\perp AC$, \therefore they are \parallel ; $\therefore AG : GC :: AE : ED$;

$\therefore AF : FB :: AG : GC$;

$\therefore FG$ is parallel to BC .

Q. E. F.

19. (1474, 1484)

Call the bags A, B, C ; so that A contains a white counter and a black one; &c.

The chances of the orders $ABC, ACB, BAC, BCA, CAB, CBA$, are, a priori, $\frac{1}{6}$ each. Since they are equal, we may, instead of multiplying each by the probability it gives to the observed event, simply assume those probabilities as being proportional to the chances *after* the observed event.

These probabilities are:—

for ABC , $\frac{1}{2} \times \frac{1}{3}$; i. e. $\frac{1}{6}$.

ACB , $\frac{1}{2} \times \frac{1}{4}$; i. e. $\frac{1}{8}$.

BAC , $\frac{2}{3} \times \frac{1}{2}$; i. e. $\frac{1}{3}$.

$$\begin{aligned} BCA, & \frac{2}{3} \times \frac{1}{4}, \text{ i. e. } \frac{1}{6}, \\ CAB, & \frac{3}{4} \times \frac{1}{2}, \text{ i. e. } \frac{3}{8}, \\ CBA, & \frac{3}{4} \times \frac{1}{3}, \text{ i. e. } \frac{1}{4}. \end{aligned}$$

Hence the chances are proportional to 4, 3, 8, 4, 9, 6; i. e. they are these Nos. divided by 34.

Hence the chance, of drawing a white counter from the remaining bag; is

$$\frac{1}{34} \cdot \left\{ 4 \times \frac{3}{4} + 3 \times \frac{2}{3} + 8 \times \frac{3}{4} + 4 \times \frac{1}{2} + 9 \times \frac{2}{3} + 6 \times \frac{1}{2} \right\};$$

$$\text{i. e. } \frac{1}{34} \times \{3 + 2 + 6 + 2 + 6 + 3\}; \text{ i. e. } \frac{22}{34}; \text{ i. e. } \frac{11}{17}.$$

20. (1474)

(Analysis)

Let ABC be the given Triangle, and P the required Point. Draw $PQ \perp BC$, and $PR \perp AB$. Then $PQ = PR$.

Hence $PC \tan C = PB \tan B$;

$\therefore PC : PB :: \tan B : \tan C$, (draw $AD \perp BC$.)

$$\therefore \frac{AD}{AB} : \frac{AD}{DC},$$

$$\therefore DC : AB.$$

Hence construction.

(Synthesis)

From A draw $AD \perp BC$. Produce BA to E , making AE equal to DC . Join EC . From A draw AP parallel to EC ; and from P draw $PQ \perp BC$, and $PB \perp AB$.

$$\begin{aligned} \text{Then } \frac{PQ}{PC} &= \frac{AC}{DC} = \frac{AD}{AB} \cdot \frac{AB}{DC}, \\ &= \frac{PR}{PB} \cdot \frac{AB}{AE}, \\ &= \frac{PR}{PB} \cdot \frac{PB}{PC} = \frac{PR}{PC}; \\ \therefore PQ &= PR. \end{aligned}$$

Q. E. F.

21. (1475, 1484)

(1) The n th term is $n \cdot \overline{n+2} \cdot \overline{n+4}$;
 \therefore the $(n+1)$ th term is $\overline{n+1} \cdot \overline{n+3} \cdot \overline{n+5}$;

$$\begin{aligned} &= (n+1) \cdot (\overline{n+2} + 1) \cdot (n+5); \\ &= \overline{n+1} \cdot \overline{n+2} \cdot \overline{n+5} + \overline{n+1} \cdot \overline{n+5} \\ &= \overline{n+1} \cdot \overline{n+2} \cdot (\overline{n+3} + 2) + \overline{n+1} \cdot (\overline{n+2} + 3); \\ &= \overline{n+1} \cdot \overline{n+2} \cdot \overline{n+3} + 2 \cdot \overline{n+1} \cdot \overline{n+2} + \overline{n+1} \cdot \overline{n+2} + 3 \cdot \overline{n+1}; \\ &= \overline{n+1} \cdot \overline{n+2} \cdot \overline{n+3} + 3 \cdot \overline{n+1} \cdot \overline{n+2} + 3 \cdot \overline{n+1}. \\ \therefore S &= \frac{n \cdot \overline{n+1} \cdot \overline{n+2} \cdot \overline{n+3}}{4} + n \cdot \overline{n+1} \cdot \overline{n+2} + \frac{5}{2} \cdot n \cdot \overline{n+1} + C; \end{aligned}$$

and $C = 0$.

$$\begin{aligned} \therefore S &= n \cdot \overline{n+1} \cdot \left(\frac{n^2 + 5n + 6}{4} + n + 2 + \frac{3}{2} \right); \\ &= n \cdot \overline{n+1} \cdot \frac{n^2 + 9n + 20}{4} = \frac{n \cdot \overline{n+1} \cdot \overline{n+4} \cdot \overline{n+5}}{4}. \end{aligned}$$

Q. E. F.

(2) S , to 100 terms,

$$= \frac{100 \cdot 101 \cdot 104 \cdot 105}{4} = 100 \cdot 101 \cdot 26 \cdot 105;$$

now $101 \cdot 105 = 10,605$;

$\therefore 101 \cdot 105 \cdot 13 = 130,000 + 7800 + 65 = 137,865$;

and twice this $= 274,000 + 1730 = 275,730$;

$\therefore S = 27,573,000$.

Q. E. F.

22. (1475, 1484)

Call given altitudes ' α , β , γ '.

Now $a\alpha = b\beta = c\gamma$;

$\therefore \alpha \cap A = \beta \cap B = \gamma \cap C$;

$\frac{\cap A}{\beta\gamma} = \frac{\cap B}{\gamma\alpha} = \frac{\cap C}{\alpha\beta} = k$ (say);

$\cap A = k\beta\gamma$, $\cap B = k\gamma\alpha$, $\cap C = k\alpha\beta$.

Now $\cap(A+B) = \cap C$;

$\therefore \cap A \cap B + \cap A \cap B = \cap C$;

$\therefore m A \cap B = m C - \cap A \cap B$;
 $\therefore m^2 A(1 - m^2 B) = m^2 C + m^2 B(1 - m^2 A) - 2 m C \cap A \cap B$;
 $\therefore m^2 A - m^2 A m^2 B = m^2 C + m^2 B - m^2 A m^2 B - 2 m B m C \cap A$;
 $\therefore m^2 A - m^2 B - m^2 C = -2 m B m C \cap A$;
 \therefore , squaring, $(m^4 A + \&c.) - 2 m^2 A m^2 B - 2 m^2 A m^2 C + 2 m^2 B m^2 C =$
 $4 m^2 B m^2 C(1 - m^2 A)$;
 $\therefore (m^4 A + \&c.) - 2(m^2 B m^2 C + \&c.) + 4 m^2 A m^2 B m^2 C = 0$;
 \therefore , substituting for $m A$, &c., and dividing by k^4 ,

$$(\beta^4 \gamma^4 + \&c.) - 2\alpha^2 \beta^2 \gamma^2 \cdot (\alpha^2 + \&c.) + 4k^2 \alpha^4 \beta^4 \gamma^4 = 0;$$

$$\therefore k^2 = \frac{2\alpha^2 \beta^2 \gamma^2 (\alpha^2 + \&c.) - (\beta^4 \gamma^4 + \&c.)}{4\alpha^4 \beta^4 \gamma^4}.$$

Now $m A = k\beta\gamma$, &c.; which answers (2).

Also $\alpha = b m C$; and similarly $\gamma = a m B$;

$\therefore a = \frac{\gamma}{m B} = \frac{\gamma}{k\gamma\alpha} = \frac{1}{k\alpha}$, &c.; which answers (1).

Also area = $\frac{bc m A}{2} = \frac{1}{2} \cdot \frac{1}{k\beta} \cdot \frac{1}{k\gamma} \cdot k\beta\gamma = \frac{1}{2k}$; which answers (3). Q. E.

23. (1475, 1484)

The original chances, as to states of bag, are

for 2 W	$\frac{1}{4}$;
1 W, 1 B	$\frac{1}{2}$;
2 B	$\frac{1}{4}$.

\therefore the chances, after adding 2 W and 1 B, are

for 4 W, 1 B	$\frac{1}{4}$;
3 W, 2 B	$\frac{1}{2}$;
2 W, 3 B	$\frac{1}{4}$.

Now the chances, which these give to the observed event, drawing 2 W and 1 B, are $\frac{3}{5}, \frac{3}{5}, \frac{3}{10}$.

\therefore the chances, after this event, are proportional to $\frac{3}{20}, \frac{3}{10}, \frac{3}{40}$; i. e. to 2, 4,

1. Hence they are $\frac{2}{7}, \frac{4}{7}, \frac{1}{7}$.

Hence the chances, as to states now are

for 2 W	$\frac{2}{7}$;
1 W, 1 B	$\frac{4}{7}$;
2 B	$\frac{1}{7}$.

\therefore the chances, after adding 1 W, are

for 3 W	$\frac{2}{7}$;
2 W, 1 B	$\frac{4}{7}$;
1 W, 2 B	$\frac{1}{7}$.

Now the chances, which these give to the observed event, of drawing 1 W, are $1, \frac{2}{3}, \frac{1}{3}$.

\therefore the chances, after this event, are proportional to $\frac{2}{7}, \frac{8}{21}, \frac{1}{21}$; i. e. to 6, 8, 1.

Hence they are $\frac{6}{15}, \frac{8}{15}, \frac{1}{15}$.

Hence the chance, that the bag now contains 2 white, is $\frac{6}{15}$; i. e. $\frac{2}{5}$. Q. E. F.

24. (1475, 1484)

Because $\frac{DO}{OA} = \frac{\triangle DOC}{\triangle OAC} = \frac{\triangle DOB}{\triangle OAB} = \frac{\triangle OBC}{\triangle OCA + \triangle OAB}$;
 $\therefore \frac{DO}{DA} = \frac{\triangle OBC}{\triangle ABC}$.
 Similarly, $\frac{EO}{EB} = \frac{\triangle OCA}{\triangle ABC}$, and $\frac{FO}{FC} = \frac{\triangle OAB}{\triangle ABC}$.
 Hence $\frac{DO}{DA} + \frac{EO}{EB} + \frac{FO}{FC} = 1$.

Q. E. F.

25. (1475, 1484)

Let 'E' mean 'having lost an eye', 'A' 'having lost an arm', and 'L' 'having lost a leg'.

Then the state of things which gives the least possible number of those who, being E and A, are also L, may evidently be found by arranging the patients in a row, so that the EA-class may begin from one end of the row, and the L-class from the other end, and counting the portion where they overlap; and, the smaller the EA-class, the smaller will be this common portion: hence we must make the EA-class a minimum.

This may be done by re-arranging the patients, so that the E-class may begin from one end of the row, and the A-class from the other: and the least possible number for the EA-class is the common portion, i. e. $(\epsilon - \overline{1 - \alpha})$, i. e. $(\epsilon + \alpha - 1)$.

Then, as already shown, the least possible number for the EAL-class is the common portion, i. e. $(\epsilon + \alpha - 1 - \overline{1 - \lambda})$, i. e. $(\epsilon + \alpha + \lambda - 2)$. Q. E. F.

26. (1475)

(Analysis.)

Let ABC be the given Triangle, and $A'B'C'$ the required one; and let the ratio, which $B'C'$ has to BC , be ' k '; so that k is less than 1.

Since $BB' = CC'$, and that $BC, B'C'$, are parallel, it may easily be proved, by dropping perpendiculars from B', C' , upon BC , which must necessarily be equal, that $\angle s B'BC, C'CB$, are equal.

Similarly, $\angle s A'AC, C'CA$, are equal; and so are $\angle s A'AB, B'BA$.

Call $\angle B'BC$ ' θ '; then $\angle C'CB = \theta$;
 $\therefore \angle C'CA = C - \theta = \angle A'AC$;
 $\therefore \angle A'AB = A - (C - \theta) = \angle B'BA$.
 Now $\angle s B'BC, B'BA$, together = B ;
 $\therefore \theta + A - (C - \theta) = B$;
 $\therefore 2\theta = B + C - A = 180^\circ - 2A$;
 $\therefore \theta = 90^\circ - A$.

Hence, if BB', CC' , be produced to meet at D , Triangle DBC will be isosceles, with a vertical \angle equal to $2A$.

Now, if a Circle be drawn about ABC , and its centre joined to B and C , the Triangle, so formed, will fulfil the same conditions;

hence the centre of this Circle will be D ;
 hence the construction.

(Synthesis.)

Bisect the sides, and draw perpendiculars, meeting at D . Join D to the vertices B, C . From DB cut off $DB' = k.DB$. From B' draw $B'C'$ parallel to BC .

Then $B'C'$ is easily proved equal to $k.BC$.

And if, from B', C' , parallels to AB, AC , be drawn, it may easily be proved that they meet on DA , and that they are respectively equal to $k.AB, k.AC$.

Q. E. F.

27. (1475, 1484)

Call the bags A, B, C .

If remaining bag be A , chances of observed event = $\frac{1}{2}$ chance of drawing white from B and black from C + $\frac{1}{2}$ chance of drawing black from B and white from C :

$$\text{i. e. it} = \frac{1}{2} \cdot \left\{ \frac{2}{3} \times \frac{1}{2} + \frac{1}{3} \times \frac{1}{2} \right\} = \frac{1}{4}.$$

Similarly, if remaining bag be B , it is $\frac{1}{2} \cdot \left\{ \frac{5}{6} \cdot \frac{1}{2} + \frac{1}{6} \cdot \frac{1}{2} \right\} = \frac{1}{4}$; and, if it be C , it is $\frac{1}{2} \cdot \left\{ \frac{5}{6} \cdot \frac{1}{3} + \frac{1}{6} \cdot \frac{2}{3} \right\} = \frac{7}{36}$.

\therefore chances of remaining bag being A, B , or C , are as $\frac{1}{4}$ to $\frac{1}{4}$ to $\frac{7}{36}$; i. e. as 9 to 9 to 7. \therefore they are, in value, $\frac{9, 9, 7}{25}$.

Now, if remaining bag be A , chance of drawing white from it is $\frac{5}{6}$; \therefore chance, on this issue, is $\frac{5}{6} \cdot \frac{9}{25} = \frac{3}{10}$; similarly, for B , it is $\frac{2}{3} \cdot \frac{9}{25} = \frac{6}{25}$; and, for C , $\frac{1}{2} \cdot \frac{7}{25} = \frac{7}{50}$. And entire chance of drawing white from the remaining bag is the sum of these; i. e. $\frac{15+12+7}{50} = \frac{34}{50} = \frac{17}{25}$.

28. (1476, 1484)

Let ABC be the given Triangle; and let its sides be divided internally at A', B', C' , in extreme and mean ratio.

And let M be the area of ABC .

Let $BA' = x$; then $x^2 = a \cdot (a - x)$;

$$\text{i. e. } x^2 + ax - a^2 = 0;$$

$\therefore x = \frac{-a \pm a\sqrt{5}}{2} = \frac{a}{2} \cdot (\sqrt{5} - 1)$, the other sign being excluded by the terms of the question.

Then area of Triangle $AB'C'$

$$= \frac{1}{2} \cdot \frac{c}{2} \cdot (\sqrt{5} - 1) \cdot \left\{ b - \frac{b}{2} \cdot (\sqrt{5} - 1) \right\} \cdot \cap A,$$

$$= \frac{1}{8} \cdot (\sqrt{5} - 1)(3 - \sqrt{5})bc \cdot \cap A,$$

$$= \frac{1}{4} \cdot (4\sqrt{5} - 8) \cdot M = (\sqrt{5} - 2) \cdot M.$$

Similarly for $BC'A'$ and $CA'B'$.

Hence the sum of these 3 Triangles = $3 \cdot (\sqrt{5} - 2) \cdot M$, and area of Triangle $A'B'C' = (7 - 3\sqrt{5}) \cdot M$. Q. E. F.

29. (1476)

This may be deduced from the identity

$$(a^2 + b^2). (c^2 + d^2) = a^2c^2 + b^2d^2 + a^2d^2 + b^2c^2.$$

$$(a^2 + b^2). (c^2 + d^2) = a^2c^2 + b^2d^2 + a^2d^2 + b^2c^2;$$

$$\left. \begin{aligned} &= a^2c^2 + b^2d^2 + 2acbd + a^2d^2 + b^2c^2 - 2adbc, \\ \text{or else} &= a^2c^2 + b^2d^2 - 2acbd + a^2d^2 + b^2c^2 + 2adbc; \end{aligned} \right\}$$

$$\left. \begin{aligned} \text{i. e.} &= (ac + bd)^2 + (ad - bc)^2, \\ \text{or else} &= (ac - bd)^2 + (ad + bc)^2. \end{aligned} \right\}$$

Now, if these last 2 sets are *identical*, $(ac + bd)$ must = $(ad + bc)$; for it cannot = $(ac - bd)$;

i. e., $a(c - d) - b(c - d)$ must = 0;

i. e., $(a - b). (c - d)$ must = 0;

i. e., one or other of the first 2 sets is the sum of 2 *identical* squares.

Hence, contranominally, if *each* of the original sets consists of 2 *different* squares, their product gives the sum of 2 squares in 2 *different* ways. Q. E. D.

30. (1476)

(Analysis.)

Let ABC be the Triangle: and suppose $B'C'$ so placed that $B'D$, $C'E$, drawn parallel to the sides, shall together = $2B'C'$.

By Euc. I. 34, $B'D = C'B$, and $C'E = B'C$:

$$\therefore B'C + C'B = 2B'C'.$$

Hence, if $B'L$ be cut off equal to half $B'C$, $C'L =$ half $C'B$.

Hence construction.

(Synthesis.)

In BC' take any point F : draw FG , $\parallel BC$, and equal to half BF : and join BG .

Similarly, in CB' take any point H : draw HK , $\parallel BC$, and equal to half HC : and join CK .

Produce BG , CK , to meet at L : and through L draw $C'B' \parallel BC$: and from B' , C' , draw $B'D$, $C'E$, \parallel the sides.

$\therefore FG =$ half FB ; \therefore , by similar Triangles, $C'L =$ half $C'B$;

Similarly $B'L = \text{half } B'C$;
 $\therefore C'B' = \text{half sum of } C'B, B'C$; i. e. $C'B + B'C = 2B'C'$;
 But, by Euc. I. 34, $C'B = B'D$, and $B'C = C'E$;
 $\therefore B'D + C'E = 2B'C'$.

Q. E. F.

31. (1476, 1484)

On July 1, watch gained on clock $5m.$ in $10h.$; i. e. $\frac{1}{2}m.$ per hour; i. e. $2m.$ in $4h.$
 Hence, when watch said 'noon', clock said ' $12h. 2m.$ '; i. e. clock was $3m.$ slow of true time, when true time was $12h. 5m.$

On July 30, watch lost on clock $1m.$ in $10h.$; i. e. $6sec.$ per hour; i. e. $19sec.$ in $3h. 10m.$ Hence, when watch said ' $12h. 10m.$ ', clock said ' $12h. 7m. 19sec.$ '; i. e. clock was $2m. 19sec.$ fast of true time, when true time was $12h. 5m.$

Hence clock gains, on true time, $5m. 19sec.$ in 29 days; i. e. $319sec.$ in 29 days; i. e. $11sec.$ per day; i. e. $\frac{11}{24 \times 12} sec.$ in $5m.$

Hence, while true time goes $5m.$, watch goes $5m. \frac{11}{288} sec.$

Now, when true time is $12h. 5m.$ on July 31, clock is $(2m. 19sec. + 11sec.)$ fast of it; i. e. says ' $12h. 7\frac{1}{2}m.$ ' Hence, if true time be put $5m.$ back, clock must be put $5m. \frac{11}{288} sec.$ back; i. e. must be put back to $12h. 2m. 29\frac{277}{288} sec.$

Hence, on July 31, when clock indicates this time, it is true noon. Q. E. F.

32. (1476, 1484)

The n th term is $n. (n + 4)$;

$$\therefore \text{the } (n + 1)\text{th term is } (n + 1). (n + 5) = (n + 1). \{(n + 2) + 3\},$$

$$= (n + 1). (n + 2) + 3(n + 1);$$

$$\therefore S_n = \frac{n.(n+1).(n+2)}{3} + 3. \frac{n.(n+1)}{2} + C; \text{ and } C = 0;$$

$$\therefore S_n = n. (n + 1). \left(\frac{n+2}{3} + \frac{3}{2}\right) = \frac{n.(n+1).(2n+13)}{6}.$$

Q. E. F.

$$\text{Also } S_{100} = \frac{100.101.213}{6} = \frac{100.101.71}{2} = \frac{6.100.7171}{2} = \frac{717100}{2} = 358550. \quad \text{Q. E. F.}$$

33. (1476)

Let $DE = x$; $\therefore BC = 2x$.

$$\text{Area} = 3x. (\sqrt{r^2 - x^2} + \sqrt{r^2 - 4x^2}) = \text{max.}$$

$$\text{let } v = x. (\sqrt{r^2 - x^2} + \sqrt{r^2 - 4x^2}) = \text{max.}$$

$$\therefore \frac{dv}{dx} = \sqrt{r^2 - x^2} + \sqrt{r^2 - 4x^2} - x^2. \left(\frac{1}{\sqrt{r^2 - x^2}} + \frac{4}{\sqrt{r^2 - 4x^2}}\right) = 0;$$

$$\therefore (r^2 - x^2). \sqrt{r^2 - 4x^2} + (r^2 - 4x^2). \sqrt{r^2 - x^2} = x^2. (4\sqrt{r^2 - x^2} + \sqrt{r^2 - 4x^2});$$

$$\therefore (r^2 - 2x^2). \sqrt{r^2 - 4x^2} = -(r^2 - 8x^2). \sqrt{r^2 - x^2};$$

$$\therefore r^4 - 4(r^2x^2 + 4x^4). (r^2 - 4x^2) = (r^4 - 16r^2x^2 + 64x^4). (r^2 - x^2);$$

$\therefore r^6 - 8r^4x^2 + 20r^2x^4 - 16x^6 = r^6 - 17r^4x^2 + 80r^2x^4 - 64x^6$;
 \therefore , omitting r^6 , and dividing by x^2 ,

$$48x^4 - 60r^2x^2 + 9r^4 = 0;$$

i. e. $16x^4 - 20r^2x^2 + 3r^4 = 0$;

$\therefore \frac{x^2}{r^2} = \frac{20 \pm \sqrt{208}}{32} = \frac{5 \pm \sqrt{13}}{8}$ (upper sign being inadmissible, though this was not thought out.) Q. E. F.

34. (1476)

(Analysis.)

Let A be the given Point, and C the centre of the given Circle. Join AC , and let ABD be the required Line. From B draw the Chord BE parallel to AC . Then $\angle DBE = \angle A$. Hence Arc $DE =$ Arc BD ; i. e. Arc BE is bisected by D ; i. e. D is on perpendicular from C .

(Synthesis.)

Join AC . From C draw CD perpendicular to AC . Join AD cutting Circle at B . From B draw BE parallel to AC .

It is easily proved that Arc $BD =$ Arc DE . Hence Arc BD subtends, in the circle, to angle $= \angle DBE = \angle A$. Q. E. F.

35. (1476)

Let ABC be the given Triangle; and let the portions of the radii, outside the Triangle, have to the radius the given ratios $k : 1, l : 1, m : 1$. (N.B. k, l, m , are supposed to be proper fractions.)

From B draw $BD \perp BA$, and $BE \perp BC$; and make BD have, to BE , the ratio $1 - m : 1 - k$. Through D draw DF parallel to BA , and EF parallel to BC ; and join BF . From F draw $FG \perp BA$, and $FH \perp BC$.

Then $FG : FH :: 1 - m : 1 - k$.

Similarly, draw CO so that the \perp s, drawn from any Point of it to CA and CB , are in the ratio $1 - l : 1 - k$; and produce BF to meet it at O .

From O draw OA', OB', OC' , \perp the sides.

Then $OA' : OB' : OC' :: 1 - k : 1 - l : 1 - m$.

Produce OA' to K , so that $OK : OA' :: 1 : 1 - k$.

With centre O , and distance OK , describe a Circle; and produce OB', OC' , to meet it at L, M .

Now $OK : OA' :: 1 : 1 - k$;

$OA' : OB' :: 1 - k : 1 - l$;

$\therefore OK : OB' :: 1 : 1 - l$;

Similarly, $OK : OC' :: 1 : 1 - m$.

But $A'K : OK :: OK - OA' : OK :: k : 1$.

Similarly $BL' : radius :: l : 1$, and $C'M : radius :: m : 1$.

Q. E. F.

36. (1477)

(Analysis.)

Let $B'C'$ be required Line: and let \angle at C' be right.
 Cut off $C'D$ equal to $C'B$: then $DB' = B'C$.
 Join DB , DC : then $\angle DBC' = 45^\circ$, and $\angle B'DC = \angle B'CD$.
 From C draw $CE \perp AB$.
 Then $\angle B'DC = \angle DCE$; $\therefore \angle B'CD = \angle DCE$.

(Synthesis.)

Hence construction. Draw $CE \perp AB$: bisect $\angle ACE$: at B make $\angle ABD = 45^\circ$. Let these lines meet at D . Through D draw $B'DC' \perp AB$.

Then $\angle C'DB = \pi - (\angle DC'B + \angle C'BD) = 45^\circ = \angle C'BD$;
 $\therefore C'D = C'B$.

Also $\angle B'DC = \angle DCE = \angle DCB'$;

$\therefore DB' = B'C$;

$\therefore C'B' = \text{sum of } BC', CB'$.

Q. E. F.

Limits of possibility:—

$\angle A$ must not be $> 90^\circ$;

$\angle B$ must not be $< 45^\circ$;

$\angle C$ must not be $<$ half complement of A ,

i. e. not $< (45^\circ - \frac{A}{2})$.

37. (1477, 1485)

Let BC be the common chord, and A, D , the centres.

Let $\angle A = 30^\circ$, and $\angle D = 60^\circ$.

And let BC (which = $DB = DC$) = 1.
 And let $AB = x$.
 Now $\sphericalangle A = \frac{\sqrt{3}}{2} = \frac{2x^2-1}{2x^2}$;
 $\therefore \frac{\sqrt{3}}{2} = 1 - \frac{1}{2x^2}$; $\therefore \frac{1}{2x^2} = \frac{2-\sqrt{3}}{2}$;
 $\therefore x^2 = \frac{1}{2-\sqrt{3}} = 2 + \sqrt{3}$;
 \therefore area of Circles are $\pi \cdot (2 + \sqrt{3})$ and π ;
 \therefore area of Sectors are $\pi \cdot \frac{2+\sqrt{3}}{12}$ and $\frac{\pi}{6}$;
 \therefore their sum = $\pi \cdot \frac{4+\sqrt{3}}{12}$.
 Again, area of Triangle $ABC = \frac{1}{2} \cdot (2 + \sqrt{3}) \cdot \frac{1}{2}$,
 = $\frac{2+\sqrt{3}}{4}$;

also area of Triangle $DBC = \frac{\sqrt{3}}{4}$;
 \therefore their sum = $\frac{2+2\sqrt{3}}{4} = \frac{1+\sqrt{3}}{2}$.

Now the portion, of the smaller Circle, that is within the larger one, is the difference between these two sum;

$$\therefore \text{it} = \pi \cdot \frac{4+\sqrt{3}}{12} - \frac{1+\sqrt{3}}{2}.$$

Hence its ratio, to the area of the smaller Circle, is this sum divided by π ;

$$\begin{aligned} \therefore \text{it} &= \frac{4+\sqrt{3}}{12} - \frac{1+\sqrt{3}}{2\pi}, \\ &= \frac{5 \cdot 732}{12} - \frac{2 \cdot 732}{\left(\frac{44}{7}\right)} = .478 - \frac{.248}{\left(\frac{4}{7}\right)}, \\ &= .478 - \frac{1 \cdot 736}{4} = .478 - .434 = .044. \end{aligned}$$

Q. E. F.

38. (1477, 1485)

Taking, in order, the bag from which this unknown counter is drawn, the bag from which a red one was twice drawn, and the remaining bag, we see that there are six possible arrangement of 'A', 'B', and 'C': viz.—

- (1) ABC , (4) BCA ,
- (2) ACB , (5) CAB ,
- (3) BAC , (6) CBA .

Now the chance of the observed event is, in case (1), $1 \times \frac{4}{9} = \frac{4}{9}$; in case (2), $1 \times \frac{1}{9} = \frac{1}{9}$; in case (3), $\frac{2}{3} \times 1 = \frac{2}{3}$; in case (4), $\frac{2}{3} \times \frac{1}{9} = \frac{2}{27}$; in case (5), $\frac{1}{3} \times 1 = \frac{1}{3}$; and in case (6), $\frac{1}{3} \times \frac{4}{9} = \frac{4}{27}$.

Hence the chances of existence, for these 6 states, are proportional to '12, 3, 18, 2, 9, 4'. Hence their actual values are $\frac{1}{4}, \frac{1}{16}, \frac{3}{8}, \frac{1}{24}, \frac{3}{16}, \frac{1}{12}$.

Hence the chance of the unknown counter being red is the sum of $\frac{1}{4} \times 1, \frac{1}{16} \times 1, \frac{3}{8} \times \frac{2}{3}, \frac{1}{24} \times \frac{2}{3}, \frac{3}{16} \times \frac{1}{3}, \frac{1}{12} \times \frac{1}{3}$; i. e. it is $\frac{36+9+36+4+9+4}{9 \times 16}$; which = $\frac{98}{9 \times 16} = \frac{49}{72}$.
 Q. E. F.

39. (1477, 1485)

Let x = no. of days.

$$\begin{aligned} \text{Then } (2 \times 10 - \overline{x-1}) \cdot \frac{x}{2} &= 14 + \{2 \times 2 + \overline{x-1} \cdot 2\} \cdot \frac{x}{2}; \text{ i. e. } \frac{21x}{2} - \frac{x^2}{2} = 14 + x + x^2; \\ \therefore 3x^2 - 19x + 28 &= 0; \therefore x = \frac{19 \pm 5}{6} = 4 \text{ or } \frac{7}{3}. \end{aligned}$$

Now the above solution has taken no account of the *discontinuity* of increase, or decrease of pace, and is the true solution only on the supposition that the increase or decrease is *continuous*, and such as to coincide with the above data at the end of each day. Hence '4' is a correct answer; but ' $\frac{7}{3}$ ' only indicates that a meeting occurs *during the third day*. To find the hour of this, let y = no. of hours.

Now in 2 days A has got to the end of 19 miles, B to the end of $(14 + 6)$, i. e. 20.

$$\therefore 19 + y \cdot \frac{8}{12} = 20 + y \cdot \frac{6}{12}$$

$$\text{i. e. } y \cdot \frac{2}{3} = 1 + y \cdot \frac{1}{2}; \therefore y = 6.$$

Hence they meet at the end of $2d. 6h.$, and at the end of $4d.$: and the distances are 23 miles, and 34 miles. Q. E. F.

40. (1477)

(1) Let ABC be the given Triangle, and AD the line from the vertex. From D draw DE, DF , parallel to the sides; and from E and F draw $EG, FH, \perp BC$.

Then Triangles FBD, EDC , are similar to ABC ;

$$\therefore FH : AD :: BD : BC,$$

and $EG : AD :: DC : BC$;

$$\therefore (FH + EG) : AD :: BC : BC;$$

$$\therefore FH + EG = AD.$$

Also, \therefore Triangles AED, AFD , are equal and on the same base AD ,

\therefore their altitudes are equal; i. e. $DH = DG$. Q. E. F.

(2) Let ABC be the given Triangle, and AD the line from the vertex.

Make $CE = BD$; from E draw EF, EG , parallel to the sides; and from F, G , draw $FH, GK, \perp BC$.

Then Triangles GBE, FEC , are similar to ABC ;

$$\therefore GK : AD :: BE : BC,$$

and $FH : AD :: EC : BC$;

$$\therefore (GK + FH) : AD :: BC : BC;$$

$$\therefore GK + FH = AD.$$

Also $BK : BE :: BD : BC$;

$$\therefore BK : DC :: EC : BC;$$

$$\therefore HC : DC;$$

$$\therefore BK = HC. \quad \text{Q. E. F.}$$

41. (1477, 1485)

(1) As there was certainly at least one W in the bag at first, the 'a priori' chances for the various states of the bag, 'WWWW, WWWB, WWBB, WBBB,' were $\frac{1}{8}, \frac{3}{8}, \frac{3}{8}, \frac{1}{8}$.

These would have given, to the observed event, the chances $1, \frac{1}{2}, \frac{1}{6}, 0$ '.

Hence the chances, after the event, for the various states, are proportional to $\frac{1}{8} \cdot 1, \frac{3}{8} \cdot \frac{1}{2}, \frac{3}{8} \cdot \frac{1}{6}$; i. e. to $\frac{1}{8}, \frac{3}{16}, \frac{1}{16}$; i. e. to '2, 3, 1'. Hence their actual values are $\frac{1}{3}, \frac{1}{2}, \frac{1}{6}$.

Hence the chance, of now drawing W , is $\frac{1}{3} \cdot 1 + \frac{1}{2} \cdot \frac{1}{2}$; i. e. it is $\frac{7}{12}$. Q. E. F.

(2) If he had not spoken, the 'a priori' chances for the states 'WWWW, WWWB, WWBB, WBBB, BBBB', would have been $\frac{1,4,6,4,1}{16}$.

These would have given, to the observed event, the chances $1, \frac{1}{2}, \frac{1}{6}, 0, 0$ '.

Hence the chances, after the event, for the various states, are proportional to $\frac{1}{16} \cdot 1, \frac{1}{4} \cdot \frac{1}{2}, \frac{1}{6} \cdot \frac{3}{8}$; i. e. to '1, 2, 1'. Hence their actual values are $\frac{1}{4}, \frac{1}{2}, \frac{1}{4}$.

Hence the chance, of now drawing W , is $\frac{1}{4} \cdot 1 + \frac{1}{2} \cdot \frac{1}{2}$; i. e. it is $\frac{1}{2}$. Q. E. F.

42. (1477, 1485)

Let ABC be the given Triangle. Bisect its angles, and draw \perp s to them, forming the Triangle $A'B'C'$.

Now $\angle CBA' = 90^\circ - \frac{B}{2}$; and so of the others.

$$\therefore A' = 180^\circ - (CBA' + BCA') = \frac{B+C}{2} = 90^\circ - \frac{A}{2};$$

$$\therefore BA' = a \cdot \frac{\sin \frac{C}{2}}{\sin \frac{A}{2}}.$$

$$\text{Similarly, } BC' = c \cdot \frac{\sin \frac{A}{2}}{\sin \frac{C}{2}};$$

$$\therefore A'C' = \frac{a \sin^2 \frac{C}{2} + c \sin^2 \frac{A}{2}}{\sin \frac{A}{2} \sin \frac{C}{2}} = \frac{a \cdot \frac{s \cdot (s-c)}{ab} + c \cdot \frac{s \cdot (s-a)}{bc}}{\frac{s}{b} \cdot \sqrt{\frac{(s-a)(s-c)}{ac}}},$$

$$= \frac{s-c+s-a}{\sin \frac{B}{2}} = \frac{b}{\sin \frac{B}{2}}.$$

$$\text{Similarly, } A'B' = \frac{c}{\sin \frac{C}{2}};$$

$$\therefore \text{area of } A'B'C' = \frac{bc \sin \frac{A}{2}}{2 \sin \frac{B}{2} \sin \frac{C}{2}};$$

$$\begin{aligned}
\therefore \frac{\text{area of } A'B'C'}{\text{area of } ABC} &= \frac{bc \sin \frac{A}{2}}{2 \sin \frac{B}{2} \sin \frac{C}{2} bc \sin A}, \\
&= \frac{\sin \frac{A}{2}}{\sin \frac{B}{2} \sin \frac{C}{2} \cdot 2 \sin \frac{A}{2} \cos \frac{A}{2}}, \\
&= \frac{1}{2 \sin \frac{A}{2} \sin \frac{B}{2} \sin \frac{C}{2}}, \\
&= \frac{abc}{2(s-a)(s-b)(s-c)}.
\end{aligned}$$

Q. E. F.

43. (1478)

Let ABC be the given Triangle; and let BFD, CFB , be the required lines, so that $FB = FC$, and Tetragon $AEFD = \text{Triangle } FBC$. And call the angle FBC ' θ '. It will suffice to calculate this angle.

Because Triangle $FBC = \text{Tetragon } AEFD$,

$$\begin{aligned}
\therefore \text{Triangle } DBC &= \text{Triangle } AEC, \\
&= \text{Triangle } ABC - \text{Triangle } EBC;
\end{aligned}$$

$$\begin{aligned}
\therefore \text{Triangles } DBC, EBC, \text{ together} &= \text{Triangle } ABC; \\
\therefore \frac{1}{2} \cdot \frac{a^2}{\cot \theta + \cot C} + \frac{1}{2} \cdot \frac{a^2}{\cot \theta + \cot B} &= \frac{1}{2} \cdot \frac{a^2}{\cot B + \cot C}; \\
\therefore \frac{1}{\cot \theta + \cot C} + \frac{1}{\cot \theta + \cot B} &= \frac{1}{\cot B + \cot C}; \\
\therefore \frac{2 \cot \theta + (\cot B + \cot C)}{\cot^2 \theta + \cot \theta \cdot (\cot B + \cot C) + \cot B \cot C} &= \text{do.}; \\
\therefore \cot^2 \theta + \cot \theta \cdot (\cot B + \cot C) + \cot B \cot C &= 2 \cot \theta \cdot (\cot B + \cot C) + (\cot B + \cot C)^2; \\
\therefore \cot^2 \theta - \cot \theta \cdot (\cot B + \cot C) - (\cot^2 B + \cot B \cot C + \cot^2 C) &= 0; \\
\therefore \cot \theta = \frac{1}{2} \cdot \{ \cot B + \cot C \pm \sqrt{5 \cot^2 B + 6 \cot B \cot C + 5 \cot^2 C} \}. &\text{ Q. E. F.}
\end{aligned}$$

44. (1478)

Let k be a No. not containing 2 or 5 as a factor, i. e. let it be prime to 10. Then, if $\frac{1}{k}$ be reduced to a circulating decimal, and that to a vulgar fraction, the digits of the denominator will be a certain number of 9's; i. e. it will be of the form $(10^n - 1)$. And since this fraction = $\frac{1}{k}$, and that k is prime to 10, and so prime to $10^n - 1$, the factor $(10^n - 1)$ must be a multiple of k .

This evidently holds good in any other scale of notation. Hence, if a be the radix of the scale of notation, and b a No. prime to a , a value may be found for n , which will make $(a^n - 1)$ a multiple of b . Q. E. D.

Examples (not thought out)

(1) With radix 10, find a value, for n , which will make $(10^n - 1)$ a multiple of 7.

$$\frac{1}{7} = .\dot{1}4285\dot{7} = \frac{142857}{10^6 - 1}.$$

Ans. $n = 6$.

(2) Let the two given Nos. be 8, 9.

Taking 8 as radix, we get $\frac{1}{9} = .\dot{0}\dot{7} = \frac{7}{8^2-1}$.

Ans. $n = 2$.

(3) Let the two given Nos. be 7, 13.

Taken 7 as radix, we get

$$\frac{1}{13} = .\dot{0}3524563142\dot{1} = \frac{35245631421}{7^{12}-1}.$$

Ans. $n = 12$.

45. (1478, 1485)

Divide each rod into $(n + 1)$ parts, where n is assumed to be odd, and the n points of division are assumed to be the only points where the rod will break, and to be equally frangible.

The chance of one failure is $\frac{n-1}{n}$;

\therefore „ „ „ n failures is $(\frac{n-1}{n})^n$

$= (1 - \frac{1}{n})^n$.

Now, if $m = \frac{1}{n}$; then, when $n = \frac{1}{0}$, $m = 0$;

\therefore the chance that no rod is broke in the middle $= (1 - m)^{\frac{1}{m}}$, when $m = 0$;

i. e. it approaches the limit $(1 - 0)^{\frac{1}{0}}$.

And Ans. $= 1 - (1 - 0)^{\frac{1}{0}}$.

Now $(1 - 0)^{\frac{1}{0}} = e$. Hence if, in the series for e , we call the sum of the odd terms 'a', and of the even terms 'b'; then $e = a + b$; and $(1 - 0)^{\frac{1}{0}} = a - b = 2a - e$.

Q. E. F.

[N.B. What follows here was *not* thought out.]

Now $a = 1 + \frac{1}{2} + \frac{1}{4} + \&c.$

$$1 = 1$$

$$\frac{1}{2} = .5$$

$$\frac{1}{4} = .04166666\&c.$$

$$\frac{1}{6} = .00138888\&c.$$

$$\frac{1}{8} = .00002480\&c.$$

$$\frac{1}{10} = .00000027\&c.$$

$$\therefore a = 1.5430806\&c.$$

$$\therefore 2a = 3.0861612\&c.$$

$$e = 2.7182818\&c.$$

$$\therefore (1 - 0)^{\frac{1}{0}} = .3678793\&c.$$

$$\therefore \text{Ans.} = 1 - (1 - 0)^{\frac{1}{0}} = .6321207\&c.$$

46. (1478)

Let ABC be the given Triangle, and D the given Point.

If we make a Triangle $D'E'F'$, having its angles equal to the given angles, and having D' as its assigned vertex, the Problem may be solved, if we can circumscribe, about the Triangle $D'E'F'$, a Triangle similar to ABC .

Now we can construct, on $E'F'$, $F'D'$, $D'E'$, segments of Circles containing angles equal to A , B , C . Hence the Problem may be solved, if we can place, in these Circles, a line $B'D'C'$, divided in the same proportion as BDC .

This Lemma may be solved as follows. Let G , H , be the centres of the Circles. Join GH , and divide it, at K , proportionally to BDC .

Join KD' ; through D' draw $B'D'C' \perp KD'$; and from G , H , draw GL , HM , $\perp B'C'$.

Now it may be easily proved that

$$LD' : D'M :: GK : KH :: BD : DC.$$

But $B'D'$, $D'C'$, are doubles of LD' , $D'M$;

$$\therefore B'D' : D'C' :: BD : DC.$$

Q. E. F.

[The construction is now obvious, viz. to join $B'F'$, $C'E'$, and produce them to meet, on the third Circle (as they may be easily proved to do), at A' ; then to divide AB , AC , at F and E , proportionally to $A'F'B'$, $A'E'C'$; and then to join DE , DF ..]

47. (1478, 1485)

By inspection, '0, 0, 0' are one set of values.

Subtracting, we get $x \cdot (\frac{1}{y} - \frac{1}{z}) = y - z$;

$\therefore x = yz \cdot \frac{y-z}{z-z} = -yz$, unless $y = z$, in which case $x = \frac{0}{0}$.

Now, by (1), $x = xy - yz$;

\therefore , when $y \neq z$, $x = xy + x$;

$\therefore xy = 0$, unless x be infinite.

Similarly, by (2), $xz = 0$, unless x be infinite.

Hence, if x be finite, and if $y \neq z$, either x or $y = 0$, and also either x or $z = 0$; i. e. either $x = 0$, or else $y = z = 0$. But the latter is excluded by our hypothesis. Hence $x = 0$. Hence $yz = 0$; i. e. either y or $z = 0$, and the other may take any value.

This gives us 2 more sets of values, viz.

$x = y = 0$; z has any value;

$x = z = 0$; y has any value.

We have now to ascertain what happens when $y = z$.

By (1), $\frac{x}{y} = x - y$;

$\therefore y^2 = x \cdot (y - 1)$; i. e. $x = \frac{y^2}{y-1}$.

Similarly, by (2), $x = \frac{z^2}{z-1}$.

This gives us a 4th set of values, viz. $x = \frac{k^2}{k-1}$, $y = z = k$; where k has any value.

Now y and z may evidently have *any* real values, but x is restricted by the equation

$$y^2 - xy + x = 0,$$

in which y cannot be real, unless $(x^2 - 4x) > 0$. Hence x may have any negative value, and any positive value that is not less than 4; but it cannot have any positive value, less than 4, without making y unreal. Q. E. F.

48. (1478)

Let ABC be the given Triangle, A' , B' , C' , the centres of the semicircles, and DE , FG , HJ , the common tangents; so that $DE = \alpha$, $FG = \beta$, and $HJ = \gamma$.

Join $B'D$, $C'E$; and from C' draw $C'K \perp B'D$. Hence $CK = \alpha$.

Call sides of given Triangle ' $2a$, $2b$, $2c$ '.

Then $B'C' = a$, and $B'K = b - c$;

$$\therefore C'K = \sqrt{\{a^2 - (b - c)^2\}};$$

$$\text{i. e. } \alpha = \sqrt{\{(a - b + c) \cdot (a + b - c)\}};$$

$$\text{similarly, } \beta = \sqrt{\{(a + b - c) \cdot (-a + b + c)\}};$$

$$\text{and } \gamma = \sqrt{\{(-a + b + c) \cdot (a - b + c)\}};$$

$$\therefore \frac{\beta\gamma}{\alpha} = -a + b + c;$$

$$\text{similarly, } \frac{\gamma\alpha}{\beta} = a - b + c,$$

$$\text{and } \frac{\alpha\beta}{\gamma} = a + b - c;$$

$$\therefore \text{their sum} = a + b + c,$$

$$= \text{semi-perimeter of } ABC.$$

Q. E. D.

49. (1478, 1485)

Take, as unit, a side of one of the Triangles.

If the Tetrahedron be cut by a vertical Plane containing one of the slant edges, the section is a Triangle whose base is $\frac{\sqrt{3}}{2}$, and whose sides are $\frac{\sqrt{3}}{2}$, 1 ;

hence cosine of smaller base-angle

$$= \left(\frac{3}{4} + 1 - \frac{3}{4}\right) \cdot \frac{1}{\sqrt{3}} = \frac{1}{\sqrt{3}};$$

\therefore its sine = $\frac{\sqrt{2}}{\sqrt{3}}$ = its altitude;

and this is the altitude of the Tetrahedron;

\therefore volume of Tetrahedron = $\frac{1}{3} \cdot \frac{\sqrt{2}}{\sqrt{3}} \cdot \frac{\sqrt{3}}{4} = \frac{\sqrt{2}}{12}$.

Also altitude of Pyramid = altitude of Triangle whose base is $\sqrt{2}$, and whose sides are 1, 1;

i. e. it = $\frac{\sqrt{2}}{2}$;

\therefore volume of Pyramid = $\frac{1}{3} \cdot \frac{\sqrt{2}}{2} = \frac{\sqrt{2}}{6}$.

Hence required ratio = $\frac{\sqrt{2}}{6} \cdot \frac{12}{\sqrt{2}} = 2$.

Q. E. F.

50. (1478, 1485)

At first, the chance that bag H shall contain

2 W counters, is $\frac{1}{4}$,

1 W and 1 B , is $\frac{1}{2}$.

2 B , is $\frac{1}{4}$,

\therefore , after adding a W , the chance that it shall contain

3 W , is $\frac{1}{4}$.

2 W , 1 B , is $\frac{1}{2}$.

1 W , 2 B , is $\frac{1}{4}$.

hence the chance of drawing a W from it is

$$\frac{1}{4} \times 1 + \frac{1}{2} \times \frac{2}{3} + \frac{1}{4} \times \frac{1}{3} : \text{i. e. } \frac{2}{3}.$$

\therefore the chance of drawing a B is $\frac{1}{3}$.

After transferring this (unseen) counter to bag K , the chance that it shall contain

3 W , is $\frac{2}{3} \times \frac{1}{4}$; i. e. $\frac{1}{6}$.

2 W , and 1 B , is $\frac{1}{2} \times \frac{1}{3} + \frac{1}{3} \times \frac{1}{4}$; i. e. $\frac{5}{12}$.

1 W , 2 B , is $\frac{1}{3} \times \frac{1}{4} + \frac{1}{3} \times \frac{1}{2}$; i. e. $\frac{1}{3}$.

3 B , is $\frac{1}{3} \times \frac{1}{4}$; i. e. $\frac{1}{12}$;

\therefore the chance of drawing a W from it is

$$\frac{1}{6} \times 1 + \frac{5}{12} \times \frac{2}{3} + \frac{1}{3} \times \frac{1}{3} : \text{i. e. } \frac{5}{9}.$$

\therefore the chance of drawing a B is $\frac{4}{9}$.

Before transferring this to bag H , the chance that bag H shall contain

2 W , is $\frac{1}{4} \times 1 + \frac{1}{2} \times \frac{1}{3}$; i. e. $\frac{5}{12}$.

1 W , 1 B , is $\frac{1}{2} \times \frac{2}{3} + \frac{1}{4} \times \frac{2}{3}$; i. e. $\frac{1}{2}$.

2 B , is $\frac{1}{4} \times \frac{1}{3}$; i. e. $\frac{1}{12}$.

\therefore , after transferring it, the chance that bag H shall contain

3 W , is $\frac{5}{12} \times \frac{5}{9}$; i. e. $\frac{25}{108}$.

2 W , 1 B , is $\frac{5}{12} \times \frac{4}{9} + \frac{1}{2} \times \frac{5}{9}$; i. e. $\frac{30}{108}$.

1 W , 2 B , is $\frac{1}{2} \times \frac{4}{9} + \frac{1}{12} \times \frac{3}{9}$; i. e. $\frac{19}{108}$.

3 B , is $\frac{1}{12} \times \frac{4}{9}$; i. e. $\frac{4}{108}$.

Hence the chance of drawing a W is

$$\frac{1}{108} \times \left\{ 25 \times 1 + 50 \times \frac{2}{3} + 29 \times \frac{1}{3} \right\}; \text{ i. e. } \frac{17}{27}.$$

i. e. the odds are 17 to 10 on its happening.

Q. E. F.

51. (1479)

Let ABC be the given Triangle, and D the given Point.

(Analysis.)

Let DE be the line required. Draw DF, EG, \perp the base. Then their sum is equal to DE .

Bisect DE at H , and draw $HK \perp$ the base: then it is evident that HK is the $A. M.$ of DF, EG , and is equal to half their sum; i. e. it is equal to half of DE . Hence a Circle, drawn with centre H and at distance HD , will pass through E and K , and will touch the base at K .

Through H draw LHM parallel to AC . Then DA is evidently bisected at L . Also LM passes through the centre of the Circle. Hence, if DN be drawn \perp LM (or CA), it is a chord of the Circle, and is bisected at R . Produce ND to meet the base produced at S . Hence SDN cuts the Circle, and SK touches it at K . But S can be found, and SK can then be taken, so that sq. of SK may be equal to rect. of SD, SN .

(Synthesis.)

From D draw $DN \perp AC$, and produce it to meet the base produced at S . Take SK , so that its square may be equal to rect. of SD, SN .

Bisect DA at L , and from L draw LM parallel to AC ; and from K draw $KH \perp$ the base, to meet LM at H . Join DH , and produce it to meet AC at E , and draw DF, EG, \perp the base.

Because $DL = LA$, and that LM is parallel to AC ,
 $\therefore DH = HE = HK; \therefore DE = 2HK$.

But $DF + EG = 2HK; \therefore DF + EG = DE$.

Q. E. F.

[N.B. This proof is incomplete. I have assumed, without proving it, that $DH = HK$. It may be proved thus. Because sq. of $SK =$ rect. of SD, SN , $\therefore DN$ is a chord of a Circle which touches the base at K ; $\therefore LM$, which bisects it at right angles, passes through the centre. But KH also passes through the centre; $\therefore H$ is the centre; $\therefore HD = HK$.]

52. (1479, 1485)

Let x be the number of pennies each had at first.

No. (3) received x , took out $(2 + 4)$, and put in $\frac{x}{2}$; so that the sack then contained $(x \cdot \frac{3}{2} - 6)$. Let us write 'a' for ' $\frac{3}{2}$.'

No. (5) received $(xa - 6)$, took out $(4 + 1)$, and put in enough to multiply, by a , its contents when he received it. The sack now contained $(xa^2 - 6a - 5)$.

No. (2) took out $(1 + 3)$, and handed on $(xa^3 - 6a^2 - 5a - 4)$.

No. (4) took out $(3 + 5)$, and handed on $(xa^4 - 6a^3 - 5a^2 - 4a - 8)$.

No. (1) put in 2. The sack now contained $5x$.

Hence $xa^4 - 6a^3 - 5a^2 - 4a - 6 = 5x$;

$$\begin{aligned} \therefore x &= \frac{6a^3 + 5a^2 + 4a + 6}{a^4 - 5}; \\ &= \frac{6 \cdot 3^3 + 5 \cdot 3^2 \cdot 2 + 4 \cdot 3 \cdot 2^2 + 6 \cdot 2^3}{3^4 - 5 \cdot 2^4} \cdot 2; \\ &= \frac{162 + 90 + 48 + 48}{81 - 80} = 696 = 2l. 18s. 0d. \end{aligned}$$

Q. E. F.

53. (1479, 1485)

Let ABC be the given Triangle, and P the given Point; and call its trilinear co-ordinates ' α, β, γ '.

From P draw PA' , PB' , PC' , \perp the sides, and therefore equal to α , β , γ . Produce PA' and PC' to A'' and C'' , making $A'A'' = PA'$, and $C'C'' = PC'$. From C'' draw $C''D \perp AC$, and produce it to E , making $DE = C''C$. Join EA'' , cutting AC in R , and BC in S . Join $C''R$, cutting AB in Q . Join PQ , PS .

The path of the ball is evidently $PQRSP$; and we have to calculate the length of AR .

Now $AR = DR + AD = DR + AB' - DB'$.

First, to calculate DR .

From P draw PU , PV , parallel to AB , AC ; from C' draw $C'W \perp PV$; and from A'' draw $A''F \perp AC$.

By similar Triangles, $DR : RF :: DE : A''F :: C''D : A''F$;

$\therefore DR : DF :: C''D : (C''D + A''F)$;

$\therefore DR = \frac{DF \cdot C''D}{C''D + A''F}$.

Now $\angle C'VP = A$; $\therefore \angle C'PV = 90^\circ - A$;

$\therefore WP = \gamma \cap A$;

$\therefore DB'$, which $= 2WP$, $= 2\gamma \cap A$.

Similarly, $B'F = 2\alpha \cap C$;

$\therefore DF = 2(\alpha \cap C + \gamma \cap A)$.

Again, $C'W = \gamma \cap A$;

$\therefore C''D$, which $= 2C'W + PB'$, $= 2\gamma \cap A + \beta$.

Similarly, $A''F = 2\alpha \cap C + \beta$;

$$\therefore C''D + A''F = 2(\alpha \sin C + \gamma \sin A + \beta);$$

$$\therefore DR = \frac{(a \sin C + \gamma \sin A) \cdot (2\gamma \sin A + \beta)}{\alpha \sin C + \gamma \sin A + \beta}.$$

$$\begin{aligned} \text{Now } AB' &= B'U + UA = B'U + PV, \\ &= \beta \cot A + \gamma \operatorname{cosec} A = \frac{\beta \sin A + \gamma}{\sin A}; \end{aligned}$$

$$\begin{aligned} \therefore AB' - DB' &= \frac{\beta \sin A + \gamma}{\sin A} - 2\gamma \sin A, \\ &= \frac{\beta \sin A + \gamma(1 - 2 \sin^2 A)}{\sin A} \\ &= \frac{\beta \sin A + \gamma \cos 2A}{\sin A}. \end{aligned}$$

$$\text{Now } AR = DR + AB' - DB';$$

$$\therefore AR = \frac{(a \sin C + \gamma \sin A) \cdot (2\gamma \sin A + \beta)}{\alpha \sin C + \gamma \sin A + \beta} + \frac{\beta \sin A + \gamma \cos 2A}{\sin A}.$$

Q. E. F.

54. (1479, 1486)

It is evident that Triangle ADE is similar to ABC .

$$\text{Let 'k' = ratio } \frac{DE}{a} = \frac{AE}{b} = \frac{AD}{c}.$$

$$\text{Now } DG = DE; \therefore DG = ka;$$

$$\therefore GB = c - ka - kc;$$

$$\therefore \frac{GB}{c} = 1 - k - k \cdot \frac{a}{c};$$

$$\therefore GF \text{ (which } = GB \cdot \frac{b}{c}) = b - kb - k \cdot \frac{ab}{c};$$

$$\text{but } GF = DE = ka;$$

$$\therefore b - kb - k \cdot \frac{ab}{c} = ka;$$

$$\therefore bc = k \cdot (bc + ca + ab);$$

$$\therefore k = \frac{bc}{bc+ca+ab} = \frac{\frac{1}{a}}{\frac{1}{a} + \frac{1}{b} + \frac{1}{c}} = \frac{1}{m} \text{ (say).}$$

$$\text{Hence } AD = \frac{c \cdot \frac{1}{m}}{1} = \frac{c}{m}; \quad DG = \frac{1}{m} = \frac{c \cdot \frac{1}{m}}{c}.$$

$$\therefore GB \text{ (which } = c - AD - DG) = \frac{c \cdot (m - \frac{1}{a} - \frac{1}{c})}{m} = \frac{c \cdot \frac{1}{b}}{m};$$

$$\therefore AD : DG : GB :: \frac{1}{a} : \frac{1}{b} : \frac{1}{c}.$$

$$\text{Also } DE = ka = \frac{1}{m} = \frac{1}{\frac{1}{a} + \frac{1}{b} + \frac{1}{c}}.$$

Q. E. F.

55. (1479)

Let A, B, C be the centres of the bases of the towers; and a, b, c their radii. Suppose P the required Point; and from P draw a pair of tangents to each circle,

and lines to the centres, which will evidently bisect the angles contained by the pairs of tangents.

Hence angles APD , BPE , CPF are equal;

$\therefore \cap APD = \cap BPE = \cap CPF$;

i. e. $AP : BP : CP :: a : b : c$.

Draw a Line through A , B , and on it take Points G , H , such that $AG : GB :: AH : HB :: a : b$.

Then the Semicircle, described on GH , is the locus of all Points whose distances, from A and B , are proportional to a , b .

Hence, if a Line be drawn through B , C , and a Semicircle described which shall be the locus of all Points whose distances, from B and C , are proportional to b , c ; the intersection of these two Semicircles will be the Point required. Q. E. F.

[*Note.* "The locus of all Points whose distances &c.," if represented algebraically, is evidently a Circle, whose centre is on the Line through A , B , and which passes through G and H .]

56. (1480, 1486)

Draw BC , CE , BD , equal to the given altitudes, so as to form right \angle s at B and C ; and produce DB , EC . Join DC , and draw $CF \perp$ to it. Join EB , and draw $BG \perp$ to it. With centre B , and distance BF , describe a circle: with centre C , and distance CG , describe another: let them meet at A : and join AB , AC .

Call the altitudes of ABC , ' α , β , γ '.

Now $\alpha \cdot BC = \beta \cdot CA = \gamma \cdot AB$

= twice area of ABC ;

also, taking BC as unit-line,

$BC = \frac{1}{BC}$, $CA = CG = \frac{1}{CE}$,

$$AB = BF = \frac{1}{BD};$$

$\therefore \frac{\alpha}{BC} = \frac{\beta}{CE} = \frac{\gamma}{BD}$;

i. e. α , β , γ are proportional to given altitudes;

\therefore Triangle ABC is similar to required Triangle.

The rest of the construction is obvious.

Q. E. F.

57. (1480, 1486)

(1) Geometrically.

Let ABC be given Triangle.

(Analysis.)

Suppose the 3 Squares described, and that their upper edges form the Triangle $A'B'C'$. Join AA' , BB' , CC' .

Now it is evident that, if BB' be produced, the perpendiculars dropped, from any Point of it, upon AB , BC , will be proportional to $B'F$, $B'D$.

Similarly for AA' and CC' .

Hence these 3 Lines will meet at the Point from which the perpendiculars, dropped upon the sides of ABC , are proportional to $B'C'$, $C'A'$, $A'B'$.

Hence, if Squares be described externally on the sides of ABC , and if their outer edges be produced to form a new Triangle $A''B''C''$: this Triangle, with these 3 Squares, will form a Diagram wholly similar to that formed by the Triangle ABC , with the 3 Squares inside it.

(Synthesis.)

Hence, if Squares be described externally on the sides of the given Triangle; and if their outer edges be produced to form a new Triangle; and if the sides of the given Triangle be divided similarly to thoses of the new Triangle: their central portions will be the bases of the required Squares. Q. E. F.

(2) Trigonometrically.

Let a , b , c be the sides of the given Triangle, and m its area; and let x , y , z be the sides of the required Squares.

It is evident that a Circle can be described about the Tetragon $BDB'F$.

Hence $\angle B'DD = \angle B'FD$.

Now, in Triangle $B'FD$, we know that

$$B'D \cap D = B'F \cap F;$$

$$\text{i. e. } x \cap (B' + F) = z \cap F;$$

$$\therefore x \cap B' \cap F + x \cap B' \cap F = z \cap F.$$

Now $\angle B$ is supplementary to $\angle B'$;

$$\therefore x \cap B \cap F = (z + x \cap B) \cap F;$$

$$\therefore \cot F = \frac{z+x \cap B}{x \cap B} = \cot B'BD.$$

Now $BD = x \cot B'BD$;

$$\therefore BD = \frac{z+x \cap B}{\cap B}.$$

Similarly, $EC = \frac{y+x \cap C}{\cap C}$.

But $BD + EC = a - x$;

$$\therefore \frac{z+x \cap B}{\cap B} + \frac{y+x \cap C}{\cap C} = a - x;$$

$$\therefore \frac{x \cap (B+C) + y \cap B + z \cap C}{\cap B \cap C} = a - x;$$

$$\text{i. e. } \frac{x \cap A + y \cap B + z \cap C}{\cap B \cap C} = a - x.$$

Now it is evident that these Triangles are similar; so that

$$\frac{a}{x} = \frac{b}{y} = \frac{c}{z}.$$

Hence, multiplying the last equation, throughout, by one or other of these equal fractions, we get

$$\frac{a \cap A + b \cap B + c \cap C}{\cap B \cap C} = \frac{a^2}{x} - a;$$

$$\begin{aligned} \therefore \frac{a \cap A + b \cap B + c \cap C}{a \cap B \cap C} &= \frac{a}{x} - 1; \\ \therefore \frac{a}{x} &= \frac{a \cap A + b \cap B + c \cap C}{a \cap B \cap C} + 1. \end{aligned}$$

Hence, multiplying above and below by one or other of the equal fractions $\frac{a}{\cap A}$, $\frac{b}{\cap B}$, $\frac{c}{\cap C}$,

$$\begin{aligned} \frac{a}{x} &= \frac{a^2 + b^2 + c^2}{ab \cap C} + 1; \\ &= \frac{a^2 + b^2 + c^2}{2m} + 1 = \frac{b}{y} = \frac{c}{z}. \end{aligned}$$

Q. E. F.

58. (1480, 1487)

It may be assumed that the 3 Points form a Triangle, the chance of their lying in a straight Line being (practically) *nil*.

Take the longest side of the Triangle, and call it 'AB': and, on that side of it, on which the Triangle lies, draw the semicircle *AFB*. Also, with centres *A*, *B*, and distances *AB*, *BA*, draw the arcs *BDC*, *AEC*, intersecting at *C*.

Then it is evident that the vertex of the Triangle cannot fall outside the Figure *ABDCE*.

Also, if it fall inside the semicircle, the Triangle is obtuse-angled: if outside it, acute-angled. (The chance, of its falling *on* the semicircle, is practically *nil*.)

Hence required chance = $\frac{\text{area of semicircle}}{\text{area of fig. } ABDCE}$.

Now let $AB = 2a$: then area of semicircle = $\frac{\pi a^2}{2}$; and area of Fig. *ABDCE* = $2 \times \text{sector } ABDC - \text{Triangle } ABC$;

$$= 2 \cdot \frac{4\pi a^2}{6} - \sqrt{3} \cdot a^2 = a^2 \cdot \left(\frac{4\pi}{3} - \sqrt{3}\right);$$

$$\therefore \text{chance} = \frac{\frac{\pi}{2}}{\frac{4\pi}{3} - \sqrt{3}} = \frac{3}{8 - \frac{6\sqrt{3}}{\pi}}.$$

Q. E. F.

59. (1480, 1487)

Let $KL = MN = a$,
 $KN = LM = b$,
 $KM = LN = c$;

and let \angle s LMK, MKL, KLM be equal to 'A, B, C'; and similarly for the \angle s of the other facets.

From K draw $KT \perp$ base-facet LMN . Also draw $KR, KS, \perp LM, MN$. And join TR, TM, TS .

It is easily proved that \angle s TRM, TSM are right.

The required volume is $\frac{1}{3} \cdot KT \cdot LMN$. The area of LMN is of course known. All we need is the length of KT . Now $KT^2 = KS^2 - TS^2$; and KS evidently = $c \cdot \cap B$. Hence all we need is the length of TS .

Now this requires a preliminary Lemma, in itself a very pretty problem, viz.—

Lemma (1).

Given, in Tetragon $RMST$, sides RM, MS , and $\angle RMS$, and that \angle s TRM, TSM are right: find TS .

Now $\frac{TS}{\cap TRS} = \frac{TR}{\cap TSR}$;

also $TS \cap TSR + TR \cap TRS = RS$;

$$\begin{aligned} \therefore \frac{TS}{\cap TRS} &= \frac{TR}{\cap TSR}, \\ &= \frac{TS \cap TSR + TR \cap TRS}{\cap TRS \cap TSR + \cap TSR \cap TRS}, \\ &= \frac{RS}{\cap RMS} = \frac{MS}{\cap MRS}; \end{aligned}$$

$\therefore \frac{TS}{\cap MRS} = \frac{MS}{\cap MRS}$; i. e. $TS = MS \cot MRS$.

Q. E. F.

Hence this requires another Lemma, in order to find the value of $\cot MRS$ (or $\tan MRS$, which will do as well, and makes a prettier problem).

Lemma (2).

Given, in Triangle RMS , sides RM , MS , and $\angle RMS$: find $\tan MRS$.

$$\begin{aligned} \tan MRS &= \frac{\text{opposite}}{\text{adjacent}} = \frac{RS \text{ opposite } MRS}{RM \text{ adjacent } MRS} \\ &= \frac{MS \text{ opposite } RMS}{RM - MS \text{ adjacent } RMS}. \end{aligned}$$

Q. E. F.

Hence, in Tetragon $RMST$, we have by Lemma (1),

$$TS = MS \cot MRS;$$

and, by Lemma (2), $\cot MRS = \frac{RM - MS \text{ adjacent } RMS}{MS \text{ opposite } RMS}$,

$$= \frac{c \text{ adjacent } A - c \text{ adjacent } B \text{ adjacent } C}{c \text{ adjacent } B \text{ opposite } C} = \frac{\text{adjacent } A - \text{adjacent } B \text{ adjacent } C}{\text{adjacent } B \text{ opposite } C};$$

$$\therefore TS = \frac{c}{\text{opposite } C} \cdot (\text{adjacent } A - \text{adjacent } B \text{ adjacent } C).$$

$$\text{Now } KT^2 = KS^2 - TS^2;$$

$$\therefore \text{it} = (c \text{ opposite } B)^2 - \frac{c^2}{\text{opposite } C} \cdot (\text{adjacent } A - \text{adjacent } B \text{ adjacent } C)^2,$$

$$= \frac{c^2}{\text{opposite } C} \cdot \{(\text{opposite } B \text{ opposite } C)^2 - (\text{adjacent } A - \text{adjacent } B \text{ adjacent } C)^2\};$$

therefore $KT = \frac{c}{\text{opposite } C}$ multiplied by

$$\sqrt{\text{opposite } B \text{ opposite } C - \text{adjacent } B \text{ adjacent } C - \text{adjacent } A + 2 \text{ adjacent } A \text{ adjacent } B \text{ adjacent } C},$$

$= \frac{c}{\text{opposite } C}$ multiplied by

$$\begin{aligned} &\sqrt{(1 - \text{adjacent } B) \cdot (1 - \text{adjacent } C) - \text{adjacent } B \text{ adjacent } C - \text{adjacent } A + 2 \text{ adjacent } A \text{ adjacent } B \text{ adjacent } C}, \\ &= \frac{c}{\text{opposite } C} \cdot \sqrt{1(\text{adjacent } A + \text{adjacent } B + \text{adjacent } C) + 2 \text{ adjacent } A \text{ adjacent } B \text{ adjacent } C}, \end{aligned}$$

which is symmetrical, as it ought to be.

$$\text{Now area of } LMN = \frac{ab \text{ opposite } C}{2};$$

hence volume of Tetrahedron

$$\frac{abc}{6} \cdot \sqrt{1(\text{adjacent } A + \text{adjacent } B + \text{adjacent } C) + 2 \text{ adjacent } A \text{ adjacent } B \text{ adjacent } C}.$$

Q. E. F.

60. (1480, 1487)

Let $\angle BAD = \theta$, $\angle CAD = \phi$.

$$\begin{aligned} \text{Now } \frac{\sin(B+\theta)}{\sin \theta} &= \frac{c}{\left(\frac{ma}{m+n}\right)} \\ &= \frac{c \cdot (m+n)}{ma}; \end{aligned}$$

$$\therefore \sin B \cot \theta + \cos B = \frac{c \cdot (m+n)}{ma};$$

$$\begin{aligned} \therefore \cot \theta &= \frac{c \cdot (m+n)}{ma \cdot \sin B} - \cot B, \\ &= \frac{(m+n) \cdot (a \cos B + b \cos A) - ma \cos B}{ma \sin B}, \\ &= \frac{(m+n)b \cos A + na \cos B}{ma \sin B}; \end{aligned}$$

$$\begin{aligned} \text{i. e. } \cot \theta &= \frac{(m+n) \cdot \frac{b}{\sin B} \cdot \cos A + na \cot B}{ma}, \\ &= \frac{(m+n)a \cot A + na \cot B}{ma}, \\ &= \frac{(m+n) \cot A + n \cot B}{m}. \end{aligned}$$

$$\text{Similarly, } \cot \phi = \frac{(m+n) \cot A + m \cot C}{n}.$$

Q. E. F.

Corollaries.

- (1) $m \cot \theta - n \cot \phi = n \cot B - m \cot C$.
- (2) $\frac{\cot B + \cot \phi}{\cot C + \cot \theta} = \frac{m}{n}$.
- (3) If Triangle be equilateral,

$$\begin{aligned} \cot \theta &= \frac{m+2n}{m} \cdot \frac{1}{\sqrt{3}}, \\ \cot \phi &= \frac{n+2m}{n} \cdot \frac{1}{\sqrt{3}}; \\ \therefore \frac{\cot \theta}{\cot \phi} &= \frac{mn+2n^2}{mn+2m^2}; \end{aligned}$$

$$\therefore \frac{\tan \theta}{\tan \phi} = \frac{mn + 2m^2}{mn + 2n^2};$$

i. e., if $CD'B'$ be drawn \perp to AD , $\frac{B'D'}{D'C} = \frac{mn+2m^2}{mn+2n^2}$; e. g., if $\frac{m}{n} = \frac{1}{2}$, $\frac{B'D'}{D'C} = \frac{2}{5}$.

(4) Let $\tan A = 1$, $\tan B = 2$, $\tan C = 3$;

then $\cot \theta = \frac{m+n+n \cdot \frac{1}{2}}{m} = \frac{2m+3n}{2m}$,

$$\cot \phi = \frac{m + n + m \cdot \frac{1}{2}}{n} = \frac{3n + 4m}{2n};$$

$$\therefore \frac{\tan \theta}{\tan \phi} = \frac{6mn+8m^2}{6mn+9n^2};$$

from which, if $\frac{\tan \theta}{\tan \phi}$ were given, we could find $\frac{m}{n}$ from a Quadratic Equation.

I tried various values, to find one which would give rational values for m and n , and found that $\frac{2}{3}$ would do, as it leads to the Quadratic

$$2(6mn + 9n^2) - 3(6mn + 8m^2) = 0,$$

in which $(B^2 - 4AC)$ becomes, after dividing all through by 6, $(1^2 + 4 \cdot 4 \cdot 3)$, i. e. 49.

The Quadratic is $4m^2 + mn - 3n^2 = 0$;

whence $\frac{m}{n} = \frac{-1 \pm 7}{8} = \frac{3}{4}$; which solves the Problem 'Given a Triangle ABC , having the tangents of its angles equal to 1, 2, 3: divide BC at D , so that, if AD be joined, and $CD'B'$ drawn \perp to it, the ratio $\frac{B'D'}{D'C}$ may be $\frac{2}{3}$ '. The answer is 'Divide it so that $\frac{BD}{DC} = \frac{3}{4}$ '.

61. (1480)

We know that the equation

$$'(a^2 + 4b^2 + 4c^2) + (4a^2 + b^2 + 4c^2) + (4a^2 + 4b^2 + c^2) = 9(a^2 + b^2 + c^2)'$$

is identically true.

Hence $a^2 + b^2 + c^2$

$$= \frac{1}{9} \cdot \{(a^2 + 4b^2 + 4c^2) + (4a^2 + b^2 + 4c^2) + (4a^2 + 4b^2 + c^2)\};$$

$$= \frac{1}{9} \cdot \{(a^2 + 4b^2 + 4c^2 + 8bc - 4ca - 4ab) + (4a^2 + b^2 + 4c^2 - 4bc + 8ca - 4ab) + (4a^2 + 4b^2 + c^2 - 4bc - 4ca + 8ab)\};$$

$$= \frac{1}{9} \cdot \{(-a + 2b + 2c)^2 + (2a - b + 2c)^2 + (2a + 2b - c)^2\};$$

$$= \left(\frac{-a + 2b + 2c}{3}\right)^2 + \left(\frac{2a - b + 2c}{3}\right)^2 + \left(\frac{2a + 2b - c}{3}\right)^2.$$

Now $(-a + 2b + 2c) = 3(b + c) - (a + b + c)$;

\therefore , if $(a + b + c)$ be a multiple of 3, so also is $(-a + 2b + 2c)$;

$\therefore \frac{-a+2b+2c}{3}$ is an integer;

and similarly for the other 2 fractions.

Also it may be proved that, if $\frac{-a+2b+2c}{3}$ be equal to a , or b , or c , then a , b , c can be arranged in $A.P.$

First, let $\frac{-a+2b+2c}{3} = a$;

then $-a + 2b + 2c = 3a$; i. e. $b + c = 2a$;

secondly, let $\frac{-a+2b+2c}{3} = b$;
then $-a + 2b + 2c = 3b$; i. e. $2c = a + b$;
thirdly, let $\frac{-a+2b+2c}{3} = c$;
then $-a + 2b + 2c = 3c$; i. e. $2b = c + a$.

And similarly for the other 2 fractions.

Hence, contranominally, if a, b, c can *not* be arranged in $A.P.$, then 2 sets of squares have no common term. Q. E. D.

Numerical Examples (not thought out).

a^2	b^2	c^2	$(\frac{-a+2b+2c}{3})^2$	$(\frac{2a-b+2c}{3})^2$	$(\frac{2a+2b-c}{3})^2$
1^2	4^2	4^2	5^2	2^2	2^2
3^2	4^2	8^2	7^2	6^2	2^2
4^2	5^2	9^2	8^2	7^2	3^2

62. (1480)

Let AB, AC , be the given Lines, and P the given Point.

Through P draw PD parallel to AB ; from DC cut off DE equal to AD ;
join EP , and produce it to meet AB at F .

Because $AD = DE$, and that DP is parallel to AB ,
 $\therefore FP = PE$.

Now let GPH be any other line through P ;
then $\angle PFH > \angle PEG$.

Because, in Triangles $PFH, PEG, PF = PE$, and
 $\angle FPH = \angle GPE$, and $\angle PFH > \angle PEG$,

$\therefore PH > PG$, and Triangle $PFH >$ Triangle PGE .

To each add Tetragon $AFPG$;

\therefore Triangle $AGH >$ Triangle AEF .

And so of any other line through P .

Hence AEF is the least possible Triangle.

Q. E. F.

63. (1480, 1487)

Let each side of each Square = 2.
Then $LG = \sqrt{3}$, $MG = (\sqrt{2} - 1)$;

$$\begin{aligned} \therefore LM(= JK) &= \sqrt{3 - (2 + 2 - 2\sqrt{2})} \\ &= 2^{\frac{3}{4}}; \\ \therefore OJ = OK &= \frac{1}{2^{\frac{1}{4}}}. \end{aligned}$$

Take O as origin, the X -axis \parallel to AD , and Y -axis to AB ; and let JK be part of the Z -axis.

Let equation to plane containing Triangle CDG be

$$x \cap \alpha + y \cap \beta + z \cap \gamma - p = 0,$$

where p is length of perpendicular dropped, from O , upon this plane, and meeting it somewhere in LG .

Hence we can find p from equation to LG , in the XZ -plane, which will be

$$x \cap \alpha + z \cap \gamma - p = 0;$$

now this line contains L , whose co-ordinates are $(1, \frac{1}{2^{\frac{1}{4}}})$, and G , whose co-ordinates are $(\sqrt{2}, -\frac{1}{2^{\frac{1}{4}}})$;

$$\begin{aligned} \therefore \cap \alpha + \frac{1}{2^{\frac{1}{4}}} \cdot \cap \gamma - p &= 0, \\ \text{and } \sqrt{2} \cdot \cap \alpha - \frac{1}{2^{\frac{1}{4}}} \cdot \cap \gamma - p &= 0; \\ \therefore (\sqrt{2} - 1) \cdot \cap \alpha &= \frac{2}{2^{\frac{1}{4}}} \cdot \cap \gamma = 2^{\frac{3}{4}} \cdot \cap \gamma; \\ \therefore \frac{\cap \alpha}{2^{\frac{3}{4}}} &= \frac{\cap \gamma}{\sqrt{2}-1} = \frac{1}{\sqrt{2^{\frac{3}{2}}+3-2^{\frac{3}{2}}}} = \frac{1}{\sqrt{3}}; \\ \therefore \cap \alpha &= \frac{2^{\frac{3}{4}}}{\sqrt{3}}, \cap \gamma = \frac{\sqrt{2}-1}{\sqrt{3}}; \\ \therefore p &= \frac{2^{\frac{3}{4}}}{\sqrt{3}} + \frac{\sqrt{2}-1}{2^{\frac{1}{4}} \cdot \sqrt{3}} = \frac{\sqrt{2}+1}{2^{\frac{1}{4}} \cdot \sqrt{3}}. \end{aligned}$$

Now area of $CDG = \sqrt{3}$;

\therefore volume of pyramid, whose base is CDG and whose vertex is O , = $\frac{\sqrt{2}+1}{3 \cdot 2^{\frac{1}{4}}}$;
and there are eight such pyramids in the solid;

\therefore their sum = $\frac{8(\sqrt{2}+1)}{3.2^{\frac{1}{4}}}$.
 Also volume of pyramid, whose base is $ABCD$, and whose vertex is O ,
 = $\frac{4}{3.2^{\frac{1}{4}}}$;
 and there are 2 such pyramids in the solid;
 \therefore their sum = $\frac{8}{3.2^{\frac{1}{4}}}$;
 \therefore volume of solid = $\frac{8(2+\sqrt{2})}{3.2^{\frac{1}{4}}} = \frac{8.2^{\frac{1}{4}}.(\sqrt{2}+1)}{3}$
Q. E. F.

64. (1480)

Let ABC be the given Triangle, and O the given Point; and let OD , its distance from BC , be less than either OE or OF , its distance from CA , AB .

Draw a line GH equal to OE , and $GK \perp$ it and equal to OF ; and join HK ; and about the Triangle GHK describe a Circle; and place in it a line KL equal to OD ; and join LH .

Because sqs of KL , $LH =$ sqs of KG , GH , and that KL is less than either KG or GH , $\therefore LH$ is greater than either;

\therefore a Circle, with centre O , and radius equal to LH , will cut all three Lines, in two Points each. Describe this Circle.

Then sqs of MD , $DO =$ sqs of PE , EO ;

also sq. of $LH =$ sqs of RF , FO ;

\therefore sqs of MD , DO , $LH =$ sqs of PE , RF , EO , FO ;

but sqs of DO , $LH =$ sqs of KL , LH ,

= sqs of GH , $GK =$ sqs of EO , FO ;

\therefore sq. of $MD =$ sqs of PE , RF ;

\therefore 4 times sq. of $MD = 4$ times sqs of PE , RF ;

i. e. sq. of $MN =$ sqs of PQ , RS .

Hence MN , PQ , RS , can be sides of a right-angled Triangle. Q. E. F.

65. (1481)

Calling the angles $\frac{1}{x}$, $\frac{1}{y}$, $\frac{1}{z}$, of 360° , we must have

$$\frac{1}{x} + \frac{1}{y} + \frac{1}{z} = \frac{1}{2};$$

an Indeterminate Equation with 3 unknowns.

Evidently none of them can be so small as 2.

(1) Let $x = 3$; then $\frac{1}{y} + \frac{1}{z} = \frac{1}{6}$.

Now, if $\frac{1}{y} = \frac{k}{k+l} \times \frac{1}{6}$, $\frac{1}{z}$ will = $\frac{l}{k+l} \times \frac{1}{6}$;

hence k can only be 1, or 2, or 3, or 6; and the same is true of l .

(N.B. It is assumed that the fractions $\frac{k}{k+l}$, $\frac{l}{k+l}$, are in their lowest terms.)

Let $\frac{1}{y}$ be $\neq \frac{1}{z}$. Then $\frac{k}{k+l} \neq \frac{1}{2}$.

Then its possible values are $\frac{1}{2}$, so that $\frac{l}{k+l} = \frac{1}{2}$
 $\frac{2}{3}$, $\frac{1}{3}$
 $\frac{3}{4}$, $\frac{1}{4}$
 $\frac{4}{5}$, $\frac{1}{5}$
 $\frac{6}{7}$, $\frac{1}{7}$.

This gives 5 sets of values for $\frac{1}{x}$, $\frac{1}{y}$, $\frac{1}{z}$, viz.:

$\frac{1}{3}$, $\frac{1}{12}$, $\frac{1}{12}$; $\frac{1}{3}$, $\frac{1}{9}$, $\frac{1}{18}$; $\frac{1}{3}$, $\frac{1}{8}$, $\frac{1}{24}$; $\frac{1}{3}$, $\frac{1}{10}$, $\frac{1}{15}$; $\frac{1}{3}$, $\frac{1}{7}$, $\frac{1}{42}$.

(2) Let $x = 4$. Then $\frac{1}{y} + \frac{1}{z} = \frac{1}{4}$, and, as before, k can only be 1, or 2, or 4, and the same is true of l .

Hence the possible values for $\frac{k}{k+l}$ are $\frac{1}{2}$, so that $\frac{l}{k+l} = \frac{1}{2}$
 $\frac{2}{3}$, $\frac{1}{3}$
 $\frac{4}{5}$, $\frac{1}{5}$.

This gives 3 more sets of values for $\frac{1}{x}$, $\frac{1}{y}$, $\frac{1}{z}$, viz.

$\frac{1}{4}$, $\frac{1}{8}$, $\frac{1}{8}$; $\frac{1}{4}$, $\frac{1}{6}$, $\frac{1}{12}$; $\frac{1}{2}$, $\frac{1}{5}$, $\frac{1}{20}$.

(3) Let $x = 5$; then $\frac{1}{y} + \frac{1}{z} = \frac{9}{10}$.

Hence denominator must contain factor "3", and k can be only 1, or 2, or 5, or 10; and the same is true of l .

Hence possible values of $\frac{k}{k+l}$ are $\frac{1}{2}$, so that $\frac{l}{k+l} = \frac{1}{2}$
 $\frac{2}{3}$, $\frac{1}{3}$
 $\frac{5}{6}$, $\frac{1}{5}$.

This gives 2 sets of values for $\frac{1}{x}$, $\frac{1}{y}$, $\frac{1}{z}$, viz.:—

$\frac{1}{5}$, $\frac{1}{5}$, $\frac{1}{10}$; $\frac{1}{5}$, $\frac{1}{4}$, $\frac{1}{20}$;

but the latter (a fact overlooked in thinking out) we have had already.

(4) Let $x = 6$; then $\frac{1}{y} + \frac{1}{z} = \frac{1}{3}$.

Hence k can be only 1, or 3, and the same is true of l .

Hence possible values of $\frac{k}{k+l}$ are $\frac{1}{2}$, so that $\frac{l}{k+l} = \frac{1}{2}$
 $\frac{3}{4}$, $\frac{1}{4}$.

This gives 2 sets of values, viz.:—

$\frac{1}{6}$, $\frac{1}{6}$, $\frac{1}{6}$; $\frac{1}{6}$, $\frac{1}{4}$, $\frac{1}{12}$;

but the latter (a fact overlooked in thinking out) we have had already.

There is no use in giving, to x , any values greater than 6; for these would make $\frac{1}{y} + \frac{1}{z} > \frac{1}{3}$; so that one or other must be $> \frac{1}{6}$; i. e. either y or z must < 6 , and we should get old values over again.

Hence there are 10 different shapes.

Q. E. F.

The 10 sets of angles (I am not certain that they were all thought out) are

- (1) 120°, 30°, 30°;
- (2) 120°, 40°, 20°;
- (3) 120°, 45°, 15°;
- (4) 120°, 36°, 24°;
- (5) 120°, 51 $\frac{3}{7}$ °, 8 $\frac{4}{7}$ °;
- (6) 90°, 45°, 45°;
- (7) 90°, 60°, 30°;
- (8) 90°, 72°, 18°;
- (9) 72°, 72°, 36°;
- (10) 60°, 60°, 60°.

66. (1481, 1487)

Write k for $\frac{\alpha}{\alpha+\beta}$. Now the counters must be either both white, or one white and one black. Let chance of first condition be x ; hence chance of second is $(1-x)$. Hence chance of drawing white is $x \times 1 + (1-x) \times \frac{1}{2}$.

$$\therefore x + \frac{1-x}{2} = k; \therefore x = 2k - 1;$$

$$\therefore (1-x) = 2 - 2k.$$

Let a counter now be drawn and prove white; then chance of 'observed event,' in 1st condition, is 1, and, in 2nd condition, $\frac{1}{2}$;

Hence the chances, of the existence of these two conditions, are proportional to $(2k-1) \times 1$, $(2-2k) \times \frac{1}{2}$; i. e. are proportional to $2k-1$, $1-k$;

hence these chances actually are $\frac{2k-1}{k}$, $\frac{1-k}{k}$;

hence the chance of now drawing white,

is $\frac{2k-1}{k} \times 1 + \frac{1-k}{k} \times \frac{1}{2}$;

i. e. $\frac{3k-1}{2k}$.

Hence the effect of *one* repetition of the experiment has been to change k into $\frac{3k-1}{2k}$.

Hence a second repetition of it will change $\frac{3k-1}{2k}$ into $\frac{3 \times \frac{3k-1}{2k} - 1}{2 \times \frac{3k-1}{2k}}$; i. e. into $\frac{7k-3}{6k-2}$.

We have now to discover the law (if there is one) for the series

$$k, \frac{3k-1}{2k}, \frac{7k-3}{6k-2},$$

regarding these as identical functions of 1, 2, 3.

We can write the 1st and 2nd term in the form of the 3rd, thus:—

$$\frac{k-0}{0 \times k - (-1)}, \frac{3k-1}{2k-0}, \frac{7k-3}{6k-2}$$

and, by inspection, we see that each is of the form

$$\frac{(2^n - 1) \times k - (2^{n-1} - 1)}{(2^n - 2) \times k - (2^{n-1} - 2)},$$

where n denotes the place of the term.

Suppose this law to hold for n terms, what will be the effect of repeating the experiment once more?

We know that it changes k into $\frac{3k-1}{2k}$. Hence the new chance will be

$$\frac{3 \times \frac{(2^n-1) \times k - (2^{n-1}-1)}{(2^n-2) \times k - (2^{n-1}-2)} - 1}{2 \times \frac{(2^n-1) \times k - (2^{n-1}-1)}{(2^n-2) \times k - (2^{n-1}-2)}};$$

i. e. $\frac{k \times (3 \cdot 2^n - 3 - 2^n + 2) - 3 \cdot 2^{n-1} + 3 + 2^{n-1} - 2}{(2^{n+1}-2) \times k - (2^n-2)}$;

i. e. $\frac{(2^{n+1}-1) \times k - (2^n-1)}{(2^{n+1}-2) \times k - (2^n-2)}$;

i. e. the $n+1^{\text{th}}$ term of the series will follow the same law. But we know that the law holds for the 1st, 2nd, and 3rd terms. Hence it holds universally.

Hence, after m repetitions of the experiment, the chance of drawing white will be the $m+1^{\text{th}}$ term of the above series; i. e. it will be

$$\frac{(2^{m+1}-1) \times k - (2^m-1)}{(2^{m+1}-2) \times k - (2^m-2)}.$$

Now, for k , write $\frac{\alpha}{\alpha+\beta}$.

Then chance is $\frac{(2^{m+1}-1) \times \alpha - (2^m-1) \cdot (\alpha+\beta)}{(2^{m+1}-2) \times \alpha - (2^m-2) \cdot (\alpha+\beta)}$;

i. e. $\frac{(2^{m+1}-2^m) \alpha - (2^m-1) \cdot \beta}{(2^{m+1}-2^m) \alpha - (2^m-2) \cdot \beta}$;

i. e. $\frac{2^m \cdot (\alpha-\beta) + \beta}{2^m \cdot (\alpha-\beta) + 2\beta}$.

Q. E. F.

EXAMPLE—Let chance be $\frac{2}{10}$; and then 1st experiment be repeated 5 times more.

Hence $\alpha = 9$, $\beta = 1$;

\therefore chance becomes $\frac{32 \times 8 + 1}{32 \times 8 + 2}$, i. e. $\frac{257}{258}$.

67. (1481, 1487)

Let $ABCD$ be the socket. Revolve the Tetrahedron until the plane, in it, DOA has taken the new position, meet the socket-rim AC at R . From A' draw $A'L \perp XY$ -plane. Join OR , and produce it to L . And draw RM , LN , the y -ordinates of R and L .

Then co-ordinates of A' are ON , NL , LA' .

Call OM , MR , ' x' ', ' y' '; and OA , OR , OD , ' a ', ' a' ', ' h '; and $\angle XOR$ ' θ '.

It is evident that the vertical axis of the Tetrahedron always coincides with the Z -axis.

Hence A moves on the surface of a cylinder,

$$\text{i. e. } x^2 + y^2 = a^2 \dots\dots\dots (1)$$

Now $\angle XAC = 150^\circ$;

$$\therefore \text{Equation to } AC \text{ is } y = -\frac{1}{\sqrt{3}} \cdot (x - a);$$

$$\text{i. e. } x + \sqrt{3} \cdot y = a \dots\dots\dots (2)$$

Also Equation to OR is $\frac{x}{\sin \theta} = \frac{y}{\cos \theta} = \delta$;

$$\therefore, \text{ at } R, \frac{x'}{\sin \theta} = \frac{y'}{\cos \theta} = a'; \dots\dots\dots (3)$$

$$\therefore \text{by (2), } a' \cdot \sphericalangle \theta + \sqrt{3} \cdot a' \cdot \cap \theta = a;$$

$$\therefore a' = \frac{a}{\sphericalangle \theta + \sqrt{3} \cdot \cap \theta} \dots \dots \dots (4)$$

Also, by similar $\triangle s D'QA', D'OR, QA' : QD' :: OR : OD'$

$$\text{i. e. } a : h :: \frac{a}{\sphericalangle \theta + \sqrt{3} \cdot \cap \theta} : h - z;$$

$$\therefore h - z = \frac{h}{\sphericalangle \theta + \sqrt{3} \cdot \cap \theta};$$

$$\text{but } \sphericalangle \theta = \frac{x}{a}, \text{ and } \cap \theta = \frac{y}{a};$$

$$\therefore h - z = \frac{ah}{x + \sqrt{3} \cdot y};$$

$$\text{i. e. } (x + \sqrt{3} \cdot y) \cdot (h - z) = ah \dots \dots \dots (5)$$

Equations (1) and (5) give the required Locus. Q. E. F.

68. (1481, 1487)

Let the Nos of bottles, taken out on the 3 days, be ' x, y, z '. Let each bottle have cost $10v$ pence, and therefore be sold for $11v$ pence.

Then the Treasurer's receipts, on the 3 days, were $(x - 1) \cdot 11v, y \cdot 11v - v, (z - 1) \cdot 11v - v$; yielding, as profits (i. e. as remainders after deducting cost-price of bottles taken out), $xv - 11v, yv - v, zv - 12v$. Then these 3 quantities are equal.

$$\text{Hence } y = x - 10, \text{ and } z = x + 1;$$

$$\therefore \text{total No. of bottles, being } (x + y + z), = 3x - 9.$$

$$\text{Now total profits are } (x + y + z) \cdot v - 24v; \text{ i. e. } (3x - 33)v;$$

$$\therefore \text{profit, per bottle} = \frac{(3x - 33)v}{3x - 9}; \text{ and this must} = 6;$$

$$\therefore (x - 11) \cdot v = (x - 3) \cdot 6.$$

$$\text{Also } z \cdot 11v = 11 \times 240; \text{ i. e. } (x + 1) \cdot 11v = 11 \times 240;$$

$$\therefore \frac{x - 11}{x + 1} = \frac{6 \cdot (x - 3)}{240};$$

$$\therefore (x + 1) \cdot (x - 3) = 40 \cdot (x - 11);$$

$$\therefore x^2 - 2x - 3 = 40x - 440;$$

$$\therefore x^2 - 42x + 437 = 0.$$

$$\text{Now } 42^2 - 4 \times 437 = 1764 - 1748 = 16;$$

$$\therefore x = \frac{42 \pm 4}{2} = 23 \text{ or } 19;$$

$$\therefore \text{No. of bottles} = 60 \text{ or } 48; \text{ but it is a multiple of } 5; \therefore \text{it} = 60.$$

$$\text{Also } (x + 1) \cdot 11v = 11 \times 240; \text{ i. e. } 24v = 240;$$

$$\therefore v = 10;$$

i. e. the wine was bought @ $8/4$ a bottle, and sold @ $9/2$ a bottle. Q. E. F.

69. (1481, 1487)

§ 1. Let $\angle BAD = k \cdot A, \angle CBE = l \cdot B, \angle ACF = m \cdot C$.

$$\text{Then } \angle ABE = (1 - l) \cdot B.$$

$$\text{Now } \angle BC'D = \angle C'AB + \angle C'BA.$$

$$\text{i. e. } k \cdot A + (1 - l) \cdot B = C. \dots \dots \dots (1)$$

$$\text{Similarly, } l \cdot B + (1 - m) \cdot C = A; \dots \dots \dots (2)$$

$$\text{and } m \cdot C + (1 - k) \cdot A = B. \dots \dots \dots (3)$$

From equations (1) and (3), l and m may be found in terms of k : but these, taken along with k , will not be *similar* functions of the single variable k . We

must have k a certain function of A, B, C , and θ (say); l a similar functions of B, C, A , and θ ; and m a similar function of C, A, B , and θ ; i. e. we must have

$$\begin{aligned} k &= f(A, B, C, \theta), \\ l &= f(B, C, A, \theta), \\ m &= f(C, A, B, \theta). \end{aligned}$$

Now we know, by (1), that $kA - lB = C - B$;
i. e. $A \cdot f(A, B, C, \theta) - B \cdot f(B, C, A, \theta) = C - B$.
Now, as an experiment, let

$$\begin{aligned} k \cdot A &= xA + yB + zC + \theta, \\ l \cdot B &= xB + yC + zA + \theta; \end{aligned}$$

then $kA - lB = (x - z) \cdot A + (y - x) \cdot B + (z - y) \cdot C$;

$\therefore x - z = 0$; i. e. $x = z$;

$z - y = 1$; i. e. $z = y + 1$.

These conditions will be fulfilled, if we make $y = 1$, and $x = z = 2$; so that

$$\begin{aligned} kA &= 2A + B + 2C + \theta, \\ lB &= 2B + C + 2A + \theta; \end{aligned}$$

which would make

$$f(A, B, C, \theta) \text{ mean } \frac{2A + B + 2C + \theta}{A}.$$

Now this may evidently be simplified by omitting $(A + B + C)$, which is constant; and we then have $k = \frac{A+C+\theta}{A}$; or, in a yet simpler form, by again subtracting 180° , $k = \frac{\theta - B}{A}$.

Similarly $l = \frac{\theta - C}{B}$,

$m = \frac{\theta - A}{C}$.

Q. E. F.

§ 2. We see that $kA = \theta - B$, so that $\angle ADC$ is evidently equal to θ ; and so are $\angle s BEA, CFB$.

This gives us a geometrical construction, viz. to draw lines from A, B, C , so that each makes the same angle θ whith the opposite side.

§ 3. Let us now ascertain the limits within which the value of θ must lie.

We know that $kA = \theta - B$.

Now $kA \not\asymp A$; $\therefore \theta - B \not\asymp A$; i. e. $\theta \not\asymp A + B$;

i. e. $\theta \not\asymp$ the supplement of C ;

and of course this is true for *each* of the three angles A, B, C ; i. e. if A, B, C , be the order of the angles in a descending order of magnitude, $\theta \not\asymp$ supplement of A .

Again $kA \not\asymp 0$.

Hence $\theta - B \not\asymp 0$; i. e. $\theta \not\asymp B$;

and of course this is true for *each* angle.

Hence if A, B, C , be the order in a descending order of mangitude, $\theta \not\asymp A$, and $\not\asymp 180^\circ - A$.

Q. E. F.

§ 4. We have now to ascertain the ratio which $B'C'$ bears to BC .

In Triangle ABC' , whose \angle s are $(\theta - B)$, $(180^\circ - \theta - A)$, $(180^\circ - C)$, we have

$$AC' = \frac{AB}{\sin AC'B} \cdot \sin ABC' = \frac{c}{\sin C} \cdot \sin(\theta + A) = \frac{a}{\sin A} \cdot \sin(\theta + A);$$

$$BC' = \frac{AB}{\sin AC'B} \cdot \sin BAC' = \frac{c}{\sin C} \cdot \sin(\theta - B) = \frac{a}{\sin A} \cdot \sin(\theta - B)$$

\therefore , by symmetry, $AB' = \frac{a}{\sin A} \cdot \sin(\theta - A)$.

Now $B'C' = AC' - AB'$;

\therefore it = $\frac{a}{\sin A} \{ \sin(\theta + A) - \sin(\theta - A) \}$,

$$= \frac{a}{\sin A} \cdot 2 \sin \theta \sin A = a 2 \sin \theta.$$

Hence $\frac{a'}{a} = \frac{b'}{b} = \frac{c'}{c} = 2 \sin \theta$.

Q. E. F.

70. (1482, 1488)

Before folding the Plane containing the Triangles, the locus of their vertices is evidently a Line parallel to their common base. Hence, if the base of the Tetrahedron = 1, we may imagine a slip of paper, whose width is $\frac{\sqrt{3}}{2}$, attached to the front facet of the Tetrahedron, and wrapped round towards the right; and the upper edge of this slip will evidently be the locus of the vertices. This slip may be conveniently regarded as divided into equilateral Triangles, placed base-downwards and base-upwards alternately, and it is evident that these Triangles will successively cover the facets of the Tetrahedron, in the order 'front, right side, base, left side, front, &c.:'; and its *upper* edge, made up of the bases of the inverted constituent Triangles, will evidently run as follows. Calling the successive Triangles, after the first (which occupies the front facet of the Tetrahedron), ' α ' (base-up), ' β ' (base-down), ' γ ' (base-up), ' δ ' (base-down), ' ϵ ' (base-up), and so on, the locus consists of the bases of α , γ , &c. Now ' α ' will occupy the right facet, its base coinciding with the back-edge of the Tetrahedron; ' β ' will occupy the base of the Tetrahedron, its base coinciding with the front-edge; ' γ ' will occupy the left facet, its base coinciding with the back-edge; and so on. Hence the locus runs down the back-edge; up again; and so on. Which answers Question (1). Q. E. F.

We may therefore, in answering the other three questions, consider the slip *before* it is folded, and calculate the positions of the vertices along its *upper* edge: and the problems thus become '*plane*' ones.

(2) Gives us a right-angled Triangle, whose left-hand base-angle is 15° , and whose altitude is $\frac{\sqrt{3}}{2}$. We must calculate its base, and then, deducting half the base of the initial Triangle (i. e. deducting $\frac{1}{2}$), we shall get the distance, measured along the upper edge of the slip, from the vertex of the initial Triangle to the vertex of the given Triangle; and from that we can calculate how many times we must go down and up the back-edge to reach it. Call the base of this right-angled Triangle ' x '. Then $\frac{\sqrt{3}}{2} \div x = \tan 15^\circ$.

Now call $\tan 15^\circ$ ' t '; then $\frac{2t}{1-t^2} = \tan 30^\circ = \frac{1}{\sqrt{3}}$;

$$\therefore 1 - t^2 = 2\sqrt{3} \cdot t; t^2 + 2\sqrt{3} \cdot t - 1 = 0;$$

$$\therefore t = \frac{-2\sqrt{3} \pm 4}{2} = (\text{rejecting negative value}) 2 - \sqrt{3}.$$

$$\therefore x = \frac{\sqrt{3}}{2(2-\sqrt{3})} = \frac{\sqrt{3}}{2} (2 + \sqrt{3}) = \sqrt{3} + \frac{3}{2}.$$

Deducting $\frac{1}{2}$, we get $(\sqrt{3} + 1)$ as the required distance.

Now $\sqrt{3} = 1.7\&c.$; \therefore distance = $2.7\&c.$

Hence we must go *down* back-edge, up again, and then about 7 down again.

This answers question (2).

(3) We need to go down the back-edge, and up again; i. e. we must use up the upward bases of ' α ' and ' γ '. Hence the base of the required right-angled Triangle is $2\frac{1}{2}$. Hence the required left-hand base-angle is

$$\tan^{-1}\left(\frac{\sqrt{3}}{2} \div \frac{5}{2}\right); \text{ i. e. } \tan^{-1} \frac{\sqrt{3}}{5}.$$

Hence, for the required base-angle, we have $\frac{\sin}{\cos} = \frac{\sqrt{3}}{5}$;

$$\therefore \frac{\sin}{\sqrt{3}} = \frac{\cos}{5} = \frac{1}{\sqrt{28}}; \therefore \sin = \sqrt{\frac{3}{28}} = \frac{\sqrt{84}}{28}, = \frac{\text{rather over } 9}{28};$$

$$\begin{array}{r} 7 \mid 9. \\ \hline 4 \mid 1.28\&c. \\ \hline \mid .32\&c. \end{array}$$

Now (by mem. tech.) $\sin^{-1} \cdot 3 = 17.45\&c^\circ$.

$\sin^{-1} \cdot 4 = 23.57\&c^\circ$.

and the required angle is about $\frac{1}{5}$ of the way from one to the other. But the difference is almost exactly 6° . Hence we must add, to the lesser, about $1\frac{1}{2}$ degrees, or 1.20° . And the total will be about 18.65° .

(4) Here the right-angled Triangle has, for its base, $3\frac{1}{2}$.

\therefore the required base-angle has, for its tangent,

$$\left(\frac{\sqrt{3}}{2} \div \frac{7}{2}\right); \text{ i. e. } \frac{\sqrt{3}}{7};$$

$$\therefore \frac{\sin}{\sqrt{3}} = \frac{\cos}{7} = \frac{1}{\sqrt{52}}; \therefore \sin = \sqrt{\frac{3}{52}} = \text{nearly } \sqrt{\frac{1}{17}},$$

= nearly $\frac{\sqrt{17}}{17}$. Now $\sqrt{17} = 4.12\&c.$ \therefore $\sin = .24\&c.$

Now $\sin^{-1} \cdot 2 = 11.53\&c^\circ$; and we must go about half-way to the next angle, viz. $17.45\&c^\circ$. The difference is about 6° ; \therefore we must add about 3° . Hence the answer is about 14.53° .

71. (1482)

Let ABC be the given Triangle, and P the given Point.

Bisect the sides of ABC at D, E, F ; and join these Points.
 First, let P be within the Triangle DEF .

Draw HG parallel to BC , so that its distance from BC may be double the distance of P from BC ; join GP, HP , and produce them to meet BC in L, M . From L draw LK parallel to AC ; join KP , and produce it to meet AC at N : join MN .

Because HG is parallel to LM ,
 $\therefore GP = PL$, and $HP = PM$;
 $\because KL$ is parallel to GN , and that $LP = PG$,
 $\therefore KP = PN$; $\therefore MN$ is parallel to HK .

Now the Triangles PGH, PLM , are equal in all respects;
 $\therefore GH = LM$. Similarly $KL = GN$, and $MN = HK$.

If P lies on FE , HG and LM vanish, and the Hexagon becomes a Parallelogram.

If P lies at D , the Hexagon becomes the line BC .

If P lies outside the Triangle DEF , the Problem is insoluble. Q. E. F.

72. (1482, 1488)

We know that, if a bag contained 3 counters, 2 being black and one white, the chance of drawing a black one would be $\frac{2}{3}$; and that any *other* state of things would *not* give this chance.

Now the chances, that the given bag contains $(\alpha) BB, (\beta) BW, (\gamma) WW$, are respectively $\frac{1}{4}, \frac{1}{2}, \frac{1}{4}$.

Add a black counter.

The the chances, that it contains $(\alpha) BBB, (\beta) BWB, (\gamma) WWB$, are, as before, $\frac{1}{4}, \frac{1}{2}, \frac{1}{4}$.

Hence the chance, of now drawing a black one,

$$= \frac{1}{4} \cdot 1 + \frac{1}{2} \cdot \frac{2}{3} + \frac{1}{4} \cdot \frac{1}{3} = \frac{2}{3}.$$

Hence the bag now contains BBW (since any *other* state of things would *not* give this chance).

Hence, before the black counter was added, it contained BW , i. e. one black counter and one white. Q. E. F.

9.22 Number-guessing

Source: manuscript written 1896

6/2/96 → 9.19, p. 1464
Other version:

- A. "Think of a number."
B. [thinks of 23]
A. "Multiply by 3. Is the result odd or even?"
B. [obtains 69] "It is odd."
A. "Add 5, or 9, whichever you like."¹
B. [adds 9, & obtains 78]
A. "Divide by 2, & add 1."
B. [obtains 40]
A. "Multiply by 3. Is the result odd or even?"
B. [obtains 120] "It is even."
A. "Subtract 2, or 6, whichever you like."²
B. [subtracts 6, & obtains 114]

B. [tacks on 5, & obtains 425]
A. "Add the previous result."
B. [obtains 520]
A. "Divide by 7, neglecting remainder."
B. [obtains 74]
A. "Again divide by 7. How often does it go?"
B. "Ten times."
A. "The number you thought of was 23."⁴

[This is an improvement on the puzzle containing the direction "Multiply by 3. Is the result odd or even?" & afterwards "Divide by 2." Four times, in the course of it, B has the choice of certain numbers, & *need not say which he uses!* I don't think this phenomenon occurs in any other such puzzle.]

¹A version from February 3 also allows adding 1. For even numbers B can add 4, 8, or 12.

²The earlier version also allows subtracting 4. For odd numbers B can add 3, 5, or 7. A should calculate the "increment". For answers "odd"—"even" it is 3. "Even"—"odd" is 0, "odd"—"odd" is 1, and "even"—"even" is 2. The mnemonics are "zErO", "fOOt", "fEEt", and "mOrE".

³In the earlier version all numbers from 20 to 50 are allowed for increment 3. For increment 2 B can add any number from 30 to 60, for 1 from 40 to 70, for 0 from 50 to 80.

⁴The instruction in the earlier version is: Subtract 5, multiply by 4, add increment.

9.23 A Mysterious Number

Source: Chatterbox, February 1897 (authorship not certain, but a very similar manuscript exists)

The number 142,857 does not at first sight appear to have anything odd about it, yet there are some strange things about it.

Let us multiply it by the numbers 2 to 7 and see the result.

142,857 by 2 is 285,714.

142,857 by 3 is 428,571.

142,857 by 4 is 571,428.

142,857 by 5 is 714,285.

142,857 by 6 is 857,142.

142,857 by 7 is 999,999.

The first five products, you will observe, are composed not only of the same figures, but of the same figures in the same order, though beginning with a different figure each time. And the strangest part of it all is that 142,857 multiplied by 7 is 999,999, but after that point the products lose their oddity.

Part 10

Games

This chapter contains all text about games, with the exception of Co-operative Backgammon, which is found as part of a notice in the *Times* (→ 19.5, p. 2461).

10.1 Rules for Court Circular (1860)

Source: printed 1860

(A New Game of Cards for Two or More Players)

Section I. (For Two Players)

I.

Cut for precedence. Highest is “first-hand;” lowest “dealer.” Dealer gives 6 cards to each, one by one, beginning with first-hand, and turns up the 13th, which is called the “Lead.” It is convenient that the same player should be dealer for the whole of each game.

II.

First-hand then plays a card; then the other player, and so on, until 6 cards have been played, when the trick is complete, and he who can make, (out of the 3 cards he has played, with or without the Lead) the best “Line,” wins it.

N.B. The cards in the figure are numbered in the order of playing.

III.

A "Line" consists of 2, or all 3, of the cards put down by either player, with or without the Lead. In making a Line, it does not matter in what order the 3 cards have been put down. Lines rank as follows:

(1) 3, OR 4 CARDS, (LEAD *included*.)

Trio—i. e. 3 of a sort, (e. g. 3 Kings, or 3 Nines.)

Sequence—i. e. 3, or 4, in Sequence, (e. g. Eight, Nine, Ten, Knave.)

Sympathy—i. e. 3, or 4, Hearts.

Court—i. e. 3, or 4, Court-cards, (if 4, it is called **Court Circular**.)

N.B. In this Class a Line of 4 cards beats a *similar* Line of 3. The Lead must not be reckoned in the middle of a Sequence.

(2) 3 CARDS, (LEAD *excluded*)

Names as above.

N.B. In making a Sequence, the Ace may be reckoned either with King, Queen, or with Two, Three.

(3) 2 CARDS, (LEAD *excluded*)

Pair—i. e. 2 of a sort.

Valentine—i. e. 2 Hearts.

Etiquette—i. e. 2 Court-cards.

IV.

If both have made Lines of the same kind, he whose Line contains the best card wins the trick; and if neither has made a Line, he who has played the best card wins it. Cards rank as follows:

(1) Hearts.

(2) The rest of the pack, in the order Aces, Kings, &c.

N.B. If no Hearts have been played, and the highest cards on each side are equal, (e. g. if each have played an Ace,) they rank in the order Diamonds, Clubs, Spades.

V.

The winner of a trick chooses, as Lead for the next trick, any one of the cards on the table, except the old Lead; he then takes the rest, turning them face upwards, if he be first-hand, but if not, face downwards; and he becomes first-hand for the next trick.

VI.

The dealer then gives cards to each, one by one, beginning with first-hand, until each hand is made up again to 6 cards.

VII.

At any time during a trick, after the first card of it has been played, and before either has played 3 cards, he whose turn it is to play may “resign” instead; in which case no more cards are played in that trick, and the other player wins it and proceeds as in Rule V. But when either has played 3 cards, the other must not resign.

VIII.

When the pack is exhausted neither player may resign. The winner of the last trick clears the board. Each then reckons up the cards he has won, which count as follows:

Cards face upwards	2 each.
downwards	1
Hearts.....	1
Court-cards	1

(so that a Court-Heart, if face upwards, counts 4 altogether.) The winner scores the difference between his own and the loser’s marks, the loser scoring nothing. Game is 20 or 50.

Section II. (For Three or More Players.)

The same rules apply, with the following necessary changes. The Lead is placed in the middle; first-hand then plays a card; then the player on his left-hand, and so on all round, each putting down his 3 cards in a row from the Lead towards himself. He who makes the best Line wins the trick, and is first-hand for the next trick. At any time during a trick, after the first card of it has been played, and before any one has played 3 cards, he whose turn it is to play may “resign” instead; in which case he loses his chance of winning that trick, and the other players go on without him. But when any one has played 3 cards, no other player may resign. In the case where all players but one “resign,” he who is left to the last wins the trick. At the end of each game all the players but the lowest score the difference between their own marks and those of the lowest, the lowest scoring nothing. Game is 50.

January, 1860.

10.2 Rules for Court Circular (1862)

Source: printed 1862

(A New Game of Cards for Two Players)

I

Cut for deal; highest is “first-hand”, lowest is dealer, gives 6 cards to each, 3 at a time, turning up 13th as “Lead”. First-hand plays a card, then dealer, and so on, as numbered in the diagram, till 6 have been played, when the trick is complete. No. 5 is kept face down until No. 6 has been played.

II

Whichever has, on his side of the trick, (Lead reckoning on each side) the best “Line” of 3 cards, (“Lines” being of 3 kinds, which rank as follows: Trio, e. g. 3 Kings or 3 Nines; Sequence, e. g. Nine of Hearts, Eight of Spades, Seven of Hearts; Suit, e. g. 3 Diamonds) wins it. It does not matter in what order the cards have been played, (e. g. if “Lead” be Five of Hearts, and one of the players play Ace of Spades, Seven of Clubs, Six of Diamonds, his side contains a sequence). Trio containing “Lead” ranks above Trio not containing it, and so of Sequence and Suit. “Lead” must not be reckoned as middle card of a Sequence. An Ace will form a Sequence with Two, Three, or with King, Queen.

III

If equal Lines be made, he who has played, among the cards forming his Line, the best card (cards ranking thus: Ace of Hearts, of Diamonds, of Clubs, of Spades, King of Hearts, etc.) wins the trick; if no Line be made, he who has played the best card wins it.

IV

When the trick is won by superiority of Line, the winner adds the value of his own Line, (reckoned thus: Trio 1, Sequence 2, Suit 3,) to that of the loser’s, if any, (reckoned thus: Trio 5, Sequence 3, Suit 1) and takes so many cards; when by superiority of cards, he takes one only. Lead for the next trick is then chosen from the cards left on the table, (by the winner, if both or neither have made a Line; otherwise by the loser), and the others laid aside. The loser is dealer for the next trick, and gives 3 cards to each.

V

When only 3 cards remain to be dealt, they are turned up, and each plays, either from the 3 cards in his hand, or from these 3, supplying its place from his own hand.

VI

When the pack is out, every trick (after four) counts 1; most cards, 2; most court-cards, (Aces reckoning as court-cards) 1. A Hit is 5, and two Hits make a Rubber.

April, 1862

10.3 Croquet Castles

Source: printed 1863

For Five Players

I.

This Game requires the 10 arches, and 5 of the 8 balls used in the ordinary game, and, in addition to them, another set of 5 balls, (matching these in colour, but marked so as to be distinct from them), and 5 flags, also matching them. One set of balls is called "soldiers"; the other, "sentinels." The arches and flags are set up as in the figure, making 5 "castles," and each player has a castle, a soldier, and a sentinel; the sentinel's "post" is half-way between the "gate" and the "door" of the castle, and the soldier is placed, to begin the game, just within the gate.

(N.B.—The distance from one gate to the next should be 6 or 8 yards, and from the gate of a castle to the door 4 yards; and the distance from the door to the flag should be equal to the width of the door.)

II.

The soldiers are played in order, as marked above; then the sentinels, in the same order, and so on. Each soldier has to "invade" the other 4 castles, in order, (*e. g.* soldier No. 3 has to invade castles Nos. 4, 5, 1, 2,) then to re-enter his own, and touch the flag; and whoever does this first, wins. To "invade" a castle, he must enter the gate, go through the door, then between the door and the flag, then out at the gate again: but he cannot enter a castle, unless either the sentinel of that castle, or his own sentinel, be out of its castle.

(N.B. No ball can enter or leave a castle, except by passing through the gate.

III.

If a sentinel touch a soldier, both being in the sentinel's castle, the soldier is "prisoner;" he is replaced (if necessary) where he was when touched, the sentinel is placed in the gate, and the castle is "fortified." The prisoner cannot move, and nothing can go through the gate, till the castle is opened again, which is done either by the prisoner's comrade coming and touching the sentinel in the gate, or by the sentinel leaving the gate to go and rescue his own comrade: in the former case, both sentinels are replaced at their posts.

IV.

When a prisoner is set free, he cannot be again taken prisoner until after his next turn.

V.

If a ball touch another, (except a prisoner, or a sentinel in his castle,) the player may, if he likes, replace it where it was when touched, and use it to croquet his own with: in the excepted cases, he must replace it, but can do no more.

VI.

If a soldier go through an arch, or between a door and flag, in his proper course, or if a sentinel go through the gate of his castle, the player has another turn.

VII.

A player whose soldier is a prisoner, plays all his turns with his sentinel; and one, whose castle is fortified, with his soldier, unless it be taken prisoner, when he must play his sentinel to rescue it.

VIII.

The sentinel of a fortified castle is considered to be in, or out of, the castle, as the owner chooses: that is, if he wishes to invade a castle, the sentinel of which is within it, he may consider his own sentinel as *out of* its castle, (which gives him the right of invasion): or, if he wishes to go and rescue his soldier, he may consider it as *in*, (so that he first plays it *through* the gate, and then has another turn).

Ch. Ch., Oxford, May 4, 1863.

N.B. This game does not absolutely require more than *two* additional balls, beside those used in the ordinary game; these may be Light Blue and Light Green, and the 10 balls may be arranged as follows:—

<i>Soldiers.</i>	<i>Sentinels.</i>
BLUE.	LIGHT BLUE.
BLACK.	BROWN.
ORANGE.	YELLOW.
GREEN.	LIGHT GREEN.
RED.	PINK.

10.4 Castle Croquet (1863?)

Source: printed 1863?

For Four Players.

I.

This game requires 8 balls, 8 arches, and 4 flags; 4 of the balls are called “soldiers,” the others “sentinels.” The arches and flags are set up as in the figure, making 4 “castles,” and each player has a castle, a soldier, and a sentinel. To begin the game, the soldier is placed just within the gate, and the sentinel half-way between the gate and the door.

(N.B.—The distance from one gate to the next should be 6 or 8 yards, and the distance from the gate to the door, or from the door to the flag, 2 or 3 yards.)

II.

The soldiers are played first, in the order given in the figure, then the sentinels in the same order, and so on. Each player has to bring his soldier out of its castle, and with it “invade” the other castles in order (*e. g.*, No. 3 has to invade castles 4, 1, 2), re-enter his own, and touch the flag, and then to touch it with his sentinel (which, if out of the castle, must re-enter for this purpose); and whoever does all this first, wins. To “invade” a castle, the soldier must enter at the gate, go through the door (either way), touch the flag, and come out at the gate again.

(N.B.—No ball can enter or leave a castle except at the gate. A sentinel, that has not left his castle, is said to be “on duty,” wherever he happen to be.)

III.

If a sentinel and soldier touch, while both are within the sentinel’s castle, or if a soldier enter a castle while its sentinel and his own are both “on duty,” the soldier becomes “prisoner” and is placed behind the flag. He cannot move till released which is done either by his own sentinel (on duty) coming and touching

the flag, or by the sentinel leaving the castle. In the former case, his own sentinel is put back where he was at the beginning of the game; and in either case the released soldier is placed behind the door, and cannot be again taken prisoner until after his next turn.

IV.

When a soldier goes through an arch, or touches a flag, in his proper course, or plays after being released, or when a sentinel enters or leaves his castle, or takes a prisoner, he may be played again; but a sentinel may not enter or leave his castle twice in one turn.

(N.B.—A sentinel can only enter or leave *his own* castle: no account is taken of his going through any arch other than his own gate.)

V.

If a ball touch another (except a sentinel on duty, a prisoner, or a released prisoner who has not played since his release), the player may use it to croquet his own with; but may not move it in doing so, unless it be his own sentinel (not on duty). He may not croquet himself twice in one turn with the same ball, unless he has done one of the things mentioned in Rule IV. meanwhile. In this game, croqueting does not give (as in the ordinary game) the right of playing again.

N.B.—The following arrangement of the 8 balls as soldiers and sentinels will be found convenient:—

<i>Soldier.</i>	<i>Sentinel.</i>
Blue	Green
Black	Brown
Orange	Yellow
Red	Pink

The flags should match the soldiers in colour.

This game may be adapted for five players, by the addition of a light-blue and a light-green ball, and the 10 balls may be arranged thus:—

<i>Soldier.</i>	<i>Sentinel.</i>
Blue	Light Blue
Black	Brown
Orange	Yellow
Green	Light Green
Red	Pink

10.5 Castle Croquet (1866)

Source: printed 1866 as Castle-Croqêt (without author, and dated “*Aug. 1866*” at the end); Aunt Judy’s Magazine, August 1867

For Four Players.

By Lewis Carroll

Rules

I.

This game requires 8 balls, 8 arches, and 4 pegs: 4 of the balls are called “soldiers;” the others “sentinels.” The arches and pegs are set up as in the figure, making 4 “castles;” and each player has a castle, a soldier, and a sentinel. Before the game begins, each player places his sentinel within a mallet’s length of his peg, and does the same with his soldier when his turn comes to play.

(N.B. The distance from one gate to the next should be 6 or 8 yards, and the distance from the gate to the door, or from the door to the peg, 2 or 3 yards.)

II.

If a sentinel goes through the gate of his castle, in the direction *from* his peg, he is said to “leave” the castle; when next he goes through it in the opposite direction, he is said to “re-enter” it, and so on. A sentinel, that has not left his castle, is said to be “on duty;” if he leaves it, he is said to be “off duty;” if he re-enters it, to be “on duty” again, and so on.

III.

To begin the game, the owner of Castle No. 1 places and plays his soldier, and then plays his sentinel; then the owner of Castle No. 2, and so on. Each player has to bring his soldier out of his castle (by playing it through the gate), and with it “invade” the other castles in order (*e. g.*, No. 3 has to invade castles 4, 1, 2), re-enter his own castle, and lastly, touch his peg, his sentinel being “on duty” at the time; and whoever does all this first, wins. To “invade” a castle, the soldier must enter at the gate, go through the door (either way), touch the peg, and go out at the gate again.

IV.

If an invading soldier touch, or be touched by, the sentinel “on duty” of the castle he is invading, he becomes “prisoner,” and is placed behind the peg. He may be released by the sentinel going “off duty,” or by his own sentinel “on duty” coming and touching the peg: in the latter case, his sentinel is at once replaced as at the beginning of the game. The released soldier is “in hand” till his next turn, when he is placed as at the beginning of the game.

V.

When a soldier goes through an arch, or touches a peg, “in order,” or when a sentinel takes a prisoner, he may be played again. Also when a sentinel leaves, or re-enters, his castle, he may be played again, but may not exercise either of these privileges twice in one turn.

VI.

If the ball played touch another (neither of them being a sentinel “on duty”), the player may “take two” off the ball so touched, but must not move it in doing so. If, however, the ball so touched be his own sentinel “off duty,” he may take a croquet of any kind, as in the ordinary game. He may not “take two,” or take a croquet twice in one turn off the same ball, unless he has meanwhile gone through an arch, or touched a peg “in order.”

N.B. The following arrangement of the 8 balls as soldiers and sentinels will be found convenient:—

<i>Castle.</i>	<i>Soldier.</i>	<i>Sentinel.</i>
I.	Blue	Pink
II.	Black	Yellow
III.	Brown	Orange
IV.	Green	Red

Advice to the Player

As it is not easy, in a new game, to see at once what is the best method of play in the various situations that may occur, the following suggestions may be of use to the player.

There are two distinct methods of play, which you may adopt in this game, and each has its own special advantages: the one consists in keeping your sentinel “on duty;” the other, in bringing it “off duty.”

In the first method, your sentinel remains constantly at home, except when your soldier is in danger of being taken prisoner, when it is played up to the peg of the castle you are invading, so as to be ready to release your soldier. In this method, the best position for your sentinel is opposite to the centre of your gate, and a ball’s width from it, so that if a soldier, trying to invade your castle, should touch it, it must have previously passed through the gate. From this position it is easy to take a prisoner in any part of your castle by the following rule:—Play your sentinel just through the gate; this gives you another turn, in which you play it again, getting as near as possible to the invading soldier: this gives you another turn, in which you may take it prisoner. The same process

may be employed for playing your sentinel up to the peg of the castle you are invading, if it should happen that you cannot play it straight for the peg. This process, however, must not be employed when you have a prisoner in your castle, as it would be released by your sentinel going out.

In the second method, your sentinel keeps with your soldier: when playing your soldier, you carry the sentinel along with it, through one or more arches, by taking "loose croquêts" or "split strokes;" and when your soldier can do no more, you either play your sentinel close up to it, ready for the next turn, or, if your soldier is in danger of being taken prisoner, you "take two" off it, getting as close as possible to the enemy's sentinel in the first stroke, and driving it to a safe distance in the second.

The first method is the safest, when any one of the other players is better than yourself, as it enables you to prevent his entering your castle and so to delay him; but as soon as all the players, whom you have reason to fear, have passed through your castle, you had better bring your sentinel "off duty," and help on your soldier.

The second method enables you to make rapid progress in invading the other castles: you can also take prisoners almost as easily as in the first method, by "taking tow" off your soldier, getting near your gate in the first stroke, and entering your castle in the second: this gives you another turn, in which you may take a prisoner. It has, however, the disadvantage of loss of time if your soldier should be made a prisoner, as in this case your sentinel has to go home, get "on duty," and return, before it can release your soldier.

If your soldier is taken prisoner, and you release it by touching the enemy's peg with your sentinel, you are in a position in which you may often retard the other players: first, by placing your sentinel (which is done directly after the release) in a line between your peg and an invading soldier which is aiming at it; secondly, by placing your soldier (which is done when your next turn comes) close to your sentinel, playing it so as to drive your sentinel in the direction of an invading soldier, and then taking it prisoner.

It evidently follows from this that, when you have yourself taken a prisoner, and happen to be invading the castle from which it came, you should not wait till the enemy's sentinel has touched your peg and so released the prisoner, but you should yourself release it (as soon as the enemy's sentinel has nearly reached your peg) by playing your own sentinel out through your gate and in again: in this case the sentinel, which was on its way to your peg, cannot be carried back at once, but must be played all the way home.

In "taking two" off a ball you may, if you choose, play your own ball so as only just to move it, and then strike it in the direction of the other, and thus drive it to a distance. This has nearly the same effect as the "loose croquêt" of the ordinary game, but with this difference, that it does not give you the right of playing again.

If a soldier, about to invade your castle, is lying near your gate, you may take it prisoner thus:—Play your sentinel out, near the soldier; then hit it with your sentinel, and "take two" off it, so as only just to move your ball, taking care to have the soldier in a line between your sentinel and your gate; then drive both in together; this gives you another turn, in which you may take it prisoner.

10.6 Word-Links (cyclostyled)

Source: cyclostyled 1878

A Game for two Players, or a round Game

The principal feature of this game consists in the linking together of words, so that any two consecutive words may differ in one letter only. Such a series of words is called a "Chain." The simplest form of a Chain is where two words are given, and the Chain is so made as to have the given words at the two ends (such as "*Head, Heal, Teal, Tell, Tall, Tail.*") The two given words are called a "Doublet," and the words introduced to make the Chain are called "Links." A more elaborate form of Chain is where there are three or more words given, (such as "*Ale, Ice, Arm, Ant.*") and the Chain is so made as to have two of them at the ends, and the others in the Chain, (such as "*Ale, Are, Ire, Ice, Ace, Act, Ant, Art, Arm.*"). The given words are called "Jewels," and all that have chain on both sides of them are said to be "set." If Links can be found to unite the two ends (such as "*Aim, Ail, All,*" which would unite "*Arm*" to "*Ale*") the Chain is called a "Necklace", and *all* the Jewels in it are then said to be "set." The above Necklace may be written in this form:—

In making a Chain or Necklace, it is not allowable to use a word twice.

We will now suppose that each of the Players is provided with a large sheet of paper to work on, a number of slips to write out Chains on, a limited stock of patience, and an *unlimited* stock of good-temper. We proceed to the

Rules for 2 Players.

One player opens a book at random and hands it to the other, who selects, at the open place, 3 words of 3 letters each, 3 of 4, and 3 of 5: he then opens it in another place and returns it to the first Player, who selects 9 words in the same manner. These 18 words are written down by each Player, and are the "Jewels."

The first Player then opens the book again and hands it to the other, who selects a word of 3, or 4, or 5 letters, as may be agreed: he then opens it in another place and returns it to the first Player, who selects another word of the same length. These words form the first "Doublet."

Each Player then works this Doublet into a Chain, which he writes out on a slip of paper and lays face-downwards on the table.

When both are written, the papers are turned up, and the one who finished the first gets 2 marks for "speed": and, if the Chains are of different lengths,

the writer of the shortest gets so many marks, as represent the difference, for "brevity." Another Doublet is then selected, and the game proceeds as before.

If one Player abandons the attempt to make a Chain, but the other succeeds; the successful one gets 2 marks for "speed" and 4 for "brevity."

If both abandon the attempt, another Doublet is selected.

A Chain which contains an inadmissible word, or which violates any of the rules, is called "null."

If both Players fail in making a Chain, he who first declared his to be "abandoned" gets 3 marks for "decision," but, if both Chains be "null," neither Player gets marks.

The Player who first finishes (or abandons) his Chain may occupy his time, till the other has finished, in making "extra-Chains" of the Jewels. These are marked at the end of the game, by the following rule:— a Jewel at the end of a Chain gets as many marks as it has letters; a "set" Jewel twice as many; and every Link loses a mark. Thus, a Chain of 6 Jewels of 4 letters each, containing 30 Links, gets 10 marks: if, by adding 6 more Links, it is made into a Necklace, it gets 12.

In making a set of "extra-Chains," it is not allowable to use any Jewel twice; but a word may be used more than once as a Link, so long as it only occurs once in each Chain.

If a set of extra-Chains violate any rule, there may still be portions which can get marks, and the writer is allowed to erase the faulty portions.

We now proceed to the

Rules for a Round Game,

which are the same as for 2 Players, with the following exceptions:—

A President is chosen to score the marks: he may play himself.

The President opens a book at random, and hands it to one of the players, who selects, at the open place, a word of 3 letters, a word of 4, and a word of 5. He then does the same with another Player, and so on, till the 18 Jewels have been selected.

The first Doublet is selected in the same way. As soon as any Player has finished his Chain, he writes it on a slip of paper and hands it, face-downwards, to the President, who places the slips in a heap.

When all have handed in (or abandoned) their Chains, the President turns over the heap, and marks for "speed" by the following rule — the first correct Chain finished gets as many marks as there are Players; the next gets one mark less, and so on, the last getting none. He then marks for "brevity" as follows:— the longest Chain gets no marks, and every shorter Chain gets as many marks as represent the difference. If any Chain be abandoned or null, it is taken as "longest" and considered to be 4 Links longer than the longest successful one.

If *all* fail in making a Chain, he who first declared his to be abandoned gets 3 marks for "decision," and the one who declared next gets 2.

Before beginning a game, it should be settled how many Doublets it is to consist of: six will be found a convenient number.

The following form of scoring-paper is recommended:— [N.B. The first figure in a "Doublet" column is for "speed," the second for "brevity." "A" stands for "abandoned the first"; "a" for "abandoned second"; "0" represents "no marks."]

Date	Names	1	2	3	4	5	6	Jewels	Total

Ap 11. 1878
Lewis Carroll

10.7 Word-Links (printed)

Source: printed 1878

A Game for two Players, or a Round Game.

A series of words of the same length, where any two consecutive ones differ in one letter only (e. g. 'Head, Heal, Teal, Tell, Tall, Tail'), is called a 'Chain.' The game consist in forming Chains so as to contain two or more given words, one of which must be at each end. Two given words are called a 'Doublet'; three or more, 'Jewels'; connecting words are called 'Links.' (Thus the above Chain might have been made for the 'Doublet' 'Head, Tail,' or for the four Jewels 'Head, Teal, Tell, Tail.')

A Jewel that has chain on both sides (e. g. 'Teal' in the above Chain) is said to be 'set.' If Links be found to unite the two ends (e. g. 'Hail, Hair, Heir, Hear,' which unite 'Tail' to 'Head'), the Chain is called a 'Necklace,' and *all* the Jewels in it are said to be 'set.' A Necklace must contain at least three Jewels. The above Necklace might be written thus:—

<i>Head</i>	Heal	<i>Teal</i>	<i>Tell</i>
Hear			Tall
Heir	Hair	Hail	<i>Tail</i>

In making a Chain or Necklace, it is not allowed to use a word twice; and no word is admissable that is not in ordinary use in good society.

The Rules for Two Players.

Each Player should be provided with writing-materials and an English book; and one of them should also have a scoring-paper, ruled as follows:—

NAMES.	DECLARATIONS, &c.				MARKS.					
	1	2	3	4	1	2	3	4	Jewels.	Total.
<i>Brown.</i>										
<i>Jones.</i>										

Each opens a book, and selects two words of three letters, two of four, and two of five. These twelve words are written down by each, and are the 'Jewels.'

Each again opens a book, and selects a word of three, four, five, or any other number of letters, as may be agreed. When both words are fixed on they are read out, and are the first 'Doublet.'

Each now tries to make a Chain of this. As soon as a Player has decided with how many Links he will undertake to make it, or that he will abandon the attempt, he says, '— Links,' or 'Abandoned,' as the case may be. He who does this first is marked 'I' in the first 'Declaration'-column, followed by the number he named or by the letter 'a': the other is marked 'II' in the same way.

A Chain is reckoned as having the 'declared' number of Links, even if it really have fewer: if it have more, it is 'null.'

When both have 'declared,' each must at once write out his Chain (if he has not already done so); if he cannot do this, it is 'null.'

The Chains are now examined, and correct Chains are marked as follows:—He who first 'declared' the length of his Chain gets 2 for 'decision;' also the writer of the shorter gets, for 'brevity,' 3 for every Link saved. (N.B. A 'null' Chain is reckoned as being two Links longer than a correct one.) If neither be correct, he who first 'abandoned' gets 2 for 'decision.' All these numbers are entered in the first 'Marks' column.

A second Doublet is then selected, and the game proceeds as before, four Doublets making one Game.

Each Player may employ his spare time in making extra Chains or Necklaces of the Jewels. These are marked at the end of the game, thus:—A Jewel at the end of a Chain gets as many marks as it has letters; a 'set' Jewel twice as many; and every Link loses a mark. (Thus a Chain with three Jewels, of four letters each, and seven links, gets 9; if, by adding four links, it be made into a Necklace, it gets 13.)

In making extra Chains, it is not allowed to use any Jewel twice; but a word may be used more than once as a Link, provided it does not occur twice in one Chain.

If a set of extra Chains transgress any rule, there may still be portions which can get marks; and the writer is allowed to withdraw the faulty portions.

The Rules for a Round Game

are the same as the above, with the following alterations:—

Each Player should have, besides a large sheet of paper for working on, a number of slips for writing out Chains when finished.

One of the Players is chosen as President: he keeps the score, and settles all disputed points.

Each Player in turn opens a book and selects a word of three letters, one of four, and one of five; till the twelve jewels have been selected.

Two Players, named by the President, select the first Doublet.

Correct Chains are marked as follows:—He who first 'declared' the length of his Chain gets, for 'decision,' as many marks as there are Players, the next gets one mark less, and so on down to '2,' which is the lowest mark given; also the writer of any Chain that is not the longest gets, for 'brevity,' 3 for every link saved. (N.B. A 'null' chain is reckoned as being two links longer than the longest correct one.) If none be correct, he who first 'abandoned' gets 4 for 'decision,' and the next gets 2.

The following Doublets may be useful for practice in making Chains:—

'Hare, Soup,' has been done with six links; 'Tree, Wood,' with eight; 'Pen, Ink,' with eight; 'Castle, Butler,' with ten; 'Mine, Coal,' with six; 'Grub, Moth,' with twelve; 'Quilt, Sheet,' with eighteen; 'Bread, Toast,' with twenty-one.

10.8 Doublets. A Word-Puzzle

Source: Doublets. A Word-Puzzle. First edition from 1879

Later editions contain more doublets, and also differ a bit in layout, especially the number of necessary links is added to the doublets.

Most of the content is reprinted with minor differences from *Vanity Fair*. The following list gives the dates of publication there, as well as the major differences:

Preface: March 29, 1879, starting from the headline “A New Puzzle”, with a few additions.

Rules: April 19, 1879; July 26, 1879 (titled “Doublet Rules” from then on); August 2, 1879; November 1, 1879; February 7, 1880. In the April version the fourth rule is: . . . found in some known Dictionary, and is also a word which might be used, and would be universally understood, in good Society.

The following are inadmissible:—

- a. Words marked “local” in the Dictionary, and Scotticisms such as “auld” and “ain.”
- b. French, Latin, and other foreign words, with the exception of those which (like “ennui,” “minimum,” “kudos,” “loot”) have been so thoroughly naturalised as to be virtually English words.
- c. Proper names.
- d. Abbreviations such as “stept” for “stepped,” “e’en” for “even,” “e’er” for “ever.”
- e. A combination of two words which is usually printed without a hyphen (such as “teapot”) is admissible as a Link; but not if (like “tea-set”) it is usually printed as two words. The diphthong *æ*, *æ*, and *qu* are counted as single letters.

Method of Scoring: April 19, 1879 (only rules 1 and 2, as rules 5 and 6 in the “Rules” section); July 26, 1879 (titled “Rules for Scoring” from then on, only rules 1 to 3); August 2, 1879; November 1, 1879; February 7, 1880.

In the version of Apr. 19, 1879, the rules are followed by:

Difficulties will, no doubt, sometimes arise in the application of Rule 4, whenever a word is used as a Link which lies close on the border-line dividing the Admissible from the Inadmissible. All such “Hard Cases” will be settled by the exercise of a dictatorial authority on the part of CHOKER, *from whose decision there is no appeal*. Any competitor who feels doubtful as to the admissibility of any word which he has uses as a Link is recommended to send in a second Chain, not containing the doubtful word; and if more than one of the Chains thus sent in are found to be admissible, CHOKER will give him credit for the shortest of them.

The version of Nov. 1, 1879 has additionally the following rule:

4. The forthcoming competition for prizes begins with the Doublets set in the present number, and will end with those set in the number of 31st January, 1880. Three prizes will be given, a proof album to the highest score and an ordinary album to each of the next two highest.

A similar rule also appears on Feb. 7, 1880.

Doublets Already Set: May 3, 1879, with the doublets up to and including that date.

Preface to Glossary: May 17, 1879, the quoted passage only.

The solutions were also published in *Vanity Fair*, but the early ones differ in some cases due to the different rules.

*“Double, double,
Toil and trouble.”*

**Quoted from *Macbeth*
by William
Shakespeare**

Preface

On the 29th of March, 1879, the following article appeared in "VANITY FAIR:"—

A New Puzzle

The readers of *Vanity Fair* have during the last ten years shown so much interest in the Acrostics and Hard Cases which were first made the object of sustained competition for prizes in this journal, that it has been sought to invent for them an entirely new kind of Puzzle, such as would interest them equally with those that have already been so successful. The subjoined letter from Mr. Lewis Carroll will explain itself, and will introduce a Puzzle so entirely novel and withal so interesting, that the transmutation of the original into the final word of the Doublets may be expected to become an occupation to the full as amusing as the guessing of the Double Acrostics has already proved.

In order to enable readers to become acquainted with the new Puzzle, preliminary Doublets will be given during the next three weeks—that is to say, in the present number of *Vanity Fair* and in those of the 5th and 12th April. A competition will then be opened—beginning with the Doublets published on the 19th April, and including all those published subsequently up to and including the number of the 26th July—for three prizes, consisting respectively of a Proof Album for the first and of Ordinary Albums for the second and third prizes.

The rule of scoring will be as follows:—A number of marks will be apportioned to each Doublet equal to the number of letters in the two words given. For example, in the instance given below of "Head" and "Tail," the number of possible marks to be gained would be eight; and this maximum will be gained by each one of those who make the chain with the least possible number of changes. If it be assumed that in this instance the chain cannot be completed with less than the four links given, then those who complete it with four links only will receive eight marks, while a mark will be deducted for every extra link used beyond four. Any competitor, therefore, using five links would score seven marks, any competitor using eight links would score four, and any using twelve links or more would score nothing. The marks gained by each competitor will be published each week.

Dear Vanity,—Just a year ago last Christmas, two young ladies—smarting under that sorest scourge of feminine hupianity, the having "nothing to do"—besought me to send them "some riddles." But riddles I had none at hand, and therefore set myself to devise some other form of verbal torture which should serve the same purpose. The result of my meditations was a new kind of Puzzle—new at least to me—which, now that it has been fairly tested by a year's experience and commended by many friends, I offer to you, as a newly-gathered nut, to be cracked by the omnivorous teeth which have already masticated so many of your Double Acrostics.

The rules of the Puzzle are simple enough. Two words are proposed, of the same length; and the Puzzle consists in linking these together by interposing other words, each of which shall differ from the next word *in one letter only*. That is to say, one letter may be changed in one of the given words, then one letter in the word so obtained, and so on, till we arrive at the other given word. The letters must not be interchanged among themselves, but each must keep to its own place. As an example, the word "head" may be changed into

“tail” by interposing the words “heal, teal, tell, tall.” I call the two given words “a Doublet,” the interposed words “Links,” and the entire series “a Chain,” of which I here append an example:—

H	E	A	D
h	e	a	l
t	e	a	l
t	e	l	l
t	a	l	l
T	A	I	L

It is, perhaps, needless to state that it is *de rigueur* that the links should be English words, such as might be used in good society.

The easiest “Doublets” are those in which the consonants in one word answer to consonants in the other, and the vowels to vowels; “head” and “tail” constitute a Doublet of this kind. Where this is not the case, as in “head” and “hare,” the first thing to be done is to transform one member of the Doublet into a word whose consonants and vowels shall answer to those in the other member (*e. g.*, “head, herd, here”), after which there is seldom much difficulty in completing the “Chain.”

I am told that there is an American game involving a similar principle. I have never seen it, and can only say of its inventors, “*pereant qui ante nos nostra dixerunt!*”

Quoted from Aelius Donatus according to St. Jerome

Lewis Carroll

Rules

1. The words given to be linked together constitute a “Doublet;” the interposed words are the “Links;” and the entire series a “Chain.” The object is to complete the Chain with the least possible number of Links.

2. Each word in the Chain must be formed from the preceding word by changing one letter in it, and one only. The substituted letter must occupy the same place, in the word so formed, which the discarded letter occupied in the preceding word, and all the other letters must retain their places.

3. When three or more words are given to be made into a Chain, the first and last constitute the “Doublet.” The others are called “Set Links,” and must be introduced into the Chain in the order in which they are given. A Chain of this kind must not contain any word twice over.

4. No word is admissible as a Link unless it (or, if it be an inflection, a word from which it comes) is to be found in the following Glossary. Comparatives and superlatives of adjectives and adverbs, when regularly formed, are regarded as inflections of the positive form, and are not given separately: *e. g.* the word ‘new’ being given, it is to be understood that ‘newer’ and ‘newest’ are also admissible. But nouns formed from verbs (as ‘reader’ from ‘read’) are *not* so regarded, and may not be used as Links unless they are to be found in the Glossary.

Method of Scoring, &c. Adopted in “Vanity Fair”

1. The marks assigned to each Doublet are as follows:—If it be given without any Set Links, so many marks are assigned to it as there are letters in the two

words together (*e. g.*, a four-letter Doublet would have eight marks assigned to it). If it be given with Set Links, so that the Chain is made up of two or more portions, so many marks are assigned to it as would have been assigned if each portion had been a separate Chain (*e. g.*, a four-letter Doublet which has two Set Links, so that the Chain is made up of three portions, would have twenty-four marks assigned to it).

2. Each competitor, who completes the Chain with the least possible number of Links, will receive the full number of marks assigned; and each who uses more than the least possible number of Links will lose a mark for every additional Link.

3. Each competitor is required to send his three Chains, with his signature attached, written on one piece of paper.

4. The Editor of 'Vanity Fair' will be glad to receive any suggestions, both as to words which it seems desirable to omit, and as to omitted words which it seems desirable to insert: but any word proposed for insertion or for omission *should be exhibited as a Link between two other words.*

5. Alterations will not be made in this Glossary during any competition, but will be duly announced before the commencement of a new competition, so that those who already possess copies will be able to correct them, and will not be obliged to buy a new edition.

*"Vanity Fair" Office,
18, Tavistock Street,
Covent Garden,
London.*

Doublets Already Set in "Vanity Fair"

March 29.— Drive PIG into STY.
Raise FOUR to FIVE.
Make WHEAT into BREAD.

April 5.— Dip PEN into INK.
Touch CHIN with NOSE.
Change TEARS into SMILE.

April 12.— Change WET to DRY.
Make HARE into SOUP.
PITCH TENTS.

April 19.— Cover EYE with LID.
Prove PITY to be GOOD.
STEAL COINS.

April 26.— Make EEL into PIE.
Turn POOR into RICH.
Prove RAVEN to be MISER.

May 3.— Change OAT to RYE.
Get WOOD from TREE.
Prove GRASS to be GREEN.

- May 10.*— Evolve MAN from APE.
Change CAIN into ABEL.
Make FLOUR into BREAD.
- May 17.*— Make TEA HOT.
Run COMB into HAIR.
Prove a ROGUE to be a BEAST.
- May 24.*— Change ELM into OAK.
Combine ARMY and NAVY.
Place BEANS on SHELF.
- May 31.*— HOOK FISH.
QUELL a BRAVO.
Stow FURIES in BARREL.
- June 7.*— BUY an ASS.
Get COAL from MINE.
Pay COSTS in PENCE.
- June 14.*— Raise ONE to TWO.
Change BLUE to PINK.
Change BLACK to WHITE.
- June 21.*— Change FISH to BIRD.
Sell SHOES for CRUST.
Make KETTLE HOLDER.

N.B. Solutions of these Doublets will be found at p. 1568.

Preface to Glossary

The following Glossary is intended to contain all well-known English words (or, if they are inflections, words from which they come) of 3, 4, 5, or 6 letters each, which may be used in good Society, and which can serve as Links. It is not intended to be used as a source from which words may be obtained, but only as a test of their being admissible.

That such a Glossary is needed may best be proved by quoting the following passage from ‘Vanity Fair’ of May 17, 1879, premising that all the strange words, here used, had actually occurred in Chains sent in by competitors:—

“CHOKER humbly presents his compliments to the four thousand three hundred and seventeen (or thereabouts) indignant Doubleteers who have so strongly shent him, and pre to being stoaked in the spate of their wrath, asks for a fiver of minutes for reflection. CHOKER is in a state of complete pye. He feels that there must be a stent to the admission of spick words. He is quite unable to sweal the chaffy spelt, to sile the pory cole, or to swill a spate from a piny ait to the song of the spink. Frils and the mystic Gole are strangers in his sheal: the chanceful Gord hath never brought him gold, nor ever did a cate become his ain. The Doubleteers will no doubt spank him sore, with slick quotations and

wild words of yore, will pour upon his head whole stores of steens and poods of spiles points downwards. But he trusts that those alone who habitually use such words as these in Good Society, and whose discourse is uniyersally there understood, will be the first to cast a stean at him.”

As the chief object aimed at has been to furnish a puzzle which shall be an amusing mental occupation at *all* times, whether a dictionary is at hand or not, it has been sought to include in this Glossary only such words as most educated people carry in their memories. If any doubt should arise as to whether any word that suggests itself is an admissible one, it may be settled by referring to the Glossary.

When there are two words spelt alike, one a noun and one a verb, or any other such combination, it has not been thought necessary to include *both*, so long as all the inflections can be obtained from *one*: e. g. ‘aim’ is given only as a verb, since ‘aims,’ the plural of the noun, is also the third person of the verb; but ‘hale, *v.a.*,’ and ‘hale, *a.*,’ are both given, the one being needed to supply ‘hales’ and ‘haled,’ and the other to supply ‘haler.’

Two abbreviations, ‘e’en’ and ‘e’er,’ have been included.

As to the many words which, though used and understood in good Society, are yet not available as Links, owing to there being no other words into which they can be changed, it has been regarded as a matter of indifference whether they are included or not.

Abbreviations Used in Glossary

- a.* adjective.
- ad.* adverb.
- c.* conjunction.
- int.* interjection.
- n.s.* noun (only used in singular).
- n.pl.* noun (only used in plural).
- n.* noun (used in both).
- pre.* preposition.
- pro.* pronoun.
- v.a.* verb (active only).
- v.n.* verb (neuter only).
- v.* verb (both active and neuter).

10.9 Doublets (1879–1881)

Source: *Vanity Fair*, March 29, 1879–April 9, 1881 (weekly, 107 issues, mostly managed by Choker)

Only the doublets are reproduced here, not other content. For the Doublets set from March 29 to June 21, 1879, as well as some other content, see the previous section.

No new Doublets were set on April 2 and April 9, 1881.

See also <https://lewiscarrollresources.net/doublets/puzzles.html>, especially for the solutions.

Jun. 28, 1879

REST on SOFA.
Trace RIVER to SHORE.
CARESS PARENT.

Jul. 5, 1879

Develop GRUB into MOTH.
Turn WITCH into FAIRY.
Make WINTER SUMMER.

Jul. 12, 1879

Reconcile LION and LAMB.
Crown TIGER with ROSES.
Put SHEET under QUILT.

Jul. 19, 1879

Put LOAF into OVEN.
Make BREAD into TOAST.
Put ROUGE on CHEEK.

Jul. 26, 1879

WHY is it wisest NOT to marry?
MANY WILL FAIL to get
PRIZES from CHOKER.

[N.B.—The chain made on the first Doublet should embody the following observation: that lovers, during the temporary insanity of courtship, too often fail to recognise the grave prudential reasons which should deter them from taking this fatal step.]

Aug. 2, 1879 (First Set of the Second Competition.)

Get GAS from OIL.
Turn JOHN into JACK.
SHAVE BEARD.

Aug. 9, 1879

Lead KID to EWE.
Let GNAT BITE.
Turn BROWN into BLACK.

Aug. 16, 1879

Find GEM in ORE.

Mend DOOR with GLUE.
Make SORRY HAPPY.

Aug. 23, 1879

Set ONE a JOB.
Trace SEED to HEMP, ROPE, and KNOT.

Aug. 30, 1879

Dip IVY in SEA.
Go from WORK to PLAY.
Send MILLER to MARKET.

Sep. 6, 1879

Write ODE to SUN.
Make MALT and HOPS into BEER.
Get TOOTH DRAWN.

Sep. 13, 1879

Pour OIL into SEA.
Change FEAR into HOPE.
Change LAMBS into SHEEP.

Sep. 20, 1879

Read THE ERA.
Turn IDEA into FACT.
Make ETHEL WISER.

Sep. 27, 1879

Feed OWL on JAM.
Change MUCH to MORE and MOST.
Pay DEBTS that are OWING.

Oct. 4, 1879

Change SHE to YOU.
BEND KNEE.
Send HOYDEN for GLOVES.

Oct. 11, 1879

SEE an ELK.
WEEP under ELMS.
Cheer BEAVER with BRANDY.

Oct. 18, 1879

FLY from ILL.
Draw TEARS from GLAND.
Change SMALL to GREAT.

Oct. 25, 1879

Take TEN with ACE.
SCORE for PRIZE.
Get TRUNKS PACKED.

Nov. 1, 1879 (First Set of the Third Competition.)

Send JOE to ANN.

Feed CHUB with FROG.
Change TILES into SLATE.

Nov. 8, 1879

AIM GUN at FOE.
Connect THUR-SDAY.

10.10 New Method of Scoring

Source: *Vanity Fair*, April 17, 1880 and April 24, 1880

Dear Vanity,—The commencement of the second year of the Doublets competition seems to afford a good opportunity for introducing a change into the system of marking. I have considered the subject very carefully, and have come to the conclusion that the present system does not accurately measure the skill employed, and that I can suggest one which will do more justice to the rival merits of your little army of Doubleteers.

I propose, then, to substitute for Rules 1, 2, in the chapter headed “Method of Scoring,” the following:—

1. The shortest Chain which can be made on a given Doublet will have so many marks assigned to it as there are letters in the Links employed, “Set Links” counting as ordinary Links.
2. Each competitor who completes his Chain with the least possible number of Links will receive the marks assigned by Rule 1; and each who uses more than the least possible number will forfeit, for every extra Link, as many marks as there are letters in it.

To illustrate the New Rules, let us take the Doublet (the first one ever published) “Drive PIG into STY.” The shortest known Chain for this (“PIG, wig, wag, way, say, STY”) contains 4 Links. Here a competitor using only 4 Links would score 12 marks; one using 5 Links, 9 marks; 6 Links, 6 marks; 7 Links, 3 marks; and any competitor using 8 or more Links would score nothing.

The points of agreement and of difference between the two systems will be best illustrated by examples.

Take a 3-Letter Doublet and a 4-Letter Doublet, and suppose that the shortest Chains made on them contain 5 Links each. By the present system one would score 6, the other 8; by the new, one would score 15, the other 20. Here, so far as the proportion is concerned, the two systems agree.

Again, take two 3-letter Doublets, and suppose that the shortest Chains made on them contain, respectively, 4 Links and 8 Links. By the present system each would score 6; by the new, one would score 12, the other 24. This is surely more just, since the second would require about twice as much mental labour as the first.

Again, take a 3-letter Doublet and a 6-letter Doublet, and suppose there are two competitors, one of whom beats the other, on each Doublet, by one Link. By the present system he would gain one mark in each case; by the new, he would gain 3 marks in the first, and 6 in the second. And surely this also is more just, since it would require about twice as much mental labour to save a 6-letter Link as to save a 3-letter one.

I feel confident that your adoption of the new system will prove satisfactory to your readers, and that the future drivers of (mental) Pigs into (mental) Sties will find their skill more exactly measured, and therefore more justly rewarded.

Lewis Carroll

10.11 Lanrick (Jan. 1879)

Source: printed 1879, title and motto added by hand, as well as one correction as noted

A Game for Two Players

"The muster-place be Lanrick mead."

Quoted from *The Lady of the Lake* by Sir Walter Scott

The Game is played on a chess-board, each Player having 5 men; the other requisites are a die and dice-box, and something (such as a coin) to mark a square.

The interior of the board, excluding the border-squares, is regarded as containing 6 'rows' and 6 'columns.' It must be agreed which is the first row and first column.

1.—The Players set the men in turn, on any border-squares they like.¹

2.—The die is thrown twice, and a square marked accordingly, the first throw fixing the row, the second the column; the marked square, with the 8 surrounding squares, forms the first 'rendezvous,' into which the men are to be played.

3.—The men move like chess-queens; in playing for the first 'rendezvous,' each Player may move over 6 squares, either with one man, or dividing the move among several.

4.—When one Player has got all his men into the 'rendezvous' the other must remove from the board one of his men that has failed to get in; the die is then thrown for a new 'rendezvous,' for which each Player may move over as many squares as he had men in the last 'rendezvous,' and one more.

5.—If it be found that either Player has all his men already in the new 'rendezvous,' the die must be thrown again, till a 'rendezvous' is found where this is not the case.

6.—The Game ends when one Player has lost all his men.

Jan. 16, 1879

¹The men are set, alternately, on any border-squares.

10.12 Lanrick (Feb./Mar. 1879)

Source: printed 1879 (version from February with minor differences as noted and some errors silently corrected)

A Game for Two Players

"The muster-place be Lanrick mead."

Quoted from *The Lady of the Lake* by Sir Walter Scott

The game is played on a chess-board, each Player having five men. The other requisites are a die and dice-box (or a teetotum with four sides), and something (such as a coin) to mark a square.

The board is regarded as containing eight 'rows' and eight 'columns.' It must be agreed which is the first row and which is the first column.

1.—Each Player throws the die, and the one who throws highest is 'first Player.'

2.—The 'first Player' sets his men on any border-squares he likes¹: then the 'second Player' does the same.

3.—The die is thrown twice, all throws less than 'three' being neglected, and a square is marked accordingly, the first throw fixing the row, the second the column. The marked square forms, with the surrounding eight squares, the first 'rendezvous,' into which the men are to be played. [N.B.—Instead of neglecting all throws less than 'three,' the following rule may be adopted: If the throw be less than three, throw again; if it be then three or more, neglect the first throw; but if it be again less than three, double the first throw and add the second.]²

4.—Each Player may move as many squares as there are men belonging to the one who has fewest, or any lesser number, either with one man, or dividing the move among several. Each man that is moved must be kept to one line, viz: either a line parallel to an edge of the board, like a rook, or a diagonal line, like a bishop.

5.—When one Player has got all his men into the 'rendezvous,' he removes from the board one of the men that have not got in, and sets the others (called 'wanderers') in the 'rendezvous.'

6.—The men in the 'rendezvous' then 'radiate,' i. e., are moved to border-squares along the eight lines which radiate from the centre of the 'rendezvous.' For all but the centre man there is no choice of direction: each must be moved along the line on which he stands: but the owner of the centre man may move it along any vacant line: if all eight be occupied, he may set it on any vacant border-square.³

7.—If there were any 'wanderers,' the winner of the last 'rendezvous' may⁴ then move his men to other border-squares, moving twice as many squares as

¹border squares

²[N.B.—The centre of the 'rendezvous' is limited to the central sixteen squares, i. e., the squares belonging to rows 3 to 6 and columns 3 to 6. Hence, if a teetotum with four sides be used, '1' must be taken to mean 'row 3,' '2' to mean 'row 4,' and so on.]

³The men in the 'rendezvous,' all but the centre man, then 'radiate,' i. e., are moved straight away from the centre to border-squares: then the owner of the centre man moves it to a border-square; if none of the eight border squares, to which it can be lawfully moved, be vacant, he sets it on any vacant one. [N.B. The four men at the four corners of the 'rendezvous' will of course move on diagonal lines, like bishops, the others will move like rooks: the centre man can move on any one of these eight lines that happen to be vacant.]

⁴the winner may

there were 'wanderers,' and not being obliged (as in Rule 4) to keep each man to one line.

8.—A new 'rendezvous' is then marked, as in Rule 3, for which the winner of last ⁵is 'first Player.'

9.—When one Player has only two men left, the other scores as many marks as he has ⁶men: the ten men are then set again, as in rule 2, the one, who was 'second Player' when last they were set, being now 'first Player,' and the game proceeds as before.

10.—The Player, who first scores ⁷five, wins the game.

March 1⁸, 1879

⁵is the 'first Player.'

10.13 Lanrick (Oct. 1880)

Source: cyclostyled 1880

A Game for Two Players

“The muster-place be Lanrick mead.”

Quoted from *The Lady of the Lake* by Sir Walter Scott

The game is played on a chess-board, each Player having five men.

1. One Player sets all the men on any border-squares he likes.
2. The other then selects a square (not a border-square) and lays on it something (such as a coin) to mark it. This, with the eight surrounding squares, forms the first ‘rendenzvous’, into which the men are to be played; the one, who did not select the ‘rendenzvous’, having the first move.
3. Each may move as many squares (or any lesser number) as he has men on the board, either with one man, or dividing the move among several. He must move each man like a rook, or else like a bishop.
4. When a player has all his men in the ‘rendenzvous’, he removes from the board one of the ‘wanderers’ (i. e. the men who have not got in), and plays the others to border-squares.
5. The other then selects a new ‘rendenzvous’ (which must be clear of the old one, and also, if possible, empty), and the game proceeds, as in Rule 2, until one of the Players has lost all his men.

Oct. 25. 1880.

10.14 Lanrick (Dec. 1880)

Source: The Monthly Packet, December 1880 (after “A Tangled Tale”); also printed 1880 (without the introduction and later remarks)

The Editor kindly allows me a little additional space, this month, in order to ask a favour of the diligent band of Knot-untiers, and of any others of her readers who take an interest in such trifles as Puzzles and Games.

I have been about two years inventing (or trying to invent) a new game, constantly altering the rules as experience suggested, until it has scarcely one of its original features left. It seems now to work fairly well, but my ambition is to make it a thoroughly good game, and I shall be deeply obliged to any reader of the *Monthly Packet* who will try it, and will send suggestions of improvement to be introduced into the game or the wording of the rules. The original idea of it was taken from the child’s game of ‘Musical Chairs.’

I append the Rules of

Lanrick

A Game for Two Players

‘The muster-place be Lanrick mead.’

Quoted from *The Lady of the Lake* by Sir Walter Scott

1. The game is played on a chess-board, each Player having five men.
2. To begin the game, one Player sets all the men on border-squares.
3. The other then selects a square set of nine squares, called a ‘rendenzvous,’ which must not include any of his own men, and lays a mark on its centre square.
4. Both then try to get their men into this rendenzvous. Each may move as many squares as he has men, or any less number, either with one man or dividing the move among several men: each man may be moved in any direction, but must, during any one turn, keep to one line of squares, whether it be straight or slanting.
5. He who did not select the rendenzvous plays first. He may, instead of moving his own men, move the rendenzvous-mark one square, in any direction, thus changing the position of the whole rendenzvous, provided he does not move it to a border-square or so as to make the rendenzvous include any of his own men; and this he may do every turn so long as he has not moved any of his own men. When the mark is thus moved one square, any men who have got into the rendenzvous must also be moved one square, so as to take the same places in the new rendenzvous as they had in the one they are leaving. But whenever this would bring two men upon the same square, the mark must not be moved in that direction. This privilege, of moving the rendenzvous-mark, is not allowed to the Player who laid it down.
6. When a Player has all his men in the rendenzvous, he takes off the board one of those who are not in, called ‘wanderers,’ and moves to border-squares, in any direction, keeping each such man to one line of squares, all wanderers not already on border-squares. All other men, on both sides, keep their places, and are played from them for the next rendenzvous. The other Player then selects a new rendenzvous, as in Rule 3, and the game proceeds as before, until one Player has no men left.

Lewis Carroll

Notices to Correspondents. Acknowledgements

Source: The Monthly Packet, February 1881

Mr. Lewis Carroll acknowledges, with many thanks, several kind communications on the subject of 'Lanrick,' which will be of great service to him in revising the rules.

Remarks (March)

Source: The Monthly Packet, March 1881 (untitled, after "A Tangled Tale")

P.S.—I return my sincere thanks to the many correspondents who have kindly sent suggestions on the subject of 'Lanrick,' which will be of great service in revising the language of the Rules, though I do not at present see that any change is needed in their substance. I add a few notes in explanation of the difficulties that have been found in interpreting them.

Line 1. 'chess-board' or draughts-board.

L. 1. 'men' or counters.

L. 4. 'lays a mark on its centre square.' This mark is not supposed to *fill* the square; a man may be played upon it.

L. 7. 'each man.' *i. e.* each for himself, independently of the moves of the others.

L. 9. Men in the rendezvous are still free to move. Men may not be moved *over* other men.

L. 13. 'it' *i. e.* the mark.

L. 15. 'any' *i. e.* all.

L. 16. 'must also be moved one square.' This is *not* to be deducted from their next move.

L. 22. 'one of those who are not in' whether on the border or not.

L. 22. 'and moves.' The nominative is 'he,' the player who has won the rendezvous.

L. 25. 'The other Player' *i. e.* the one who did *not* win the rendezvous.

Two difficulties I will give in the words of the writers:—

'The Player who both places the men and has the first move may always win.'

'When the game comes near the end, it seems impossible to avoid its being won by the player who has the last turn to choose the rendezvous.'

How one would like to see a game between these two, one placing the men and having first move, the other choosing the last rendezvous!

One most startling suggestion has reached me. N. E. T. proposes to diversify the game 'by changing the 5 men into the King, Queen, Bishop, Knight, and Castle of Chess, each with his own moves, and by allowing only one man to move at once. By this means,' he (or she) adds, 'each man becomes a distinct individual.' The effect on *me* would be, I believe, a sensation of having become *two* 'distinct individuals,' if not more; but I speak diffidently, not having had the courage to try this bewildering medley of games. Nightmare would be nothing to it.

L. C.

Remarks (June)

Source: The Monthly Packet, June 1881 (untitled, after "A Tangled Tale")

With regard to 'Lanrick,' E. V. W. asks:—

'May men, when in the rendenzvous, move out?' *Ans.* 'Yes.'

'Can a man be moved *twice* in one turn, so long as he keeps to the same line of squares, straight or slanting?' *Ans.* 'The only objection is the diffidently of remembering what line he is on. The safest rule, to avoid disputes, seems to be to touch each man *once only* in a turn.'

'Can a player fix a rendenzvous which includes one of his adversary's men?' *Ans.* 'Yes.'

CHARLES CLARKE sends a most interesting letter of suggestions about 'Lanrick,' for which I am much obliged. He asks:—

'Can the winner of a rendenzvous take off the board *any* wanderer, whether on a border-square or not?' *Ans.* 'Yes.'

'In moving to the border wanderers not on border-squares, can he take *any* direction?' *Ans.* 'Yes.'

C. C. also points out that he who sets the men may secure the *first* rendenzvous by massing the adversary's men to command the centre. He forgets apparently that the adversary's proper game, in this case, is to fix the rendenzvous in the most distant corner, and not attempt to play into it, but simply mass his men in the opposite corner, thus securing the *second* rendenzvous.

He also asks what must be done if neither side will move his last man into the rendenzvous. This, I think, ought to be a drawn game.

L. C.

10.15 Lanrick (1881)

Source: The Monthly Packet, August 1881 (with minor differences as noted); The Monthly Packet, November 1881; Third Edition, with signature “October, 1881” also printed separately

A Game for Two Players. Third¹ Edition

‘The muster-place be Lanrick-mead.’

Quoted from *The Lady of the Lake* by Sir Walter Scott

1. The game requires a chess-board, five white and five black men, and something, such as a coin, with which to mark a square. The twenty-eight border-squares form ‘the border’: the other thirty-six form ‘the field.’²

2. The men are moved like chess-queens, that is, along any line of squares, straight or slanting.

3. The mark may be set on any square in the field³. The marked square forms, with the surrounding eight, a ‘rendezvous,’ into which both Players try to get their men: it counts as a vacant square, so that a man may be moved into or over it.

4. When playing for a rendezvous, he who plays first may not move in that turn more than two squares: in any other turn a Player may not move more squares than he has men on the board. He may move all these squares⁴ with one man, or may divide them among two or more men. He may move a man more than once in one turn, provided it be along the same line of squares.

5. He who begins sets on the border one of his men: the other does the same, and so on alternately. The Player named first in this Rule then sets the mark, taking care that none of his men are in the rendezvous, and that he cannot, in one turn, move them all in. Both then play for this rendezvous, he who did not set the mark playing first.

6. As soon as either Player has ‘won’ the rendezvous, *i. e.* has all his men in it,⁵ he takes off the board some one of his adversary’s men⁶ who is not in, and moves to the border, in accordance with⁷ Rule 2, all others of his adversary’s men who are not in and not already on the border⁸.

7. Then, if the Players have unequal numbers of men in the field, he who has most makes⁹ the numbers equal by moving to the border one or more of his men.¹⁰

8. Then he who has fewest men on the board, or in case of equality he who lost the last rendezvous, moves to the border one of his men, unless all be already on it: the other does the same, and so on alternately. The Player named first in this Rule then sets the mark as in Rule 5, and the game proceeds

¹Second

²(missing in second edition)

³but a border-square

⁴them all

⁵all his men in the rendezvous

⁶some man

⁷as in

⁸other men who are not in and not already on it

⁹if either Player has more men off the border than the other has, he makes

¹⁰moving men to the border

as before till one Player has taken four of his adversary's men, which wins the game.¹¹

¹¹has lost four men.

I shall be very grateful to any of the Knot-untiers or any other readers of the *Monthly Packet*, who will try this new version of 'Lanrick' and make suggestions for its further improvement. I shall also be very glad to have records of sets of games between the same two players, where each begins half the entire set, with results, in the following form:—

100 games between *A* and *B*.

A began 50, of which *A* won 32;

B began 50, of which *A* won 27.

I beg to thank H. M. S. PINAFORE for her suggestion about 'Mischmasch,' which deserves, and shall have, careful consideration.

Lewis Carroll.

10.16 Lanrick. A Game for Two Players

Source: Syzygies and Lanrick, published 1893; private second edition with minor differences as noted

“The muster-place be Lanrick-mead.”

Quoted from *The Lady of the Lake* by Sir Walter Scott

§ 1. Requisites for the Game

This Game requires a chess or draughts board, 8 men of one colour and 8 of another (chess-pawns, draughts, or counters), 8 pieces of card cut to the size of a square, and something (*e. g.* a coin) with which to mark a square.

§ 2. Definitions

Def. 1

A “Rendezvous” is a set of squares, into which each Player tries to get his men. Its position¹ is determined by that of the Mark, and the number of its square is always one less than that of the men which are on the Board when the Mark is set. There are two kinds of Rendezvous, “close” and “open”.

Def. 2

A Rendezvous must be “close,” when the number of its squares is odd. It consists of the marked square and certain adjacent squares, as shown in the following diagrams, in which the Players are supposed to be at the upper and lower edges. The numerals indicate the number of Rendezvous-squares, the letter “m” the Mark, and the asterisks the Rendezvous-squares.

A 3-square Rendezvous consists of a line of 3 squares, having the marked square in the middle, in any position, straight or slanting, chosen by the Player who sets the Mark.

Def. 3

A Rendezvous must be “open,” when the number of its squares is even. It consists of certain border-squares, which would be “in check” if the Mark were a chess queen, as shown in the following diagrams, which are to be interpreted as in Def. 2.

¹The position of its central square

For any but a 9-square Rendezvous, it will be found convenient to mark the Rendezvous-squares with pieces of card.

§ 3. Rules

Rule 1

Each man may be moved along any line of unoccupied squares, straight or slanting; but it may not (except in the case named in Rule 6) change its direction.

Rule 2

To begin the game, ten men are set as in this diagram, in which the five *B*'s indicate black men, and the five *Y*'s yellow² men. Then one Player sets the Mark on any one of the central four squares (indicated in this diagram by the letter '*m*') of the diagonal *not* containing men. Both then try to play their men into the Rendezvous thus determined, he, who did not set the Mark, having the first turn.

²Second edition has "W's white", also in the diagram

BLACK.

	B			Y			B
Y							
		m					
			m				Y
B				m			
					m		
							B
Y			B			Y	

YELLOW.

Rule 3

In playing the first turn for a Rendezvous, a Player may move 2 squares only. In any other turn he may move 5, 4, or 3 squares, according as he has on the Board more than 4, 4, or less than 4 men. He may divide these squares among his men as he likes, but may not move more than 3 of them with any one man, unless it be his only man outside the Rendezvous. He need not move more than one square in one turn. While playing, he should count aloud the squares through or into which he moves a man. After once playing a man and letting go of it, he may not move it again in that turn.

Rule 4

The Mark, for any Rendezvous after the first, may be set on any square that has enough squares round it to form the Rendezvous.³

Rule 5

When the Mark has been set, he, who did not set it, may, before playing, demand an "interchange"; in which case he, who set the Mark, must interchange all his own men with whichever he chooses of the others. He, who claims an "interchange," must move one of the enemy's men into a corner of its square, and cannot, after letting go of it, revoke his claim.⁴

Rule 6

In playing for an open Rendezvous, a Player may move any man, that is on the border, along it, without regarding the corners, as if it were one continuous line of squares: and any such man, if not moved beyond the first Rendezvous-square, reckons as having been moved *one* square only; but, if it be moved beyond, each square⁵ must be counted as in Rule 3.

³The Mark, for any Rendezvous, may be set on any but a border-square; for a 3-square one, on any but a corner-square; provided that he, who sets it, has no man in the Rendezvous.

⁴missing in the second edition

⁵square so moved

Rule 7

When a Player gets all his men into the Rendezvous, it being not yet full, he removes one of the outlying men from the Board, replacing it with a fresh man of his own colour; and this ends his turn.

Rule 8

When a Player has got all his men into the Rendezvous, it being now full, he removes the outlying man from the Board. Then he who has fewest men on the Board, or in the case of equality he who has just lost a man, sets the Mark for the next Rendezvous, as in Rule 4.

Rule 9

When a Player has only one man left, he has lost the Game.

§ 4. Hints to Players

In playing for a ‘close’ Rendezvous, remember that you have *two* objects in view—one to get your own men *in*, the other to keep the enemy’s men *out*. A mere race for the Rendezvous is not always your best course: much may be done by getting into the way of the enemy’s men, and checking *their* advance. Do not try to block *all* his men; *one* is generally as much as you can hope ultimately to exclude: hence it is often good play to select that man, of the enemy’s, who is furthest from the Rendezvous, and to devote, to his especial benefit, the services of (say) *three* of your own men, whose duty it will be to march, in close rank, in front of him, as a kind of ‘guard of honour’, taking care to march *in*, in front of him, so as to be able to announce his approach, and secure his being received with all proper respect!

It is an advantage to get hold of the *central* square of a “close” Rendezvous, and also of a square at that corner (or side) of it, where you wish to bring in another man. As soon as the outsider has reached a square adjacent to this corner-man, he can be played in, in the following turn, by first moving the central man into some vacant Rendezvous-square, then the corner-man into the central square, and then the outsider into the corner-square.

B	C	D	E
a	A	d	e
b	c		

For instance, supposing it to be a nine-square Rendezvous, and that your 5 men are A, B, C, D, E, (A being in the centre), and that the enemy’s 5 men are *a, b, c, d, e*, and that it is your turn to play; you may win the Rendezvous by moving A into the vacant square, D into A’s place, and E into D’s.

a	C	D	E
B	c	d	e
b	A		

Or, if the men be arranged thus (*c* being in the centre), you may win it by moving *A* into the vacant square, *B* into *A*'s place, *C* into *B*'s, *D* into *C*'s, and *E* into *D*'s.

		*		*			
		<i>c</i>		<i>d</i>			
*	<i>b</i>						
						<i>e</i>	
*	<i>a</i>		<i>m</i>				*
		<i>D</i>					
*	<i>C</i>						
		<i>B</i>				<i>A</i>	
		*		*			

Similarly, in playing for an “open” Rendezvous, supposing it to consist of 8 squares (here marked by asterisks), and that your 4 men are *A*, *B*, *C*, *D*, and the enemy's 5 men *a*, *b*, *c*, *d*, *e*, and that it is your turn to play; you may win the Rendezvous by moving *A* into the vacant Rendezvous-square, *B* into *A*'s place, *C* into *B*'s, and *D* into *C*'s.

	*	
	*	
	*	
	*	
	*	*

You should also arrange your men, that are already *in* the Rendezvous, so as to make things comfortable for those, of the enemy's men, who are on their way towards it. For instance, if it be a 9-square Rendezvous, and if there are four such men approaching from the East: by placing three of your men in the squares marked with asterisks, you may form an impenetrable wall across the Rendezvous, and thus provide a set of *three* vacant squares to accommodate the *four* weary travellers—a polite attention which they will not soon forget. Similarly, if there are *two* of the enemy's men approaching from the North-East: by placing three of your men, as here indicated, you will provide *one* vacant square for the two guests, who will probably indulge in the pathetic strain, “For⁶ one of us must stop outside, But that one won't be *me!* So, Tommy, make room for your Uncle!”

Quoted from *Tommy Make Room for Your Uncle* by T. S. Lonsdale

Should you find that the enemy is likely to get all his men into the Rendezvous, while you still have two or three men outside, remember that, as soon as all his men are in, he will replace one of your outlying men with a fresh

⁶Now

man of his own colour; and that he will most certainly choose for this purpose whichever of the outlying men is *nearest* to the Rendezvous. Consequently, *your* best course is to have no one of them nearer than the others. Keep them all together, at the same distance from the Rendezvous, so that, whichever of them he transforms into an enemy, you can at once bar its progress with your other outlying men.

The advice I have given, as to barring the progress of the enemy's men rather than merely hurrying on with your own, is also worth remembering when playing for an "open" Rendezvous.

In carrying out the operation described in Rule 5—the interchanging of the two sets of men—difficulties may arise, when men have been taken off their squares, in settling *which* squares they came from. These difficulties may lead to angry disputes; thence to mutual accusations of unverity; thence to estrangement of friends; and thence to family feuds, lasting through several generations. These deplorable results may all be avoided by observing the following simple Rule:—

Move every one of the men, which are to be interchanged, into a corner of its square. Place a card-marker on a square occupied by a *yellow*⁷ man (I am supposing the two colours to be "yellow" and "black"), and take the yellow man off its square. Place this yellow man in the centre of a square occupied by a *black* man, and take the *black* man off its square. Place this *black* man in the centre of a square occupied by another *yellow* man. Proceed thus, till all the men on the Board are in the centres of squares, and you have one black man in hand, which of course you place on the square indicated by the card-marker.

Rule 5 serves to prevent the Mark from being so set that he, who set it, is *absolutely*⁷⁸ certain to get his men in first—which certainly would rob the Game of much of its interest. In playing for a final 3-square Rendezvous, the mere setting of the Mark would, but for this Rule, decide the Game.

⁷In the second edition here and everywhere in this paragraph: "white"

Source: The Monthly Packet, June 1881

Though this text logically follows the entry on “A Tangled Tale” it is in a separate section.

P.P.S.—I beg to offer, for the consideration of the Knot-untiers, the rules for another new Game, and shall gratefully receive suggestions for its improvement.

Mischmasch

A Game for Two Players, or Two Sets of Players

1. An ‘extract’ is a selected portion of a word (*e. g.* ‘ati,’ ‘tigu,’ and ‘gue’ are all extracts from ‘fatigue’). To ‘guess an extract’ is to guess any ‘admissible’ word (*i. e.* a word correctly spelt, and understood and used in good society) containing it: this need not be the word from which it was taken.

2. To begin the game, each Player invents an extract to set to the other, and says ‘ready’ when he has done so. When both are ready, the extracts are named.

3. When a Player thinks he has guessed the extract set him, or that it is hopeless, he ‘declares,’ by saying ‘guessed’ or ‘resigned.’

4. If he say ‘guessed,’ he names the word: if it be admissible, he scores one; if not, the other scores one, and he goes on guessing. If he say ‘resigned,’ the other names the word from which the extract came: if it be admissible, he scores two; if not, he who resigns it scores four.

5. If an extract be thus disposed of, the other Player must at once ‘declare’ or else supply a new extract. But no one is bound to ‘declare’ till a reasonable time (say a minute or two) has passed since he began to guess the extract he has in hand.

6. When neither has an extract in hand, the game proceeds as in Rule 2.

7. When either Player has scored 10, the other, if he has an extract in hand must ‘declare’ and proceed as in Rule 4. The game is over, and the highest score wins.

10.18 Mischmasch (1882, Monthly Packet)

Source: The Monthly Packet, November 1882

A Word-Game for Two Players, or Two Sets of Players

The essence of this game consists in one player proposing a ‘nucleus’ (*i. e.* a set of 2 or more letters, such as ‘gp,’ ‘emo,’ ‘imse’), and in the other trying to find a ‘lawful word’ (*i. e.* a word known in ordinary society, and not a proper name) containing it. Thus, ‘magpie,’ ‘lemon,’ ‘himself,’ are lawful words containing the nuclei ‘gp,’ ‘emo,’ ‘imse.’ A nucleus may not contain a hyphen: *e. g.* ‘apple-tree’ is no a lawful word for the nucleus ‘letr.’ Substantives and adjectives, derived from proper names and beginning with capitals (*e. g.* ‘Jacobite,’ ‘French’), count as proper names.

Rules

1. Each thinks of a nucleus, and says ‘ready’ when he has done so. When both have spoken, the nuclei are named. A player may set a nucleus without knowing of any word containing it.
2. When a player has guessed a word containing the nucleus set to him (which need not be the word thought of by the player who set it), or has made up his mind that there is no such word, he says ‘ready,’ or ‘no word,’ as the case may be; when he has decided to give up trying, he says ‘I resign.’ The other must then, within a stated time (*e. g.* 2 minutes), say ‘ready,’ or ‘no word,’ or ‘I resign,’ or ‘not ready.’ If he says nothing, he is assumed to have said ‘not ready.’
3. When both have spoken, if the first speaker said ‘ready,’ he now names the word he has guessed; if he said ‘no word,’ he, who set the nucleus, names, if he can, a word containing it. The other player than proceeds in the same way.
4. The players then score as follows:—(N.B.—When a player is said to ‘lose’ marks, it means that the other scores them.)

Guessing a word,	rightly,	scores	1	
”	”	wrongly,	loses	1
Guessing ‘no word,’	rightly,	scores	2	
”	”	wrongly,	loses	2
Resigning		loses	1	

This ends the first move.

5. A ‘resigned’ nucleus cannot be set again during the same game. If, however, one or more letters be added or subtracted, it counts as a new one.
6. For every other move, the players proceed as for the first move, except that when a player is ‘not ready,’ or has guessed a word wrongly, he has not a new nucleus set to him, but goes on guessing the one already in hand, having first, if necessary, set a new nucleus for the other player.
7. The move in which either scores 10 is the final one; when it is completed, the game is over, and the highest score wins, or, if the scores be equal, the game is drawn.

I shall be grateful to any readers of the *Monthly Packet* who will try this game, and will kindly send me any criticisms, or suggestions for improving it, which occur to them. It seems to make a better game for *sets* of players than for individuals; the two sets ranging themselves on opposite sides of the room, and holding a whispered consultation on each side.

Lewis Carroll

10.19 Mischmasch (1882)

Source: printed 1882

A Word-Game for Two Players or Two Sets of Players

'Pars pro toto.'

The essence of this game consists in one Player proposing a 'nucleus' (*i. e.* a set of two or more letters, such as 'gp,' 'emo,' 'imse'), and in the other trying to find a 'lawful word' (*i. e.* a word known in ordinary society, and not a proper name), containing it. Thus, 'magpie,' 'lemon,' 'himself,' are lawful words containing the nuclei 'gp,' 'emo,' 'imse.'

A nucleus must not contain a hyphen (*e. g.* for the nucleus 'erga,' 'flower-garden' is not a lawful word).

Any word, that is always printed with a capital initial (*e. g.* 'English'), counts as a proper name.

Rules

1. Each thinks of a nucleus, and says 'ready' when he has done so. When both have spoken, the nuclei are named. A player may set a nucleus without knowing of any word containing it.

2. When a player has guessed a word containing the nucleus set to him (which need not be the word thought of by the player who set it), or has made up his mind that there is no such word, he says 'ready,' or 'no word,' as the case may be: when he has decided to give up trying, he says 'I resign.' The other must then, within a stated time (*e. g.* 2 minutes), say 'ready,' or 'no word,' or 'I resign,' or 'not ready.' If he says nothing, he is assumed to be 'not ready.'

3. When both have spoken, if the first speaker said 'ready,' he now names the word he has guessed: if he said 'no word,' he, who set the nucleus, names, if he can, a word containing it. The other Player then proceeds in the same way.

4. The Players then score as follows:—(N.B.—When a Player is said to 'lose' marks, it means that the other scores them.)

Guessing a word,	rightly,	scores	1.
„	„	wrongly,	loses 1.
Guessing 'no word,'	rightly,	scores	2.
„	„	wrongly,	loses 2.
Resigning		loses	1.

This ends the first move.

5. For every other move, the Players proceed as for the first move, except that when a Player is 'not ready,' or has guessed a word wrongly, he has not a new nucleus set to him, but goes on guessing the one already in hand, having first, if necessary, set a new nucleus for the other Player.

6. A 'resigned' nucleus cannot be set again during the same game. If, however, one or more letters be added or subtracted, it counts as a new one.

7. The move, in which either scores 10, is the final one; when it is completed, the game is over, and the highest score wins, or, if the scores be equal, the game is drawn.

Source: Court Circular, December 2, 1886

A Word-Game for Two Players or Two Sets of Players

By Lewis Carroll, Author of "Alice's Adventures in Wonderland," &c.

"Pars pro toto."

The essence of this game consists in one Player proposing a "nucleus" (i. e. a set of two or more letters, such as "gp," "emo," "imse"), and in the other trying to find a "lawful word" (i. e. a word known in ordinary society, and not a proper name), containing it. Thus, "magpie," "lemon," "himself," are lawful words containing the nuclei "gp," "emo," "imse".

A nucleus must not contain a hyphen (e. g. for the nucleus "erga," "flower-garden" is not a lawful word).

Any word, that is always printed with a capital initial (e. g. "English"), counts as a proper name.

Rules

1. Each thinks of a nucleus, and says "ready" when he has done so. When both have spoken, the nuclei are named. A Player may set a nucleus without knowing of any word containing it.

2. When a player has guessed a word containing the nucleus set to him (which need not be the word thought of by the Player who set it), or has made up his mind that there is no such word, or that there is one, but he cannot guess it, he says "ready." When he has decided to give up trying, he says "I resign". The other must then, within a stated time (e. g. 2 minutes), say "ready," "not ready". If he says nothing, he is assumed to be "not ready."

3. When both have spoken, if the first speaker has guessed a word, he names the word he has guessed: if he says "no word," he who set the nucleus, names, if he can, a word containing it. The other Player then proceeds in the same way.

4. The Players then score as follows:—(N.B.—When a player is said to "lose" marks, it means that the other scores them.)

Guessing a word,	rightly,	scores	2.	
"	"	wrongly,	loses	2.
Guessing "no word,"	rightly,	scores	3.	
"	"	wrongly,	loses	3.
Resigning		loses	1.	

This ends the first move.

5. For every other move, the Players proceed as for the first move, except that when a Player is "not ready," or has guessed a word wrongly, he has not a new nucleus set to him, but goes on guessing the one already in hand, having first, if necessary, set a new nucleus for the other Player.

6. A "resigned" nucleus cannot be set again during the same game.

7. The move, in which either scores 10, is the final one; when it is completed, the game is over, and the highest score wins, or, if the scores be equal, the game is drawn.

10.21 Lawn Tennis Tournaments (1882)

Source: The St. James's Gazette, August 12, 1882

To the EDITOR of the ST. JAMES'S GAZETTE

SIR,—Players of Lawn Tennis, and those interested in other kinds of sport in which Tournaments occur, have no doubt often realized the very unsatisfactory way in which the prizes are at present adjudged. I propose to deal with the subject mathematically, and to point out, first, the extraordinary injustice of the existing laws; and secondly, a method of adjudging the prizes which would, as I hope, really carry out the principle of *detur digniori*.

Suppose there are 32 competitors. These are arranged as 16 pairs for the contest of the first day: on the second day, the 16 winners are arranged as 8 pairs, the losers being excluded from further competition: similarly, on the third day, there are 4 pairs, and the 4 winners (supposing 4 prizes to be given) are now known to be the prize-winners. In order to settle their claims, 2 pairs contend on the fourth day, and the 2 winners have a final contest on the fifth day, to decide which is to take the first prize and which the second: the two losers have no further contest, since the third and fourth prize are of equal value.

The injustice of this system needs few words to prove it. Any one of your readers, who will write down 32 numbers, and bracket them in 16 couples, and then, after marking the supposed winner in each couple, will bracket these winners in 8 couples, and so on, will easily convince himself that the result is really as follows: if the original list be divided into 4 quarters, the best man in each quarter is a winner of the 4 prizes—the best in each half wins one of the first 2 prizes—and the best in the whole list (it would indeed be a strange system which failed to secure *this!*) wins the first prize. Now suppose the original list chanced to be arranged in the order of merit: in this case it will be found that the 17th best player gets the second prize, while the 9th and 25th best get the third and fourth!

This, of course, is an extreme case: but, in every case, the 2nd best player has only 16-31ths of a chance of getting the prize he deserves, and the chance, that the best 4 players shall get their prizes, is almost exactly 19-250ths: *i. e.* the odds are more than 12 to 1 against it!

Now, if any Lawn-Tennis-player is content that the element of pure chance should so largely enter into a contest of skill, I have nothing to say against it: every one to his taste: but to those who think, with me, that a Tournament would give more general satisfaction if the prizes were always given to those who played best, the following suggestions may prove interesting.

It is quite unimportant how the names are bracketed for the first set of contests: but, after that, the contests should be arranged thus:—the 16 winners (I am taking, as before, 32 competitors and 4 prizes) should be bracketed together, and the 16 losers should also be bracketed together. A list should be kept of the players, and against each man's name should be entered the names of those who have been proven superior to him, either by actually beating him or by beating those who have done so (*e. g.* if A beats B, and B beats C, both A and B are “superiors” of C). The contests should all be arranged on the principle of bracketing together, as far as possible, those who have the same number of

superiors but have no common superior (*e. g.* if A has been beaten by K and L, B by K and R, C by L and S, D by S and T, we should bracket A with D, and B with C). It would not be at all necessary to have only one set of contests each day: as soon as any court was finished with, the committee would assign it to any two disengaged players, who could be properly bracketed together.

The 4 prizes would be assigned thus:—so soon as any player had 4 superiors entered against his name, he would be struck out of the list: so soon as all, but one, had at least one superior, that one would be marked as “first prize:” of the remainder, so soon as all, but one, had at least 2 superiors, that one would be marked as “second prize:” and, of those then remaining, so soon as all, but two, had at least 4 superiors, those two would receive the remaining prizes.

This system would require many more contests than the present one does, so that there would be much more spectacle for the public to see: but, since the courts would usually be filled up as fast as vacated, I do not think that the whole Tournament would be likely to occupy more time than under the present most unsatisfactory system, which may often result in the 2nd, 3rd, and 4th best players all returning home empty-handed, while their prizes are carried off by players known to be far inferior the them.—I am, Sir, your obedient servant,

*Charles L. Dodgson,
Late Mathematical Lecturer of Ch. Ch. Oxford.
August 10.*

10.22 The Fallacies of Lawn Tennis Tournaments

Source: St. James's Gazette, August 1, 1883

To the EDITOR of the ST. JAMES'S GAZETTE

SIR,—In treating this subject I propose to myself four things:—

- (1.) To prove that the existing method of assigning prizes in lawn tennis tournaments is, except in the case of the first prize, entirely absurd;
- (2.) To prove that the existing method of scoring in matches leads, in many cases, to an unjust result;
- (3.) To suggest a method for conducting tournaments which, while requiring less time than the present, shall give more equitable results;
- (4.) To suggest a better method of scoring in matches.

(1.) To prove the absurdity of the present method of assigning prizes in lawn tennis tournaments will not need many words. Suppose there are 32 competitors and 4 prizes. On the 1st day, these contend in 16 pairs: on the 2nd day, the 16 winners contend in 8 pairs, the losers being excluded from further competition: on the 3rd day, the 8 winners contend in 4 pairs: on the 4th day, the 4 winners (who are now known to be the 4 prize-men) contend in 2 pairs: and on the 5th day, the 2 winners contend together, to decide which is to take the first prize and which the second—the 2 losers having no further contest, as the 3rd and 4th prize are of equal value.

Now, if we divide the original list of competitors into 4 sections, we may see that all, that this method really does, is to ascertain who is the best man in each section, then who is the best in each half of the list, and then who is the best of all. The best of all (and this is the only equitable result arrived at) wins the first prize: the best in the other half of the list wins the second: and the best men in the 2 sections not yet represented by a champion win the other two prizes. If the original list had chanced to be arranged in the order of merit, the 17th best player will necessarily carry off the 2nd prize, and the 9th and 25th best the 3rd and 4th! This of course is an extreme case: but anything within these limits is possible: *e. g.* any competitor, from the 3rd best to the 17th best, may, by the mere accidental arrangement of names, and by no means as a result of his own skill, carry off the 2nd prize. As a mathematical fact, the chance that the 2nd best player will get the prize he deserves is only 16-31ths: while the chance that the best 4 shall get their proper prizes is so small that the odds are 12 to 1 against its happening!

(2.) To prove that the existing method of scoring in matches leads, in many cases, to an unjust result, let us suppose a “set” to mean “the best of 5 games,” and a “match” “the best of 5 sets.”

Suppose A and B to play the following 23 games:—BAABB | AAA | BAABA* | B*ABAB | BAABA. Here A wins 13 games to 10, and also wins the match. But, by simply transposing A*, B*, we get BAABB | AAA | BAABB | AABA | BBAAB |, the last game of the original series not being played. Here A still wins 12 games to 10: yet he loses the match!

(3.) The method for conducting tournaments, which I have to propose, involves two departures from the present method. First, I propose to make a “match” last only half a day (the necessary reduction in the number of games

I will discuss in section 4): secondly, I propose to give only 3 prizes. The rules for a tournament of 32 players would be as follows:—

(a.) The tournament begins in the middle of the 1st day, so that there is only one contest that day—the 32 players being arranged in 16 pairs.

(b.) A list is kept, and against each name is entered, at the end of each contest, the name of any one who has been proved superior to him—whether by actually beating him, or by beating some one who has done so (thus, if A beats B, and B beats C, A and B are both “superiors” of C). So soon as any name has 3 “superiors” entered against it, it is struck out of the list.

(c.) For the 2nd day (morning) the 16 unbeaten men are paired together, and similarly the 16 with 1 superior (the losers in these last-named pairs will now have 3 superiors each, and will therefore be struck off the list). In all other contests they are paired in the same way: first pairing the unbeaten, then those with 1 superior, and so on, and avoiding, as far as possible, pairing two players who have a common superior.

(d.) By the middle of the 3rd day the unbeaten are reduced to two, one of them is certainly “first-prize-man.” These two do not contend in the afternoon contest that day, but have a whole-day match on the 4th day—the other players meanwhile continuing the usual half-day matches.

(e.) By the end of the 4th day, the “first-prize-man” is known (by the very same process of elimination used in the existing method): and the remaining players are paired by the same rules as before, for the 2 contests on the 5th day. In some cases the 2nd and 3rd prizes will both be decided by the middle of the 5th day. If, in section (a), the tournament were begun in the morning, the two men named in section (d) being still allowed a whole-day match, nothing would be gained in time, as the tournament would still take $4\frac{1}{2}$ days, while much would be lost in interest, as the first-prize would be settled in 3 days.

These rules will, I think, be sufficiently illustrated by going through a tournament of 16; and if the reader will draw up for himself these Tables, in blank, and fill them up, column by column, according to the following directions, he will easily understand the working of the system.

Let the players be arranged alphabetically, and call them A, B, C, etc., and let their relative skill be represented by the following numbers:—

A	B	C	D	E	F	G	H	J	K	L	M	N	P	Q	R
6	10	13	5	15	9	7	12	1	14	3	2	8	16	11	4

These numbers will enable the reader to decide which will be the victor in any contest: but of course they are not supposed to be known to the Tournament Committee, who have nothing to guide them but the results of actual contests. In the following tables, “I. (e)” means “first day, evening,” and so on: also a player, who is *virtually* proved superior to another, is entered thus “(A).” The victor in each contest is marked *.

Table I. (Pairs)

I. (e)	II. (m)	(e)	III. (m)	(e)	IV. (m)	(e)
A }*	A }*	D }*	D }	D }	D }	D }
B }	D }	G }	J }	J }*	M }	L }*
C }	F }	J }	A }	M }	L }	
D }*	G }	R }	M }	R }	R }	
E }	J }	A }	G }	L		
F }*	M }	F }	R }			
G }	N }	H }	L }			
H }	R }	N }	N }			
J }	B }	M }				
K }	C }	Q }				
L }	E }	B }				
M }	H }	L }				
N }	K }					
P }	L }					
Q }	P }					
R }	Q }					

Table II. (Superiors.)

	I. (e)	II. (m)	(e)	III. (m)	(e)	IV. (m)	(e)
A	...	D	...	M (J) out			
B	A	(D)	L out				
C	D	B (A) out					
D	J	M	L out
E	F	H (G) out					
F	...	G	A (D) out				
G	D	R (J) out			
H	G	...	N (D) out				
J	First		
K	J	L (M) out					
L	M	(J)	Third
M	...	J	Second	
N	...	R	(J)	L out			
P	N	Q (R) out					
Q	R	...	M (J) out				
R	J	...	M	L out	

In contest I. (e), we see that A beats B, and so on: hence we enter A as a “superior” to B, D to C, and so on. For contest II. (m), we pair the winners A, D, and so on: and then the losers, B, C, and so on. After it, we enter the *actual* superiors, D, C, etc.: we then find that, A having a superior D, and B a superior A, B has a *virtual* superior D: and so on. Having done this, we see that C, E, K, P, have three superiors each, and must be struck out. For contest II. (e) we should avoid pairing F and H, because they have a common superior: and the same may be said of N, Q. After it, we strike out B, F, H, Q. On the 3rd day, as there are only 2 unbeaten left, they contend during the whole day, the others having half-day contests: L and N have to be paired, even though they have a common superior. After the morning contest, we strike out A, G, N. For the evening, D and J are still contending: so that M and R must be paired, though they have a common superior; and L is “odd man.” After the evening contest,

J is seen to be “first-prize-man.” After contest IV. (m), we strike out R; and we see that M is “second-prize-man.” After contest IV. (e), we strike out D, and give L the 3rd prize.

If this tournament were fought by the present method, the 4 prize-men would be D, G, J, R: D would get the 2nd prize, and G and R the 3rd and 4th: *i. e.* the 5th best man would get the 2nd prize, and the 7th and 4th best the other two.

(4.) To make “matches” more equitable, I propose to abolish “sets,” and make a “match” consist of “games.” Thus instead of “best of five games = set; best of 5 sets = match” (*i. e.* he who first wins 3 games wins a set; he who first wins 3 sets wins a match), where a player *may* win with as few as 9 games, and *must* win with 13, I would substitute “he who wins 13 games, or who gets 9 games ahead, wins the match.” This, however is a short match. The London Athletic Club say “he who wins 6 games wins a set; he who first wins 3 sets wins a match.” Here a player *may* win with 18 games, and *must* win with 28: so that it might need as many as 55 games to decide a match. This again seems needlessly large. I am inclined for a compromise, and propose as follows: “For a whole-day, he who first wins 24 games, or who gets 16 ahead, wins the match: for a half-day, he who first wins 12 games, or who gets 8 games ahead, wins the match.” The proposed form of tournament, though lasting a shorter time than the existing one has a great many more contests going on at once, and consequently furnishes the spectacle-loving public with a great deal more to look at.—I am, Sir, your obedient servant,

Charles L. Dodgson
Student and late Mathematical Lecturer of Christ Church, Oxford

10.23 Lawn Tennis: Reply to “Cavendish”

Source: The St. James’s Gazette, August 4, 1883

To the EDITOR of the ST. JAMES’S GAZETTE

SIR,—I am honoured by the attention such an authority as “Cavendish” has given my letter on Lawn Tennis Tournaments, and hope you will afford me space for a brief reply.

He says “the primary object is to give the 1st prize to the best man,” but that it is “a matter of comparatively small concern” to give the 2nd to the 2nd best. Why so wide a distinction between them? Is it fair that the one should be certain of his prize, while the other has only an even chance of his?

Again, he says that, under my system, “the prize-winners could easily be predicted, and the interest of the whole meeting would suffer.” Is he not ignoring the “chances of the board,” where the element of luck enters largely, even under my system? The man reputed best is by no means certain of the 1st prize: many things may prevent his playing best. Also, does he find that the interest of a rifle-match suffers, because he who makes 2nd score is certain of getting 2nd prize?

Again, he thinks the present system “entices” 2nd-class players to enter more than mine would. Let us see what he and I, representing the two systems, would say to players before a tournament of 32 with three prizes. (We may assume that every one hopes to play at least up to his reputation.)

To the man reputed 2nd best, he would say, “If you play up to your reputation, your chances are—of the 2nd prize, one half; of the 3rd, 1-4th; of getting nothing, 1-4th;” whereas I should say, “If you do so, you will get the 2nd prize.” Here undoubtedly I make the best bid.

To the man reputed 5th best, he would say, “If you play up to your reputation, your chance of a prize is about 1-4th; and even if, by great luck and painstaking, you play 2nd or 3rd best, it never rises above a half;” whereas I should say, “I admit that, if you only play up to your reputation, you will get nothing; but, if you play 2nd or 3rd best, you are certain of the proper prize.” Thus he offers a chance of 1-4th, where I offer nothing; and of a half, where I offer certainty. I am inclined to think that here also I make the best bid.

I agree with him that “all popular games have, and must have, an element of luck.” This is true of all games—whether of pure chance, *e. g.* pitch-farthing; or of pure skill, *e. g.* chess; or mixed, *e. g.* whist. My proposal is to make Lawn-Tennis Tournaments a game of pure skill, instead of being mixed: but this would not destroy, what he thinks necessary, “some hope, even in the breast of a second-class player, of success through fortune, if not through skill.”

He says the logical conclusion of my proposal, to make a match consist of games, is to make it consist of strokes. I admit it, but think that would be going too far.

He thinks a match consisting of games would be uninteresting, so soon as one of two even players got a little ahead, while under the present system “a lucky game on one side is often balanced by a lucky game on the other side.” And why should not the being ahead on one side be balanced by a lucky game on the other side? *Suo sibi gladio hunc jugulo.*

Quoted from Terence

I believe that a system of handicapping, such as is usual in races, would be a much more satisfactory way of equalizing players, and thus giving all a reasonable hope of winning a prize, than the present lottery-system. But in any case I protest against the present absurdity of excluding a man, who has been beaten only once, from all further competition in a tournament with more than one prize.

May I add a few words in reply to "Corrigenda," whose letter, in MS., you have kindly sent me? He thinks I am estimating too highly the chance of its happening that the players should be paired "in order of merit," because I have not allowed for the rule "that the players draw for their oponents (*sic*) every time:" and he calculates that, with 16 players, the odds against this event are 21 to 1. Let me remind "Corrigenda" that I spoke of it as "an extreme case:" the odds against it, I do not mind admitting, are more than 21 to 1: how much more, I do not feel bound to say.

He also says that the absurdity I pointed out in scoring matches, where A wins twelve games to ten and yet loses the match, could never happen, because one must "always" win six games, not three, to win a "set." I think that for "always" we should read "always in Corrigenda's experience;" but I gladly accept a correction which strengthens my case so much. If he, who wins six games, wins a set; and he, who wins three sets, wins a match; than a player may actually win 27 games to 18, and yet lose the match!—I am, Sir, your obedient servant,

Charles L. Dodgson.

10.24 Lawn Tennis

Source: The St. James's Gazette, August 21, 1883

To the EDITOR of the ST. JAMES'S GAZETTE

SIR,—I am glad to see, in the letters of “Phayllus” and “East Sheen L. T. C.,” which appeared in your columns on August 16 and 18, signs that opinion is changing as to the best form of tournament, and that two *desiderata*, which the present form fails to supply, are beginning to be recognized, namely (almost in the words of “Phayllus”), “that the best players shall take the prizes, and that all the players shall be occupied the greater part of the time, and not be forced to look on idly if they have lost their match in the first round.” The “American,” or “Weybridge,” form, which they advocate, though a great improvement on the existing one, yet labours under two defects. One is, the pairing together of players whose rival claims have been already *virtually* decided. When A has been beaten by B, and B by C, a match between A and C is surely a foregone conclusion, since we may fairly assume that their relative skill is the same to-day as it was yesterday. If not—if it be held that one night may make such a difference that A may now beat C—why not apply the same principle to A and B, and thus prolong the tournament *in sæcula sæculorum*? The other defect is the breaking up the whole set of players into several independent tournaments, and letting the winners in the respective divisions contend among themselves for the prizes—thus making it possible (as I showed in my letter of August 4) for the four prizes, in a tournament of thirty-two, to be won by the 1st, 17th, 9th, and 25th best players.

If these superfluous contests were omitted, there would then be plenty of time for all to play in one grand tournament; and the American system, minus these two defects, will be found to be identical with the system I advocated in your columns on the 4th of August, in a letter since published by Messrs. Macmillan as a pamphlet, enlarged and with a full account of a tournament of thirty-two players.

It will not be long, I hope, before the “American” system, with these necessary modifications, supplants the present one, under which, though a first prize may fairly be placed among those won by rowing or running, yet a second prize has very little more right to such a position than if it had been won in a raffle.—I am, Sir, your obedient servant,

Charles L. Dodgson.

The True Method of Assigning Prizes with a Proof of the Fallacy of the Present Method

Palmam qui meruit ferat

§ 1. Introductory

At a Lawn Tennis Tournament, where I chanced, some while ago, to be a spectator, the present method of assigning prizes was brought to my notice by the lamentations of one of the Players, who had been beaten (and had thus lost all chance of a prize) early in the contest, and who had had the mortification of seeing the 2nd prize carried off by a Player whom he knew to be quite inferior to himself. The results of the investigations, which I was led to make, I propose to lay before the reader under the following four headings:—

(a) A proof that the present method of assigning prizes is, except in the case of the first prize, entirely unmeaning.

(b) A proof that the present method of scoring in matches is constantly liable to lead to unjust results.

(c) A system of rules for conducting Tournaments, which, while requiring even less time than the present system, shall secure equitable results.

(d) An equitable system for scoring in matches.

§ 2. A proof that the present method of assigning prizes is, except in the case of the first prize, entirely unmeaning

Let us take, as an example of the present method, a Tournament of 32 competitors with 4 prizes.

On the 1st day, these contend in 16 pairs: on the 2nd day, the 16 Winners contend in 8 pairs, the Losers being excluded from further competition: on the 3rd day, the 8 Winners contend in 4 pairs: on the 4th day, the 4 Winners (who are now known to be the 4 Prize-Men) contend in 2 pairs: and on the 5th day, the 2 Winners contend together, to decide which is to take the 1st prize and which the 2nd—the two Losers having no further contest, as the 3rd and 4th prize are of equal value.

Now, if we divide the list of competitors, arranged in the order in which they are paired, into 4 sections, we may see that all that this method really does is to ascertain who is best in each section, then who is best in each half of the list, and then who is best of all. The best of all (and this is the only equitable result arrived at) wins the 1st prize: the best in the other half of the list wins the 2nd: and the best men in the two sections not yet represented by a champion win the other two prizes. If the Players had chanced to be paired in the order of merit, the 17th best Player would necessarily carry off the 2nd prize, and the 9th and 25th best the 3rd and 4th! This of course is an extreme case: but anything within these limits is possible: *e. g.* any competitor, from the 3rd best to the 17th best, may, by the mere accidental arrangement of pairs, and by no means

as a result of his own skill, carry off the 2nd prize. As a mathematical fact, the chance that the 2nd best Player will get the prize he deserves is only 16-31sts; while the chance that the best 4 shall get their proper prizes is so small, that the odds are 12 to 1 against its happening!

If any one thinks that, after all, we are merely introducing another element of chance into the game, and that no one can fairly object to *that*, let him try the experiment in a rifle competition. Let him interpose when the man, who has made the 2nd best score, is going to receive his prize, and propose that he shall draw a counter from a bag containing 16 white and 15 black, and only have his prize in case he draw a white one: and let him observe the expression of that rifleman's face.

§ 3. A proof that the present method of scoring in matches is constantly liable to lead to unjust results

To prove this, let us suppose a "set" to mean "the best of 11 games," and a "match" "the best of 5 sets": i. e. "he, who first wins 6 games, wins a set; he, who first wins 3 sets, wins a match."

Suppose A and B to play the following 50 games ("A²" means A wins 2 games, and so on):—

$$B^2A^5B^4|A^6|B^3A^5B^2A^*|B^*A^2B^4A^3B|B^2A^5B^3A.$$

Here A wins 28 games to 22, and also wins the match.

But, by simply transposing A*, B*, we get

$$B^2A^5B^4|A^6|B^3A^5B^3|A^3B^4A^3|B^3A^5B^3,$$

the last game of the original series not being played. Here A still wins 27 games to 22: yet he loses the match!

§ 4. A system of rules for conducting Tournaments, which, while requiring even less time than the present system, shall secure equitable results

The method for conducting Tournaments, which I have to propose, involves two departures from the present method. First, I propose to make a "match" last only half a day (the necessary reduction in the number of games I will discuss in section 5): secondly, I propose to give only 3 prizes. The rules for a Tournament of 32 Players would be as follows:—

(a) The Tournament begins in the middle of the 1st day, so that there is only one contest that day—the 32 Players being arranged in 16 pairs.

(b) A list is kept, and against each name is entered, at the end of each contest, the name of any one who has been proved superior to him—whether by actually beating him, or by beating some one who has done so (thus, if A beats B, and B beats C, A and B are both "superiors" of C). So soon as any name has 3 "superiors" entered against it, it is struck out of the list.

(c) For the 2nd day (morning) the 16 unbeaten men are paired together, and similarly the 16 with 1 superior (the Losers in these last-named pairs will now have 3 superiors each, and will therefore be struck off the list). In all other contests they are paired in the same way; first pairing the unbeaten, then those

with 1 superior, and so on, and avoiding, as far as possible, pairing two Players who have a common superior.

(*d*) By the middle of the 3rd day the unbeaten are reduced to two, one of whom is certainly “First-prize-man.” These two do not contend in the afternoon contest that day, but have a whole-day match on the 4th day—the other Players meanwhile continuing the usual half-day matches.

(*e*) By the end of the 4th day, the “First-prize-man” is known (by the very same process of elimination used in the existing method): and the remaining Players are paired by the same rules as before, for the 2 contests on the 5th day. In some cases the 2nd and 3rd prizes will both be decided by the middle of the 5th day. If, in section (*a*), the Tournament was begun in the morning, the two men named in section (*d*) being still allowed a whole-day match, nothing would be gained in time, as the Tournament would take $4\frac{1}{2}$ days, while much would be lost in interest, as the first prize would be settled in 3 days.

To illustrate these rules, I will give the complete history of a Tournament of 32 competitors, with 3 prizes. If the reader will draw out the following Tables, in blank, and fill them up for himself, referring, if necessary, to the accompanying directions, he will easily understand the workings of the system.

Let the Players be arranged alphabetically, and let the relative skill, with which they play in this Tournament, be:—

A	B	C	D	E	F	G	H	J
19	22	14	32	16	25	15	28	3
K	L	M	N	P	Q	R	S	T
10	8	1	29	4	12	2	17	23
U	V	W	X	Y	Z	a	b	c
26	11	20	31	13	18	6	24	9
d	e	f	g	h				
21	30	5	7	27				

These numbers (“1” meaning “best”) will enable the reader to name the victor in any contest: but of course they are not supposed to be known to the Tournament-Committee, who have nothing to guide them but the results of actual contests. In the following Tables, “I (e)” means “first day, evening,” and so on: also a Player, who is virtually proved superior to another, is entered thus “(A).” The victor in each contest is marked *: and ⊙ means “struck out.”

Table I. (Pairs)

I. (e)	II. (m)	(e)	III. (m)	(e)	IV. (m)	(e)	V. (m)	(e)

Directions for filling in the Tables:—

Tab. I. Day I (e). The names are written out alphabetically, and paired as they stand. The victors are marked with asterisks.

Tab. II. Day I (e). As B has been beaten by A, A is entered as his “superior”; C as D’s superior; and so on.

Tab. I. Day II (m). We first pair together all the unbeaten, A, C, E, G, &c. Then those who have one superior, B, D, F, H, &c.

Tab. II (m). We first enter the *actual* superiors, C, G, &c. Then, since A has a superior C, and B has a superior A, we see that B has a *virtual* superior C; and so on. We then see that D has 3 superiors, and must be struck out; and so with H, &c.

Tab. I. Day II (e) We first pair together all the unbeaten, C, G, &c. Then all with one superior, A, E, &c.; but when we come to J, L, we find we have a common superior; so we pair J with P, and L with Q. This series ends with an odd one, g, who must therefore be paired with the first of those who have two superiors each, F, T, &c.

Tab. I. Day III (m). Here, in pairing those with one superior, we again end with an odd one, g, who must therefore be paired with the first of those with two superiors, viz. T. We end with an “odd man,” c.

Tab. II. Day III (m). The unbeaten are now reduced to one pair, M, f, who therefore will do nothing this afternoon, but will have a whole-day contest to-morrow.

Tab. I. Day III (e). Those who have one superior are C, J, L, R, all with a common superior M; and then V, a, g, all with a common superior f. We therefore pair C with V, and so on, leaving an odd one R, who must be paired with the only one who has two superiors, viz. c.

Tab. II. Day III (e). Enter as usual.

Tab. I. Day IV (m). We pair the 2 unbeaten, M, f, for their whole-day contest. Then those with one superior.

Tab. II. Day IV (m). M and f are still contending. V and g are struck out.

Tab. I. Day IV (e). J and R must be paired together, though they have a common superior.

Tab. I. Day IV (e). M is First-prize-man.

Tab. I. Day V (m). R and f must be paired together, though they have a common superior. J is “odd man.”

Tab. II. Day V (m). R is now the only man with one superior, and is therefore Second-prize-man.

Tab. I. Day V (e). J and f contend for the Third prize.

If this Tournament were fought by the present method, the 4 Prize men would be C, M, V, f: f would get the 2nd prize, and C and V the 3rd and 4th: i. e. the 5th best man would get the 2nd prize, and the 14th and 11th best the other two.

§ 5. An equitable system for scoring in matches

In order to make “matches” more equitable, I propose to abolish “sets,” and make a “match” consist of “games.” Thus, instead of “best of 11 games = set; best of 5 sets = match” (i. e. he who first wins 6 games wins a set; he who first wins 3 sets wins a match), where a player *may* win with as few as 18 games, and *must* win with 28, I would substitute “he who first wins 28 games, or who gets 18 games ahead, wins the match.” I therefore propose as follows: “For a whole-day, he who first wins 28 games, or who gets 18 ahead, wins the match: for a half-day, he who first wins 14 games, or who gets 9 ahead, wins the match.”

§ 6. Concluding remarks

Let it not be supposed that, in thus proposing to make these Tournaments a game of pure skill (like chess) instead of a game of mixed skill and chance (like whist), I am altogether eliminating the element of luck, and making it possible to predict the prize-winners, so that no one else would care to enter. The “chances of the board” would still exist in full force: it would not at all follow, because a Player was reputed best, that he was certain of the I St prize: a thousand accidents might occur to prevent his playing best: the 4th best, 5th best, or even a worst Player, need not despair of winning even the 1st prize.

Nor, again, let it be supposed that the present system, which allows an inferior player a chance of the 2nd prize, even though he fails to play above his

reputation, is more attractive than one which, in such a case, gives him no hope. Let us compare the two systems, as to the attractions they hold out to (say) the 5th best Player in a Tournament of 32, with 3 prizes. The present system says, "If you play up to your reputation, your chance of a prize is about $\frac{1}{4}$ th; and even if, by great luck and painstaking, you play 2nd or 3rd best, it never rises above a half." My system says, "It is admitted that, if you only play up to your reputation, you will get nothing: but, if you play 2nd or 3rd best, you are certain of the proper prize." Thus, the one system offers a chance of $\frac{1}{4}$ th, where the other offers nothing; and a chance of a half, where the other offers certainty. I am inclined to think the second the more attractive of the two.

If, however, it be thought that, under the proposed system, the very inferior Players would feel so hopeless of a prize that they would not enter a Tournament, this can easily be remedied by a process of handicapping, as is usual in races, &c. This would give every one a reasonable hope of a prize, and therefore a sufficient motive for entering.

The proposed form of Tournament, though lasting a shorter time than the present one, has a great many more contests going on at once, and consequently furnishes the spectacle-loving public with a great deal more to look at.

10.26 Circular Billiards (Variant A)

Source: printed 1890, two similar editions, here only one

For Two Players. Invented, in 1889, by Lewis Carroll.

The Table is circular, with a cushion all round it, no pockets, and three white spots arranged in an equilateral triangle.

Rules

1.

String for lead. Then the player, who is not to begin, places the 3 balls (red, white, and spot-white) on the spots provided for them. The first stroke must be played at the *red* ball.

2.

A 'miss' counts 1 to the adversary. A ball driven off the table, counts 2 to the adversary, and must be replaced on its original spot.

3.

If the ball in play strike one ball, and nothing else, it counts nothing.

4.

A cannon counts 2, and gives the right of playing again.

5.

Striking the cushion counts 1 for every ball struck afterwards. Thus, a cushion struck before striking one ball counts 1: a cushion struck during a canon counts 1: a cushion struck previous to a cannon counts 2. Two or more consecutive cushions are reckoned as one only.

6.

Game is 50 or 100.

[P. T. O.]

Remarks

The circular Table will be found to yield an interesting variety of Billiard-playing, as the rebounds from the cushion are totally different from those of the ordinary game.

The 5 possible modes of scoring are here appended. (N.B. '*B*' stands for 'Ball', '*c*' for 'cushion'.)

All scores below the line give the right of playing again.

10.27 Circular Billiards (Variant B)

Source: printed 1890

For Two Players. Invented, in 1889, by Lewis Carroll.

The Table is circular, whith a cushion all round it, and has neither pockets nor spots.

Rules

1.

One Player takes the 3 balls (red, white, and spot-white) in his hand, turns his back on the Table, and rolls them on. The other Player begins.

2.

A 'miss' counts 1 to the adversary.

3.

If the ball in play strike one ball, and nothing else, it counts nothing.

4.

A cannon counts 2, and gives the right of playing again.

5.

Striking the cushion counts 1 for every ball struck afterwards. Thus, a 'plain' cushion (struck before striking one ball) counts 1, and two such count 2: a 'sandwich' cushion (struck during a canon) counts 1, and two such count 2: a 'previous' cushion (struck previous to a connon) counts 2, and two such count 4. Three or or more consecutive cushions are reckoned as two only.

6.

Game is 50 or 100.

Remarks

The circular Table will be found to yield an interesting variety of Billiard-playing, as the rebounds from the cushion are totally different from those of the ordinary game.

To illustrate the great variety of play, in this game, the 12 possible modes of scoring are here appended. (N.B. '*B*' stands for 'Ball', '*c*' for 'cushion,' '*s*' for 'sandwich-cushion', and '*p*' for 'previous cushion'.)

All scores below the line give the right of playing again.

10.28 Arithmetical Croquet

Source: manuscript written April 22, 1889

for two Players

1. The first player names a number not greater than 8: the second does the same: the first then names a higher number, not advancing more than 8 beyond his last; and so on alternately—whoever names 100, which is ‘winning peg’, wins the game.

2. The numbers 10, 20, etc. are the ‘hoops’. To ‘take’ a hoop, it is necessary to go, from a number below it, to one the same distance above it: e. g. to go from 17 to 23 would ‘take’ the hoop 20: but to go to any other number above 20 would ‘miss it’, in which case the player would have, in his next turn, to go back to a number below 20, in order to ‘take’ it properly. To miss a hoop twice loses the game.

3. It is also lawful to ‘take’ a hoop by playing *into* it, in one turn, and out of it, to the same distance above it in the next turn: e. g. to play from 17 to 20, and then from 20 to 23 in the next turn, would ‘take’ the hoop 20. A player ‘in’ a hoop may not play out of it with any other than the number so ordered.

4. Whatever step one player takes, bars the other from taking an equal step, or the difference between it and 9: e. g. if one player advances 2, the other may not advance 2 or 7. But a player has no ‘barring’ power when playing *into* a hoop, or when playing from any number between 90 and 100, unless the other player is also at such a number.

5. The ‘winning-peg’, like the ‘hoops’, may be ‘missed’ once, but to miss it twice loses the game.

6. When one player is ‘in’ a hoop, the other can keep him in, by playing the number he needs for coming out, so as to bar him from using it. He can also do it by playing the difference between this and 9. And he may thus go on playing the 2 barring numbers alternately: but he may not play either twice running: e. g. if one player has gone from 17 to 20, the other can keep him in by playing 3, 6, 3, 6, etc.

10.29 Syzygies

Source: *The Lady*, July 23, 1891–June 2, 1892, weekly with two gaps (first three weeks in November 1891, and December 24, when *The Lady* was not published), 42 issues; some parts are omitted: repeated texts (which are only reproduced once, including the title), tables with scores (which are omitted completely), and texts not related to Syzygies (which are moved to other places); several printing errors have been corrected, sometimes without notice

A Word-Puzzle. By Lewis Carroll.

July 23, 1891

When two words have one or more letters standing together in the same order, common to both, this collection of letters may be called a “Syzygy” between the two words. Thus “a” is a Syzygy between cat and rat; “en” is a Syzygy between friend and enemy; and “din” is a Syzygy between pudding and dinner.

The puzzle consists in linking together two given words by a chain of words, called links, such that every two consecutive words may contain a Syzygy, and the longer the Syzygies are, the more marks do they obtain. Thus, supposing the two given words were door and window, the following would be a chain linking them together:—

DOOR
 (oor)
poorest
 (res)
resound
 (und)
undo
 (ndo)
WINDOW

The above will serve as a specimen of the way in which such chains should be written out, each Syzygy being placed in a parenthesis.

Rules

1. A Syzygy may stand at the beginning, or end, or in the middle of a word; but it may not begin both of the words to which it belongs, neither may it end both. Thus

handsome
 (some)
somewhere

would be a lawful Syzygy; but

handsome
 (some)
troublesome

would be an unlawful one. A chain containing an unlawful Syzygy would get no marks.

2. The words used as links must be ordinary words given in dictionaries, or inflexions of them. Proper names and words containing hyphens are not allowed.

3. The letters “y” and “i” are to be regarded as the same. Thus

busy
 (usi)
 using

would be a lawful Syzygy.

4. The marks to be given with each chain are calculated by adding together the number of letters in the longest Syzygy and seven times the number in the shortest, and deducting a mark for every link and for every “waste” letter (*i. e.*, every letter which does not enter into a Syzygy).

Specimen Chains

In the following chains the figure placed against each word indicates the number of “waste” letters in it.

We propose to give a prize of One Guinea to the competitor who gains the greatest number of marks from the date of this number to the 29th of September.

The first Competition will be to

Change a CONSERVATIVE into a LIBERAL.

Answers must be received by (or before) the first post on the 4th of August. The envelope to be marked “Syzygies” in the left-hand corner.

July 30, 1891

[...]¹

On reconsidering the matter, it seems to us that by fixing the period at which the prize will be given at such an early date as 29th of September we shall hardly be giving our readers sufficient time to become acquainted with the true nature of the Syzygy. So we have decided to give the first two competitions as experimental ones, and then to start the series for the prize, which will continue until 3rd December inclusive.

We propose to give a prize of One Guinea to the competitor who gains the greatest number of marks, commencing next week, to the 3rd of December. The first two competitions will be to

*Change a CONSERVATIVE into a LIBERAL, and
Get VERDICT from JURY.*

Marks will be given for these Competitions, but they will not count towards gaining the prize.

Answers must be received by (or before) the first post on the 11th of August. The envelope to be marked "Syzygies" in the left-hand corner.

August 6, 1891

[...]²

August 13, 1891

[...]³

The marks for the two trial Syzygies will be published next week.

We propose to give a prize of One Guinea to the competitor who gains the greatest number of marks, commencing next week, to the 3rd of December. The competitions this week will be to

*Turn DOOR into WINDOW
TRAVEL on CONTINENT*

Answers must be received by (or before) the first post on the 25th of August. The envelope to be marked "Syzygies" in the left-hand corner. The problems for the prize competition will be set as follows:—

[...]⁴

The competitions this week will be to

Change CHAIR into TABLE
AVOID a STORM

Answers must be received by (or before) the first post on the 1st of September. The envelope to be marked “Syzygies” in the left-hand corner.

The following questions, received from competitors, have been submitted to Mr. Lewis Carroll, whose answers are here appended:—

Qu. 1. [*Turquoise*] Is the name “Syzygy” taken from the dictionary meaning, sun, moon, and earth being in “Chain”? Or do the Greek roots give the idea of “linking together”?—Ans. Both.

Qu. 2. [*A Snark*] May a competitor send more than one chain? If so, will they all count, or only the one that gets most marks?—Answer. He may. Only the one that gets most marks.

Qu. 3. [*Wrath*] May chains be sent on postcards?—Ans. Yes.

Qu. 4. [*Wrath*] Should competitors make a score of their own marks by the side of their answers?—Answer. It is not necessary.

Qu. 5. [*G. G., Persevere, Quercusonis*] Are plurals, or inflections, allowed to count as distinct terminations?—Answer. Yes. Thus the Chain

rats
(at)
cat
(at)
eats

would be lawful.

Qu. 6. [*Jay, Toofdiarb*] Is it lawful to use the same Syzygy twice consecutively?—Ans. Yes. Thus the Chain

bend
(end)
ends
(end)
mend

⁴Remark: Rewritten version of Rules very similar to original from July 23

would be lawful.

Qu. 7. [*Henry, Persevere*] May there be two words, with the same termination, with another Link between them?—Ans. Yes. See previous answer for example.

Qu. 8. [*Nenia*] May consecutive Links begin or end with the same set of letters, provided such beginnings or endings are not used as the Syzygy?—Ans. They may, provided *none* of the set are used as the Syzygy. Thus, the Chain

minion
(io)
ration

would be unlawful, because “io” is a portion of the common ending. But the Chain

minion
(on)
onion

would be lawful, even though “on” is a portion of the common ending. Perhaps “*Nenia*” can guess why?

Qu. 9. [*Toofdiarb*] May a Syzygy consist of the whole of one of the two Links, and the beginning or end of the other?—Ans. No. Thus in the Chain

bold
(old)
old
(old)
older

both Syzygies are unlawful, since the set of letters “o, l, d,” stands at the *beginning* of “old,” and also at the *end* of it.

Qu. 10. [*Gwynedd, Miriam*] Is there *no* limit to the length of a Chain?—Ans. None whatever: but since a mark is deducted for every Link, it is better not to use more than a thousand or so.

Marks for the Syzygy Set on July 23rd, 1891

“Change a CONSERVATIVE into a LIBERAL.”

The seven numbers appended to each name are “maximum Syzygy, minimum Syzygy, total; links, waste letters, total: score.” Where the score is given as 0*, it is *really* less than zero, but, by a special favour on the part of *The Lady*, it is raised to zero. The words quoted in the parantheses violate the Rules, so that no score can be allowed.

[...]⁵

Then Chains have attained the highest score—29. That sent in by “*Persevere*” (selected from the ten by drawing lots) is as follows:

CONSERVATIVE
(servati)
observation

⁵Remark: Scores here and everywhere following omitted

(ation)
deliberations
(libera)
LIBERAL

August 27, 1891

Notice to Competitors

Competitors are requested to remember that no marks can be given for a Chain, unless it be distinctly shown what are the common parts, of each pair of Links, which are claimed as Syzygies. Sometimes two consecutive links have two or more common parts, each of which might be taken as a Syzygy, and it is for the Competitor to declare which of them he wishes to be so taken. For example, if “conservative” and “reconsideration” were two consecutive Links, either (cons) or (er) or (ati) might be taken as a Syzygy; and it would clearly be unfair to credit a competitor with the longest, when perhaps he had not seen it, but had meant to use the shortest.

The proper way to write a Chain is to place each Syzygy, in a paranthesis, between the Links to which it belongs. *Atol* and *Signora* have contented themselves with merely underlining the portions they wish to use as Syzygies, and have done even that incompletely, *Atol* having only marked a few in No. 1, and *Signora* having marked only one in No. 1, and none at all in No. 2. The above will serve as answer to questions asked by *Esperance* and *Therise*.

Supplementary List of Marks for Problem 1,

“Change a CONSERVATIVE into a LIBERAL.”

The best Chain in this List is that of *Ave*, which scores 29, but need not be given here, as it scores no higher than the one published last week.

Marks for Problem 2.

“Get VERDICT for JURY.”

For Problem 2, seven Competitors attained the maximum score of 22. They are *F. M. P.*, *Jay*, *Kel*, *Lady Margaret*, *Peacock*, *Quercusonis*, *Rosemary*. That of *Peacock* (selected by drawing lots) is as follows:—

JURY
(jury)
injuring
(ring)
ringlet
(ingle)
dingle
(ding)
herding
(erdi)
VERDICT

The competitions this week will be to

PROSECUTE *a* TRESPASSER
and
Put COALS *on* FIRE

Answers must be received by (or before) the first post on the 8st of September. The envelope to be marked “Syzygies” in the left-hand corner.
[...]⁶

September 3, 1891

[...]⁷
The Competitions this week will be to

Turn DOG *into* CAT
and
BUILD *a* PALACE

Answers must be received by (or before) the first post on the 15st of September. The envelope to be marked “Syzygies” in the left-hand corner.

The marks for last week’s Competition will be published next week. The Chain, or “Conservative-Liberal,” by “*Persevere*,” was accidentally misstated in some copies of *The Lady*, by omitting the “s” in “deliberations,” and thereby causing the Syzygy “ation” to be an unlawful one.

September 10, 1891

As I, the inventor, am at present undertaking the scoring for this Competition, it will be simpler to write what I have to say in the “first person.” And, first, I am sorry to have to announce that the commencement of the Prize Competition must again be deferred, as experience has shown me that the present system of scoring fails to secure the absolutely essential condition that those who show the greatest skill shall make the highest scores. Consequently, I must ask the gracious forbearance of all lady-readers of *The Lady* (for, if they only prove kind, the gentleman-readers must needs follow suit) for my issue of a revised system of Rules, and for the announcement that the Prize Competition will commence with the two problems here given, viz.—

“*Change* BOY *to* MAN,”
“*Reconcile* GLADSTONE *to* SALISBURY”

and will conclude with the two to be set on October 29th, so that the Competition will consist of sixteen problems altogether. It seems to be necessary, also, that I should undertake (for there is not time to consult the Editor in each case) to decide which are, and which are not, “ordinary” words. It is an arduous task, for the “ordinary” shade off into the “extraordinary” by almost imperceptible gradations, and already I begin to feel the boiling torrents of wrath it must bring upon my head! Still, I warn all whom it may concern that I will have no mercy on words that are never used in ordinary conversation, and would

⁶Remark: Competition dates omitted

⁷Remark: Introduction with Rules reprinted from July 23, Notice shortened from August 27

not be understood if they were (here are a few that have been sent in:—serai, edelite, morling, vellon, entonic, eben, lere. What a cheerful tea party it would be where such words were bandied about!), and that, if any fair one feels a doubt about a word being “ordinary,” she had better send in an alternative Chain, not containing it, and thus escape the fatal “zero.”

But the question, whether a Chain has or has not, been sent in too late to be accepted, or whether revised versions of Chains are to be accepted after the date fixed for sending in, is one I leave entirely to the Editor to decide. If controversy should arise on this thorny topic, I prefer that he should do the arguing; and if, unfortunately, a duel should be the result, I prefer that he should do the fighting.

I will now give a revised version of the Rules of the Puzzle.

Definitions

1. When two words contain a common letter, or a common set of consecutive letters, this letter, or set of letters, is called a “Syzygy” between the two words.

2. A series of words, such that each two consecutive words contain a Syzygy, is called a “Chain.” And all the series, except the two extremities, are called the “Links” of the Chain.

3. This puzzle consists in forming a Chain, with two given words as its extremities. For example, if “door” and “window” were the given words, the following would be a Chain linking them together, the Syzygies being placed in parentheses:—

DOOR
 (oor)
poorest
 (res)
resound
 (und)
undo
 (ndo)
WINDOW

Rules

1. The Chain must be written out as above. If the Syzygies claimed be not all stated, the score will be “0.” Also if a Syzygy be claimed which does not exist in both the words between which it stands. And no more will be allowed for than what is claimed, even though a longer Syzygy might have been claimed. For example, a Chain containing “poorest (rest) resound” would score “0”; but, if it were written “poorest (re) resound,” this would only count as a two-letter Syzygy.

2. If two words have a common set of letters at the beginning of both, or at the end of both, none of these letters, standing in corresponding places in the two words, may be used as a Syzygy; but this does not apply to a common set at the beginning of one of the two words, and at the end of the other. Thus “handsome (om) somewhere” would be a lawful Syzygy; but “handsome (om) troublesome” would be an unlawful one. Yet “waverer (er) wanderer” would be a lawful Syzygy, since the common part contains “er” twice over, and the first “er” in one word may be taken along with the second in the other. A Chain containing an unlawful Syzygy would score “0.”

3. The letters “y” and “i” may be regarded as identical. Thus “busy (usi using)” would be a lawful Syzygy.

4. The words used as Links must be “ordinary” words—i. e., words one would have a reasonable chance of hearing in ordinary conversation, and such as would be generally understood in ordinary society. Proper names, when such as are usually printed with capital letters, are not admissible. Thus, “India” would be an unlawful Link; but “china” would be lawful. Words usually printed with hyphens (e. g. “tea-table”) are unlawful. And also foreign words, unless they have made their way into ordinary conversation (e. g., “ennui,” “alibi,” “nous”), and have thus been practically anglicised. And also abbreviated words (e. g., “silver’d”).

5. The score given to each Chain is calculated by adding together the number of letters in the first and in the last Syzygy, and seven times the number in the shortest Syzygy, and deducting two marks for every Link and one for every “waste” letter (i. e., every letter which does not enter into a Syzygy). If the first and the last Syzygy are of different lengths in a Chain containing three or more Syzygies, when the first and the last are of different lengths, no account is taken of the shorter of the two in estimating the “shortest” in the Chain.

These Rules will only come into force in marking for the Prize Competition. Till that begins, the Chains will be marked by the old Rules.

Before giving the lists of scores for Problems, I will make one or two remarks, and answer some questions that have reached me.

Remarks

Many competitors have sent no address. It would be better to furnish it in all cases, as it is just conceivable that one of these homeless ones might win the prize.

A wrongly-spelt word I do not notice, unless it affects a Syzygy, in which case I quote the word, and score a “0.”

The very careless mistake I made in writing out the Chain sent by “*Persevere*” for Problem 1, by omitting the “s” in “deliberations,” has naturally brought upon me a brisk shower of remonstrances. The moment I received a “proof” of the article I telegraphed to the Editor to correct it, but I am sorry to find that copies of *The Lady* containing the mistake had already been sold.

The following Chain, sent in by “*Aaron*,” is a good example of the method of scoring:—

DOOR
 (oor)
mooring
 (ring)
ringing
 (ing)
swing
 (win)
WINDOW

The score is—“4, 3, 25; 3, 9, 12: 13.” It looks very much as if it contained an unlawful Syzygy, doesn’t it?

A very funny thing has happened. Two competitors, being doubtful which of two given words I wished to stand at the top of the Chain, have worked it

both ways, but, oddly enough, instead of merely writing out the first Chain backwards, they have thought it necessary to make two *different* Chains! Much as if one should say, "To go from London to York you must take such-and-such a route; but to go from York to London you must take another route."

Many competitors seem to think a word must be "ordinary" if it is in a dictionary. Surely that would prove too much. All words are given in dictionaries. Many seem to think that such a Syzygy as "interposition (nterpos) interposed" would be lawful. I do not think this a fair interpretation of the Rule. What would be the use of forbidding eight letters to be used, and yet allowing seven of them?

Qu. 11. [*A Novice*] Is it lawful to make plurals of any words, whether they be nouns, participles, or otherwise?—Ans. Only when the plurals are "ordinary" words. Thus, "faintness" is an "ordinary" word; but "faintnesses" distinctly "extraordinary."

Qu. 12. [*Margaret, Tivoli*] May a Syzygy consist of the whole of a Link?—Ans. Yes. See Prob. 3.

Qu. 13. [*A Novice*] Is the use of a whole word as a Syzygy limited to the case where "y" and "i" are taken as equivalent?—Ans. No.

Qu. 14. [*Acanthus*] Is it better to have long Syzygies, or short?—Ans. Long.

Qu. 15. [*Acanthus*] Is it better to have long words or short?—Ans. It does not affect the score.

Qu. 16. Is it necessary to have a pseudonym?—Ans. No.

Qu. 17. [*A Novice*] When sending up for this competition, what address should be used?—Ans. Any address that is safe to reach you.

Anne writes to say that her Chain for Problem 2 contained "perdition (ditio) expeditious," and that this is quoted as "perditions (ditions) expeditious," thus producing an unlawful Syzygy. On referring to her previous paper, I find that she uses exactly the same symbol for "n" and "u," but all three words end with the same seven letters, the last being "s." The only effect of substituting "u" for "n" would be to turn "perditions," a word whose existence is doubtful, into "perditious," a word whose non-existence is certain. If Anne likes to send her address she can have her papers returned to her, to examine for herself.

Firefly complains that she was not credited with any score for Problem 1. Let her refer once more to the list published August 20th.

Miss F. Longton writes, under date August 24th, that she is sending solutions for Problems 3, 4; but none have reached me. *Peter* asks why his Chain, for Problem 1, was not noticed. I regret to say that it never reached me. *Phlox's* Chains for Problems 1, 2 arrived to late to be entered in the lists. Her scores are—"5, 2, 19; 5, 18, 23: 0," and "[storage (st) sterile] 0."

Plumbago, writing from Malta, asks for a week's "grace" in sending in answers on account of distance. On such a principle we must allow time for answers to come in from Australia. No; this Puzzle is meant for persons resident in England.

Polyphemus writes (letter undated) that he had sent (no date named) a chain for Problem 1. I regret that it did not reach me. The one he now sends would score "7, 5, 42; 3, 11, 14: 29"; which is the highest that was attained.

S. M. G. complains that her score for Problem 2 is printed "1" instead of "11." I fear there are many such misprints; I did not correct for press, but hope to be able to do so in future. *Stellaria* has sent in an amended version of her Chain for Problem 2, which contained a *lapsus pennae*. Her score now is "6, 3, 27; 5, 11, 16: 11."

Marks for Problem 3.

“Turn DOOR into WINDOW.”

When “x,” instead of a number, occurs in a score, it means that I do not count that number, as the number of links were alone enough to extinguish the score.

NOTE—Each of the pseudonyms “Aaron” and “Foggs” has been adopted by two competitors, and no one of the four has sent any name or address. One competitor, writing from Clarence Hill, Tunbridge Wells, gives no name. Another gives neither name nor address; the post-mark is Launceston. Of the 154 competitors no less than sixty have reached the maximum score, “28.” They all send in the same Chain, viz—DOOR (door) indoors (indo) WINDOW.

Marks for Problem 4.

“TRAVEL on CONTINENT.”

Two competitors, “*St. Helier*” and “*Wraith*,” have reached the maximum score, “31.” They send the same Chain, viz.:—

TRAVEL
(trave)
contravene
(contr)
uncontrite
(ncont)
incontinently
(continent)
CONTINENT

September 17, 1891

Whenever the Philosophy of Puzzles comes to be fully discussed (and, if only I could be secure that my life would endure for a thousand long years, I would try it myself), one chief merit of that form of recreation will be declared to be that it offers a bribe to the human intellect (just as we bribe with dainty dishes an invalid who has lost his appetite) to exert itself, on however trivial a matter, so as not to spend all its waking hours in simple stagnation. All healthy mental games have the same merit, some perhaps (e. g., *chess*) in excess, by requiring such intense thinking as to cease to be *recreations* at all.

But, to effect this, the Puzzle needs to be *mentally* soluble—to be such that one can work it out when lying awake at night or when taking a solitary walk. “Double Acrostics,” in its original form, had this merit, no doubt. In this age, when the most unheard-of words are admitted, words that can only be found in dictionaries, it has degenerated into a purely mechanical occupation, and no longer requires the slightest exercise of *thought*, specially since the appearance of what is perhaps the most ghastly invention of this century—the “Acrostic Dictionary.”

It is in the hope of saving my new Puzzle, “Syzygies,” from this fate that I sternly refuse to accept *any* words which have evidently been culled from dictionaries. I have worked out dozens of them myself, simply in the *head*; and

I want the competitors to do the same. And it is with the same object that I have altered the rules, so that it will no longer be possible to score marks by simply dragging in a couple of very long words, in order to have a large "maximum-Syzygy." If this were allowed, competitors would soon begin to keep such couples of words "cut and dried," to be regularly used in every Chain, and all skill and all healthy mental exercise would be eliminated.

In the new Rules, published September 10, readers are requested to erase the latter half of Rule 5.

B. B.'s Chains for Problems 3 and 4 came in late. Her scores are "3, 2, 17; 4, 11, 15: 2," and "4, 3, 25; 3, 10, 13: 12." *Foggs* was scored "9" by mistake for Problem 4. His true score was "[pontine] 0."

Lortay need not trouble herself to print the *whole* Chain in capitals. The two given words are all that need it.

Marks for Problem 5.

"Turn CHAIR into TABLE."

The † mark indicates that the Chain contains an "artificial" maximum-Syzygy. The highest score reached is that of *Quercusonis*, "29"; but, as it contains what I have called an "artificial" maximum, I cannot regard it as showing the highest *skill*, though it is strictly legitimate, according to the present Rules. Her Chain is as follows:—

CHAIR†
 (hair)
 hairless
 (less)
 lesser
 (sser)
 assertion
 (tion)
 constitutionally
 (constitutional)
 unconstitutional
 (const)
 constables
 (table)
 TABLE

The highest score reached without any such aid is that of *St. Helier*, "27." Her Chain is as follows:—

CHAIR
 (hair)
 hairiness
 (ness)
 finessing
 (essing)
 blessings
 (bles)
 stables

(table)
TABLE

Marks for Problem 6.

“AVOID a STORM.”

The mark † indicates that the Chain contains the word “voidance,” which I do not regard as an “ordinary” word, but have marked these Chains, under protest, in deference to the fact that 57 out of 144 competitors do so regard it. In a prize competition I should score them all “0.”

Ignoring these Chains, I find the highest score to be “25,” which has been reached by *Dolly Varden* and *E. M. R.* Their Chains are as follows:—

AVOID	AVOID
(void)	(avoid)
voids	unavoidable
(void)	(avoida)
avoidance	avoidance
(ance)	(ance)
ancestor	ancestor
(stor)	(stor)
STORM	STORM

I have mislaid *Signora's* Chain, and cannot be certain whether she used the word “voidance.” If not, and if she will send a fresh copy, it shall be published as best of all.

September 24, 1891

I wish to say a few words in defence of the rule I have laid down, to allow no marks to a Chain in which a Syzygy is claimed which does not exist in both the words between which it stands. Take, as an instance, *Caterina's* Chain for Problem 8, which scores 0, because she has claimed the Syzygy “(itable)” as existing in the word “uncharitably.” Some might think it rather hard that a mere oversight, in writing “(itable)” instead of “(itabl)” does not deserve so severe a penalty. But surly oversights a part of the game? Many a game of chess is lost by a single oversight; yet it would spoil the interest of that noble pastime entirely to begin allowing moves to be recalled. However, suppose for a moment that I *were* to adopt the rule of correcting an unlawful Syzygy by erasing the unlawful letters, and had altered this Syzygy to “(itabl)”; and suppose that the next Chain I had to mark were to contain “consternation (ternation) alteration”; and that the Chain next after that were written “COALS (coals) charcoal (charcoal) arcades (arcades) desires (desires) FIRE”; will those gentle-hearted readers, who think I ought to have scored *Caterina's* Chain, kindly say how they would have me to treat these other cases?

Let me also point out that it is not *every* participle that can have an “un-” prefixed, and still remain an ordinary word: and that it is not *every* active participle that can be treated as a substantive, and have an “s” tacked on to it. The test in every case must be “is the word ever used in books or heard in conversation?” If I do not make a firm stand here, I shall soon have to accept such monstrous coinages as “unfricasseeing, unfricasseed, fricasseeings,” and the whole interest of the Puzzle, as a test of *ingenuity*, will be destroyed.

Somebody has sent in Chains for Problems 7 and 8 with no name or address (none, at least, on the half note-sheet forwarded to *me*). The scores are “unprosecuted, 0,” and “uncoalescent, ascention, 0.”

Anne points out that, on August 27, I quoted her as using the word “peritions,” whereas she had written “perditions.” It was merely a mis-print. I quoted it correctly on September 10. Her other remarks shall be replied to.

A Novice’s Chains, for Problems 3 and 4, came in late. Her scores are “4, 3, 25; 2, 7, 9: 16,” and “compromit, recompelling, 0.”

Bittern asks “if *Aaron’s* Chain is right with ‘ringing (ing) swing,’ how can *Bittern’s* be *wrong* with ‘wishing (ing) swing’?” His apparent paradox was explained in Rule 2 on September 10.

Several competitors write about the vexed question of “ordinary words.” *Bosco* pleads that “*acontias*” is in Nuttall’s dictionary, and means a genus of serpents; and *Jay* suggests that “it would be a good plan to name a dictionary as a standard to which we could all refer.” If I could anyhow prevent *all* competitors alike from ever using a dictionary in this Puzzle, I would gladly do so. My object is to make the prize accessible to any one by ingenuity only, and not to allow any advantage at all to those who will not exert their wits, but only their hands and eyes. With this object, I accept such words only as might occur to any one without referring to dictionaries. If any competitor wants to test a word, let him mention it in a party of, say, ten people, and say “Is there any one here who does not understand it, or any one who never heard it in ordinary conversation, and never saw it in any ordinary book?” If there *is* any such person present, he had better not use the word. *Jay* also points out that I have given marks to a Chain containing the word “uncontrite.” Well, that is one of those puzzling “border-cases” that fringe every law, and harass every law-giver. Still, I can well imagine hearing it said, in my test party of ten people, “As the boy seemed perfectly callous and uncontrite, it seemed best to expel him from the school,” and I should feel quite sure that the whole party would understand what was meant.

By an unfortunate mistake, no Problems were set last week. The Prize Competition, however, shall still contain sixteen Problems, as promised. Those for this week are

3. “DO SO,”
4. “*Build a RAILWAY STATION,*”
5. “*Visit BEACHY HEAD.*”

Answers must be received by (or before) the first post on the 1st of October. The envelope (or card) to be marked “Syzygies” in the left-hand corner.

The remaining Problems for the Prize Competition will be set as follows:—

Problems	Dates of Setting	Dates of sending in Answers
6, 7, 8	Oct. 1.....	Oct. 8
9, 10	Oct. 8.....	Oct. 15
11, 12	Oct. 15.....	Oct. 22
13, 14	Oct. 22.....	Oct. 29
15, 16	Oct. 29.....	Nov. 5

Marks for Problem 7.

“PROSECUTE *a* TRESPASSER.”

French Polish has sent in a Chain for “Prosecute a Passenger,” a problem which has not yet been set.

The highest score reached is that of *Lady Margaret*, “22”; but, as it contains an “artificial” maximum, I cannot regard it as showing the highest skill, though it is strictly legitimate, according to the present Rules. Her Chain is as follows:—

PROSECUTE
(secute)
persecuted
(perse)
disperse
(dispe)
indispensably
(dispensabl)
dispensable
(sable)
sables
(sable)
surpassable
(surpass)
unsurpassed
(passe)
TRESPASSER

The highest score reached without any such aid is “20.” This has been attained by three competitors—*Adoxa*, *Curlitot*, and *Glen*—who send Chains which differ only in one or two final letters. *Adoxa*’s Chain is

PROSECUTE
(secute)
persecuted
(pers)
usurpers
_(surp)⁷⁸
surpassed
(passe)
TRESPASSER

Marks for Problem 8.

“Put COALS on FIRE.”

The highest score reached is that of *Mad*, “29”; but, as it contains an “artificial” maximum. Her Chain is—

COALS
(coal)
charcoal
(char)

⁸accidentally “usurp”

uncharacteristic
(characteristic)
characteristically
(alli)
falling
(fall)
pitfall
(pitf)
spitfires
(fire)
FIRE

The highest score reached without any such aid is that of *Curlitot*, 18. Her Chain is—

COALS
(coal)
charcoal
(char)
discharge
(charge)
chargeable
(able)
cables
(able)
despicable
(espi)
respite
(spit)
spitfires
(fire)
FIRE

October 1, 1891

As I should like to explain my motives for withdrawing the second half of Rule 5, and as a communication from *Nenia* expresses with admirable clearness all that I wish to say, I quote it almost *verbatim*. She points out that the Rule, as first given, made the Puzzle “easier, but certainly not so clever. Take the following, which gives the net score of 19 for a very poor arrangement: Gladstone (adstone) loadstones (ston) astonish (is) Salisbury. There would be no difficulty, and therefore no credit, in getting a miserable little Syzygy of 2 at the last, if that might be ignored in counting the shortest.”

Such a curious interpretation has been suggested for Rule 5, that I will quote what *Persevere* says about it, as I think my answer will interest others as well. After quoting the definition of a “waste” letter—viz., a letter “which does not enter into a Syzygy,” she says, “according to that, I make my ‘chair-table’ answer score 28, whereas I only receive 26 marks. I subjoin it, and show how I scored it: Chair (hair) hairless (less) blessed (bles) stables (table) table. For ‘blessed’ I take the Syzygy ‘bles,’ leaving only ‘d’ as a waste letter. For ‘stables,’ the

Syzygy ‘table,’ and the ‘s’ out of ‘less.’ Can the letters only be used once in the whole Chain? Or must they be in the two Syzygies above and below the Link? I am not writing to make any complaint, but want to understand the scoring system thoroughly.” This is a very good instance to show the enormous difficulty of so constructing a Rule that it shall be incapable of any other interpretation than the one desired. I certainly never intended the Syzygies to be broken up in this way, and their component letters scattered right and left, like pepper! In “blessed,” letters 2 to 5 constitute the preceding Syzygy, and letters 1 to 4 the following one; consequently letters 6 and 7 are “waste.” Similarly, in “stables,” letters 4 to 7 constitute the preceding Syzygy, and letters 2 to 6 the following one; consequently letter 1 is “waste.”

Let me earnestly advice every competitor to send in for every Problem *one* perfectly “safe” Chain (i. e., one as to which there can be no possible doubt that every Link is an “ordinary” word). Along with that send as many as you like containing doubtful words, provided that every such Chain scores higher than the safe one. By this method you are certain of scoring something. Hitherto, one score in every three has been “0”!

There is an unfortunate misprint in *Adoxa’s* Chain for “prosecute-trespasser” in the number for September 24th. The third Syzygy was “surp” in her MS., and also in my MS., which I happen to have preserved. The “u” was added by the printer, and overlooked by me in correcting the proof, so it is partly my fault. *Curlitot* cannot think why “uncontribute” should be allowed as an “ordinary” word, as it is neither a dictionary word, nor one used in ordinary conversation. I gave my reasons in the last number of *The Lady*. She adds: “At present we have no real rule to go by, and Syzygy-making is becoming rather a labour than a pleasure.” I am very sorry she finds it so, and would be very glad to consider any “real rule” she can suggest which would not deprive the Puzzle of what I cling to as its chief merit—that it is soluble in the head, without any aid from books.

Denley asks why her Chain, containing “chair (air) hair” was scored “0.” It is because of Rule 2. She also asks why her answer to Problem 6 was omitted. I am sorry that I overlooked it in writing out the list. It was duly entered on her scoring-paper as “avoid (oid) asteroid, 0.”

Heartes asks whether a word (she means “a set of letters”) which occurs in the middle of each of two consecutive words may be used as a Syzygy—e. g., “palisade (alis) Salisbury.” Certainly.

E. Heathfield, Esq., Edgbaston, is requested to choose another nom de plum.

Mavis is informed that the Chain she sent for Problem 1, containing “flamboyant,” was not passed over on that account, but because it also contained “unmantle.”

Mrs. R. asks what the six figures which precede each score in the lists of marks stand for. This was explained in *The Lady* for August 13th.

Persevere asks how many alternative Syzygies are allowed. I have not seen my way to limiting the number, as it seems only fair to allow a competitor who has constructed a Chain containing a word whose claim to be regarded as “ordinary” is doubtful, to offer an alternative Chain. But I hope competitors will be merciful, as the scoring costs me a good deal of time and trouble, and will count for themselves what each Chain would score, and never send in a doubtful one, if there is a safe one that scores as much. As an instance of this, one competitor sent in for Problem 1 the Chain “boy (oy), royal (al), almanac

(man), man,” whose Links were clearly “ordinary,” and which scored 11. But, not content with this, she sent in four other Chains, whose scores were 11, 19, 9, and 8!

Quetta has sent (from India) a Chain for Problem 1, which did not come to hand till September 19, more than six weeks after date fixed for receiving answers. I shall be most happy to *score* any Chains she likes to send, but I fear it is out of question to let her compete for the Prize. Her score is “un-liberated, 0.”

S. C. G.’s answers to Problems 7 and 8 came in more than a week late. Her scores are “3, 2, 17; 2, 7, 9: 8”: and “4, 3, 25; 1, 13, 14: 11.”

Skirmisher asks, “Do we score most for a *fewer* number of Links or for *long* Syzygies in a *greater* number of Links?” Sometimes one, sometimes the other. To raise the minimum Syzygy one letter higher gains seven marks; so you can afford in doing so to forfeit six marks (e. g., by two extra Links and two extra waste letters), and still be a gainer; but if in doing so you would forfeit seven or more marks it is not worth while.

Stellaria is informed that “stablish” does not answer to the definition of an ordinary word as given in Rule 2. Did she ever hear it used in ordinary conversation? Or has she herself even once used it in the whole course of her life?

Turquoise doubts whether “sensorial” would be accepted as an “ordinary” word; “though,” she adds, “to one who has lived among medical men and books it is at least as ordinary as burials.” Do the medical men, then, among whom *Turquoise* spends a precarious life, *so constantly* talk of “burials”? She had far better migrate to that happy town where it is said that so many of the poor “die *without* medical assistance”! *Turquoise* also protests against “the idea of doing Syzygies in bed.” That is a matter that cannot be disposed of in a few words. I hope to deal with it hereafter.

The Problems for this week are—

6. “GET AGE,”
7. “CHEAT *a* TORTOISE,”
8. “*Turn a* CAMEL *into a* DROMEDARY.”

Marks for Problem 8.

“*Turn* DOG *into* CAT.”

The highest score reached is 20. This has been attained by three competitors, *E. M. R.*, *H. H.*, and *Quercusonis*; but each chain contains an “artificial” maximum. That of *H. H.* (selected by drawing lots) is as follows:—

DOG
(dog)
endogen
(end)
blend
(ble)
undistinguishable
(distinguish)
distinguish

(ing)
scathing
(cat)
CAT

The highest score reached without any such aid is that of *Aaron*, 18. His Chain is:—

DOG
(dog)
endogen
(gen)
gentry
(ntri)
intricate
(cat)
CAT

Marks for Problem 9.

“BUILD *a* PALACE.”

The highest score reached is *Quercusonis*; 27; but it contains an “artificial” maximum. His Chain is:—

BUILD
(build)
rebuildest
(dest)
destitution
(stitution)
constitutional
(constitutional)
unconstitutionally
(tion)
laceration
(lace)
PALACE

The highest score reached without any such aid is that of *Toofdiarb*, 22. His Chain is:—

BUILD
(build)
rebuilding
(ding)
dingles
(ingle)
tingle
(ting)
lacerating
(lace)
PALACE

Answers must be received by (or before) the first post on the 8th of October.
[...]⁹

October 8, 1891

Would you like to know the best possible method for solving a Syzygy problem? It is this. Having ascertained from your doctor that you are in a state of health to bear, without risk, severe brainwork and keen intellectual excitement; from the most candid of your intimate friends that you are in a pleasant temper, and free from all morbid irritability; and from yourself that you are in the humour for the task—seat yourself in an easy-chair, taking care that you have writing materials within reach, and that there are no dictionaries in the room; close your eyes, and paint the two given words on your mental retina. First look out for two-letter Syzygies (one-letter Syzygies are of no use), taking care that your Links are *absolutely* “ordinary” words. You may sometimes find such a Syzygy in the two given words, using no Link at all (e. g., “prosecute-trespasser” might be made into the Chain “prosecute [se] trespasser,” which would score “3”; and in most cases where the given words are fairly long, you may do it with a single Link, e. g., “Gladstone-Salisbury” might be made into the Chain, “Gladstone [st] list [lis] Salisbury,” which would score “3”). Having thus got a perfectly safe Chain, which will score *something*, say to yourself, “this, at any rate, shall be sent, unless I can find a better, which is *also* absolutely safe.” And, now that you are secure of not being scored “0,” begin looking for longer Syzygies. If I were doing “Gladstone-Salisbury,” I should probably begin with five-letter Syzygies, and picture to myself, successively, “glads,” “ladst,” “adsto,” &c, trying, in each case, to *see* a word in which it occurred. If this led to nothing hopeful, I should try four-letter ones, “glad,” “lads,” &c. I should then do the same thing with “Salisbury.” Having got a hopeful Syzygy out of each word, I should then go back to “Gladstone,” put on one Link, and try what Syzygies I could get out of that Link, and perhaps tack on a second Link, experimentally. Then back to “Salisbury” again, and run the Chain on two or three Links from *that* end, always *aiming* at getting the two ragged ends linked together *somehow*. The entire process is, of course, beyond the reach of rules. Success depends a good deal on ingenuity, and a good deal on *luck*. When a fairly good Chain has at last been hit on, then calculate its score; and, if it scores no higher than your “safety” Chain, try again. If it does score higher, and contains no doubtful word, take it as a new “safety” Chain, and reject the other. If it scores higher, and contains a doubtful word, send in *both* Chains.

Annafield, whose Chain for “avoid-storm” was scored “0,” on account of the word “voider,” writes to say that ‘it is really a common word, and means a butler’s tray.’ For my part, I never met with the word, and I am over thirty-two; but I am glad it is not part of the Prize Competition. I doubt if *Annafield* could find ten friends (chosen at random in different parts of England) who know the word. *Annafield* also asks “Can two Syzygies be used in one Link, e. g. ‘burials [buri] [al] Salisbury’? And would it obtain higher marks in consequence?” Only one can be scored. If a Chain contained two together, I should take the longest.

Esperance sent in an alternative Chain for Problem 2, being doubtful whether “amnesty” would be accepted. “Amnesty” is all right; but that Chain also con-

⁹Remark: reprinted modified rules omitted

tained “burial [rial] Salisbury,” which is all wrong! She is right in addressing her answers to the Editor of *The Lady*, 39, Bedford Street, Strand, London.

Skirmisher would like to have an explanation as to how it is she cannot see the Problems “prosecute-trespasser” and “coals-fire” in the columns of *The Lady*, though she has looked through the old numbers. The misfortune would appear to be partly physical, partly mental; perhaps if *Skirmisher* were to consult (1) a good oculist, (2) *The Lady* for August 27, it might be alleviated in both these aspects.

The Problems for this week are

9. “*Buy* BANBURY CAKES.”
10. “*Spend* a MONTH at TRIESTE,”

Answers must be received by (or before) the first post on the 15th of October. In the following Lists, the seven numbers appended to each name are “sum of first and last Syzygy, minimum Syzygy, total; Links, waste letters, total: score.”

Marks for Prize-Problem 1.

“Change BOY to MAN.”

With some reluctance I have accepted, as a Link, the word “unboiled,” which seems to be a favourite with many competitors (I suppose they like eggs done that way); but I will accept no more of that family, or I shall be encouraging the novelists of the future to indulge in some such rhapsody as this: “How utterly precious to the undemoralised artistic eye, when strolling through the unfrosted meadows, to watch the unroasted sheep peacefully grazing, and the unfricasseed lambs sporting merrily around them!”

The highest score reached is that of *Lady Margaret*, 19. Her Chain is

BOY
 (boy)
tomboys
 (tom)
ottomans
 (man)
MAN

Marks for Prize-Problem 2.

“*Reconcile* GLADSTONE to SALISBURY.”

Will those fourteen competitors, who will be wishing me all manner of evil things on seeing their “loadstones” thrown overboard, kindly ask themselves whether they have ever seen, or heard, or used the word, and whether they would have me accept such ghastly inflexions as “platinums,” or “micas,” or “gneisses”? Because, if *not*—

The highest score reached is twenty. This has been attained by three competitors, *Adoxa*, *St. Helier*, and *Spero*, who send the same Chain, viz.—

GLADSTONE
 (tone)
atonement

(ement)
disbursements
(isbur)
SALISBURY

October 15, 1891

Chains have been sent for Problems 13, 14, 15 from “29, Sion Hill, Bath,” with no name or *nom de plume*.

Glen asks “Am I right in thinking the smallest Syzygy is irrespective of the first and last which are to be added together?” No; see Rule 5 in *The Lady* for October 1.

Jiguel writes “Coals-on-fire I have never seen set.” No doubt, *Jiguel* has always lived in a warm climate. See *The Lady* for August 27.

Louisa cannot understand why “ringoal” (a game lately introduced) is not accepted as “ordinary” word. Well, these new words are certainly a difficulty. My feeling was that it has not yet worked its way so far into the language as to be an “ordinary” word. The fact, that it does not occur in Nuttall’s Dictionary, seems to support this view.

Persevere writes “I suppose it is lawful to begin two Links in the same Syzygy” (she means “Chain”) “with the same letter, as in the Chain ‘prosecute [secute] persecuted.” Certainly; the “p” does not form part of the Syzygy.

Phlox remonstrates against my having scored her Chain, for “avoid-storm,” 0, on account of the word “salsify.” And *Quercusonis* thinks it was “a little severe to condemn” this word, as well as “castor,” “ancestress,” “sometime,” and “unconstrainedly.” As to the last three, I still think they are not “ordinary” words, but as to the other two I find I must eat a fairly large slice of umblepie (which is sometimes mis-spelt as “humble-pie.”) With shame I confess that, though I had often enough heard the word “salsify” as the name of a vegetable, and “castor” as the wheel placed under the leg of a sofa, I thought only of the meanings “to make salt” (on the analogy of falsify) and “a beaver”! It is a convincing proof that I am not infallible. I had long suspected this, and now I am sure of it.

I have hunted out the papers of the competitors who have used the words “salsify,” and “castor,” and re-marked them as follows:—

For “coals-fire”
Phlox 4, 2, 18; 2, 6, 10
For “avoid-storm”
Admirolph “voidable” 0
French Polish 4, 3, 25; 6, 11, 17: 8
M. A. R. “voided” 0

Quercusonis points out that “indoors,” which I had accepted as a single word, is printed with a hyphen in Nuttall’s Dictionary; and that he (or she) had rejected the word in consequence. That comes of consulting dictionaries. *Quercusonis* also asks if I will accept both “s” and “z” in spelling such words as “crystallize,” “patronise.” Yes.

The new Problems are—

11. "CROSS *the* OCEAN."
 12. "*Get* TRUTH *from* LABOUCHERE."

Answers must be received by (or before) the first post on the 22nd of October.

Marks for Problem 3.

"DO SO."

The highest score reached is 11. This has been attained by 33 competitors, who have sent in five different varieties of Chains. The variety (selected by throwing a die), which was adopted by *Adoxa*, *Curlitot*, *Dolly Varden*, *E. M. R.*, *Ethne*, *Foggs*, *Hose-in-hose*, *Nil Desperandum*, *Quercusonis*, and *Stellaria* is

DO
 (do)
 adore
 (re)
 reason
 (so)
 SO

Marks for Problem 4.

"*Build a* RAILWAY STATION."

The highest score reached is 26. This has been attained by two competitors *Glen* and *Nil Desperandum*, whose Chains are the same, viz:—

RAILWAY
 (rail)
 trail
 (traí)
 straightest
 (test)
 attestations
 (station)
 STATION

Marks for Problem 5.

"*Visit* BEACHY HEAD."

The highest score reached is 24. This has been attained by two competitors *Quercusonis* and *Stellaria*, who send the same Chain, viz.:—

BEACHY
 (eachy)
 teaching
 (achi)
 headachy
 (head)
 beheads
 (head)
 HEAD

Compton sent in a Chain, beginning with "Beachey (ache)." The correction, of erasing the "e," reduced her minimum Syzygy from 4 to 3.

October 22, 1891

Chains have been sent for Problems 6, 7, 8 with no name or address. The Chain for 7 contains the word "torturing." I have entered them as "Anon."

I have no time, this week, to answer all of the many questions received.

B. E. E. has sent a Chain for "Cheat a Porpoise," a Problem which has not yet been set.

Cosmopolitan's Chains for Problems 7, 8, 13, 14, 15 have only just reached me—long after the proper time, but that is the Editor's business, not mine. Her scores are:—(7) "respersion, 0"; (8) "unchary, 0"; (13) "unsen, 0"; (14) "drail, 0"; (15) "9, 4, 37; 3, 7, 13: 24."

Similarly, *Idatia's* Chains for Problems 13, 14, 15, are scored "4, 2, 18; 2, 4, 8: 10," "9, 4, 37; 3, 11, 17: 20," "8, 4, 36; 3, 8, 14: 22."

Cosmopolitan asks me to explain how it is that he has failed to see the setting of Problems 7, 8, though he has searched the back numbers. See my reply to *Skirmisher* on October 8.

Cosmopolitan also writes, "the change about ordinary and extraordinary words has been, in my humble opinion, an awkward one for both parties." But there has been no change. I have *explained*, but not *altered*, the rule given on July 23.

Cosmopolitan also asks why I regard "endogen" as ordinary, but not "endogamy." See Rule 2, September 10. He also points out that "endogen" cannot be found in the dictionaries, but only "endogens." Is not this hypercritical? If he wished to refer to *one* of the "endogens," what would he call it?

Emelyne asks whether the Syzygies "get (get) forget," and "set (set) settles" would be eligible. They would not. See Rule 2. She adds that she cannot make it out from the rules, though she knows that "seize (seiz) seizure" is not allowable. I do not see any distinction between her second and third example.

Glen suggests that I should ask my cook if she has any "stalish" bread, and thinks she would understand me. No doubt she would; but that is not enough to constitute an "ordinary" word: it must be in ordinary *use* in ordinary *society*. If I were to say to *Glen* "that looks a very railwaystationish kind of house," I have no doubt that she would quite *understand* the word.

Glen also remarks that this puzzle "becomes difficult when one word is refused because it is uncommon and in a dictionary, and the next because it is common and *not* in a dictionary." This is not quite correctly put. I never make the fact, that a word *is* in a dictionary, a ground for refusing it! But, if a word is *not* in a dictionary, it surely cannot be an "ordinary" word?

Glen also writes that she "cannot understand the scoring." Her difficulty is that, "if the shortest Syzygy is not independent of the first and last, there seems to be no use in having any Syzygy longer than two letters in such a puzzle as "do—so." It is true that any longer Syzygies would not score, *as such*; but, the longer the Syzygies, the fewer the waste letters.

Glen also writes, "surely loadstone does not admit a plural? Your remarks this week" (her card bears no date) "look as if you would allow it to be used with an 's.'" What? When I have scored fourteen Competitors "0" for using it!

M. A. E. did, as she supposes, put "readings" instead of "beadings" in her Chain for Problem 5; but it made no difference in the score.

Mother Mildew has sent a Chain for "Tease a Tortoise," a Problem which has not yet been set.

Nenia writes, “will you kindly say whether we may use the names of animals and birds; the well-known ones?” Certainly.

Nenia and *Whim* remonstrate against the rejection of the plural of “loadstone.” I cannot think of anything to add to what I have already said. *Nenia* has seen the phrase “the loadstone,” and asks “if *the* loadstone, why not *a* loadstone? And if *one*, why not *two* loadstones?” I also have seen the phrase “the gout.” If *the* gout, why not *a* gout? And if *one*, why not *two* gout?

Old Cat asks “if the name Syzygy is not a corruption of sausage, and suggested by links.” It comes from two Greek words, and means literally “a yoking together.”

Pliny writes that she has been acquainted with the word “voider” during “all the years of her life” (even in her *first* year?), and that if I were “one of the gentler sex” I should “know more about the requisites of a pantry.” Perhaps I should. But I wish this puzzle to be available for *all*, even for the *ungentler* sex, and for those who are ignorant of housekeeping.

S. C. C. asks “what is an artificial maximum?” I meant, by the phrase, a maximum Syzygy introduced by means of a pair of long links, which served no other purpose.

Spes laments having failed to notice the alteration of the Rule about maximum Syzygies, and adds “it is provoking after trying one’s best to find that Chains which should have scored 80 will only count 10.” I should be really grateful to *Spes* if she would send me a Chain which would have scored 80 under the rule she alludes to.

Vessent pleads that “ingrate,” “derrick,” and “rater” are ordinary words, and says the last is often heard “in connection with yachts.” I should be glad if she would make a sentence containing it, such as one might have a reasonable chance of hearing in ordinary society.

The new Problems are:—

13. “*Be* DEFINITE ENOUGH.”

14. “*Unite* ERIN to ALBION.”

Answers must be received by (or before) the first post on the 29th of October.

Marks for Problem 6.

“GET AGE.”

The highest score reached is 23. This has been attained by five competitors, *Adoxa*, *Avo*, *Kelpie*, *Punch*, and *St. Helier*, who send the same Chain, except that *St. Helier* has “wageth” instead of “rageth.”

GET
(get)
rageth
(age)
AGE

Marks for Problem 7.

“CHEAT *a* TORTOISE.”

The highest score reached is 25. This has been attained by three competitors, *Caterina*, *Compton*, and *Stellaria*, who all sent the same Chain

October 29, 1891

The problems for this week, being the last two of the Prize Competition, are—

15. “OBTAIN DISTINCTION”
by writing
16. “SYZYGIES *for* LADY.”

There will be no further Competition this year. Whether I can ever start another is a question I cannot settle at present. The difficulties in constructing a really satisfactory set of rules seem almost insuperable.

[...]¹¹

November 26, 1891

Edina's scores for Problems 6, 7, 8 seem to have been overlooked. They are 5, 2, 19; 5, 7, 17: 2; 6, 2, 20; 2, 11, 15: 5; and 6, 3, 27; 3, 13, 19: 8.

I have no time, this week, to attempt answers to the many questions, remonstrances, complaints, and oburgations that have reached me, but hope to deal with them after publishing all the scores, and before reconsidering the papers, in order to adjudge the prize.

Marks for Prize-Problem 9.

“*Buy* BANBURY CAKES.”

The highest score reached is that of *H. H.*, 20. Her Chain is

BANBURY
(buri)
buriest
(ries)
bakeries
(aker)
taker

¹⁰Remark: Marks for Problem 8 missing in source.

¹¹Remark: The following description of the Nyctograph is moved to its own section (→ 16.42, p. 1993).

OCEAN

Marks for Prize-Problem 12.

“*Get TRUTH from LABOUCHERE.*”

The highest score reached is 21. This has been attained by seven competitors—viz., *Acacia*, *Adoxa*, *Avo*, *Florence*, *Leweston*, *M. A. B.*, and *Rosemary*—all of whom, except *Rosemary*, send the same Chain. The two Chains are:—

LABOUCHERE	LABOUCHERE
(abou)	(oucher)
abound	voucher
(bound)	(uche)
boundless	duchesses
(less)	(esses)
ruthlessly	blessest
(ruth)	(less)
TRUTH	ruthless
	(ruth)
	TRUTH

December 3, 1891

In answer to a number of letters (some referring in most gratifying terms to the pleasure this puzzle has given) begging that there may be another Competition, I have much pleasure in announcing that I hope to be able to begin one next year. A plan has occurred to me which will, I think, get over most of the difficulty about “ordinary” words. It is that I should, on receiving the answers to a problem, publish a list of the words I have rejected; and then allow time for any who choose to send in fresh answers, and then publish the list of marks. I admit that even this plan will not meet the case of a competitor who sends in as his “second edition” a Chain containing some unheard-of word; but this case I see no way of meeting. Such competitors had better emigrate.

Several competitors have called my attention to the “Railway-Station” Chain, published October 15th, which, as there printed, does not score the “26” assigned to it. They have overlooked the correction given in the next number.

Many competitors have written to explain (in answer to my statement on October 8th that the Problems “Prosecute-Trespasser” and “Coals-Fire” were duly set in *The Lady* for August 27th) that no such notice can be found in their copies. I have just discovered that it appeared in some copies, but not in others; and I humbly apologise to *Skirmisher* for my uncalled-for sarcasm on her eyesight! I cannot explain how this extraordinary phenomenon came to pass. I can but state the fact, which has surprised me quite as much as it has others.

Marks for Prize-Problem 13.

“Be DEFINITE ENOUGH.”

The highest score reached is 27. This has been attained by three competitors—*Quercusonis*, *St. Helier*, and *Stellaria*, who send the same Chain, except that *St. Helier* has “haughtiness” for “naughtiness.”

DEFINITE
 (definite)
 indefinitely
 (defin)
 defines
 (fines)
 finesse
 (iness)

naughtiness
(ughty)
doughy
(ought)
nought
(nough)
ENOUGH

Marks for Prize-Problem 14.

“Unite ERIN to ALBION.”

The highest score reached is 20. This has been attained by 24 competitors—*Acacia, Auntie, Avo, B. E. E., Caterina, Chute, Dolly Varden, E. M. R., Florence, Miss F. Fox, H. H., Jabberwock, Jiguel, Kelpie, Louisa, Margaret, Nil Desperandum, Quercusonis, Rosemary, St. Helier, Stellaria, Thermometer,* and *Triple Alliance*, who all send the same Chain, viz.:—

ALBION
(ion)
pioneering
(erin)
ERIN

Marks for Prize-Problem 15.

“OBTAIN DISTINCTION.”

The highest score reached is 29. This has been attained by three competitors, *Nenia, Quercusonis,* and *St. Helier*, who all send the same Chain, except that *Quercusonis* has “enabled” instead of “enables.”

OBTAIN
(obtain)
unobtainable
(nable)
enables
(nable)
actionable
(ction)
DISTINCTION

Marks for Prize-Problem 16th and Last.

“SYZYGIES for LADY.”

Curlitot is mistaken in thinking that I stated, on October 15th, that I would accept either “s” or “z” in spelling such words as “crystallize” and “patronise.” I would accept such a spelling as “sisygies.”

The highest score reached is 25. This has been attained by sixteen competitors, *Adoxa, Auntie, Avo, Chute, E. L. W., E. M. R., Esperance, Glen, H. H., Jiguel, Kelpie, Leta, Persevere, Rosemary, Stellaria,* and *Thermometer*, who all send the same Chain, viz.:—

SYZYGIES

(gies)
dingiest
(ding)
unlading
(ladi)
LADY

December 10, 1891

Next year (perhaps in February or March) I hope to start a new Competition. Meanwhile it will be desirable, after publishing the new Rules, to set a few experimental Problems, the answers to which shall be duly scored, and the marks published, in order that competitors may “get their hands in” before the regular “tug of war” begins.

I will now deal with the rest of the unanswered letters from competitors. Many of them reopen questions about (so called) “ordinary” words, as to which I have already said all I have to say. It is not possible to carry on any discussion for ever. Doubtless many readers have frequented cricket-matches, and have often heard the umpire say “You may argue till you are black in the face” (the well-known physiological effect of an attack of Sub-acute Syzygitis), “but, when the umpire says ‘No ball!’ why it *is* no ball!” And so say I. Argue as you will, it must come at last to *somebody* deciding whether the word is “ordinary” or not; and if that somebody is not to be *me*, *who is it to be?* (Answers to this conundrum to be sent in by the 20th of December at latest.)

Auntie sends a copy of her “do—so” Chain, which she sais ought to have been scored 10 instead of 9. “Do (do) idol (ol) resole (so) so.” The Chain sent to me had “resolve” instead of “resole.” Had this new version been sent in, I should have scored it “resole, 0.”

B. E. E. sends a fresh Chain for “cheat a tortoise,” and pleads that ‘it was quite by mistake’ that she tried to cheat a ‘porpoise.’ But is it not of the essence of a competition of wits that players who make mistakes must pay the penalty? In playing chess, does *B. E. E.* expect to be allowed to recall every move in which he has made a mistake?

Dolly Varden protests against my rejection of “waist-band,” and pleads that Nuttall prints it *without* a hyphen. But he prints “wrist-band” *with* a hyphen! I consider that these two compounds stand on the same footing; and that neither of them has yet worked its way up to the status of being regarded as a single word.

Ellerslie’s and *Leta’s* Chains for Problems 3, 4, 5 never reached me. They seem to have been sent off at the proper time, so the Post Office must bear the blame.

Esperance’s Chains for Problems 6, 7, 8 duly reached me, but without name or address, as she will find recorded at the beginning of the article on October 22nd. I entered the scores under the heading “Anon,” but have now transferred them to the proper scoring-paper.

Esperance also writes “I fear I must have made a mistake when copying my ‘Gladstone-Salisbury’ Chain, as I find the original is quite correct.” She sends the original rough copy, which contains “burial (bury) Salisbury.” The copy sent

to me contained "burial (rial) Salisbury." I fear that, like *B. E. E.*, she must take the usual consequences of making mistakes.

Esperance's score for Problem 2 is "7, 3, 28; 2, 14, 18: 10." I overlooked this Chain on her paper, but have found it on going through all the papers again.

Glen writes to protest against my rejection of "stalish." I do not consider it correct English, but merely colloquial. It was mainly to exclude such words that I laid down the rule that the words must be such as we find in dictionaries. This word is not in Nuttall. Is it in any dictionary?

Hose-in-hose pleads that "tocherless" is an ordinary Scottish word. That may be, but it is not an ordinary English word. She also wonders at my accepting "taker," which she thinks no one ever heard used, unless when compounded with others. I am not a betting man, but I am certainly familiar with the phrase "the betting was 5 to 1, no takers."

Idalia writes that she posted her answers to Problems 3, 4, 5 in time to reach the office on the 6th of October. But the 1st of October was the proper day for receiving. Still, the paper seems to have reached me, and all papers, sent to me by the Editor, are duly scored. Her three scores are:—

- (3) 4, 2, 18; 2, 4, 8: 10
- (4) 9, 4, 37; 3, 11, 17: 20
- (5) 8, 4, 36; 3, 8, 14: 22

Marie's Chains for Problems 1, 2, never reached me. She sends a fresh copy of the one for Problem 1, which would have been scored "oil-man, 0," if it had arrived in time.

Nenia puts forward, under date of 1st of October, a plea for accepting her Chains though she sent in late. She writes "It is only in today's *Lady* that I have observed the alteration, though I now see that the dates are plainly given in last week's paper. I had simply not noticed it, and gone on the old rules. Under the circumstances, I hope you can accept my Syzygies now enclosed." Surely, if *Nenia* were Editor, she would not accept such an excuse as this? Whose fault was it that she did not see the notice? And what more could the Editor have done to acquaint her with the change? To send a crier round with a bell to every house, would be tedious and costly, besides annoying the neighbouring residents.

Nil Desperandum and others defend "heritages" as an "ordinary" word, on the ground of its being in the Bible. I do not think this proves it at all. There are many Bible words that have quite disappeared from ordinary use.

Nix has sent in such an ingenious extra-Chain for "Unite Erin to Albion," that I think the readers of *The Lady* ought to have the benefit of it.

(al)
ALBION

Punch has most properly taken me to task for accepting and rejecting the word “voids” in the same list of marks! No doubt I first rejected it, and then changed my mind and accepted it, and forgot to make the necessary correction. He also most properly protests against my rejecting “meditations” and “always.” These, however, were misprints for “mediations” and “alway.”

S. C. G. brings a serious charge against me. She writes:—“When alternate” (she means “alternative”) “solutions are sent up, and there is a mistake in one and not in the other, why is the one that has the mistake taken, and the one without a mistake ignored? This is the case with both mine.” (See score 3 published October 1.) “You take Build (build) builder, &c., and put no score. As the alternative one, I sent ‘Build (ild) gilder (er) lacquer (ac) Palace,’ but no notice is taken of this; and the same with Dog (dog) dogger (er) cater (cat) Cat; but, again, this not taken, but the other one.” I have referred to *S. C. G.*’s paper, and find that the Chain “Build (ild) &c.,” was crossed out by herself, otherwise I should have quoted from it the unlawful Syzygy “gilder (er) lacquer.” The Chain “Dog (dog), &c.,” I accidentally omitted to quote from, but I had duly scored it “0” since every Syzygy in it is unlawful.

S. C. G.’s score for Problem 12 is 6, 3, 27; 4, 11, 19: 8, for a Chain not containing “ancestress,” which was overlooked.

S. C. G., writing in defence of the rejected word “ancestress,” asks whether, in pointing to a family-picture, she ought to say “she was a female ancestor of mine.” With the omission of the word “female,” I think it would be the ordinary way of expressing the fact. The words “ancestor,” “governour,” and “overseer” seem to be ordinarily used of both sexes. The word “female” seems as superfluous as it would be in the Prayer-Book phrase, “our Queen and Governour.”

Signora’s score for Problem 8 is 8, 4, 36; 4, 14, 20: 14, as I have decided to accept “illiterately.”

Spes “cannot understand why ‘prevarications’ is rejected, and ‘beheads’ accepted.” It seems to her that the former is a noun which could be made plural, but that ‘behead’ can only be a verb. I grant that ‘prevarication’ is an ordinary word, and that it can be made plural, but I do not think the plural is in ordinary use. I do not see the drift of her remark about ‘behead.’ Of course, it can only be a verb. What then?

Spes also thinks that “nationalism,” which was rejected, “would stand the test of ten fairly educated people understanding it.” Perhaps it would, but I do not think it would stand the test of being “reasonably likely to be heard in ordinary conversation.”

Spes has been marked wrong for Problems 15, 16, her two scores having been accidentally interchanged.

St. Helier’s score for Problem 5 is 8, 4, 36; 3, 6, 12: 24; as I have decided, after much deliberation, to accept “beheadings,” and have referred to the MS. of every Chain sent in for it, in order to make the necessary corrections. However, the only other Competitor who has used the word is *Nil Desperandum*: and her chain has already be accepted and scored! Homer does sometimes nod: there is no doubt of it!

Swallow pleads that “odor” is “surely an ordinary word spelt in the modern

way?" I am aware that the Americans are trying to change our spelling, and to rob us of "favour," "honour," and "valour," and all that makes life dear to a Briton; but my answer to them is "Sor-visaged honds, shot not so lodly! We croch to no prod foeman! This is British grond!"

Thekla writes "in what ordinary conversation would one hear such words as 'endogen' and 'wageth'?" I have looked for them unsuccessfully in three dictionaries. The latter I can guess the meaning of, the former I cannot." I think that the elementary terms of a Science so universally studied as Botany are quite reasonably likely to be heard in ordinary conversation. I have just looked out "endogen" in three well-known dictionaries. Worcester and Skeat give "endogen": Nuttall gives "endogens."

"To wage war" is surely an ordinary phrase, and I do not see how I can accept a verb without also accepting its grammatical inflexions; but if *Thekla* expects to find all *inflexions* in her three dictionaries, she has, I fear, much disappointment in store for her!

Thekla also asks for the meaning of "maximum" and "minimum" Syzygies. They are those which contain the greatest and the least number of letters.

Triple Alliance writes "We were told, in *The Lady* of September 17th, to erase the latter half of Rule 5; and we were obliged to send in the Chains for Problems 1, 2, on September 16th. Not being gifted with second sight, we scored these Chains in the old way, as, of course, every one else must have done." *Triple Alliance* has got the dates wrong. The Chains in question were not due till September 22nd; most of them came in on the 21st and 22nd.

There still remain a number of remonstrances about "ordinary" words, which I fear I have neither time nor space to answer individually. Some of them seem to be based on the assumption that if a word is known to have been used, or even if the thing denoted by it is known to exist, it must be an "ordinary" word. Thus, *M. A. B.* writes that "in a class of thirty-two, the other day," a lady mentioned the "stonings" of St. Paul. And *Punch* writes: "Is it possible that you never heard the 'trachea' mentioned during the sad illness of the late Emperor of Germany?" and "can you be unaware that, but for the 'sailings' of the colliers, you might have to go without a fire, and that the said colliers are loaded by means of 'derricks'?"

I will conclude with a little anecdote, suggested by another remark of the writer last quoted. In reference to my rejection of the word "ancestress," he indignantly exclaims "You never had an ancestress!" My anecdote is a genuine one, and not invented for the occasion. The friend who told it me was walking in the road, when a little girl fell down and hurt herself. "Why don't you run in to your grandmother?" another little girl inquired. "I haven't got a grandmother!" the sobbing child replied. "What a dummy you must be, not to have a grandmother!"

That sobbing child and I seem to have something in common: the same bitter sarcasm has fallen on us both! As I wearily push aside the mass of letters, now at last disposed of, a ghostly voice seems to whisper in my ear "What! You deny that 'ancestress' is an ordinary word? Then you never had one! What a dummy you must be, not to have an ancestress!"

December 17, 1891

Caterena's score for Problem 16 was wrongly stated; it ought to have been 8, 4, 36; 2, 7, 11: 25, so that she was one of those who reached the highest score for that Problem. I ask her pardon for my careless mistake. *Miss Fox's* Chains for Problems 15, 16, never reached me, I regret to say. If they reached the Editor by or before the first post on November 5th they would almost certainly have been forwarded to me. In that case the Post Office must bear the blame.

Jabberwock writes, in defence of the rejected word "distain": "It is one of the most common words in the English dictionary, and I have also repeatedly heard it used in theatres, in plays, by Irving, Toole, &c. Its real meaning is 'to take away the colour of.'" *Jabberwock* then quotes, from Spenser and Dryden, passages in which the word occurs. All this is, no doubt, "dreadful true" (as Hannibal Chollop would say), but it does not prove that there would be any reasonable chance of hearing it in ordinary conversation. Has *Jabberwock* ever so used it, or ever heard it so used?

Quoted from *Life and Adventures of Martin Chuzzlewit* by Charles Dickens

Leweston's Chains for Problems 15, 16 (written on p. 4 of a note-sheet, whose very pleasant contents terminated on p. 3, with no hint that there was anything over-leave), were accidentally overlooked. They are now duly scored:—

(15) 10, 3, 31; 2, 20, 24: 7

(16) 6, 3, 27; 3, 15, 21: 6

S. C. G.'s score for Problem 13 has been duly entered as "9, 2, 23; 3, 8, 14: 9." The mistake about "hightly" arose from her having used the same symbol to express "n" and "h." In Problem 14 the word should be, as she rightly supposes, "pioneering." Misprints do occasionally happen.

[...]¹²

Total Scores for Prize Competition

Problems set September 10th to October 29th, 1891

The highest Score is that of *St. Helier*, 330, who is, therefore, the winner of the Prize. But as the next on the list, *E. M. R.*, is only one mark short of this, the Managers of *The Lady* have decided on presenting two equal prizes of one guinea each. It may fairly be regarded, I think, as a 'dead heat' between this two Competitors, whose real names and addresses I have much pleasure in announcing, with sincere congratulations on their success.

St. Helier. "Miss Jermyn, Ormonde Lodge, Clarendon Road, St. Helier's, Jersey."

E. M. R. "Miss Ryves, 10, Pembroke Vale, Clifton, Bristol."

In the following list, wherever only one number is appended to a name, it is to be understood that the Competitor sent in Chains for all the 16 Problems. When a parenthesis is added, the first number in it indicates how many Problems the Competitor attempted; the second the Score that would have been obtained if only the Competitor had tried them all and had exhibited the same amount of skill throughout; while the third number indicates the place on the list that would have been thus obtained. I hope these additional facts may be a consolation to some who find themselves very low down on the list, and may encourage them to attempt all the Problems in the next Competition.

¹²Remark: The following Postal Problem is moved to its own section (→ 15.8, p. 1921).

[...]¹³

December 31, 1891

S. C. G. has a claim on me for an apology for my paragraph of Dec. 17th, which I hereby humbly tender. I did not charge here with using the same symbol for “n” and “h.” What I wrote was “N,” but the capital shrank to a small letter in the printing. If *S. C. G.* has ever had to get *her* MS. through the press she will know how true, in a new sense, is the old exegetical rule, “Wherever you find a type, there you find an antitype.” And may we not add, Yea, and an errantype to boot, not to say a peccantype!

Skirmisher sends a communication which thrills me with a wild and dreary hope! I had said, on Dec. 10th, “It must come at last to *somebody* deciding whether the word is ‘ordinary’ or not; and if that somebody is not to be *me*, *who is it to be?*” In reply to this, *Skirmisher* writes, “I should decide in favour of an appeal to a dictionary. Allow me to say I do not consider your decisions by any means infallible; in fact, I should say they are very arbitrary.” Now, granting (as I willingly do) that my decisions are by no means infallible, and that they are very arbitrary; and also granting (as I reluctantly do, and merely *argumenti gratia*) that a dictionary is infallible in all it professes to tell us, I am still wholly ignorant of the existence of any dictionary which professes to draw this distinction. Is it possible that there is one now “in the press” and just about to be published? “An English Dictionary, wherein words that are ordinarily used in Society are distinguished from those that are not so. Compiled by ‘Skirmisher.’ Thick 4to, 2560 pp., price 30s.” Let *Skirmisher* gloure herself that I shall order an early copy! I fear, however, that this is but a dream: and that *Skirmisher* is really playing at “Cross Questions and Crooked Answers,” and is pretending that my question was, “If the test for admitting a word is *not* to be its being ‘ordinary,’ what test shall we substitute?” But *this* question I have no intention of putting. The Competitors are, of course, perfectly free to start a new Syzygy Competition for themselves, and admit all words that occur in some named dictionary; but *I* must respectfully decline to act as a Scorer! It would, in my opinion, completely spoil this Puzzle, which, instead of being (as I believe it now is) a contest of minds, solvable by *thinking*, and accessible to *all*, would become a contest of *thumbs*, solvable only by turning over pages, and accessible only to possessors of the dictionary in question.

Let me now explain a feature of this Puzzle, which adds much, as I venture to think, to its interest and its sociability. It makes (I say it confidently, for I have tested it) a very workable game for two players. This, I think, deserves a heading to itself:—

Syzygies as a Game for Two Players

This game is best played in a railway carriage, since it involves no reading (so tiring to the eyes of travelers) nor talking (so tiring to their voices and ears). The only appliances needed (and these not indispensable) are writing materials (say a couple of small memorandum books). Each player thinks of a good long word, the longer the better. When *she* has thought of *hers* (I assume the two travelers to be a “he” and a “she,” and that “she” is the quickest thinker) she says,

Other version:
→ 19.28, p. 2520

¹³Remark: list omitted

“Ready;” and when *he* has thought of *his*, both words are announced, watches are consulted, and the game begins, each player trying to make a “chain” of the two words. At the end of ten minutes (or whatever time they like to fix) the chains are interchanged, examined to see if they are lawful, and the scores recorded. Then they think of another couple of words, and so on. Whoever first scores 100 wins; or, if both reach the 100 at the same time, the highest score wins. It will be desirable, in playing this game, to use some of the new Rules, which I will now quote:—

“A Chain must contain at least two Links.”

“It is forbidden to have two consecutive Syzygies, one containing the other.”

“If either of the given words has more than nine letters, the extra ones are not counted as waste letters.”

“To score a chain, add together twice the number of letters in the first and last Syzygy, and seven times the number in the shortest; and deduct twice the number of Links and the number of waste letters.”

January 7, 1892

New Code of Rules

Definitions

1—When two words contain the same set of one or more consecutive letters, a copy of it, placed in a parenthesis between the two words, is called a ‘Syzygy,’ and is said to ‘yoke’ one set to the other, and also to ‘yoke’ each letter of one set to the corresponding letter of the other set.

Examples

(1)	(2)	(3)	(4)
walrus	walrus	walrus	mine
(a)	(l)	(wa)	(m)
swallow	swallow	swallow	mimic

N.B.—In Ex. (2), the Syzygy may be regarded as yoking the ‘l’ in ‘walrus’ to whichever ‘l’ in ‘swallow’ the writer may prefer. And in Ex. (4) the Syzygy may be regarded as yoking the ‘mi’ in ‘mine’ to whichever ‘mi’ in ‘mimic’ the writer may prefer.

2—A set of four or more words, with a Syzygy between every two, is called a ‘Chain’, of which all but the end-words are called ‘Links’.

3—In a ‘Syzygy-Problem’ two words are given, which are to form the end-words of a Chain.

Example

If the given words are ‘walrus’ and ‘carpenter’ (the Problem might be stated in the form ‘*Introduce* WALRUS to CARPENTER’), the following Chain would be a solution of the Problem:—

WALRUS
 (rus)
 rusticate
 (ica)
 vicar
 (car)
 CARPENTER

4—Every letter in a Chain, which is not yoked to some other, is called “waste”; but, if either of the end-words contains more than seven letters, the extra ones are not counted as waste.

Thus, in the above Chain, the “wal” in “walrus,” the two “t’s” and the “e” in “rusticate,” the “v” in “vicar,” and the “pent” in “carpenter” are “waste”: so that this Chain has eleven waste letters.

5—When a letter in one word, alphabetically identical with a letter in another word, is forbidden to be yoked to it, these letters are said to be “barred” with regard to each other.

Rules for Making Chains

1—A Chain should be written as in the Example to Def. 3. It does not matter which given word is placed at the top. Any number of alternative Chains may be sent in.

2—Any word, used as a Link, must satisfy all the following tests:—

(a) It may not be foreign, unless it is in such common use that it may fairly be regarded as naturalised. (The words ‘ennui,’ ‘minimum,’ ‘nous,’ may be taken as specimens of words thus naturalised.)

(b) It must be in common use in conversation, letters, and books, in ordinary society. (Thus, slang words used only in particular localities, and words used only by specialists, are unlawful.)

(c) It may not be a proper name, when usually spelt with a capital letter. (Thus ‘Chinese’ is unlawful; but ‘china’, used as the name of a substance, is lawful.)

(d) It may not be an abbreviated or a compound word, when usually written with an apostrophe, or hyphen. (Thus, ‘silver’d,’ ‘don’t,’ ‘man’s,’ ‘coach-house’, are unlawful.)

3—When one of two words contains a set of one or more consecutive letters, alphabetically identical with a set in the other word; and when either these two sets commence both words, or else the preceding portions are prefixes such that, by some one of the three following processes,

(a) removing whatever preceding portion exist,

(b) transposing them

(c) removing one and transposing the other,

real words might be formed, without any word or portion of a word losing its identity; each letter in the one set is “barred” with regard to the corresponding letter in the other set.

Examples

Certain prefixes are here marked off by perpendicular lines, and the “barred” letters are placed in square brackets. The letters placed over the examples indicate which process is to be employed:—

(1)	(2)	(3) a
[do]g	[car]riage	un [do]ne
[do]or	[car]case	[do]or

(4) a	(5) b	(6) c
un [do]ne	con [ve]rt	con [str]ain
in [do]rs	in [ve]nt	in [str]uct

N.B.—The letters are only ‘barred’ as here marked. They may often be yoked in other ways: e. g., in Ex. (2), the ‘c’ above may be yoked to the second

'c' below.

Examples of Letters which are Apparently, but not Really, "Barred"

Certain prefixes are here marked off by perpendicular lines, and the letters, which are apparently but not really "barred," are indicated by writing them as Syzygies, which are therefore all lawful. The letters placed over them indicate which process is (apparently) applicable.

(1)	(2) a	(3) a
carriage	con done	con done
(ca)	(don)	(do)
carcase	donkey	in doors
(4) b	(5) a, c	
con servative	de fined	
(se)	(fi)	
pre sented	re fix	

N.B.—In Ex. (2), (3), process (a) fails, because "done" loses its identity when the prefix is removed: it ceases to be the root of "condone," and becomes the participle of "do." In Ex. (4), process (b) fails, because "sented," as part of "presented," is etymologically different from "sented," as part of "consented." In Ex. (5), process (a) fails, because "find," by itself, is etymologically different from "fined" as part of "defined"; and process (c) fails, because "fined" as a part of "defined" is etymologically different from "fined" as a part of "refined."

4—When one of two words contains a set of one or more consecutive letters, alphabetically identical with a set in the other word; and when either these two sets conclude the words, or else the succeeding portions are suffixes such that, by some one of the three following processes,

- (a) removing whatever succeeding portion exist,
- (b) transposing them
- (c) removing one and transposing the other,

real words might be formed, without any word or portion of a word losing its identity; each letter in the one set is "barred" with regard to the corresponding letter in the other set.

Examples

Certain suffixes are here marked off by perpendicular lines, and the "barred" letters are placed in square brackets. The letters placed over the examples indicate which process is to be employed:—

(1)	(2)	(3) a	(4) a
me[at]	oni[on]	me[an] ing	s[ink] ing
c[at]	mo[on]	m[an]	l[ink]
(5) a	(6) a	(7) b	
me[an] ing	s[ink] ing	inf[lat] ed	
m[an] hood	l[ink] s	re[lat] ion	
(8) b	(9) c	(10) c	
infl[at] ed	conv[ent] ion	plu[ng] es	
sati[at] ing	att[ent] ive	wro[ng] ing	

Examples of Letters which are Apparently, but not Really, "Barred"

Certain suffixes are here marked off by perpendicular lines, and the letters,

which are apparently but not really “barred,” are indicated by writing them as Syzygies, which are therefore all lawful. The letters placed over them indicate which process is (apparently) applicable:—

(1)	(2)	(3) a, b
onion	sink ing	din ed
(on)	(in)	(in)
moon	link s	pin s
(4) b	(5) c	(6) a, c
inflat ed	plung es	plan ing
(at)	(ng)	(lan)
satiat ing	wrong ing	ortolan s

N.B.—In Ex. (3), processes (a) and (b) fail, because “din,” as a part of “dined,” is etymologically different from “din” by itself, or as part of “dins”; and also because “pin,” as a part of “pins,” is etymologically different from “pin,” as part of “pined.” In Ex. (6), processes (a) and (c) fail, because “plan,” as part of “planing,” is etymologically different from “plan” by itself, or as a part of “plans.”

5—Nouns and verbs are not to be regarded as prefixes or suffixes.

Examples

“landlord,” “handmade,” “breakwater.”

The following Syzygies are lawful:—

demand
(and)
handmade
(mad)
madly

6—The letters ‘i’ and ‘y’ may be treated as if identical.

Example

The following Syzygy is lawful:—

busy
(usi)
using

Rules for Scoring

7—If the writer of a Chain has omitted a Syzygy, the Scorer inserts a one-letter Syzygy, if he can find a lawful one.

8—If the writer has omitted a Link, the Scorer erases the two adjacent Syzygies, and proceeds as in Rule 7¹⁴.

9—If a Link be mis-spelt, the Scorer corrects it.

10—If a Syzygy contains unlawful letters, the Scorer erases them, and deducts twice that number of marks from the Score.

11—If one of two consecutive Syzygies contains the other, the Scorer erases the intermediate Link, and one Syzygy containing the other.

¹⁴accidentally “Rule 1”

Examples

(1)	(2)
meeting	meeting
(ting)	(ting)
tinge	tinge
(ing)	(ting)
loving	parting

N.B.—In Ex. (1) the Scorer erases ‘tinge’ and the first Syzygy: in Ex. (2), he erases ‘tinge’ and either Syzygy. The results are:—

(1)	(2)
meeting	meeting
(ing)	(ting)
loving	parting

both of which are, by Rule 4, unlawful Syzygies.

12—The penalty, awarded by the preceding Rule, cannot be evaded by writing shorter Syzygies than might be claimed, so as to avoid the result of one containing the other. In such a case, the Scorer would treat them as if written in full.

Examples

meeting
(tin)
tinge
(ng)
parting

This would be treated as if it had been written, in full.

13—If the Chain now contains less than two Links, or an unlawful Link or Syzygy, the Scorer rejects it. Otherwise he calculates its score by writing down 7 numbers, as follows:—

(1) The number of letters in the longer of the two end-Syzygies, *plus* twice the number in the shorter.

(2) The number of letters in the minimum-Syzygy.

(3) The sum of (1) and the product of the two numbers next above (2).

(4) The number of Links.

(5) The number of waste letters.

(6) The sum of twice (4) and (5).

(7) The remainder left after deducting (6) from (3). If (6) be greater than (3), the remainder is written as “0*.”

No. 7 is entered as the Score of the Chain.

Example

The figures on the right indicate the number of waste letters.

WALRUS	3
(rus)	
rusticate	3
(ica)	
vicar	1
(car)	
CARPENTER	4

As the end-Syzygies are equal, we might say that there are 3 letters in the longer and 3 letters in the shorter: Hence No. (3) is the sum of “9” and “4 times

5"; i. e., it is 29. Also, there are two Links and 11 waste letters. Hence, No. (4) is "2," No. (5) is "11," and No. (6) is the sum of "twice 2" and "11"; i. e., it is "15." Hence, No. (7) is the remainder, after deducting "15" from "29"; i. e., it is "14." And this is the score for the Chain.

All this may conveniently be set down thus:—

9, 3, 29; 2, 11, 15: 14.

Algebraically, let

a = Number of letters in the longer of the end-Syzygies;
 b = Number in the shorter;
 m = Number in minimum-Syzygy;
 l = Number of Links;
 w = Number of waste letters:

then the score is¹⁵

$$(a + 2b) + (m + 1) \cdot (m + 2) - (2l + w).$$

14—In reckoning shortest of all Syzygies, the Scorer takes no notice of any Syzygies inserted by himself, unless there are no others.

15—If a writer sends in alternative Chains, the Scorer takes the best of them.

16—If all be rejected, the Scorer puts '0' against the writer's name, assigning a reason for rejecting each Chain.

Example If "*Ignoramus*" sends in 3 alternative Chains, one containing less than two Links, a second containing the word "zumbooruk," and the third containing "constrain (str) destruction," the Scorer should enter them in the list thus:—

Ignoramus. (1) short linkage (2) "zumbooruk," (3) "con|strain (str) de|struction."
 [N.B. "strain" and "construcion" are real] 0.

As 26 Syzygy Problems have already appeared in *The Lady*, the new ones shall be numbered consecutively. The following three shall be scored, but not competitive:—

- (27) a HAPPY NEW
- (28) YEAR to ALL,
- (29) this FESTIVE SEASON

Answers must be received by, or before, the first post on Thursday, January 14th. I will then issue a list of the rejected words: then the competitors can send in fresh Chains if they like; and I will then publish the scores. My ambition is to publish 3 lists of marks without a single zero!

January 14, 1892

The problems for this week, which shall be duly scored (but are not competitive) are:—

- (30) Make BULLETS of LEAD
- (31) to SHOOT an APTERYX.

Answers must be received by (or before) the first post on the 21st of January.

¹⁵The "." was accidentally printed as "—"

January 21, 1892

In order to reassure any of my readers who may have been so much alarmed at the enormous length of the "New Code of Rules" as to despair of ever understanding them, let me point out that most of the space is devoted to *Examples*.

The problem (non-competitive) for this week is

(32) INDULGE *an* IDIOSYNCRASY.

Answers must be received by (or before) the first post on January 28th.

N.B.—I am reprinting the rules, in pamphlet form, placing the Rules first and the Examples afterwards. It is part of a larger book, but I shall be happy to supply the Syzygy part, by itself, to any subscribers to *The Lady* who will send their names and addresses. It will cost about 2d.

January 28, 1892

In the new Code of Rules, two rather important corrections are necessary. At the end of Rule 8, for "Rule 1" read "Rule 7." And, in the algebraical formula at the end of Rule 13, for " $(m + 1) - (m + 2)$ " read " $(m + 1) \cdot (m + 2)$."

Toofdiarb writes "In the examples to Rule 4 'ng' is given as a barred syzygy between 'plu[ng]les' and 'wro[ng]ing'; and, in the next example, it is allowed." This is because the "ng" in "plunges," though it may not be yoked with the first "ng" in "wronging," may lawfully be yoked with the *second*.

Toofdiarb also writes:—"Is 'ing' an unlawful suffix, when, if taken away, it leaves an incomplete word—e.g. 'racing'?" All would depend on whether the other word could supply a suffix to make it a complete word. Thus "racing (ac) lac" would be a lawful Syzygy; but "racing (ac) laces" would be unlawful, because, by transposing suffixes two real words are formed—viz., "races" and "lacing."

Let me try to make Rules 3, 4 in the New Code a little more intelligible. No one, who has not tried to invent a new game, can have any idea of the difficulty of making the rules at once brief and intelligible. My object in composing those two Rules, was to exclude a form of Syzygy, the making of which involved no skill, and which was becoming so common, in the last Competition, as to threaten to reduce my Puzzle, from being (as I hope) a fair test of mental skill, to the level of an utterly brainless pastime, which could easily be learned, in the course of a few billion years (as an Evolutionist would carelessly remark), by oysters and sea-anemones.

The 59 specimens in Rule 3 will show the sort of thing I mean. It would have been easy to make the Rule shorter and simpler (e.g., "A Syzygy, which has only a prefix before it, may be treated by the Scorer as if it stood at the beginning of the word."), but I should have been at once overwhelmed with a host of "border-cases," where one hardly knew if a syllable was, or was not, a prefix. How many, who read this, know that "com" in "common" is as much a prefix as "com" in "composition"? Besides, to forbid *all* prefixes, would exclude a great many Syzygies, which *do* exhibit skill—e.g., "common (mon) money." There is a great deal more skill needed in that Syzygy than in "reasons (eason) season"!

So it occurred to me (in order not to exclude *all*, and in order to avoid “border-cases”) to supply the Scorer with a test as to what prefixes he might regard as removable.

The Scorer’s position, it must be remembered, is that of *hostility* to the Competitor. He is bound to give the *lowest* mark he lawfully can, and, where a doubt of guilt exists, to give the prisoner the malefit thereof. So I have limited his power in this matter. If he can, by one or other of the three operations, marked (a), (b), (c), form a pair of real words, he may remove the prefixes, and so bring the Syzygy to the beginning of both words, thus making it unlawful. If he cannot, he must accept the Syzygy. “Border-cases” are thus, I hope, avoided. A word must either be real or unreal. It cannot lie on the boundary-line!

Words rejected, as having violated Rule 2:

domal, nesting, pea-soup, perone, pine-wood, springal, treasonous.

February 4, 1892

Problems 30, 31: first set of Chains

In publishing these rejected words, &c., to enable Competitors to revise their chains, I do not think it necessary to do more than give a list of the “non-ordinary” words rejected, and of cases which come under rules that appear *for the first time* in the new Code. For instance, I do not think it necessary to warn any Competitor, who sends in a Syzygy such as “dog (do) door,” or “meat (at) cat,” which were unlawful under the *old* Rules. The only exception I have made is the case of *Anglim*, who appears to be a new Competitor, and perhaps never saw the old Rules, and whose Chains at present contain many *Syzygies* of the above forbidden type.

Words rejected in accordance with Rule 2:

eschalo, gullable, hooper, rooter

February 11, 1892

Will those readers of *The Lady* who wish to possess the new rules in pamphlet form, kindly desist from sending postage stamps along with their names and addresses? I am keeping an account of those received, which shall be duly credited to the senders, but it is to the managers of *The Lady*, and not to me, that payment must be made; and it is impossible to say, at present, what the price will be. For my part, I regard the whole “Syzygy” business as “a labour of love,” and do not wish to make any profit by it; so my intention is, as soon as we are ready to work off copies, in pamphlet form, of the “Syzygy” portion of my some-day-to-be-published book of “Games and Puzzles,” to calculate what it will cost to produce (say) 250 copies, which I should be prepared to supply to the managers at cost-price. They will then put on it whatever they think a fair price, and will invite their readers, who wish to have copies, to send their names and addresses (and the price in postage stamps) by a certain named date. The number of names sent in will guide me as to the number of copies to work off.

Whether I shall be able this year to conduct (personally) another Competition, is a point I have not yet decided. I should like to do it very much, for I

believe the Competitors like it, and that it supplies them with innocent amusement and real mental exercise; but it costs me some time and trouble, and I have but little to spare of either commodity! However, we shall see. Let us, at any rate, have a few more non-competitive Problems. Here are the two for this week:—

- (33) Set KNIFE by FORK
(34) to WELCOME a FRIEND.

The “First Chains” for these must be received by (or before) the first post on Tuesday, February 16th. (Observe, I have named Tuesday, not Thursday, which abridgment of time will enable me to publish the list of rejected words, &c., on February 25th—i. e., a week sooner than I otherwise could do.) The “second Chains” will be due on March 1st. And the scores will be published on March 10th.

H. H. asks an interesting question (the answer to which will, I hope, be useful to others also), viz.: Are the following Syzygies lawful or unlawful? (1) “lateral (tera) literary”; (2) “regulator (ulat) undulate”; (3) “undulation (ulati) regulating”; (4) “posing (sing) singer”; (5) “shingle (ingl) tingling” My answer is as follows:—In (1), all the three processes, called “(a), (b), (c),” in Rule 4, fail to make real words, since neither “latera” nor “laterary” is real. Hence the scorer must *accept* this Syzygy as *lawful*. In (2) although “regulate” is real, yet neither “undulat” nor “undulator” is real; so the Syzygy is *lawful*. In (3), process (b) succeeds, since “undulating” and “regulation” are both real. Hence the Syzygy is *unlawful*. In (4) “posing” and “sing” are both real; so the Syzygy is *unlawful*. In (5), neither “shingl” nor “shingling” is real; so the Syzygy is *lawful*.

[. . .]¹⁶

Words rejected in accordance with Rule 2:

cerement, eremite, fulgent, Hindustani, incrassate, incrust.

February 18, 1892

Will Competitors be so kind as to desist from sending, on the same piece of paper, answers to Problems which were set at different times, as it adds much to my trouble in classifying the papers.

The Problem for this week is

- (35) CULTIVATE PELARGONIUMS.

The “First Chains” for this must be received by (or before) the first post on Tuesday, February 23rd. The list of rejected words will be published on March 3rd: The “second Chains” will be due on Tuesday, March 8th. And the scores will be published on March 17th.

Chute is to be congratulated on having outwitted the scorer! With what savage delight I at first gloated on that Syzygy of his, “unreasoning (eason) season”! Eagerly I seized my pen, to mark off what seemed so easily removable a suffix, the “ing” in “unreasoning.” “But no!” I said to myself, while a chill horror froze me. “There is no such verb as ‘to unreason.’ There ought to be, for the sake of the ladies: but there isn’t. It is a lawful Syzygy!” How *Chute* would have chuckled to see my face of blank despair! And I was again taken in, when I came

¹⁶Remark: Some contents omitted in source

to count up the waste letters. “Humph” I said, when I came to “unreasoning.” “What did he want the ‘un’ for? Two unnecessary waste letters!” But I was wrong again. Without the “un,” the “ing” would have been a removable suffix! Then at last I understood the deep cunning of this competitor. Ah, how keenly I shall watch for his next mistake!

Inwick will, I hope, accept my humble apologies for my carelessness in not warning him, on January 28th, that all his “First Chains” were illegal; two of them for reasons then stated, and all the rest as having only one Link each, thus violating Def. 4. It is entirely my fault that he had no opportunity allowed him for “amending the record.”

Lady Margaret’s Chains for Problems 27, 29, contained the words “chapping” and “overseas,” both of which, had I examined those Chains in a lucid interval, I should have rejected on January 28th; as I doubt if the first of these words has ever been used, and am quite sure that the second ought to be written with a hyphen. Having omitted to warn her at the time, I am bound to accept them now; but she had better not use them again!

To *Leta* also I offer my humble apologies for not having warned her, on January 28th, that her Chain for Problem 29 contained the unlawful Syzygy “unseasonable (season) season.” Though not warned, she chanced to send a “Second Chain” for it: but this, unfortunately, contained the unlawful Syzygy “singlest (sing) routing.” Had this been a Prize Competition, I would have delayed publishing these Scores, in order to give *Inwick* and *Leta* another chance.

S. C. G. will observe that I have complied with her request, by indicating which, of the alternative Chains, was the one scored. For Problem 28 she only sent one Chain.

Stellaria (whose good wishes I beg to reciprocate) inquires about the following Syzygies, which I had rejected as unlawful:—(1) “infesting (est) reasonest”; (2) “sinews (new) new.” My answer ist that, in both, I used process (a) in Rule 4. In (1), I found that, by removing the suffix “ing,” I obtained two real words, “infest” and “reasonest,” both ending with “e, s, t,” which letters are therefore “barred.” Similarly, in (2), by removing the suffix “s” from “sinews,” I obtain two real words, “sinew” and “new,” both ending with “n, e, w,” which letters are therefore “barred.”

Stellaria also asks why I rejected the Syzygy “partially (all) all.” My answer is that I did *not* reject it. Her Chain, containing it, is the one I have scored.

Stellaria also inquires whether the following Syzygies would be lawful:—“indulge (ndul) unduly” and “incredulous (incr) idiosyncrasy.” My answer is that they would.

Toofdiarb is “not quite clear as to whether a plural would be allowable or not.” Well, that depends: *some* would, and some *wouldn’t*. Here, for instance, is a lawful Syzygy, “trucks (uck) buckle”; for, though “buck” is a real word, it cannot be identified with the “buck” in “buckle.” And here is an unlawful one, “trucks (uck) ducking”; for “truck” and “duck” are both real words, and retain their identify after losing their suffixes.

Scores for Problem 27.

“a HAPPY NEW.”

The highest score reached is 14. This has been attained by two Competitors, *Chute* and *Lady Margaret*, who send the same Chain, viz.

HAPPY
(happi)
chapping
(pin)
pine
(ne)
NEW

Scores for Problem 28.

“YEAR to ALL.”

The highest score reached is 22. This has been attained by five Competitors, *Auntie*, *Flora Fox*, *Foggs*, *H. H.* and *Quercusonis*, who send the same Chain, except that *Auntie* has “tallies,” and *Quercusonis* “rallies.”

YEAR
(ear)
earliest
(lies)
sallies
(all)
ALL

Scores for Problem 29.

“This FESTIVE SEASON.”

The highest score is that of *Chute*, viz. 24. His Chain is

FESTIVE
(esti)
destine
(stin)
breasting
(reas)
unreasoning
(eason)
SEASON

February 25, 1892

The Problems for this week are

- (36) OH, DO
- (37) *Change* DOUBT to CERTAINTY.

The “First-Chains” for these must be received by (or before) the first post on Tuesday, March 1st. The rejected words, &c., will be published on March 10th. The “Second-Chains” will be due on Tuesday, March 15th. And the scores will be published on March 24th.

I should be grateful if Competitors would kindly desist from sending *whole* note-sheets when they only write on the first half. They should bear in mind

the good old nursery rhyme—"For wilful waste makes woeful want, and you may live to say, 'How much I wish I had the blank half note-sheet that then I threw away!'"

Parody on *The Crust of Bread* by James Currie

Lewiston was, through my carelessness, defrauded of the chance of sending in a "Second Chain" for Pr. 30. I ought to have warned her, on January 28, that her "First Chain" was too short, having only one link; and I offer my humble apologies. Not that it can be held, as certain, that she *would* have tried again, if warned; for I observe that a warning was given her, as to Pr. 31, but given in vain: no "Second Chain" appeared. The Lion, when in quest of prey, is said to differ from the Tiger, in that, while the Tiger, having missed his prey, will spring again and again, the Lion makes *one* spring only, and, if that fails, utters one loud roar of disappointment, and returns to his den. Possibly *Lewiston* may have taken the Lion, rather than the Tiger, for her model in life. It is a grander style of hunting, no doubt: but it has its drawbacks; to the Lion it sometimes means "no dinner," to the Syzygy-hunter, "zero."

To *S. C. G.* I offer, as I have done to *Lewiston*, my humble apologies; and I beg her to take to herself all I have said to her predecessor.

Stellaria asks where it is forbidden to send in a Chain containing only one link. My answer is that a series of 3 words is *not* a "Chain," (see Def. 2), and so could not be scored.

Scores for Pr. 30.

"*Make* BULLETS *of* LEAD."

The highest score reached is that of *Toofdiarb*, 18: her Chain is

BULLETS
(let)
replete
(ple)
plea
(lea)
LEAD

Scores for Pr. 31.

"SHOOT *an* APTERYX."

The highest score reached is that of *Osrice*, 19: his Chain is

SHOOT
(hoo)
hoopst
(pest)
pestering
(teri)
APTERYX

Rejected Words, &c., for Pr. 33. coniferous, fifer, sifter

Rejected Words, &c., for Pr. 34. comestible, medicate

March 3, 1892

The Problem for this week is

(38) "DEMAND a CORMORANT."

The "First-Chains" for this must be received by (or before) the first post on Tuesday, March 8th. The rejected words, &c., will be published on March 17th. The "Second-Chains" will be due on Tuesday, March 22nd, and the scores will be published on March 31st. Anyone can send in Chains on (or before) March 22nd, whether they have, or have not, sent in any "First-Chains."

My present intention is to set two more non-competitive Problems and then (after completing the pamphlet, and allowing full time for any Competitors, who wish, to procure copies of it) to hold the Second Prize-Competition, for which *The Lady* will give two Prizes, of 20s. and 10s., and I will present to each of the next four Competitors a "Wonderland Postage-Stamp Case" and a copy of "Eight or Nine Wise Words about Letter-writing."

Novice may like to know that I have had to erase part of her Chain for Pr. 35. It contains "miniature (ature) mature (atur) natural." Here, by Rule 11, I erase "(ature) mature." The resulting Syzygy is lawful; but the Chain (the only one sent in by her) cannot be scored, owing to other defects, named in Rule 2; 1, 3, 4, 5.

N. S. L. may like to know that I have had to erase part of her Chain for Pr. 35. It contains "arrival (ar) jargon (argon) pelargoniums." Here, by Rule 11, I erase "jargon (argon)." The resulting Syzygy is lawful, however, and the Chain can be scored.

S. C. G. may like to know that I have had to erase part of her Chain for Pr. 35. It contains "arrival (arg) enlarge (larg) pelargoniums." Here, by Rule 11, I erase "enlarge (larg)." The resulting Syzygy is lawful, however, and the Chain can be scored.

S. C. G. asks how it is that *Chute's* Chain for Pr. 29 was not rejected, as containing two consecutive Links, "breasting" and "unreasoning," both of which end with "i, n, g." The effect of their doing so is, by Rule 5, that these 3 letters are "barred" from being used in the intermediate Syzygy; and they are *not* so used. The Syzygy "reas" is lawful.

To *Tortoise* I offer my humblest apologies for having omitted to warn her, on February 11th, that neither of her Chains for Pr. 32 could score anything. One was "indulge (ind) bind (in) syncope (sinc) idiosyncrasy," where the Syzygy "in" is part of each of the adjoining Syzygies. This obliges me to erase, in accordance with Rule 11, not only "(ind) bind," but also "syncope (sinc)," thus making the Chain too short to satisfy Def. 2. The other Chain contained the word "hindings," which I believe to have no existence.

Scores for Pr. 32.

"INDULGE an IDIOSYNCRASY."

The highest score reached is 23. This has been attained by two Competitors, *Auntie* and *St. Helier*, who send the same Chain, viz.:—

INDULGE
(ndul)
unduly

(duli)
incredulity
(incr)
IDIOSYNCRASY

Words rejected in accordance with Rule 2:
aricular, captivation, enconium [non-existent], pellerene, pellerine, shindy

March 10, 1892

The Problem for this week is

(39) “*Go from LONDON to PARIS.*”

The “First-Chains” will be due on Tuesday, March 15th. The rejected words, &c., will be published on March 24th. The “Second-Chains” will be due on March 29th. And the Scores will be published on April 7th.

Now that every Syzygy-competitor has the opportunity of testing whether any word will or will not be rejected, by sending it in a “First-Chain,” I shall feel no scruple in rejecting a word contained in a “First-Chain” which lies on the boundary-line between “ordinary” and “extraordinary,” or even a word which is clearly “ordinary,” if I see good reason for so doing. Nobody will be wronged by such a course, as every one will have the opportunity of sending in a “Second-Chain” *not* containing the forbidden word. One reason which would cause me to forbid an “ordinary” word might be that it made the puzzle too easy. There might be some very obvious word, leading to a Chain scoring high and yet needing no mental effort to discover, which is exactly the kind of Chain which I wish to render impossible. For instance, suppose I were to set the Problem “Prevaricate in Mesopotamia,” and that forty identical “First Chains” were sent in, all containing “mutton” as a Link, and all scoring very high. I should say to myself “Dear me! I never intended it to be so easy as *this!* I must forbid ‘mutton’ as a Link.” And the set of Second-Chains would then be a much better test of mental skill than the “First Chains” had been. Of course, if I had foreseen how easy it would be to make the “mutton” Chain, I would have forbidden it when setting the Problem; but it might happen that I did not notice it till the “First-Chains” had come in. In rejecting a word that occurs for the first time in a “Second-Chain,” I shall, of course, limit myself to the “ordinary” test.

N. S. L. sends me an interesting letter, for which I am grateful—specially for his sympathy with me in my “hard task,” as he truly calls it. He charges me with being “rather arbitrary,” in rejecting words. I have dealt *generally* with this matter in the first paragraph of this article; but the *particular* words which he mentions were all rejected on the score of violating Rule 2: which position I now proceed to defend.

(1) “*Debouch.*”—He says he has come across the word “in reading”; and that a friend tells him he uses it and that “there is no other word to express the meaning.” All this may be true, without affecting the fact that it is a word only used by specialists [see Rule 2 (b)]—viz, either Fellows of the Royal Geographical Society or military men. I have not mixed much with either class, and, to the best of my belief, have never heard it used in “conversation” [see Rule 2 (b)] in the whole course of my long and disreputable life.

(2) "Hindustani."—He thinks I rejected it as mis-spelt; and offers other spellings. Now, first, I do *not* reject a word, merely for being mis-spelt; but only reject the Chain, containing it in case the correction of the mis-spelling spoils a Syzygy. *All* his spellings of "Hindustani" are correct, so far as I know, but *no* spelling of it can make it cease to be "a proper name, usually spelt with a capital letter" [see Rule 2 (c)].

(3) "Incrust."—He says, most truly, that "'incrusted' is a very common word in common conversations;" and grants that "incrust" is not *so* common. In my opinion, it is not *at all* common. I never heard it used. I hold that "crusted" and "incrusted" (or "encrusted") are really derived from the substantive "crust," just as "talented" is from the substantive "talent."

(4) "Hoopest."—He takes me to task for having *accepted* this word, while rejecting the word "fifer." He asks me what *I* would "say, when speaking of the drummers and fifers of a regiment." I reply that I have never yet had to speak of "fifers"; but I admit that "fifer" lies very near the boundary-line. As to "hoopest," I have already laid down the principle that, if a verb be an "ordinary" word, I cannot forbid Competitors to *conjugate* it; and I cannot exclude *Quakers* from this Competition! I hold that "to hoop a barrel" is an "ordinary" phrase. I would *not* (as *N. S. L.* suggests) say to my child "Thou hoopest, I hear"; though I *would* (if I were a Quaker, and if I had a child, and if that child suffered from "pertussis"), mildly remark to him "Thou whoopest, I hear".

Bittern's "First Chain" for Pr. 37 cannot be scored. It contains "doubt (doub) re|double."

E. L. W. and *S. C. G.* take me to task for having accepted "hoopest" as an "ordinary" word. I can but refer them to what I have already said to *N. S. L.*, which I hope will satisfy them, but there seems to be, in some minds, a deep prejudice against allowing *Quakers* to join in this Competition! Really they are a most kindly and estimable set of people, and do not deserve to be so summarily ostracised.

Mimosa had better study Rule 1 in the Code published on January 14. Her Chains for Pr. 36, 37, are not "Chains" at all. They contain no Syzygies!

N. S. L.'s Chains for Pr. 30, 31, now reach me for the first time. Here are his scores—(30) 9, 3, 29; 2, 9, 13: 16. (31) shoot (sho) a|shore, 0.

Persevere's "Second-Chain" for Pr. 32 came too late to be entered on the List of Scores. Here is her Score:—10, 2, 22; 2, 11, 15: 7.

Toofdiarb points out that her proper Score for Pr. 30 was "17," and not "18" as I made it. I find she is right; and I beg pardon, humbly, but hopelessly; for to say that a young lady is 18, when she is only 17, is surely an unpardonable libel!

Words rejected for Pr. 36, 37.

"OH, DO *change* DOUBT to CERTAINTY!"

blent, oubliette, stead.

Scores for Pr. 33

"Set KNIFE by FORK."

Auntie's "First-Chain" was too short; and I accidentally omitted to warn her of this on February 25th, for which I humbly beg her pardon.

[N.B.—The symbol “0*” means “less than zero.” The symbol “[r. b.]” means “Refer back to *The Lady* for February 25th, where the reasons for rejecting this competitor’s Chains were stated.”]

The highest score reached is that of *Toofdiarb*, 21. Her Chain is as follows:—

KNIFE
 (nife)
manifest
 (man)
workman
 (ork)
FORK

Scores for Pr. 34

“WELCOME a FRIEND.”

N. S. L. ought to have been warned on February 25th (I humbly beg pardon for the omission) that his only “First-Chain” could not score, as it contained “horse (ors) dorsal (dors) endorse,” in which I erase, by Rule 4, “dorsal (dors),” leaving “horse (ors) endorse,” which, by Rule 4, is an unlawful Syzygy.

Rosemary was warned, on February 25th, that one of her “First-Chains” contained an unlawful Syzygy; but I omitted to notice that the other did so also. I humbly beg her pardon.

The highest score reached is 25. This has been attained by two Competitors, *Auntie* and *H. H.*, who send the same Chain, viz:—

WELCOME
 (come)
comely
 (meli)
ameliorate
 (orat)
oratories
 (orie)
orient
 (rien)
FRIEND

March 17, 1892

The Problem for this week is

(40) “Buy ‘*The Lady*’ every
WEDNESDAY AFTERNOON.”

The “First-Chains” will be due on Tuesday, Mar. 22nd. The rejected words, &c., will be published on Mar. 31st. The “Second-Chains” will be due on Tuesday, Ap. 5th. And the scores will be published on Ap. 14th. Any one can send in Chains up to Ap. 5th, whether she has sent in “First-Chains” or not.

In Rule 6, I wish to make the following addition, which will, I think, give a little more variety and interest to this puzzle:—“The letters “u” and “v” may be treated as if identical. Hence the following Syzygy is lawful:—

question
(ves)
vessel

Rejected Words etc. for Pr. 38

“DEMAND a CORMORANT.”

In what follows, the symbol [0] after a name, means “has sent in no Chain which can be scored”; the symbol [1] means “has sent in at least one.”

Ettelra [0] has sent, for Pr. 38, a series of words, no doubt meant for the Links of a Chain: but, as there are no Syzygies, it is not a “Chain” at all. She may as well be told, however, that, in the 2 words “remain, remorse,” which she has put consecutively, the letters “r, e, m,” are, by Rule 3 “barred” from being used in a Syzygy.

H. H. is entreated to accept my humble apologies (N.B.—I seem to be *always* apologising just now! When my Biography is published, it ought to be called “An Apology for the Life of Lewis Carroll”) for my mistake in publishing the scores for Pr. 30. The highest Score reached was “17,” not “18”; consequently *H. H.* was one who attained it; and his Chain ought to have been published. Here it is:—

BULLETS
(ets)
jetsam
(sam)
sample
(ple)
plea
(lea)
LEAD

I must also apologise to *H. H.* for not having warned him that one of his Chains for Pr. 35 (which would otherwise have scored 25) contained “multiplies (lies) loneliest,” in which the letters “l, i” are barred, thus reducing the Syzygy to “es.”

Skirmisher [0] has sent in one Chain only, in which she has put 2 Links consecutively, with no Syzygy between them. They are “natural, morals (or moralise).” Here, by Rule 7, I must put in a one-letter Syzygy, if I can find one. There is one: the first “a” in “natural” can be linked with the second in “moral.” This is the only possible Syzygy, as the letters “r, a, l” are barred by Rule 4. But, having thus supplied the missing Syzygy, I then have to deal with “emanate (nat) natural (a) morals (mora) cormorant.” Here, by Rule 11, I must erase “(nat) natural” and also “morals (mora).” The Chain is now reduced to “demand (eman) emanate (a) cormorant,” in which I must, by Rule 11, erase “(eman) emanate.” This reduces the Chain to “demand (a) cormorant,” thus making the Problem do duty as answer to itself! But it is too short to be regarded as a “Chain” at all.

Stellaria [1] has sent in a chain containing “cormorant (rmor) armorer (ore) foreman.” I cannot accept “armorer,” as spelt, as an “ordinary” word. After

correcting it to “armourer,” I must then, by Rule 10, reduce the first Syzygy to “rmo,” and the second to “re.”

Rejected Words:
“mandatory,” “orangery”

Scores for Pr. 35

“CULTIVATE PELARGONIUMS.”

The highest score reached is that of *Rosemary*, 25. Her Chain is

CULTIVATE
(cul) difficulty
(icul)
gesticulate
(gest)
largest
(larg)
PELARGONIUMS

March 24, 1892

[...] ¹⁷

(3) *For all Wrestlers with Syzygies.*—In all Lists of Rejected Words, &c., the symbol “[0]” appended to a Competitor’s name, means “she has sent in *no* Chain which can be scored”; any other figure, so appended, means that she has sent in that number of scorable Chains. In the List of Scores, the symbol “[r. b.]” means “refer back to the No. of *The Lady* which contained the Rejected Words, &c., for this Problem, where reasons were given for rejecting all her First-Chains: she has sent no Second-Chain.” Such a symbol as “(serva) (se) 6 f,” means “she claimed the Syzygy “serva”; I had to reduce it to “se,” so, by Rule 10, she forfeits 6 marks for the three unlawful letters; these will be deducted from her Score.” And the symbol “0*” at the end of a Score, means “the Score really comes out less than nothing: this Competitor may think herself very lucky in getting as much as zero!” Any one may send in Chains for a Problem up to the date fixed for receiving “Second-Chains,” whether she has, or has not, sent in any “First-Chains”.

The Problem for this week is

(41) “WRITE *a* NOVEL.”

The “First-Chains” will be due on Tuesday, Mar. 29th. The rejected words &c. will be published on Ap. 7th. The “Second-Chains” will be due on Tuesday, Ap. 12th. And the Scores will be published on Ap. 21st. In reference to this Problem, I may as well mention that the “e” in “write,” though it is a suffix, and one that the Scorer could lawfully exchange for another (e. g. “ing”), yet it is one he could not lawfully erase, leaving only the word “writ”: for, though “writ” is a real word, it is not the basis of “write.” Hence “write (it) bit” would be a lawful Syzygy; but “write (it) biting” would be unlawful.

¹⁷Remark: Under the headline “Three Things to Think About” appear as first two (with numbers) “For All Lovers of Children” (→ 19.10, p. 2470) and “For All Writers of Letters” (→ 19.11, p. 2471).

I have a most humiliating confession to make about the Score-list, published February 18th, for Pr. 28, "YEAR to ALL"—it is that I marked *seven* of the Competitors wrongly! For this I can only plead that the Rules are as new to *me* as they are to you, and that, in the hurry of finishing the List to catch the post, I overlooked flaws which take off a great deal from the Scores of the (shall I say "lucky" or "unlucky"?) seven. *Auntie's* Chain contained "earli|est (lies) talli|es," in which "l, i" are barred by Rule 4, so that I must reduce the Syzygy to "es," and deduct "4," as forfeit, from the Score. Hence the Chain, published as worth "22," ought to have been scored "19, 2, 21; 2, 6, 10: 7." Similarly *Flora Fox, Foggs, H. H.*, and *Quercusonis* ought all of them to have been scored "7" instead of "22." *Persevere's* Chain contained "earli|er (lie) ralli|es." Here "l, i" are barred letters; so the Syzygy must be reduced to "e," and "4" deducted as forfeit. Thus her Score is 9, 1, 15; 2, 7, 11: 0. *Stellaria's* Chain (the one I scored as her best) contained "hartily (arti) partially." Here "a, r, t" are barred letters: so the Syzygy must be reduced to "i," and the Score of *that* Chain comes out less than zero. She has, however, sent in other Chains, the best of which scores "9, 2, 21; 2, 4, 8: 13." The net result of all this is to make *Weetoo's* Score the highest, viz. "20." Her Chain is

YEAR
 (ear)
 earth
 (art)
 partially
 (all)
 ALL

H. H.'s "Second-Chain" for Pr. 33 *was* rejected on account of "conifer," which seems to me to come under the same category as "coniferous," both being words used only by *specialists*.

H. H. asks whether the following is a lawful Syzygy:—"honesty (esti) resting." The letters "e, s, t" are barred by Rule 4; but the letter "i" may lawfully be used as a Syzygy.

N. S. L. again objects to my acceptance of "hoopest," as being not ordinarily heard except among Quakers. My rule is (I say it for the third time, and "what I tell you three times is true," as Milton or some other poet has said) to apply the "ordinary" test to the *infinitive* only of a verb, and, if *that* be admitted, to admit *all* the grammatical inflexions. Thus, having admitted "to snuff a candle" as an "ordinary" verb, I accept "snuffs, snuffed, snuffing, snuffest, snuffeth, snuffedst," though I never heard any human being any of the last three! But we are nothing if not grammatical.

N. S. L. further asks if I would admit "pertussis," "snark," and "hooper" as "ordinary" words. Most certainly not! The first is only used by specialists; the second, though used by one extravagant writer, has not yet been admitted into the English language. The third I will accept, as soon as *N. S. L.* has found ten persons, *outside Hanwell*, who habitually use it.

N. S. L. finally asks, "do you say there is no such verb as to incrust?" No. But I think the order of formation was, first the participle "incrusted," formed from the substantive, and fairly common; then the verb "to incrust," formed from the participle, and very uncommon. In the same way we have, from the

Quoted from *The Hunting of the Snark*
 by Lewis Carroll

substantive “suicide,” the fairly common participle “suicide”; but the verb “to suicide” is so far from being common that it *doesn't yet exist!*

Queenie's Chains for Pr. 33, 34 were sent without any name, and with “The Lydiate,” in inverted commas, at the top: so I supposed them to have come from some new Competitor, whose “nom-de-plume” was *The Lydiate*, and scored them as such.

Quercusonis thinks that I ought, in accordance with Rules 3, 4, to have rejected the Syzygies “wel|come (come) come|ly” and “work|man (ork) fork,” in the same way that I rejected “retail (ail) ail|ment.” By Rule 5 I may not regard “wel” as a prefix; and though “ly” is a suffix, yet its removal would cause the syllable “come” to change from an adjective to a verb, and thus to lose its identity. Also, by Rule 5, I may not regard “man” as a suffix. But, in the word “ailment,” “ment” is neither a noun nor a verb, but a mere suffix. Away with it!

[...] ¹⁸

The Problem for this week is

(42) “*get FISH out of WATER.*”

The “First Chains” will be due on Tuesday, April 5th; the Rejected Words, &c., will be published on April 14th; the “Second-Chains” will be due on Tuesday, April 19th; and the Scores will be published on April 28th.

The above problem is the first of Seven Prize Problems, which will form one continuous, convivial sentence. The Rules are not yet in a sufficiently perfect state, nor sufficiently understood, to give Prizes in *money*; so the winner of the first prize shall have the choice of “A Tangled Tale,” “The *Hunting of the Snark*,” “Alice’s Adventures Under Ground,” and the best edition of the “Nursery Alice”; the second on the list shall have the choice of “The Game of Logic” and the People’s Edition of the “Nursery Alice”; and the third and fourth shall have “Wonderland Postage-Stamp Cases,” with the accompanying “Wise Words.”

New Definition

6—If a prefix to a word can be removed, or if it can be replaced by another prefix, the word, so formed, being real and etymologically the same as before, it is called a “removable” prefix. And the same is true of a suffix.

New Edition of Rules 3, 4

3—When two adjacent words, in a Chain, begin with the same set of letters, or end with the same set, every such letter is barred with regard to the corresponding letter of the other word.

Thus, the Syzygy “dog (do) door” is unlawful, but “don (on) onion” is lawful, even though both words end with “on”; since the “on” at the *end* of “don” may lawfully be linked with the “on” at the *beginning* of “onion.”

Thus the “un” and the “est” in “unhappiest” are removeable: so also are the “con” and “ing” in “convoking,” since they may be replaced by “re” and “es.” But the “re” in “restoration” and the “s” in “victuals” are *not* removable.

4—When two adjacent words in a Chain are such that, by removing certain “removable” prefixes, or suffixes, they can be made to begin with the same set of letters, or to end with the same set, every such letter is “barred” with regard to the corresponding letter in the other word.

Thus the Syzygies “unhappiest (hap) happen” and “unhappiest (pi) copy” are unlawful. So also is the Syzygy “choral (or) scoring,” since the “al” and “ing” may be replaced by “us” and “e.” But the Syzygies “restoration (sto) stoker” and “animal (al) victuals” are lawful.

It would greatly diminish the misery of existence for me if competitors would kindly forbear from sending, on *one* piece of paper, Chains for Problems set at *different* times.

Stellaria has sent in fresh Chains for Pr. 37, “Change DOUBT to CERTAINTY” too late to appear in the Score list. The best one scores “13, 4, 43; 4, 13, 21: 22.” She also says she did not offer the Chain “demand (and) abandon (ban) banter (ant) cormorant,” because “ban” and “band” are both real words.

¹⁸Remark: Under the headline “Things to Think About” appear (with numbers) “For All Lovers of Children” and “For All Wrestlers with Syzygies” (reprinted from March 24).

So they are, but they are not portions of “abandon” or “banter,” nor can the “on” and the “ter” be regarded as suffixes. It would have been a lawful Chain.

Rejected Words, etc., for Pr. 40.

“WEDNESDAY AFTERNOON.”

Collectedness, intern, landrate, lusterless, raftered, stern-sheets, undisdained.

(oran)	(oran)
CORMORANT	CORMORANT

April 7, 1892

[...] ¹⁹

The Problems for this week are

(43) “COOK *it* for DINNER.”

(44) “INVITE *a* GUEST.”

The “First-Chains” will be due on Tuesday, April 12th. The Rejected Words, &c., will be published on April 21st. The “Second-Chains” will be due on Tuesday, April 26th. And the Scores will be published on May 5th. In this Prize-Competition, if I have to score any one “0” for a mistake, in a “First-Chain,” of which I had given no warning, that Problem shall not count in the final Score, but another shall be set instead.

In the “New Edition of Rules 3, 4,” published March 31st, the third paragraph, beginning “thus the ‘un,’” should be erased, having been printed by mistake: an amended version of it stands as the fifth paragraph.

A Chain has been sent in, for Pr. 39, without name or address: its links are “sardonic” and “leopard”: I have scored it as “*N. S. L.*,” as it looks like her hand, and is on the same coloured paper as she has used.

Bittern asks why, in the Syzygy “endearing (eari) bearish,” the letters “e, a, r” are unlawful. It is because, by omitting the suffixes “ing” and “ish,” I produce two real words, “endear” and “bear,” both ending with “e, a, r.”

Queenie asks if I received her “Second-Chain” for Pr. 36 and her “First-Chain” for Pr. 39. Neither, I am sorry to say.

S. C. G. is entreated not to use the same symbol for “h” and “N”: it is bewildering.

¹⁹Remark: Under the headline “Things to Think About” appear (with numbers) “For All Writers of Letters” and “For All Wrestlers with Syzygies” (reprinted from March 24).

Toofdiarb is thanked for her suggested rule for the Prize Competition, which, as she will see, I have adopted.

April 14, 1892

[...]²⁰

The Problems for this week are

- (45) “PROVIDE CHAMPAGNE,”
- (46) “SPREAD *the* BANQUET.”

The “First-Chains” will be due on Tuesday, April 19th. The Rejections will be published on April 28th. The “Second-Chains” will be due on Tuesday, May 3rd. And the Scores will be published on May 12th.

Permit me to begin with one serious remark. I would entreat my correspondents to remember that texts of the Bible should never be lightly or playfully alluded to, but should be quoted seriously, if quoted at all.

Bittern is entreated to accept my apologies for not having warned her that in “in|credible (ncre) un|created,” the letters “cre” are barred. She would no doubt, but for my negligence, have sent in a better Chain.

Euterpe gives various reasons for thinking that I did not act fairly in rejecting the word “hooper” and in accepting the word “hoopest.” As any reply I could make would simply be a repetition of what I have already said, I will ask her to be kind enough to refer to *The Lady* for March 10th, first paragraph, and for March 24th, first answer to *N. S. L.*

Euterpe also asks “to whom should I be expected to send if my water-butt required repairing”? I think a *cooper* be the proper person to send for. She is also “inclined to believe that the word ‘hoopest’ has not been used by any one in the United Kingdom for the last fortnight.” I entirely coincide in her belief.

Quercusonis supposes that, as “tingest (nges) oranges” was allowed, so also “confiscates (ates) latest” will be allowed. The former was allowed, in accordance

²⁰Remark: Under the headline “Things to Think About” appear (with numbers) “For All Lovers of Children” and “For All Wrestlers with Syzygies” (reprinted from March 24).

with the rules published January 7th: the latter comes under the operation of the revised rule published March 31st. I hold that, in “confiscate|s,” the “es” is a removable suffix, which has taken the place of “e” in “confiscate”; and similarly for the “est” in “lat|est.” By removing these suffixes I make the words “confiscate,” “late,” which end with the same 3 letters. Hence the letters “a, t” are barred. Hence the Syzygy must be reduced to “es.” Had the given words been “confiscate” and “late,” of course the letters “a, t, e” would have been barred. But, in the present case, the “e” is part of the suffix, not of the word itself, and therefore is not barred.

S. C. G. is also entreated to accept my apologies. I ought to have warned her that in “terminate (ter) rafter (after) afternoon,” I must erase “rafter (after),” thus leaving “terminate (ter) afternoon,” which, however, is a lawful Syzygy.

Scores for Pr. 40

“WEDNESDAY AFTERNOON.”

The highest score reached is 28. This has been attained by 2 Competitors, *Auntie* and *Weetoo*, whose Chains are:—

²³ Remark: Under the headline “Things to Think About” appear (with numbers) “For All Writers of Letters” and “For All Wrestlers with Syzygies” (reprinted from March 24).

The Problems for this week are

(47) "CONVERSE CHEERFULLY":

(48) "FEAST *till* MIDNIGHT."

These conclude the Second Prize-Competition. The "First-Chains" will be due on Tuesday, April 26th. The Rejections will be published on May 5th. The "Second-Chains" will be due on Tuesday, May 10th. And the Scores will be published on May 26th.

Kelpie has sent in, for Pr. 41, a Chain containing no Syzygies at all! It is "write, rite, item, stem, stove, novel." For its 1st Syzygy, "r, i, t, e" are barred; for its 3rd, "t, e, m;" for its 4th, "s, t." So only three Syzygies are possible, viz. "rite (ite) item" and "stem (e) stove (ove) novel." *Kelpie* should refer to *The Lady* for Jan. 7th and March 31st, and study the Rules. She will then succeed better.

Leta's pardon is humbly begged, for not having named her on April 7th, as sending the same unlawful Syzygy as *Rosemary* did.

Lion and Tiger send 2 Chains for Pr. 43. One contains "cook (ook) look|ing (king) king|dom (ing) call|ing" and "nation|al (ation) generation": the other contains "king|dom (ing) right|ing (right) alright." Every Syzygy, here quoted, is unlawful.

Rosemary sends (in proper time, but accidentally not forwarded to me) a "Second-Chain" for Pr. 40 ("Wednesday Afternoon"). It contains "bless|edness (less) restless," which is an unlawful Syzygy.

Skins wants the Pamphlet on Syzygies, if ready, but does not know how to get it, nor what it will cost. It will be announced when ready: to be had at *The Lady* Office: price not yet fixed, but will certainly be *less* than five guineas.

Toofdiarb sends for Pr. 39 ("London—Paris"), a Chain which scores "12, 3, 32; 3, 9, 15: 17." It is a duplicate of one sent previously, but accidentally overlooked. I am very sorry to have been so careless. *Mentally*, I prostrate myself at her feet, and cast ashes on my head; but I trust she will excuse me from doing it *practically*, as they are so difficult to brush out afterwards.

Toofdiarb thinks "condonation (ation) ration|al" is a lawful Syzygy, "because, if you cut off the 'al' from 'rational,' you leave 'ration,' which is a different word." But it is *not* a "different" word; "ration" is the very word from which "rational" is formed by adding the suffix "al."

Toofdiarb also asks why I accepted the Syzygy "tingest (nges) oranges" (see Mar. 31), and yet rejected "condonation (ondon) apparitions" (see Ap. 7). If she will refer to Rule 4, published Jan. 7, and try the 3 processes, there named, upon the first of these instances, she will find that no one of them yields a pair of real words. Process (a) gives "ting, orang"; process (b) gives "tinges, orangest"; and process (c) gives either "tinges, orang," or else "ting, orangest." As to the second instance, it is enough to say that "ondon" is *not* a part of "apparitions." No doubt she *meant* to put "tion"; but even *this* would not have been a lawful Syzygy, since "condonation" and "apparition" are both *real* words.

Toofdiarb also asks, "Why do you allow one conjugation" (she means "inflection") "of a verb and not another? You would allow 'stonest,' but not 'stoned' or 'stones.'" My answer is that I would accept all three. She seems to have been misled by my rejection, on Oct. 8th, of "stoner, stonings" (both being non-ordinary substantives), and of "head-stones" (rejected because it contained a hyphen).

Rejections for Pr. 43: bouncer, look-out, scooper, tinnest

Rejections for Pr. 44: book-shelf, editress, tantrum, untested, Vestal

Scores for Pr. 41

“WRITE a NOVEL.”

The highest score reached is that of *Osrice*, 27. His Chain is:

WRITE
 (rite)
meritest
 (test)
testy
 (esti)
destines
 (ines)
loveliness
 (ovel)
NOVEL

April 28, 1892

[...]²⁴

I think it best to set no more Problems until the pamphlet is completed, when I hope, after setting a few experimental Problems, to begin the Third Prize-Competition.

Q. E. D. enquires why, on April 14th, I gave the first Syzygy, in each of the published Chains for Pr. 40, “WEDNESDAY-AFTERNOON,” as “edness,” seeing that there is only one “s” in “Wednesday.” Let me recommend the following as a healthy mental attitude for all readers of the “Syzygy” Article. Here is “edness” given as a Syzygy to follow “Wednesday.” What an ignorant scorer we have got! But stay. It may be a misprint. Such a thing might happen, even under the eye of that dazzling genius, that greatest of all great men, that &c., &c. (*ad libidum*). This can be very simply tested. If he wrote “edness” as the Syzygy, the first number of the Score would be “16”: if “ednes,” it would be “15.” It *is* 15. Therefore he wrote “ednes.” Therefore “edness” is a misprint, *Q. E. D.*

Stellaria sent in for Pr. 42, the Chain “fish (fis) kingfisher (king) risking (risk) asterisk (teri) material (ater) water.” This only scores 12: but, if she had put “fish,” instead of “fis,” as her first Syzygy, it would have scored 26!

Rejected Words for Pr. 45.

“PROVIDE CHAMPAGNE”:

cadency, improves, magnetizer.

Rejected Words for Pr. 46.

“SPREAD *the* BANQUET”:

(ater)
WATER

May 5, 1892

[...] ²⁶

It would save me some trouble if Competitors would kindly refrain from sending, on the *same* paper or card, Chains in answer to *different* Problems.

Lion and Tiger have sent in 3 “Second-Chains” for Pr. 44. Two of them contain “iterate,” which I cannot accept as an “ordinary” word. The other contains “manifest (est) guest,” which is an unlawful Syzygy. I have scored their only “First-Chain,” which could be scored at all. “I give thee all, I can no more, Though poor the offering be. A round duck’s egg is all the score That I can offer thee!” (May 5, 1892)

Parody on *My Heart and Lute* by Thomas Moore

Ne Cede Malis has sent in one Chain only for Pr. 43. It contains “meter (er) nerve (ner) dinner,” in which I must erase “nerve (ner),” thus leaving “meter (er) dinner,” which is an unlawful Syzygy.

Q. E. D. has sent in 2 Chains for Pr. 43. One contains “poker (poke) bespoke.” Here, by removing from “poker” the suffix “er,” and replacing the “e” which is supplanted, I get “poke (poke) bespoke,” which is an unlawful Syzygy. The other Chain contains “bother (ther) withers (ithe) neither.” Here I must first complete the Syzygy “ithe,” by adding the “r” which *Q. E. D.* has omitted, and must then erase “withers (ither),” thus leaving “bother (ther) neither,” which is an unlawful Syzygy.

Scarborough is the postmark on a post-card, containing Chains for Pr. 43, 44, with no name or address. They are called “Second-chains,” but I cannot find any “First-Chains” in the same hand, and so have entered them under the above name.

Skins, if a good cricketer, may perhaps someday play in a match where her side wins the game in one “inning.”

²⁵accidentally “perambulate”

²⁶Remark: Under the headline “Things to Think About” appear (with numbers) “For All Writers of Letters” and “For All Wrestlers with Syzygies” (reprinted from March 24).

Stellaria “concludes” that I rejected the Syzygy “manner (nner) dinner” because the verb “to manner” is non-existent. It was not so much because “manner” does *not* exist as a *verb*, as because it *does* exist as a *noun*. She also asks whether “look-out” is not generally written as one word. It is so, in dictionaries; but I cannot accept it, as my rejection may have prevented some one from using it.

Rejected words: turn-overs.

Scores for Pr. 43:

“COOK it for DINNER”

The highest score reached is 20. This has been attained by seven competitors, *Auntie*, *Carrot*, *E. M. R.*, *H. H.*, *Lancashire Witch*, *Quercusonis*, and *Toby*, all of whom sent in the same chain:

COOK
 (coo)
scooping
 (pin)
pinned
 (inne)
DINNER

Scores for Pr. 44:

“INVITE a GUEST”

The highest score reached is that of *Quercusonis*, 31. Her chain is:—

INVITE
 (vite)
suiteth
 (teth)
tethering
 (ering)
meringues
 (gues)
GUEST

May 12, 1892

[...] ²⁷

Among the rejected words, for Pr. 46, published April 28, appears “perambulate.” This was a misprint for “preambulate.”

Carrot’s “First-Chain,” for Pr.45, was “provide (rovi) roving (ing) gingham (ham) hamper (hamp) champagne.” Here I ought to have erased, in accordance with Rule 11, “hamper (hamp),” and to have mentioned this in my List of Rejections. But I overlooked it. I therefore feel bound, now, to accept it as it

²⁷Remark: Under the headline “Things to Think About” appear (with numbers) “For All Lovers of Children” and “For All Wrestlers with Syzygies” (reprinted from March 24).

stands, or to correct it, whichever gives here the highest score. I have corrected it, and this scored her 18 instead of 17.

Lion and Tiger "had no idea that names of birds and animals were allowed." All words are allowed, unless forbidden by the Rules or rejected by the Scorer. They also demur my rejection of "ancestress," pleading that it is in common use. I said my say, on that point on Dec. 21, 1891; and, as the Rules have been changed since then, it seems hardly worth while to reopen any question relating to the old rules.

Q. E. D. did not understand that, when I said "get fish out of water," I meant "get water out of fish." I admit that I ought to have printed the Chain the other way up; but it would not have affected the score: also I laid it down, in Rule 1, that "it does not matter which given word is placed at the top."

Q. E. D. also cannot understand why, in the Chain "vinegar (nega) negation (ne) champagne," I erased "(nega) negation." It was in obedience to Rule 11, as published on Jan. 7.

Q. E. D. is also puzzled at my rejecting, as not "ordinary," words which are in the dictionary. Surely, if *this* were evidence of words being "ordinary," every word in the language would have to be accepted as ordinary! Would *Q. E. D.* accept "zumbooruk" as an "ordinary" word?

May 19, 1892

[...]²⁸

The scores for Pr. 47, 48, and the Total Scores for the Second Prize-Competition, now concluded, will be published on May 26.

N. S. L. asks why, in the Score-list for Pr. 43, published May 5, I rejected the Syzygy “cook (ook) rookery.” I did it in accordance with Rule 4, published March 31. By removing the suffix “ery” from “rookery,” I get, as two adjacent word, “cook” and “rook,” in which the letters “o, o, k” are “barred.”

N. S. L. also asks why, in the Score-list for Pr. 44, I put “[r. b.] 0” against her name. It meant “refer back to list of Rejections, for the Problem, published April 21.” By referring to it, she will see that her Syzygy “vestry (vest) guest” was rejected, as violating Rule 4, that “[0]” was appended to her name, indicating that she had sent in *no* Chain which could be scored.

N. S. L. also demurs my rejection, on May 5, of “turnovers” thinking apparently, that I rejected it as not “ordinary.” My reason was that it is a word which, in my judgement, ought to be spelt with a hyphen (see rule 2 (d), published Jan. 7).

Q. E. D. also demurs my erasure, on May 5th, of “withers (ither)” in her Chain “bother (ther) withers (ither) neither,” again assuming that it must have been because I thought “withers” to be a “non-ordinary” word. My reason was that the Syzygy “(ither)” contains the Syzygy “(ther),” and my erasure was in accordance with Rule 11, published January 7th, and in spite of the fact that she has written the second Syzygy as “(ithe)” instead of “(ither)”; for it is laid down, in Rule 12, that the penalty, awarded by the preceding Rule, cannot be evaded by writing shorter Syzygies than might be claimed, so as to avoid the result of one containing the other. She pleads that “withers” is a well-known word: which is perfectly true, of course, but is not relevant to the question.

Q. E. D. thirdly demurs my erasure, on May 5th, of “(aught) naughty,” in her Chain “distraight (aught) naughty (ght) midnight.” My reason was the same as the preceding case—viz., that one of these Syzygies contains the other, and must therefore, by Rule 11, be erased, as well as the intermediate link.

Q. E. D. fourthly demurs my rejection, on May 5th, of the Syzygy “shameful (ful) cheerfully,” adding “I wrote it, on purpose, as a test, to see if you would dissect your own word, and thus make it ‘cheerful,’ which is not the word we were to write to; and I hold this to be an unfair judgement.” I am sorry to be thought unfair; but I do not see how it can be so: I acted in strict accordance with Rule 4, published March 31st. The word “cheerfully” consists of “cheerful” and the suffix “ly.” Hence these two adjacent words, “shameful” and “cheerfully,” can be made, by removing this suffix, to end with the same set of letters—viz., “f, u, l.” Hence these letters are “barred.”

Q. E. D. fifthly complains that she cannot understand the Score assigned to her for Pr. 44, viz., “7, 2, 19; 4, 12, 20: 0*.” If she will turn to Rule 13, published Jan. 7, the following statement will, I hope, be intelligible. Her longest end-Syzygy contained 3 letters, and her shortest 2. Adding together ‘3’ and twice ‘2’, I get ‘7’ as the *first* number to record. Her shortest Syzygy contained 2 letters. Hence ‘2’ is the *second* number to record. The two numbers, next above ‘2’, are ‘3, 4’; and their product is ‘12’. Adding together ‘7’ and this product,

²⁸Remark: Under the headline “Things to Think About” appear (with numbers) “For All Writers of Letters” and “For All Lovers of Children” (reprinted from March 24).

I get '19' as the *third* number to record. Her Chain contained 4 Links and 12 waste letters. Hence '4' and '12' are the *fourth* and *fifth* numbers to record. Adding together twice '4' and '12', I get '20' as the *sixth* number to record. Now the score is "the remainder after deducting No. (6) from No. (3)." Hence, in this case the Score must be got by deducting '20' from '19'. But this is actually *less* than nothing! Which result I record (as explained in the paragraph, addressed to "all Wrestlers with Syzygies," which appears every week) by entering it as "0*."

Swerdna is puzzled by my acceptance, on May 5, of a Chain for Pr. 43, which contains "cook (coo) scooping." She says "I would have thought that the 'ing' could have been removed from 'scooping' and then added to 'cook,' thus leaving 'scoop,' a proper word." The "ing" is no doubt a removable suffix, but the words, left after its removal, viz., "cook, scoop," do not end with the same number of letters, so that there are no "barred" letters. The same explanation will apply to her second puzzles, viz., my acceptance, for Pr. 44, of a Chain containing "suiteth (teth) tethering," where she points out that "teth" and "ing" are suffixes. So they are, but the words, left after their removal, viz., "suit" and "tether," do not end with the same set of letters, so that here again there are no "barred" letters.

Swerdna also thinks I was very severe on *Stellaria* on taking her Syzygy as she wrote it (see May 5), "fis" instead of "fish," which would have scored much higher. "It was also evident," she adds, "that she had forgotten to put the 'h' on." Now, firstly, I think it quite fair that a player in a game should bear the result of his or her oversights. What would be thought of a player in a Chess Tournament who should say, "Oh, let me have that move back. I quite forgot it would place my Queen in check!" Secondly, if I once began putting in what writers had forgotten, where could I stop? *A* has *evidently* forgotten that she might have claimed another letter in this Syzygy: *B* has *probably* forgotten a similar thing; *C* has *perhaps* forgotten it: *D* has *possibly* forgotten it: and so on. I don't see where one could draw a line among these delicately shaded differences.

Toofdiarb also thinks that I was rather hard on *Stellaria*, in not supplying the "h" she had omitted to claim. She asks two questions about it, which I will reply to separately:—

(1) "Are you not obliged by the rules to use every letter in your Syzygy that could be used?" There is no such rule.

(2) "Did you not say you would rectify mistakes?" Not *all* kinds of mistakes, but only such as are specified in the rules.

May 26, 1892

[...]²⁹

H. H. writes "Surely 'risk|ing (risk) asterisk,' quoted by you from *Stellaria's* Chain for Pr. 42" (see Ap. 28) "would not have been a lawful Syzygy?" *H. H.* is quite right. I had overlooked this Syzygy, which, of course, spoils the Chain.

Lethe is thanked for the suggestion that I should, while the Syzygy pamphlet is preparing, set Mathematical Problems. It would be a very pleasant task, but would require more time than I can conveniently spare.

²⁹Remark: Under the headline "Things to Think About" appear (with numbers) "For All Lovers of Children" and "For All Writers of Letters" (reprinted from March 24).

Q. E. D.'s Second-Chain for Pr. 48 contains "sinecure (ecur) recur (ur) lurid." Here I have, in obedience to Rule 11, erased "(ecur) recur." However, *Q. E. D.* need not lament this too despondingly: had I scored the Chain as sent, there would have been 21 marks to be deducted, instead of 20!

Stellaria sends 2 Chains (too late for "First-Chains") for Pr. 48. One contains "feast (east) breast|ing," which is clearly an unlawful Syzygy. The other contains "plating (plat) breastplate," where, by removing the 'ing' of 'plating,' and replacing the 'e,' which had been supplanted by the suffix, I get the two adjacent words "plate, breastplate." Hence the letters "p, l, a, t" are barred.

Scores for Pr. 47

"CONVERSE CHEERFULLY."

The highest Score reached is 25. This has been attained by 2 Competitors, *E. M. R.* and *H. H.*, whose Chains are as follows:—

 9. *Persevere* 112
 10. *Rosemary* 95
- [...]³⁰

June 2, 1892

From *Lion and Tiger* comes an uneasy roar. They are distressed at finding that the best Chain for Pr. 45, “PROVIDE CHAMPAGNE,” was scored on May 12th as 29 instead of (as they make it) 27. The Chain end with “(ampag)

³⁰Remark: rest of list omitted

champagne,” and they reckon 4 waste letters for the last word, instead of (as I make it) 2. *Lion and Tiger* should keep, at the back of their den, among the old bones they love so well to gnaw, a copy of *The Lady* for Jan. 7, where they may read, in Def. 4, words which are not nearly as hard as bones, though (I fear) quite as dry! These words are “if either of the end-words contains more than seven letters, the extra ones are not counted as waste.”

10.30 Syzygies. A Word-Puzzle

Source: Syzygies and Lanrick, published 1893

“Phæbus, what a name!”

Quoted from *English Bards and Scotch Reviewers* by Lord Byron

§ 1. Definitions

Def. 1

When two words contain the same set of one or more consecutive letters, a copy of it, placed in a parenthesis between the two words, is called a “Syzygy,” and is said to “yoke” one set to the other, and also to “yoke” each letter of one set to the corresponding letter of the other set.

Examples to Def. 1

(1)	(2)	(3)	(4)
walrus	walrus	walrus	mine
(a)	(l)	(wal)	(mi)
swallow	swallow	swallow	mimic

[N.B. In Ex. (2), the Syzygy may be regarded as yoking the ‘l’ in ‘walrus’ to whichever ‘l’ in ‘swallow’ the writer may prefer. And in Ex. (4) the Syzygy may be regarded as yoking the ‘mi’ in ‘mine’ to whichever ‘mi’ in ‘mimic’ the writer may prefer.]

Def. 2

A set of four or more words, with a Syzygy between every two, is called a “Chain,” of which all but the end-words are called “Links.”

Def. 3

In a “Syzygy-Problem,” two words are given, which are to form the end-words of a Chain.

Example to Def. 3

If the given words are ‘walrus’ and ‘carpenter’ (the Problem might be stated in the form “*Introduce* WALRUS *to* CARPENTER”), the following Chain would be a solution of the Problem:—

WALRUS
(rus)
peruse
(per)
harper
(arpe)
CARPENTER

Def. 4

Every letter in a Chain, which is not yoked to some other, is called “waste”; but, if either of the end-words contains more than 7 letters, the extra ones are not counted as waste.

[Thus, in the above Chain, the ‘wal’ in ‘walrus,’ the ‘e’ in ‘peruse,’ the ‘h’ in ‘harper,’ and the ‘c’ and the ‘nter’ in ‘carpenter’ are ‘waste’: so that this Chain has 10 waste letters; but since 2 of the 5 waste letters in ‘carpenter’ are not counted as waste, the Chain is reckoned as having only 8 waste letters.]

Def. 5

When two words contain the same letter, but these two letters are forbidden to be yoked together, these two letters are said to be “barred” with regard to each other.

§ 2. Rules for Making Chains

Rule 1

A Chain should be written as in the Example to Def. 3. It does not matter which given word is placed at the top. Any number of alternative Chains may be sent in.

Rule 2

Any word, used as a Link, must satisfy all the following tests:—

(a) It may not be foreign, unless it is in such common use that it may fairly be regarded as naturalised. (The words ‘ennui’, ‘minimum’, ‘nous’, may be taken as specimens of words thus naturalised.)

(b) It must be in common use in conversation, letters, and books, in ordinary society. (Thus, slang words used only in particular localities, and words used only by specialists, are unlawful.)

(c) It may not be a proper name, when usually spelt with a capital letter. (Thus ‘Chinese’ is unlawful; but ‘china’, used as the name of a substance, is lawful.)

(d) It may not be an abbreviated or a compound word, when usually written with an apostrophe, or hyphen. (Thus, ‘silver’d’, ‘don’t’, ‘man’s’, ‘coach-house’, are unlawful.)

[N.B. If the Scorer accepts the infinitive of a verb as ‘ordinary’, he is bound to accept all its grammatical inflexions.

Thus, if he accepts ‘to strop (a razor)’ as an ordinary word, he is bound to accept ‘stroppest’, ‘stroppeth’, ‘stropping’, and ‘stropped’, even though the first two have probably never been used by any human being.

But, if he accepts the singular of a noun as ‘ordinary’, he is not thereby bound to accept its plural; and *vice versâ*.

Thus, he may accept ‘remorse’ and ‘tidings’ as ‘ordinary’, and yet reject ‘remorses’ and ‘tiding’ as ‘non-ordinary’.

Rule 3

When two words begin with the same set of one or more consecutive letters, or would do so if certain prefixes were removed, each letter in the one set is 'barred' with regard to the corresponding letter in the other set.

Examples to Rule 3

Certain prefixes are here marked off by perpendicular lines, and the 'barred' letters are printed in italics.

(1)	(2)	(3)	(4)
<i>dog</i>	<i>carriage</i>	un <i>done</i>	un <i>done</i>
<i>door</i>	<i>carcase</i>	<i>door</i>	in <i>doors</i>

[N.B. The letters are only 'barred' as here marked. They may often be yoked in other ways: *e. g.*, in Ex. (2), the 'ca' above may be yoked to the second 'ca' below.]

Rule 4

When two words end with the same set of one or more consecutive letters, or would do so if certain suffixes were removed, each letter in the one set is 'barred' with regard to the corresponding letter in the other set.

Examples to Rule 4

Certain suffixes are here marked off by perpendicular lines, and the 'barred' letters are printed in italics.

(1)	(2)	(3)	(4)
<i>meat</i>	<i>onion</i>	<i>sink</i> ing	<i>sink</i> ing
<i>cat</i>	<i>moon</i>	<i>link</i>	<i>link</i> s
(5)	(6)		
inflat ed	plung es		
satiat ing	chang ing		

[N.B. The letters are only 'barred' as here marked. They may often be yoked in other ways: *e. g.*, in Ex. (2), the first 'on' above may be yoked to the 'on' below; in Ex. (3), (4), the second 'in' above may be yoked to the 'in' below; in Ex. (5), the 'at' above may be yoked to the first 'at' below; and, in Ex. (6), the 'ng' above may be yoked to the second 'ng' below.

Observe that, in Ex. (5), the reason why 'at' is barred, is that the words become, when the suffixes are removed, 'inflate' and 'satisfy', which end with the same 3 letters. Similarly, in Ex. (6), 'plunge' and 'change' end with the same 3 letters. But in the words 'plunges' and 'singer', the 'ng' is *not* barred, since the words 'plunge' and 'sing' do not end with the same letters.]

Rule 5

Nouns and verbs are not to be regarded as prefixes or suffixes.

Thus 'landlord (and) handmade' would be a lawful Syzygy.

Rule 6

The letters ‘i’ and ‘y’ may be treated as if identical.

Thus ‘busy (usy) using’ would be a lawful Syzygy.

Rule 7

The Score for a Chain may be calculated by writing down 7 numbers, as follows:—

- (1) The greater No. of letters in an end-Syzygy, *plus* twice the least.
 - (2) The least No. of letters in a Syzygy.
 - (3) The sum of (1) *plus* the product of the two numbers next above (2).
 - (4) The No. of Links.
 - (5) The No. of waste letters.
 - (6) The sum of twice (4) *plus* (5).
 - (7) The remainder left after deducting (6) from (3). If (6) be greater than (3), the remainder is written as “0*”.
- No. (7) is entered as the Score of the Chain.

Example to Rule 7

[The figures on the right indicate the Nos. of waste letters.]

WALRUS 3
 (rus)
 peruse 1
 (per)
 harper 1
 (arpe)
 CARPENTER 3

As the greatest No. of letters in an end-Syzygy is ‘4’, and the least is ‘3’, No. (1) is ‘10’. Also (No. 2) is ‘3’. Hence No. (3) is the sum of ‘10’ *plus* ‘4 times 5’; *i. e.* it is ‘30’. Also there are 2 Links and 8 waste letters. Hence No. (4) is ‘2’, No. (5) is ‘8’, and No. (6) is the sum of ‘twice 2’ *plus* ‘8’; *i. e.* it is ‘12’. Hence No. (7) is the remainder after deducting ‘12’ from ‘30’; *i. e.* it is ‘18’; which is the Score for the Chain.

The result may be conveniently recorded thus:—

10, 3, 30; 2, 8, 12; 18.

[The formula for the Score may, for the benefit of Algebraists, be stated thus:—

- Let *a* = greatest No. of letters in an end-Syzygy.
- b* = least do.;
- m* = least No. in a Syzygy;
- l* = No. of Links;
- w* = No. of waste letters:

then the Score =

$$(a + 2b) + (m + 1). (m + 2) - (2l + w).]$$

§ 3. Rules for Scoring Chains

Rule 1

If the writer of a Chain has omitted a Syzygy, the Scorer inserts a one-letter Syzygy, if he can find a lawful one.

Rule 2

If the writer has omitted a Link, the Scorer erases the two adjacent Syzygies, and proceeds as in Rule 1.

Rule 3

If a Link be mis-spelt, the Scorer corrects it.

Rule 4

If a Syzygy contains unlawful letters, the Scorer erases them, and deducts twice that number of marks from the Score.

Rule 5

If one of two consecutive Syzygies contains the other, the Scorer erases the intermediate Link, and one Syzygy containing the other.

Examples to Rule 5

(1)	(2)
meeting	meeting
(ting)	(ting)
tinge	tinge
(ing)	(ting)
loving	parting

[N.B. In Ex. (1) the Scorer erases 'tinge' and the first Syzygy: in Ex. (2), he erases 'tinge' and either Syzygy. The results are

(1)	(2)
meeting	meeting
(ing)	(ting)
loving	parting

both of which are, by Rule 4, unlawful Syzygies.]

Rule 6

The penalty, awarded by the preceding Rule, cannot be evaded by writing shorter Syzygies than might be claimed, so as to avoid the result of one containing the other. In such a case, the Scorer would treat them as if written in full.

Examples to Rule 6

meeting

(tin)

tinge

(ng)

parting

This would be treated as if it had been written, in full,

meeting

(ting)

tinge

(ting)

parting

Rule 7

If the Chain now contains less than two Links, or an unlawful Link or Syzygy, the Scorer rejects it. Otherwise he calculates its Score.

Rule 8

In reckoning ‘the least number of letters in a Syzygy,’ the Scorer takes no notice of any Syzygies inserted by himself, unless there are no others.

Rule 9

If a writer sends in alternative Chains, the Scorer takes the best of them.

Rule 10

If all be rejected, the Scorer puts ‘0’ against the writer’s name, assigning a reason for rejecting each Chain.

Rule 11

In announcing a Problem, the Scorer may bar any word, that he likes to name, from being used as a Link. After receiving the “First-Chains”, he must publish a list of the Links which he regards as violating Rule 2, and of the Syzygies which he regards as violating, owing to the occurrence of prefixes or suffixes, Rule 3 or Rule 4 and he must then allow time for sending in “Second-Chains”. He may not, when scoring, reject any “First-Chain” for a defect which ought to have been, but was not, published in the above-named list.

§ 4. Hints on Making Chains

I have tried to embody some useful hints on this subject in the form of a soliloquy, supposed to be indulged in by the possessor of what Tennyson would call “a second-rate sensitive mind”, while solving the problem “*Turn CAMEL into DROMEDARY*”.

“No use trying the whole CAMEL. Let’s try 4 letters. ‘Came.’ That must be something ending in ‘cament,’ I fancy. That gives ‘predicament’, and ‘medicament’: I ca’n’t think of any others: and either of these would lead to ‘mental’ or

Quoted from
Supposed Confessions
of a Second-rate
Sensitive Mind by
Alfred Tennyson

‘mention’. Then ‘amel’. That gives ‘tamely’ and ‘lamely’. ‘Samely’ is hardly an ‘ordinary’ word: and I’m afraid ‘gamely’ is slang! Well, we’ve got *four* Links, at any rate. Let’s put them down:—

CAMEL	{	(came)	{	predicament (ment)	{	mental	
				medicament		mention	
	(amel)	{			tamely		
					lamely		

“Now for DROMEDARY. No 5-letter Syzygy, that *I* can see. Let’s try the 4’s. ‘Drom’. There’s ‘loxodrome’: but that’s quite a *specialist’s* word. And there’s ‘palindrome’—no, *that* wo’n’t do: ‘palin’ is a prefix. ‘Rome’. That gives ‘chrome’, which is *not* very hopeful to go on with. ‘Omed’. That’ll give us all the participles ending in ‘—omed’: ‘domed’, ‘doomed’, ‘groomed’; not very suggestive: however, there’s ‘comedy’: *that* sounds hopeful. ‘Meda’. Well, there’s ‘medal’, and ‘medalist’, and—and—that’s all, I think: but ‘medalist’ leads to ‘listen’, or ‘listless’. ‘Edar’. That leads to ‘cedar’, and words beginning with ‘re’, such as ‘redarn this stocking’—no, I’m afraid that would have a hyphen! However, ‘cedar’ leads to ‘dared’, or any participle ending in ‘—ced’. ‘Dary’. There’s ‘daring’: that might lead to something, such as ‘fringe’, or ‘syringe’. Well, let’s tabulate again:—

DROMEDARY	{	(omed)	{	domed, &c.		
				comedy		
		(meda)	{	medal	{	listen
				medalist (list)		
(edar) cedar	{	(dar) dared				
		(ced) . . . ced				
		(dary) daring (ring)	{	fringe		
				syringe		

“Now, can we link any of these ragged ends together? ‘Predicament’. That’ll link on to ‘dared’, though it’s only a 3-letter Syzygy. That gives the Chain ‘Camel (came) predicament (red) dared (dar) cedar (edar) dromedary.’ But there’s something wrong there! ‘Edar’ contains ‘dar’. We must write it ‘Camel (came) predicament (red) dared (dar) dromedary’. That’ll score 17. Let’s try another Chain. ‘Predicament’ and ‘cedar’ can be linked by putting in ‘enticed’. How will *that* work? ‘Camel (came) predicament (ent) enticed (ced) cedar (edar) dromedary’. *That* scores only 16! Try again. ‘Medicament’. Why that links straight on to ‘comedy’, with a 4-letter Syzygy! That’s the best chance we’ve had yet. ‘Camel (came) medicament (medi) comedy (omed) dromedary’. And what does *that* score, I wonder? Why it actually scores 31! Bravo!”

If any of my readers should fail, in attempting a similar soliloquy, let her say to herself “It is not that my mind is not *sensitive*: it is that it is not *second-rate*!” *Then* she will feel consoled!

§ 5. Some Syzygy-Problems

The gentle reader (N.B. *All* readers are ‘gentle’: an *ungentle* reader is a *lusus naturæ* never yet met with) may like to amuse herself by attempting (without referring to § 6) some of the following Problems, solutions of which have been published in the ‘Lady’. The appended scores are the highest hitherto attained.

11.1 To All Child-Readers of “Alice’s Adventures in Wonderland”

Source: printed 1871

Dear Children,

At Christmas time a few grave words are not quite out of place, I hope, even at the end of a book of nonsense—and I want to take this opportunity of thanking the thousands of children who have read “Alice’s Adventures in Wonderland,” for the kindly interest they have taken in my little dream-child.

The thought of the many English firesides where happy faces have smiled her a welcome, and of the many English children to whom she has brought an hour of (I trust) innocent amusement, is one of the brightest and pleasantest thoughts of my life. I have a host of young friends already, whose names and faces I know—but I cannot help feeling as if, through “Alice’s Adventures,” I had made friends with many many other dear children, whose faces I shall never see.

To all my little friends, known and unknown, I wish with all my heart, “A Merry Christmas and a Happy New Year.” May God bless you, dear children, and make each Christmas-tide, as it comes round to you, more bright and beautiful than the last—bright with the presence of that unseen Friend, Who once on earth blessed little children—and beautiful with memories of a loving life, which has sought and found that truest kind of happiness, the only kind that is really worth the having, the happiness of making others happy too!

Your affectionate Friend,

Lewis, Carroll.
Christmas. 1871.

11.2 An Easter Greeting

Source: printed since 1876 (with several minor variations); later added to various “Alice” editions, here from *Nursery “Alice”*, *Alice’s Adventures under Ground* differs slightly in punctuation

To Every Child Who Loves “Alice.”

Dear Child,

Please to fancy, if you can, that you are reading a real letter, from a real friend whom you have seen, and whose voice you can seem to yourself to hear, wishing you, as I do now with all my heart, a happy Easter.

Do you know that delicious dreamy feeling when one first wakes on a summer morning, with the twitter of birds in the air, and the fresh breeze coming in at the open window—when, lying lazily with eyes half shut, one sees as in a dream green boughs waving, or waters rippling in a golden light? It is a pleasure very near to sadness, bringing tears to one’s eyes like a beautiful picture or poem. And is not that a Mother’s gentle hand that undraws your curtains, and a Mother’s sweet voice that summons you to rise? To rise and forget, in the bright sunlight, the ugly dreams that frightened you so when all was dark—to rise and enjoy another happy day, first kneeling to thank that unseen Friend, who sends you the beautiful sun?

Are these strange words from a writer of such tales as “Alice”? And is this a strange letter to find in a book of nonsense? It may be so. Some perhaps may blame me for thus mixing together things grave and gay; others may smile and think it odd that any one should speak of solemn things at all, except in church and on a Sunday: but I think—nay, I am sure—that some children will read this gently and lovingly, and in the spirit in which I have written it.

For I do not believe God means us thus to divide life into two halves—to wear a grave face on Sunday, and to think it out-of-place to even so much as mention Him on a week-day. Do you think He cares to see only kneeling figures and to hear only tones of prayer—and that He does not also love to see the lambs leaping in the sunlight, and to hear the merry voices of the children, as they roll among the hay? Surely their innocent laughter is as sweet in His ears as the grandest anthem that ever rolled up from the “dim religious light” of some solemn cathedral?

And if I have written anything to add to those stores of innocent and healthy amusement that are laid up in books for the children I love so well, it is surely something I may hope to look back upon without shame and sorrow (as how much of life must then be recalled!) when *my* turn comes to walk through the valley of shadows.

This Easter sun will rise on you, dear child, “feeling your life in every limb,” and eager to rush out into the fresh morning air—and many an Easter-day will come and go, before it finds you feeble and gray-headed, creeping wearily out to bask once more in the sunlight—but it is good, even now, to think sometimes of that great morning when “the Sun of righteousness” shall “arise with healing in his wings.”

Surely your gladness need not be the less for the thought that you will one day see a brighter dawn than this—when lovelier sights will meet your eyes

Quoted from *Il Penseroso* by John Milton

Quoted from *We Are Seven* by William Wordsworth

Quoted from Malachi 4:2

than any waving trees or rippling waters—when angel-hands shall undraw your curtains, and sweeter tones than ever loving Mother breathed shall wake you to a new and glorious day—and when all the sadness, and the sin, that darkened life on this little earth, shall be forgotten like the dreams of a night that is past!

Your affectionate friend,

Lewis Carroll.
*Easter, 1876.*¹

¹missing in *Nursery "Alice"*

11.3 “The Priest in Absolution”

Source: Pall Mall Gazette, July 14, 1877

To the EDITOR of the PALL MALL GAZETTE

SIR,—I should not venture to hope that you will find room for this letter, on so uninviting a topic, did I not believe that it contains something which may prove, as I trust, a useful contribution to the discussion—an answer, namely, to an argument constantly and triumphantly advanced in defence of this book and the system to which it belongs. The argument is this: that “just as the physician is obliged, in treating certain diseases of the body, to ask questions which under other circumstances could not be asked; so the priest is obliged, in treating certain diseases of the soul, to do the same thing.” Many who are met with this argument are apt to go on the principle “*omne ignotum pro magnifico*”—to profess an entire ignorance of medical matters, and to yield the battle, without another blow, to the Ritualistic “father confessor.” But it should always be borne in mind that there is no more fertile source of error in controversy than a “false analogy,” and that every argument which rests on analogy ought to be very carefully and critically tested. The present case is a very good instance of this fallacy, as the analogy breaks down in two essential points; and my object in writing this letter is to make these two points clear to all who are interested in opposing the Roman theory of confession. The first point concerns the necessity of human intervention: this is universal on the physiological side of the analogy—most exceptional on the psychological; and even where confession to a human being is desirable, it by no means follows that a priest is the best person to go to; in the case of young persons a parent is often a much more suitable “confessor.” The second point concerns the effect of the questioning process in aggravating the disease; on the physiological side (in cases where such questions are asked) no such effect is to be feared—on the psychological side the danger is real and imminent. If they want a really parallel case in medicine, let them take the handling of an inflamed joint. “To an inflamed part,” a great physician has said, “every touch is a bruise,” and, with a strict parallelism, we may say that to a morbid imagination every question is an injury. And if they demand that the parallel case shall also involve the asking of questions, let them take a case where the question would involve a similar danger, *e. g.*, a case of melancholia with suicidal tendencies. What course does a wise physician take? Does he try to turn the thoughts into other channels, by suggesting subjects of healthy interest? That would be parallel to the practice of our Church. Or does he, by a series of minute questions as to the form of suicide which the patient has attempted, &c., convert a shadowy and transient delusion into a definite, haunting, and irresistible frenzy? That would be parallel to the theory of Rome, and of the Ritualists. Let there be no mistake about this. I would appeal to any experienced physician, who has ever had to deal with morbid impulses of any kind—nay, I would appeal to any man, however profligate, even to one who has abandoned all hope of a return to purity, and has accepted his miserable lot

to limp and crawl,
Blind and forgot, from fall to fall,

Quoted from *Agricola*
by Tacitus

Quoted from *The
Scorched Fly* by
Coventry Patmore

but who yet remembers (as who does not?) the days of innocence and the perfect peace that springs from purity of thought—whether it is not a fast principle (a principle that seems to be ignored in this wretched book) to keep the foe at arm's length, to banish him to the realm of shadows and dreams, never to admit him to parley or let him take a definite shape.

It is pitiable to think how many of these young priests there are, full of zeal and self-devotion, honestly believing that they are forwarding the cause of religion, who nevertheless, in their utter ignorance of the elementary laws of body and mind, are doing they know not what, and endangering not only their own souls (every man must choose for himself what risks he will run), but also many a young and innocent soul who has no choice in the matter. Surely it is high time that this delicate and important matter were taken out of the hands of these pseudo “fathers,” and that the real “fathers” of England took it up with a fixed resolution to preserve our pure English Church from priestly despotism, and pure English children from the poison of an enforced confessional.—Your obedient servant,

Lewis Carroll.

July 12.

11.4 Marriage Service

Source: manuscript written 1877

“Till death us do part.”

Those who say that the oath “to have & to hold, to love & to cherish & (in the case of the woman) to obey . . . till death us do part,” makes re-marriage after divorce sinful, have the “a priori” argument in their favour, no doubt. I shall here set down two points, which seem to me to favour the view that the universal law has exceptions.

Quoted from from
the wedding vow from
the *Book of Common
Prayer*

The case where the marriage is pronounced null & void is hardly an exception, because (most would agree that) an oath taken under circumstances where its fulfilment is impossible even at the time of taking it (e. g. in the case of bigamy) is, in God’s sight, no oath, & can entail no obligation. Some might go to the extreme of saying that the oath is binding even then: such people would maintain that if a usurper deceives me into thinking him the true heir to the throne, & and so gets me to swear allegiance to him, I cannot escape that allegiance: but such assertions are hardly worth discussion.

The first of the two points is that where an oath is of *mutual* obligation, & where its purpose can only be effected when *both* parties observe it, the failure of one of the parties releases the other. A fair illustration of this would be the case of two travellers who are passing through a hostile country, & swear to help each other, & to supply each other with food, weapons, &c. If one turns traitor to the other, & plots against his life, he must be an extreme casuist who would say that the other is still bound to supply him with food & weapons. Applying this to the case of marriage, it certainly seems a very strong argument to say that the oath to have & hold, love & cherish, presupposes that *both* have taken the oath; that the thing becomes unmeaning when one side has ceased to observe it; & that so, by the act of the one (which of course *is* a breach of the oath & *is* sinful), the other is released from further obligations.

The other point is perhaps only another way of putting this point: it is that when the fulfilment of an oath becomes impossible, the oath is no longer binding—in other words, that it is no sin God’s sight not to do a thing which we cannot do. Now if one of the two parties in a marriage contract has broken it, & has ceased to have, hold, love, & cherish, it seems impossible that the other can continue to do these things: at any rate, to have, to hold, & to cherish, have become impossible, and to love (in the sense intended in the oath) is also impossible.

But the other side may urge that at least the other party *can* forbear marrying again, & that to this extent the fulfilment of the oath is still binding. It seems to me a fair question to ask how far the *purpose*, for which the oath was taken, is thus carried out: the answer must surely be that it can have no effect of the kind. Granting this, the only thing to be settled seems to me to be this: in which way is the will of God most fulfilled? A and B have entered into these mutual obligations. A has (sinfully, no doubt), broken & abrogated them: B’s further fulfilment of them has thereby become impossible: B has two course to choose between—either to remain unmarried for life, or at least till the death of A, even though the remaining so has no effect whatever on A—or to consider

the oath as at an end, & that a second marriage is allowable. The latter course seems to me one that I should not dare to assert to be displeasing to God.

Those who object to *all* re-marriage, even after the *death* of a husband or wife, take a view that seems to me at variance with Scripture as well as with common sense.

July 22, 1877.

11.5 Traitors in the Camp

Source: The St. James's Gazette, December 30, 1881

To the EDITOR of the ST. JAMES'S GAZETTE

SIR,—Would the British public—that genial and simple-minded abstraction that stands for ever on the broad grin, with its hands in its pockets, always ready for a game of “Open your mouth and shut your eyes!”—would that amiable and ecstatic infant be deeply surprised to learn what are the “wheels within wheels”¹ that move that great moral enigma, the Church Association? Would it shudder, or simply chuckle, to be told that among the most influential supporters of that Society—not its most prominent members, observe; not those whose names are flaunted like a banner in the eyes of an admiring world; but those far more powerful background figures, the wire-pullers—are to be found: first, certain advanced Ritualists, bold spirits whose further advance is only checked by the thought that the next step would be to Rome; secondly, certain actual members of the greatest, the most secret, and the most unscrupulous of all fraternities, the Jesuits?

The battle is set in array, and the Church Association advances to the fight. In the foreground caper the band of skirmishers, yelling with Protestant enthusiasm, haunted by no shadow of a doubt but that the cry “To gaol with them!” so stealthily suggested by an invisible prompter, is the war-cry that must shortly change into the pæon victory. But glance a little further back into that dark tent where certain figures in masks and cloaks are gathered in secret consultation. Why do these warriors hide their faces? Dare they not face the light of day? And what mean these constant relays of messengers that leave them ever and anon, and, creeping through the brushwood and carefully skirting the edges of the fight, go off at full speed to the headquarters of the foe? Is there treachery in the camp? The thing is possible.

If it be not so, then *who* is it—in the name of outraged common sense I ask the question—who has invented this worse than suicidal policy, the imprisonment of Ritualists? Does any sane man suppose that any persecuted Ritualist does not thankfully seize the opportunity of posing as a martyr? Does any sane man doubt, when the English Church Union hold their monster indignation meetings, and loudly protest against the imprisonment of their champions, that each of the furious orators is really thrilled with a secret delight? “Oh, let us be joyful!” would be the opening chorus of all such meetings if only they dared show the “hand” they hold in this deep and dangerous game. Let all who love the Reformed Church of England pause and ponder.

And do not be taken in, oh too-easily-gullible British public, by all these piteous outcries. “Why, oh, why do you imprison us?” cries the orator. “We are the lambs and you the wolves! We do but stand up for Truth, for the Right, for the Church! Why will you not let us alone? We never persecute you! We never drive you into prison!” And the wail rises into a shriek; but as it dies away, if you put your ear close and hold your breath, you may chance to hear him mutter, in quite another tone, “We are such fools!” And if you watch him narrowly you may even be lucky to catch the crafty smile that flits like a dream across those

¹Remark: “wheels within wheels”

quivering lips, and to detect a quiet twinkle in the eyes so lately brimming over with crocodilian tears.

Such was the tone of a recent manifesto, issued by the president of the English Church Union, where he spoke of those who have suffered legal penalties for disobeying their Bishops, in language that would not have been out of place if he had been describing martyrs who have chosen death rather than abjure their faith.

Moreover, in a speech of his, reported in the papers of December 16, the improvement of Mr. Green is the one dominant idea to which he again and again recurs—the one haunting melody which he cannot get out of his head. Wander as he may among the verdant meads of theological polemics, sparkling with the flowers of rhetoric and tuneful with the notes of controversy, this is his first love, to whom he ever faithfully returns; and still the burden of his song shall be “And Mr. Green is in prison!”

“And in prison,” so chorus the delighted English Church Union, “because he conscientiously refuses obedience to a secular court!” It is mere waste of breath to point out to these impassioned orators that he also refuses obedience to his ecclesiastical superior, the Bishop whom he has solemnly sworn to obey: the argument has no more hold upon them than a syllogism has upon a lady, or a drop of rain upon a duck. They have even discovered a new and most astonishing axiom in morals—that whatever you are ordered to do by any one to whom you owe no allegiance you may rightly refuse to do, even if it be also ordered by a lawful authority. This is very much as if some sturdy Briton should vindicate his freedom from French control by obstinately refusing obedience to English laws wherever the two national codes happened to agree.

The only consolation, which the Protestant portion of the English Church (under which title I include all, whether High, Low, or Broad, who hold to the principles of the Reformation) are likely to find in the present miserable state of things, is the thought that now at last we have a crucial test as to whether Ritualism is or is not suited to the genius of the English nation. “You have had every chance,” they can now say to the Ritualists: “your choral services have charmed our ears, your rich vestments our eyes, and even your incense our noses! And now you have the darling wish of your heart: you are persecuted: you can appeal to the ineradicable instinct which ever impels John Bull to side with the persecuted, be he right or wrong. Fortune can do no more for you: you must stand or fall by your present chance: if persecution will not popularize Ritualism, nothing will!”

Let me quote in conclusion the following sentence from an unpublished work—a Revised Version of the English Prayer Book. I entirely decline to say how I obtained it, and will merely remark that important documents sometimes see the light sooner than their authors intended:—

Q. Will you reverently obey your Ordinary, and other chief Ministers, unto whom is committed the charge and government over you: following with a glad mind and will their godly admonitions, and submitting yourself to their godly judgments?

A. I will reverently obey them (when they order that which I desire to do); I will gladly follow their godly admonitions (when they admonish those who oppose me); and I will submit myself to their godly judgments (whensoever and wheresoever they will submit their godly judgments to me).

Quoted from
concluding question of
the Ordination Service
of the Anglican
Church

If these few words should cause even only one of the supporters of the Church Association to “take stock,” and to cast a wary look around him before he again lends his voice to the insane cry of “Imprison them!” this little trumpet-blast will not have been blown in vain.—I am, Sir, your obedient servant, *Lewis Carroll.*

11.6 “Whoso Shall Offend One of These Little Ones—”

Source: St. James’s Gazette, July 22, 1885

I know that any writer who ventures to protest against what happens to be a popular cry has little chance even of respectful attention. The rapid intercommunication of our age has brought us one evil from which our forefathers were free: the mass is moved too suddenly and too violently: each tide of popular feeling runs headlong in one direction, sweeping all before it, and back again with an equally dangerous reflux, leaving ravage and ruin behind it. Only a few years ago, if any impure scandal arose, its investigation and punishment were left to those whose painful duty it was to know the sickening details: women and boys were turned out of court: no particulars were given in any respectable journal—nothing but the words “the evidence was unfit for publication.” But a horrible fashion seems to be setting in, of making all things public, and of forcing the most contaminating subjects on the attention even of those who can get nothing from them but the deadliest injury. Against this I desire to raise a warning voice.

The question at issue is *not* whether great evils exist—nor again whether the rousing of public opinion is *a* remedy for those evils—on these two points we are agreed. The real question is, whether this mode of rousing public opinion is, or is not, doing more harm than good.

And the worst of the danger is that all this is being done in the sacred name of Religion. If we had no other evidence for the existence of a devil, we might find it, I think, in the Argument from Design—in the terrible superhuman ingenuity with which temptation is adapted to the taste of the age. Not so many years ago, Vice was fashionable, and the literature of the day was *openly* profligate: no pretext of piety was offered to readers who would only have despised it. But in our day, to be popular, one must profess the very highest and purest motives. Straightway Satan is transformed into an angel of light, and with an air “devout and pure, sober, steadfast, and demure,” offers us his old wares, furbished up in new colours.

Quoted from *Il Penseroso* by John Milton

May I not plead with those, who have not yet lost their heads in the whirl and din of this popular Maelstrom, to consider whither the stream is really carrying us?

I plead for our young men and boys, whose imaginations are being excited by highly-coloured pictures of vice, and whose natural thirst for knowledge is being used for unholy purposes by the seducing whisper “read this, and your eyes shall be opened, and ye shall be as gods, knowing good *and evil!*” I plead for our womankind, who are being enticed to attend meetings where the speakers, inverting the sober language of the apostle, “it is a shame even to speak of those things which are done of them in secret,” proclaim that it is a shame *not* to speak of them: who are being taught to believe that they are still within the bounds of true womanliness and modesty, while openly discussing the vilest of topics: and who all too soon prove, by the eagerness with which they turn to what so lately was loathsome to them, that there is but one step from prudishness to pruriency. Above all, I plead for our pure maidens, whose souls are being saddened, if not defiled, by the nauseous literature that is thus thrust upon

Quoted from Genesis 3:5

Quoted from Ephesians 5:12

them—I plead for them in the name of Him who said “Whoso shall offend one of these little ones which believe in me, it were better for him that a millstone were hanged about his neck, and that he were drowned in the depth of the sea.” For all these I plead, with whosoever has the power to interfere, to stay, before it is too late, the flood of abomination with which we are threatened.

Quoted from
Matthew 18:6

Let me add some words, bearing on this matter, better and more eloquent than any that I could devise. I quote from “Sermons by the Rev. E. Monro,” published in 1850, p. 136.

By all means, and on all occasions, avoid dwelling on the object of impure sensation; we are told, by holy men of old, that on this point alone we may be cowards; we must fly from it. The mere dwelling on its forbidden pollutions, even to combat them, forms evil habits, and withers holiness. We are often led to bring the object of sinful desire before us, and that with the best intentions, when we pray against it, when we would examine ourselves on it, when we are regretting the past, when we unfold our grief to another, when we compare ourselves with ourselves. But on all these occasions as far as possible shun the image; do not let the coloured lights fall into a shape or outline, nor suffer, if you can help it, your vision to centre them in a focus; if they are dimmed, leave them so, and do not restore the view; repress even the slightest image, lest it should strengthen and invigorate evil desire; you are too weak to bear it. If you have to pray against it, to examine yourselves on it, let the object be an imperfect memory, a recollection of something past, rather than of the object itself; mean it without expressing it, intend without defining it. Let no excuse avail to dwell on it.

The contrast between these wise words and the conduct of those who are doing their best to “centre in a focus” the soul-destroying picture, and to add yet more “coloured lights” than the devil has already supplied, needs no words of mine to emphasize it.

A beautiful fiend is abroad in the midst of us: let the wise know her and shun her while yet there is time. On her fair brow she bears the title of “Religion”: “pacing with downward eyelids pure,” she passes, unsuspected, among our youths and maidens, and whispers to them the dark secrets of Hell. Like Arthur’s profligate queen,

Quoted from *The
Two Voices* by Alfred
Lord Tennyson

being by our cowardice allow’d
Her station, taken everywhere for pure,
She like a new disease, unknown to men,
Creeps, no precaution used, among the crowd,
Makes wicked lightnings of her eyes, and saps
The fealty of our friends, and stirs the pulse
With devil’s leaps, and poisons half the youth.

Quoted from *Idylls of
the King* by Alfred
Lord Tennyson

Lewis Carroll

11.7 “An Oxford Scandal”

Source: St. James’s Gazette, December 6, 1890

To the EDITOR of the ST. JAMES’S GAZETTE

SIR,—Will you permit me, as a tolerably senior member of this university, to make a few remarks on the miserable story of undergraduate profanity which appeared in your columns last Thursday? I wish to point out that whatever disgrace this outrage may be thought to entail on the junior portion of our residents must in justice be shared by the senior portion, who are setting them, more and more from year to year, the evil example of jesting about sacred things. This, our latest development of irreverence, startling though it be as a great and sudden stride on the downward path, is but the logical outcome of a fashion that has taken firm hold on Oxford society, and is slowly eating away, like a canker, the very heart of our religious life.

I have resided in this university for nearly forty years, and during that time have spent some seven or eight thousand evenings in college “common rooms,” and have heard, at a moderate computation, some twenty thousand anecdotes (many of them, of course, told for the twentieth time). My impression is that there has been a gradual, but very real and steady, change in the tone of the anecdotes that have thus obtained currency and won applause among the senior men. This change has been in one respect for the better, in that it is very seldom indeed now that any such anecdote depends for its point on some objectionable *double entendre*; but it has been in another respect distinctly for the worse, in that anecdotes whose point consists in a comic allusion to some Bible text, or the existence of evil spirits, or the reality of future punishment, or even the name of God, are more freely bandied about and more openly enjoyed, not only by laymen, to whom such things may possibly be mere myths not worthy of any respect, but even by ordained clergymen, to whom, if to any living men, these things are solemn realities.

I can easily imagine one of the very undergraduates who perpetrated this outrage sitting at breakfast with some reverend “don” and hearing from his lips, told with unmistakeable gusto, some utterly profane comic story, and afterwards saying to himself, “Well, if he, a sworn defender of Christianity, can thus make game of things he professes to believe, how much more may I, who neither believe nor profess to do so!”

But it is not in Oxford alone that these “signs of the times” are patent; they are to be found in our light literature, in parliamentary debates, in newspaper articles—nay, in our very pulpits. “He that runs may read” the change that is coming over English society generally. More and more are we beginning to treat as mere toys the words and symbols which represent the most sacred elements of the religion which, as a nation, we still profess; more and more is the acknowledgment of any real purpose in this life, or any practical belief in a life to come, made matter for gay banter or for cold sarcasm. We shudder to hear yelled along our streets the vile blasphemics which the “Salvation Army” has now made so common: but are they worse than others? Is not their noisy irreverence but the logical outcome of the whole drift of modern thought?

I copy the following sentence from an article, entitled “My First ‘Season,’” in the *St. James’s Gazette* of December 4:—“When Dixon the next morning

Quoted from
Matthew 16:3

Quoted from
Tirocinium by
William Cowper

dropped hints that as churchwarden he had heavy calls upon him, and that I had not told him whether I would take those two sittings which had hitherto gone with the house, I told him point-black that, when I wanted to hear what the Reverend Bellerby Lowder had to say, I would run my chance of finding an empty seat.”

This passage is worth noting, as a plain expression of the popular notion that the only possible motive, for attendance at public worship, is the wish to hear what the preacher “has to say.”

I also copy the following passage from the report of the meeting of the Irish Parliamentary Party, in the *Standard* of the same date:—

Mr. Parnell: It is my answer, and upon that answer I will stand or fall.

Mr. Healy: Then you will fall. (Cheers.) And now that both sides have made up their minds, what is the use of further debate? (Cheers and interruptions.)

Mr. Leamy: Away with him! Away with him!

Mr. John O'Connor: Crucify him! (Cries of “Oh!”)

Mr. Condon: I think that is an expression that should not be made use of. (Hear, hear.)

Mr. Sexton: Mr. Parnell, I think you will agree with me that the interests of good order cannot be advanced by observations which, under the circumstances, are nothing but blasphemous. (Cheers.)

I prefer to leave this shameful record without remark.

This Oxford scandal may yet, I hope, work some good, if only it serves to open the eyes of unsuspecting persons to the goal that lies before us, in case the coming years should carry on, as surly as hitherto, the work of the past. No real belief in Christianity can possibly long co-exist with a general practice of making all holy things ludicrous. A section of us may still cling to the ancient Faith: but it will be a dwindling section, holding its way, as best it can, through taunts, perhaps through persecutions, in the midst of a nation of infidels.—I am, Sir, your obedient servant,

*Charles L. Dodgson,
Student of Ch. Ch., Oxford.

11.8 Eternal Punishment

Source: unpublished proof written 1895/1897

The most common form of the difficulty, felt in regard to this doctrine, may be thus expressed:—

“I believe that God is perfectly good. Yet I seem compelled to believe that He will inflict Eternal Punishment on certain human beings, in circumstances which would make it, according to the voice of my conscience, unjust, and therefore wrong.”

This difficulty, when stated in logical form, will be found to arise from the existence of *three* incompatible Propositions, each of which has, apparently, a strong claim for our assent. They are as follows:—

I. *God is perfectly good.*

II. *To inflict Eternal Punishment on certain human beings, and in certain circumstances, would be wrong.*

III. *God is capable of acting thus.*

One mode of escape from this difficulty is, no doubt, to let the whole subject alone. But to many such a position is a cause of distress; they feel that one of these three Propositions *must* be false; and yet to regard any one of them as false plunges them into difficulties and bewilderment.

The first thing to be done is to settle, as clearly as possible, what we *mean* by each of these Propositions, and then to settle, if possible, *which* two of the three rest, in our minds, on the deepest and firmest foundations, and thus to discover *which* one, of the three, must perforce be abandoned.

First, then, let us settle, as clearly as possible, what we *mean* by each of these Propositions.

I. **God is perfectly good** As to the meaning of this word “good,” I assume that the Reader accepts, as an Axiom antecedent to any of these three Propositions, the Proposition that the ideas of Right and Wrong rest on eternal and self-existent principles, and not on the arbitrary will of any being whatever. I assume that he accepts the Proposition that God wills a thing because it is *right*, and *not* that a thing is right because God wills it. Any Reader, of whom these assumptions are not true, can feel no difficulty in abandoning Proposition II., and saying, “If God inflicts it, it will be *right*.” He, therefore, is *not* one of those for whom I am now writing.

I assume, then, that this Proposition means that God always acts in accordance with the eternal principle of Right, and that He is, therefore, perfectly good.

II. **To inflict “Eternal Punishment,” on certain human beings and in certain circumstances, would be wrong.** The word “Punishment” I assume to mean, here, “suffering inflicted on a human being who has sinned, and *because* he has sinned.” I use the word “suffering,” rather than “pain,” because the latter word is so often understood as implying *physical* pain only, whereas *mental* pain might *also* serve as punishment.

Hence we may at once simplify this inquiry by excluding from our consideration, the case of suffering inflicted where the sin of the creature is *not* a necessary cause. Taking “sin” to mean (as already defined) a “conscious and *voluntary*” act, so that, if the act be *involuntary*, it ceases to be sin, we may

set aside the Calvinistic theory, which contemplates the infliction of suffering on creatures unable to abstain from sin, and whose sins are therefore *involuntary*. This theory will be considered elsewhere.

The word "Eternal" I assume to mean "without end."

As to the human beings who are here contemplated as the subjects of Eternal Punishment, there are three conceivable cases, viz.:—

(A) The case of one who has ceased to possess Free-Will, and who therefore has no further power either to sin or to repent. In such a case, Eternal Punishment would be suffering inflicted through infinite time, and therefore itself infinite in amount as punishment for sins committed during a finite time.

(B) The case of one who retains Free-Will, and who has ceased to sin, has repented of all past sins, and is choosing good *as good*. In this case also Eternal Punishment would be infinite suffering, inflicted as punishment for sins committed during a finite time.

(C) The case of one who does not come under either of these descriptions, that is, one who retains Free-Will and continues for ever to choose *evil*. In such a case Eternal Punishment would be infinite suffering, inflicted as punishment for infinite sin.

I assume that the reader would *not* feel any difficulty in recognising the justice of inflicting continuous suffering as punishment for continuous sin.

Hence we may set aside case (C) altogether.

Also we may combine cases (A) and (B) into one, and interpret Proposition II. as asserting that it would be wrong to inflict infinite suffering, on human beings who have ceased to sin, as punishment for sins committed during a finite time.

Proposition III. does not seem to need any explanation.

It will be well before going further to re-state the three incompatible Propositions, in order to give to Proposition II. the form it has now assumed.

I. *God is perfectly good.*

II. *To inflict infinite suffering on human beings who have ceased to sin, as punishment for sins committed during a finite time, would be wrong.*

III. *God is capable of acting thus.*

We know with *absolute* certainty that *one* at least of these three Propositions is *untrue*. Hence, however overwhelming may be the weight of evidence with which each seems to claim our assent, we know that *one* at least may reasonably be abandoned.

Let us now take them, one by one, and consider, for each in turn, what are the grounds on which it claims our assent, and what would be the logical consequences of abandoning it. It may be that the Reader will then be able to see for himself *which* two of the three have the *strongest* claims on his assent, and *which* he must, therefore, abandon.

First, then, let us consider the Proposition.

I. "God is perfectly good."

The grounds on which this claims our assent, seem to be, first, certain *intuitions* (for which, of course, no *proofs* can be offered), such as "I believe that I have Free-Will, and am capable of choosing right or wrong; that I am responsible for my conduct; that I am not the outcome of blind material forces, but the creature of a being who has given me Free-Will and the sense of right and wrong, and to whom I am responsible, and who is therefore perfectly good. And this being I call 'God.'"

And these *intuitions* are confirmed for us in a thousand ways by all the facts of revelation, by the facts of our own spiritual history, by the answers we have had to our prayers, by their resistible conviction that this being whom we call "God" *loves* us, with a love so wonderful, so beautiful, so immeasurable, so wholly undeserved, so unaccountable on any ground save His own perfect goodness, that we can but abase ourselves to the dust before Him, and dimly hope that we may be able someday to love Him with a love more like His great love for us.

The abandonment of this Proposition would mean practically, for most of us, the abandonment of the belief in a God, and the acceptance of Atheism.

Secondly, let us consider the Proposition.

II. *To inflict infinite suffering, on human beings who have ceased to sin, as punishment for sins committed during a finite time, would be wrong.*

Here it will greatly simplify our inquiry to begin by considering what are the various *purposes* for which punishment may be supposed to be, first, *enacted*, and secondly, *inflicted*; and what are the *principles* which, in view of those purposes, would make us regard its enactment and infliction as right or wrong.

Punishment, when enacted or inflicted, by human beings upon each other is necessarily limited in its purposes. We cannot read the *minds* of others, and therefore can never know whether any human being is or is not really *guilty* in anything he does. Consequently, human punishment can never reach beyond the outward *act*: we dare not attempt to punish *thoughts*, however sinful, that have not resulted in *action*. And, even here, our principal purpose must necessarily be to save *Society* from the injury that such acts would cause to it. Hence there is little in the principles affecting punishment, when inflicted by *Man*, that we can safely appeal to in considering punishment as inflicted by *God*. There is, however, *one* principle which clearly applies equally to both: we recognise that some *proportion* should be observed, between the amount of crime and the amount of punishment inflicted: for instance, we should have no hesitation in condemning as unjust the conduct of a judge who, in sentencing two criminals, had awarded the *greater* punishment to the one whose crime was clearly the *lesser* of the two.

But, in the sight of *God*, our guilt consists in the sinful *choice*, and we rightly hold that two men, who had resolved, in similar circumstances, on committing the same crime, would be equally guilty in His sight, even though only *one* had actually committed the crime, while the *other* had been accidentally prevented from carrying out his intention.

Hence we may assume that God's purpose, in the enactment of punishment, is the prevention of the sinful *choice*, with all the evils consequent upon it. When once the punishment has been *enacted*, it must necessarily, unless some change takes place in the circumstances contemplated in the enactment, be *inflicted*. We may easily imagine a *man*, who has enacted some punishment, finding good reasons for not inflicting it; for instance, he might find that he had made a mistake in enacting it, or that he had failed to take account of some unforeseen circumstance. We might even imagine a *man* to have threatened a punishment without any intention of ever inflicting it. But none of these suppositions can be made as to punishment enacted by *God*. We cannot believe *Him* to be ignorant of any of the circumstances, or capable of announcing that He will do what He does not really intend to do.

We must trust His perfect knowledge of the thoughts of men, for judging who is guilty and who is not, and the only principle of right and wrong that seems reasonably applicable, is the sense that some *proportion* should be observed between the amount of sin and the amount of the punishment awarded to it.

And here comes in the one consideration which, as I believe, causes all the difficulty and distress felt on this subject. We feel intuitively that sins committed by a human being during a finite period must necessarily be *finite* in amount; while punishment continued during an infinite period must necessarily be *infinite* in amount. And we feel that such a proportion is unjust.

Once suppose the punishment to be *finite* for finite sin, so that if at any period of time the sinful *choice* ceased to exist, the punishment would *not* be infinite, and I believe this difficulty would no longer be felt, and that we should be ready to recognise punishment as *deserved*, and therefore as justly inflicted; and also to recognise the many good purposes, such as the reformation of the sinner, or the warning given to others, which the punishment might serve.

There is another intuition, felt, I believe, by most of us, of which no account has yet been taken. It is that there is some eternal *necessity*, wholly beyond our comprehension, that *sin* must result in suffering. This principle is, I believe, enshrouded in, and may to some extent make more credible to us, the unfathomable mystery of the Atonement. And this principle must be allowed for, I think, in considering the present subject.

There is also a difficulty, that will probably occur to some readers, which ought to be noticed here. It is the doubt whether the man who checks and puts out of his mind a sinful wish merely from fear of *punishment*, can really be less *guilty* in the sight of God. "Granted," it may be urged, "that Divine punishment is incurred by the evil wish, whether or no it result in evil *act*, so that its enactment may serve to prevent that wish, yet surely what God requires is that we should love good *as good*, and hate evil *as evil*. If a man checks the evil wish merely from fear of punishment, and not because it *is* an evil wish, does he thereby cease to sin?" Here it must be admitted, I think, that the enactment of punishment for evil wishes does not, of *itself*, produce the love of good *as good*, and the hatred of evil *as evil*. Yet surely it may help in that direction? God uses, I believe, such motives as best suit the present need; at one time, perhaps, *fear* may be the only one that will influence the sinner; later on, when, through fear, some *habit* of self-restraint has been formed, the evil wish may be checked by the consideration that indulgence of it might lead to acts which the man is beginning dimly to recognise as evil; later still, when this recognition has grown clearer, a higher motive (such as human love) may be appealed to; and later still, the love of good *as good*, and the love of God as the Being whose essence is *goodness*.

When all this has been considered, its outcome seems to me to be the irresistible intuition that infinite punishment for finite sin would be unjust, and therefore wrong. We feel that even weak and erring Man would shrink from such an act. And we cannot conceive of God as acting on a lower standard of right and wrong. In the words of Dean Church, "Can *we* be so compassionate and so just, and cannot we trust *Him* to be so?"

To set aside this intuition, and to accept, as a just and righteous act, the infliction on human beings of infinite punishment for finite sin, is virtually the abandonment of *Conscience* as a guide in questions of Right and Wrong, and the embarking, without compass or rudder, on a boundless ocean of perplexity.

In taking this position, we have to face such questions as these: "Why do I accept whatever God does as being right, though my conscience declares it to be wrong? Is it that He is my *Maker*? What ground have I for holding that the power of *creating* is a guarantee for *goodness*? Or is it that He loves me? But I know already that wicked beings can love. No. The only reasonable ground for accepting what He does as being right seems to be the assurance that He is perfectly *good*. And how can I be assured of this, if I put aside as useless the *only* guide that I profess for distinguishing between right and wrong, the voice of *Conscience*?"

Such are the difficulties that meet us, if we propose to take the *second* possible course, and to reject Proposition II.

The *third* possible course is to accept Propositions I. and II., and to reject III. We should thus take the following position. "I believe that God will *not* act thus. Yet I also believe that, whatever He has declared He will do, He *will* do. Hence I believe that He has *not* declared that He will act thus."

The difficulties, entailed by choosing this *third* course, may be well exhibited in another set of incompatible Propositions, as follows:—

1. *God has not declared that He will act thus.*
2. *All that the Bible tells us, as to the relations between God and man, are true.*
3. *The Bible tells us that God has declared that He will act thus.*

As these three Propositions cannot possibly be *all* of them true, the acceptance of (1) necessarily entails the rejection of either (2) or (3).

If we reject (2), we are at once involved in all the perplexities that surround the question of Biblical Inspiration. The theory of *Plenary* Inspiration—which asserts that *every* statement in the Bible is absolute and infallibly true—has been largely modified in these days, and most Christians are now, I think, content to admit the existence of a *human* element in the Bible, and the possibility of *human* error in such of its statements as do not involve the relations between God and Man. But, as to *those* statements, there appears to be a general belief that the Bible has been providentially protected from error: in fact, on any other theory, it would be hard to say what value there would be in the Bible or for what purpose it could have been written.

The more likely course would seem to be to reject (3). Let us consider what difficulties *this* would entail.

We are now supposed to have taken up the following position: "I do not believe that the Bible tells us that God has declared He will inflict Eternal Punishment on human beings, who are either incapable of sinning, or who, being capable of sinning, have ceased to sin."

It is well to remind the Reader that, in taking up this position, he entirely escapes from the original difficulty on account of which we entered on this discussion. And how widely different this is from what we considered as the *first* of the courses possible to us! *That* would have involved us in the abandonment of Christianity itself; this entails many difficulties, no doubt: but they all belong to the infinitely less important field of Biblical Criticism.

The Reader who is unable, whether from want of time or from want of the necessary learning, to investigate this question for himself, must perforce accept the judgment of others: and all he needs here to be told is that the interpretation of the passages, which are believed to teach the doctrine of "Eternal Punishment," depends largely, if not entirely, on the meaning given to one single

word (αἰών). This is rendered, in our English Bibles, by the word “eternal” or “everlasting”: but there are many critics who believe that it does not necessarily mean “endless.” If this be so, then the punishment, which we are considering, is finite punishment for finite sin, and the original difficulty no longer exists.

In conclusion, I will put together in one view the various modes of escape, from the original difficulty, which may be adopted without violating the inexorable laws of logical reasoning. They are as follows:—

(1) “I believe that the infliction, on human beings, of endless punishment, for sins committed during a finite time, would be unjust, and therefore wrong. Yet I cannot resist the evidence that God has declared His intention of acting thus. Consequently I hold Him to be capable of sinning.”

This would practically mean the abandonment of Christianity.

(2) “I believe that God is perfectly good, and therefore that such infliction of punishment would be right, though my conscience declares it to be wrong.”

This would practically mean the abandonment of conscience as a guide to distinguish right from wrong, and would leave the phrase “I believe that God is perfectly *good*” without any intelligible meaning.

(3) “I believe that God is perfectly good. Also I believe that such infliction of punishment would be wrong. Consequently I believe that God is not capable of acting thus. I find that the Bible tells us that He *is* capable of acting thus. Consequently I believe that what the Bible tells us of the relations between God and Man cannot be relied on as true.”

This would practically mean the abandonment of the Bible as a trustworthy book.

(4) “I believe that God is perfectly good. Also I believe that such infliction of punishment would be wrong. Consequently I believe that God is not capable of acting thus. I find that the Bible, in the English Version, seems to tell us that He *is* capable of acting thus. Yet I believe that it is a book inspired by God, and protected by Him from error in what it tells us of the relations between God and Man, and therefore that what it says, according to the real meaning of the words, may be relied on as true. Consequently I hold that the word, rendered in English as ‘eternal’ or ‘everlasting,’ has been mistranslated, and that the Bible does not really assert more than that God will inflict suffering, of unknown duration but *not* necessarily eternal, punishment for sin.”

Any one of these four views may be held, without violating the laws of logical reasoning.

Here ends my present task; since my object has been, throughout, *not* to indicate one course rather than another, but to help the Reader to see clearly *what* the possible courses are, and *what* he is virtually accepting, or denying, in choosing any *one* of them.

11.9 Address by the Rev. C. L. Dodgson

Source: St. Mary Magdalen Church Magazine, November, 1897

*(Louis Carroll) at S. Mary Magdalen Church (3 p. m. The Children's Service)
on Harvest Thanksgiving Day.*

A little girl named Margaret went to a Harvest Festival Service one Sunday. The Church was beautiful with flowers and fruit and sweet music of thanksgiving. And the preacher spoke of God's great love and goodness in giving us everything that we possess, and that we must try to show our thankfulness to Him by offering of our best to Him in return. Some of us—and especially the children—perhaps thought they had nothing to give, or worthy to offer, to God, but the preacher said that God would accept even a little deed of love, or a simple act of kindness to one of His creatures, and that children, especially, could do these if they would try.

When the service was over and the people had gone away, little Margaret lingered in the churchyard thinking about what the preacher had said, and a lark started up from her feet and sang soaring into the blue sky with such gladness that Margaret said to herself, "Ah, he is trying to thank God as well as he can—how much I wish there were something that such a little girl as I could do too!"

She sat down on the grass in the sunshine to think, and presently she noticed a rose-bush growing near, and that the roses were hanging their heads, quite withered in the sun for want of water. So she ran to the brook, and making a cup of her hands dipped them into the water and ran and threw the water on the roses. She did so again and again, and the roses revived.

Little Margaret then walked on till she passed a cottage where a baby was sitting on the doorstep and crying sadly because his toy was broken. It was a paper windmill, and the sails had become all crumpled up and would not go round any more. Margaret took the toy from the baby and straightened out the sails, and a wind came by and turned them round merrily, so that the baby stretched out his hands and laughed for joy.

Then little Margaret thought she must go home, but as she passed the brook again she saw a little brown bird struggling in the water. He had fallen in and was being drowned, and growing weaker in his struggles. So Margaret caught hold of a bough, and stretching as far as she could, with her other hand she lifted the little bird out of the water and laid him safely on the bank.

And now she began to feel very tired, and at last reached her home. She climbed up to her room, and lay down on her little bed, very white and still, and closed her eyes. And then she said to herself, "I think this must be dying—yes, I am dying—and soon I shall be dead." And her friends came in and said, "Ah, she is dying, poor little Margaret!"

But a rose that was growing outside by the garden path heard it, and began to grow, and climbed and grew till it reached the window, and crept in through the window into the room, and crept all round the walls and little bed till there were wreaths of lovely roses filling the room with their sweetness. And the roses bent over Margaret's little pale face till her cheeks began to take a faint colour too. And just then a soft wind came blowing in at the window and fanned her

face, and a little brown bird outside began to sing so prettily, that Margaret smiled, and opened her eyes and . . . well, she was still sitting on the grass outside the Church, in the soft sunshine—for it was a dream!

I read this story in a book, and put it by to tell you, dear children, this afternoon; but now I will tell you three stories of love and kindness. For—

“He prayeth well, who loveth well
Both man and bird and beast.”

Quoted from *The Rime of the Ancient Mariner* by Samuel Taylor Coleridge

Some forty years ago there was a great singer, named Jenny Lind, and her voice and her singing were so beautiful that people who heard her felt as if they were listening to an angel. And they would go in crowds, and pay any money, to hear her sing.

On one occasion when she was singing at Manchester, she was caught by the rain during her morning walk and she took shelter in a poor little cottage, where a poor old woman lived alone. Jenny Lind talked kindly to her at once, and the poor old woman (of course not knowing who she was) told her about the wonderful Singer, who, “she was told was going to sing that afternoon,” and how everybody was “mad” to hear her, and how very very much she wished that she could hear her too. But that of course was impossible “for a poor old body like me!” Then Jenny Lind told the old woman that she was the Singer, and said she, “and I will sing to you.” So then and there, in that poor little cottage, the great Singer sang three or four of her sweetest songs, and gave the poor old woman the desire of her heart.

Again—a man walking along a country lane heard such a fluttering and chirping in the hedge that he stopped to look what it could be; and he saw that a young bird had fallen out of its nest, and its wings having caught on a thorn, it was hanging helpless. The mother bird was close to it fluttering and crying with all her might, but powerless to release her little one. She did not move as the man gently lifted the young bird and replaced it in the nest, but then instantly hopped on to the nest herself, and spread her wings over her little ones without a trace of fear, but in perfect confidence in the person who had come to her aid.

And now one more true tale, and this of a child’s kindness to one of God’s creatures. You will, I think, all have heard of Florence Nightingale. Hers is a name to make all English hearts beat warm as long as they exist;—one of England’s noblest women, for she was the first who thought of going to nurse our poor wounded soldiers on the battle-field.

From her childhood Florence Nightingale was always wanting to help and heal those in pain, and her first patient was a dog! She was but a child when one day she met a shepherd whom she knew, and he was in great distress because his faithful old dog, that had served him for so many years, was near his end. Some cruel boys—or I would rather say, thoughtless boys—had stoned the poor old dog, and he was so much hurt that he had only just been able to drag himself home to die! He was well-nigh worn out, but, “Now he’s done for, and I must do away with him,” said the shepherd, as he led the child to the cottage to show her the dog, and then he went sadly away to get the means of putting him out of his misery.

Florence Nightingale sat down beside the poor suffering creature, her kind heart full of pity. Presently she saw some one pass the door who she knew

understood all about animals, and calling him in, she showed him the dog. After examining him, her friend said, "Well, he's very bad, but there are no bones broken; all you can do is to wring out some cloths in hot water and lay them on the wounds, and keep on doing that for a long time." And the child set to work at once, lighted a fire, boiled the water, and persevered in her work for many hours, and to her joy the old dog began to get better and better. When the shepherd came home, Florence Nightingale said to him, "Call him, oh! do call him;" and so he called the old dog, who got up and greeted his master.

"He prayeth best, who loveth best
All things both great and small;
For the dear God who loveth us,
He made and loveth all."

Quoted from *The Rime of the Ancient Mariner* by Samuel Taylor Coleridge

And now, dear children, I want you to promise me that you will each one try, every day, to do some loving act of kindness for others. Perhaps you have never really tried before; will you begin to-day—the beginning of a new week? Last week is gone for ever; this week will be quite different. As you rub out the sums on your slate that have not come right, and begin all over again, so leave behind the disobedience, or selfishness, or ill-temper of last week, and begin quite fresh to try your very best, every day, to do what you can towards fulfilling God's law of love.

Part 12

Texts concerning Oxford

This chapter contains all texts about Christ Church, Oxford, etc. Some of these texts are written in a humourous tone (which may make it hard to understand what they are really about), some seriously. Note that there are also some poems that would have fitted here for its topic, but are together with the other poems. These are: *Examination Statute* (→ 18.2, p. 2012), *The Elections to the Hebdomadal Council* (→ 18.56, p. 2118), and *The Deserted Parks* (→ 18.110, p. 2220)

12.1 “Endowment of the Greek Professorship”

Source: printed 1861

In the ALTERNATIVE AMENDMENTS recently proposed in a paper issued under the above heading, the attention of Members of Convocation is respectfully invited to the following passage.

After proposing the institution of an independent Professorship of Greek, the following words occur: “That the Corpus element be omitted, and the Professor of Latin be substituted for the Regius Professor of Greek.”

Here are two propositions, startling in their novelty, and demanding serious and separate consideration.

The first, “That the Corpus element be omitted,” is a condition never before annexed to a Professorship, and which indicates but too clearly the wide influence which the so-called “spiritualist” views have attained both in America and in this country.

It may no doubt be desirable that a Professor should be free from the petty cares and distracting influences which are inseparable from our corporeal condition; still, as none but a member of All Souls can possibly fulfil the stringent requisition here proposed, Members of Convocation are respectfully reminded that to confine this piece of preferment within such narrow limits would be illiberal, if not unjust to other Colleges.

The second portion of the clause above quoted is as novel as the first, but so desirable an innovation, that it cannot be too widely known, or too heartily supported by Members of Convocation. There is no doubt that the substitution of Mr. Conington for Mr. Jowett would remove one of the most powerful elements

of discord in this "*vexata quæstio*," and would probably tend to its speedy and peaceful settlement. The question whether Mr. Conington himself would consent to the change is one which has no doubt suggested itself to, and been fully considered by, the proposer of these amendments. *Nov. 22, 1861.*

12.2 The New Examination Statute

Source: printed 1864; The Morning Post, March 4, 1864 (without paragraph breaks, and other minor changes)

Dear Mr. Vice-Chancellor,

I much regret the necessity, under which I feel that the new Examination Statute has placed me, of resigning my present office of Public Examiner in Mathematics. In taking this step, I think it right to lay before you, and before the University, a statement of the reasons that have led me to it.

It is not for me to dwell on the general objection which may be raised against the new Statute, as affecting the study of Classics in this place: the objection, I mean, that, in permitting the Student wholly to abandon that study during the latter half (it may be) of his necessary residence, it involves a partial surrender, and so is a step towards a total surrender, of the principle, hitherto inviolate, that the Classics are an *essential* part of an Oxford education. This objection must be felt, and may be urged, far more forcibly by Classical Tutors: I content myself with mentioning it, and pass on to considerations more nearly affecting my special line of study.

In the first place, then, I cannot bring myself to take any part in the degradation of Mathematical Honours which, as I conceive, this Statute must produce. I have always believed it to be the very essence of *Honours* that they should be given simply and solely "*honoris causa*," for work done over and above that which was necessary for any other purpose whatever. When that work comes to be utilised, and made to subserve the lower purpose of obtaining an ordinary B.A. Degree, it would seem to be a mockery to continue to apply the name of "Honours" to the Class List as a whole.

Secondly, it appears to me that, in the case of every candidate who just fails to obtain his Third Class, and whose time of standing is such as to allow of his trying again, it would be an act of common justice to pluck him, and so give him the opportunity of again offering himself in that School, rather than to put him into the Fourth Class, and so compel him to return to studies he may have long abandoned. I feel that to inflict a Fourth Class in such a case would be to visit a mere error of judgement with a penalty hitherto reserved for culpable idleness: and yet I cannot but fear that this course would virtually annul the Fourth Class, and so would much diminish the value both of the Third and of the Second.

Thirdly, I believe that it will be found necessary greatly to modify the present Final Mathematical Examination, and to draw up, and publish, a definite statement of the minimum amount of work sufficient to obtain a Third Class in Mathematics, if ever that Class is to be made a worthy test of the mental training hitherto implied in the Oxford B.A. Degree. Plausible as it may sound in theory, to say that this is not a case for a minimum standard at all—that those who begin to read for a Third Class will be led on to aim higher, and to do more than what is merely necessary for their purpose—I am quite sure that, in actual practice, it will be found necessary to provide such a minimum standard to meet the case of those who either do not aim higher, or who do so unsuccessfully; and that the Third Class will then be neither more nor less than a new Pass, only distinguished from the old by greater difficulty, and by the transparent disguise of a different name. These modifications and this standard must be settled by

the Examiners of the time being, and I feel that I, as one who entirely disapproves of the essential principle of the change to be introduced, cannot possibly be a fit person to discuss such a question.

Sincerely hoping that the further changes, which I feel sure must follow this, may not have the effect of yet further dissociating the names of Oxford and of Classical education,

I remain, dear Mr. Vice-Chancellor,

*Faithfully yours,
Charles L. Dodgson.
Christ Church,
March 2, 1864.*

12.3 American Telegrams (Summary)

Source: printed 1865

The interview which has just taken place, between President L—— and the Confederate Commissioners, has resulted in a proposal from the President that three representatives from each of the contending parties shall meet to arrange conditions of peace. The following is said to be the Confederate “platform”:—

(1.) That the almost dictatorial power, held by General Grant, shall be largely curtailed, if not altogether abolished. It is understood that the President himself is so entirely under his influence as to be a free agent in name only: a state of things which, it is urged, cannot but be highly prejudicial to the Union.

(2.) That the enormities perpetrated by General Butler shall meet with their due reward. The document from which we quote urges that “he has cost his country more in battels (*sic*) than any other known in our time,” and that “the interests of the few magnates, whose wealth he has augmented, cannot be suffered to outweigh those of the Commons he has so wantonly sacrificed.”

(3.) That the Treasury shall be placed under the control of Confederates and Federals alike: the Confederates urge that their party is “inadequately represented under the present administration,” and that the Secretary in particular “would be a blot in any conceivable system of government.”

(4.) That the forces at present in occupation of Confederate territory be withdrawn. “We can discuss no terms of peace,” say the Confederates, “with an armed foe. It is unworthy the dignity of a nation to be thus dictated to by the roar of canons (*sic*).”

Other minor propositions may, it is understood, be presented to the Federals for consideration. One is, “that the services which General Early has rendered to his country be rewarded by advancement in the course of the ensuing summer.” This proposal, however, is said to be distasteful to the Federals, and the President himself is so opposed to the very idea of Early rising, that there is little hope of its being agreed on. Various charges are brought against this unpopular general, of which his abandonment of “Pillow,” (the Federals’ strongest fort) is one of the gravest.

Gold 200, at which price it occasionally excites a brisk competition.

The difficulties of transit from place to place are enhanced by the insufficiency of public conveyances, and most of the travelling is done by means of private coaches. So much of the country, however, is still under martial law, that passes are not easy to obtain: in some instances they have been refused altogether.

The officers continue to send in long lists of sick and missing: much of this illness is supposed to be feigned for the sake of avoiding active service.

With a view to improving the condition of the lower classes, it is understood that collections will shortly be set on foot, under the authority of the President: this will probably have the effect of drawing attention to their number and wretchedness, but, beyond this, it is not anticipated that any great results will be derived from this measure.

12.4 The New Method of Evaluation as Applied to π

Source: The New Method of Evaluation as Applied to π (with minor differences as noted); The Dynamics of a Parti-cle; Notes by an Oxford Chiel

*“Littly Jack Horner
Sat in a corner
Eating a Christmas pie”*

Quoted from nursery rhyme

The problem of evaluating π , which has engaged the attention of mathematicians from the earliest ages, had, down to our own time, been considered as purely arithmetical. It was reserved for this generation to make the discovery that it is in reality¹ a dynamical problem: and the true value of π , which appeared an ‘ignis fatuus’ to our forefathers, has been at last obtained under pressure.

The following are the main data of the problem:

Let U = the University, G = Greek, and P = Professor. Then GP = Greek Professor; let this be reduced to its lowest terms, and call the result J.

Also let W = the work done, T = the Times, p = the given payment, π = the payment according to T, and S = the sum required; so that $\pi = S$.

The problem is, to obtain a value for π which shall be commensurable² with W.

In the early treatises on this subject, the mean value³ assigned to π will be found to be 40.000000. Later writers suspected that the decimal point had been accidentally shifted, and that the proper value was 400.00000: but, as the details of the process for obtaining it had been lost, no further progress was made in the subject till our own time, though several most ingenious methods were tried for solving the problem.

Of these methods we proceed to give some brief account. Those chiefly worthy of note appear to be Rationalisation, the Method of Indifferences, Penrhyn’s Method, and the Method of Elimination.

We shall conclude with an account of the great discovery of our own day, the Method of Evaluation under Pressure.⁴

I. Rationalisation.

The peculiarity of this process consists in its affecting all quantities alike with a negative sign.

To apply it, let H = High Church, and L = Low Church, then the geometric mean = \sqrt{HL} : call this ‘B’ (Broad Church).

$$\therefore HL = B^2.$$

Also let x and y represent unknown quantities.

¹really

²commensurate

³the value

⁴missing in original publication

The process now requires the breaking up of U into its partial factions, and the introduction⁵ of certain combinations. Of the two principal factions thus formed, that corresponding with P presented no further difficulty, but it appeared hopeless to rationalise the other.

A ‘*reductio ad absurdum*’ was therefore attempted, and it was asked ‘why should π not be evaluated?’ The great difficulty now was, to discover y .

Several ingenious substitutions and transformations were then resorted to, with a view to simplifying the equation⁶, and it was at one time asserted, though never actually proved, that ‘the y ’s were all on one side⁷. However, as repeated trials produced the same irrational result, the process was finally abandoned.

II. The Method of Indifferences.

This was a modification of ‘*the method of finite Differences,*’ and may be thus briefly described:—

Let E = Essays, and R = Reviews: then the locus of (E + R), referred to multilinear co-ordinates, will be found to be a superficies (i. e. a locus possessing length and breadth, but no depth). Let ν = novelty, and assume (E + R) as a function of ν .

Taking this superficies as the plane of reference, we get—

$$E = R = B$$

$$\therefore EB = B^2 = HL \text{ (by the last⁸ article.)}$$

Multiplying by P, $EBP = HPL$.

It was now necessary to investigate the locus of EBP: this was found to be a species of Catenary, called the Patristic Catenary, which is usually defined as ‘passing through origin, and containing many multiple points.’ The locus of HPL will be found almost entirely to coincide with this.

Great results were expected from the assumption of (E + R) as a function of ν : but the opponents of this theorem having actually succeeded in demonstrating that the ν -element did not even enter into the function, it appeared hopeless to obtain any real value of π by this method.

III. Penrhyn’s Method.

This was an exhaustive process for extracting the value of π , in a series of terms, by repeated divisions. The series so obtained appeared to be convergent, but the residual quantity was always negative, which of course made the process of extraction impossible.

This theorem was originally derived from a radical series in Arithmetical Progression: let us denote the series itself by A.P., and its sum by (A.P.)S. It was found that the function (A.P.)S entered into the above process, in various forms.

The experiment was therefore tried of transforming (A.P.)S into a new scale of notation: it had hitherto been, through a long series of terms, entirely in the

⁵introducing

⁶missing in original publication

⁷all the y ’s were on one side of the equation

senary, in which scale it had furnished many beautiful expressions: it was now transferred into the denary.

Under this modification, the process of division was repeated, but with the old negative result: the attempt was therefore abandoned, though not without a hope that future mathematicians, by introducing a number of hitherto undetermined constants, raised to the second degree, might succeed in obtaining a positive result.

IV. Elimination of J.

It had long been perceived that the chief obstacle to the evaluation of π was the presence of J, and in an earlier age of mathematics J would probably have been referred to rectangular axes, and divided into two unequal parts—a process of arbitrary elimination which is now considered not strictly legitimate.

It was proposed, therefore, to eliminate J by an appeal to the principle known as ‘*the permanence of equivalent formularies*:’ this, however, failed on application, as J became indeterminate. Some advocates of the process would have preferred that J should be eliminated ‘*in toto*.’ The classical scholar need hardly be reminded that ‘*toto*’ is the ablative of ‘*tumtum*,’ and that this beautiful and expressive phrase embodied the wish that J should be eliminated by a compulsory religious examination.

It was next proposed to eliminate J by means of a ‘*canonisant*.’ The chief objection to this process was, that it would raise J to an inconveniently high power, and would after all only give an irrational value for π .

Other processes, which we need not here describe, have been suggested for the evaluation of π . One was, that it should be treated as a *given* quantity: this theory was supported by many eminent men, at Cambridge and elsewhere; but, on application, J was found to exhibit a negative sign, which of course made the evaluation impossible.

We now proceed to describe the modern method, which has been crowned with brilliant and unexpected success, and which may be defined as

V. Evaluation Under Pressure.

Mathematicians had already investigated the locus of HPL, and had introduced this function into the calculation, but without effecting the desired evaluation, even when HPL was transferred to the opposite side of the equation, with a change of sign. The process we are about to describe consists chiefly in the substitution of G for P, and the application of pressure.

Let the function $\phi(HGL)$ be developed into a series, and let the sum of this be assumed as a perfectly rigid body, moving in a fixed line: let ‘ μ ’ be the coefficient of moral obligation, and ‘ e ’ the expediency. Also let ‘F’ be a Force acting equally in all directions, and varying inversely as T: let A = Able, and E = Enlightened.⁹

We have now to develop $\phi(HGL)$ by Maclaurin’s Theorem.

⁹missing in original publication

⌊The function itself vanishes when the variable vanishes:⌋¹⁰

$$\begin{aligned}
 \text{i. e. } \phi(0) &= O \\
 \phi'(0) &= C \text{ (a prime constant)} \\
 \phi''(0) &= 2. J \\
 \phi'''(0) &= 2. 3. H \\
 \phi''''(0) &= 2. 3. 4. S \\
 \phi'''''(0) &= 2. 3. 4. 5. P \\
 \phi''''''(0) &= 2. 3. 4. 5. 6. J
 \end{aligned}$$

after which the quantities recur in the same order.

The above proof is taken from the learned treatise '*Augusti de fallibilitate historicorum,*' and occupies an entire Chapter: the evaluation of π is given in the next Chapter. The author takes occasion to point out several remarkable properties, possessed by the above series, the existence of which had hardly been suspected before.

This series is a function both of μ and of e : but, when it is considered as a body, it will be found that $\mu = 0$, and that e only remains.

We now have the equation

$$\phi(HGL) = O + C + J + H + S + P + J.$$

The summation of this gave a minimum value for π : this, however, was considered only as a first approximation, and the process was repeated under pressure ⌊EAF¹¹⌋, which gave to π a partial maximum value: by continually increasing ⌊EAF¹²⌋, the result was at last obtained, $\pi = S = 500.00000$.

This result differs considerably from the anticipated value, namely 400.00000: still there can be no doubt that the process has been correctly performed, and that the learned world may be congratulated on the final settlement of this most difficult ⌊problem.⌋¹³

¹⁰In the original publication all but the first line of the following equation are prefixed by some explanation:

differentiating under pressure,
 let P = J, and we get
 differentiating for H,
 let L = S, and we get
 let G = P, and we get
 let P = J, and we get

12.5 The Dynamics of a Parti-cle

Source: The Dynamics of a Parti-cle (with minor differences as noted); Notes by an Oxford Chiel

*“Tis strange the mind, that very fiery particle,
Should let itself be snuff’d out by an article.”*

Quoted from *Don Juan* by Lord Byron

Introduction.

‘It was a lovely Autumn evening, and the glorious effects of chromatic aberration were beginning to show themselves in the atmosphere as the earth revolved away from the great western luminary, when two lines might have been observed wending their weary way across a plane superficies. The elder of the two had by long practice acquired the art, so painful to young and impulsive loci, of lying evenly between his extreme points; but the younger, in her girlish impetuosity, was ever longing to diverge and become an hyperbola or some such romantic and boundless curve. They had lived and loved: fate and the intervening superficies had hitherto kept them asunder, but this was no longer to be: *a line had intersected them, making the two interior angles together less than two right angles.* It was a moment never to be forgotten, and, as they journeyed on, a whisper thrilled along the superficies in isochronous waves of sound, “Yes! We shall at length meet if continually produced!” (Jacobi’s Course of Mathematics, Chap. 1.)

We have commenced with the above quotation as a striking illustration of the advantage of introducing the human element into the hitherto barren region of Mathematics. Who shall say what germs of romance, hitherto unobserved, may not underlie the subject? Who can tell whether the parallelogram, which in our ignorance we have defined and drawn, and the whole of whose properties we profess to know, may not be all the while panting for exterior angles, sympathetic with the interior, or sullenly repining at the fact that it cannot be inscribed in a circle? What mathematician has ever pondered over an hyperbola, mangling the unfortunate curve with lines of intersection here and there, in his efforts to prove some property that perhaps after all is a mere calumny, who has not fancied at last that the ill-used locus was spreading out its asymptotes as a silent rebuke, or winking one focus at him in contemptuous pity?

In some such spirit as this we have compiled the following pages. Crude and hasty as they are, they yet exhibit some of the phenomena of light, or ‘enlightenment,’ considered as a force, more fully than has hitherto been attempted by other writers.⁷¹

June, 1865.

⁷¹In the original publication followed by: Its *dynamical* effect, in producing divergence in a line hitherto perfectly straight, is well exemplified in Prop. VI: while its *statical* effect, as set forth in the concluding “Excursus in the evaluation of π ,” is perhaps, with all its attendant phenomena, the most extraordinary and momentous discovery of which Modern Mathematics can boast.

Chapter I. General Considerations.

Definitions

I PLAIN SUPERFICIALITY is the character of a speech, in which any two points being taken, the speaker is found to lie wholly with regard to those two points.

II PLAIN ANGER is the inclination of two voters to one another, who meet together, but whose views are not in the same direction.

III When a Proctor, meeting another Proctor, makes the votes on one side equal to those on the other, the feeling entertained by each side is called RIGHT ANGER.

IV When two parties, coming together, feel a Right Anger, each is *said* to be COMPLEMENTARY to the other, (though, strictly speaking, this is very seldom the case).

V OBTUSE ANGER is that which is greater than Right Anger.

Postulates

I Let it be granted, that a speaker may digress from any one point to any other point.

II That a finite argument, (i. e. one finished and disposed of,) may be produced to any extent in subsequent debates.

III That a controversy may be raised about any question, and at any distance from that question.

Axioms

I Men who go halves in the same (quart) are (generally) equal to another.

II Men who take a double in the same (term) are equal to anything.

On Voting

The different methods of voting are as follows:

I ALTERNANDO, as in the case of Mr. . . . who voted for and against Mr. Gladstone, alternate elections.

II INVERTENDO, as was done by Mr. . . . who came all the way from Edinburgh to vote, handed in a blank voting-paper, and so went home rejoicing.

III COMPONENTO, as was done by Mr. . . . whose name appeared on both committees at once, whereby he got great praise from all men, by the space of one day.

IV DIVIDENDO, as in Mr. ...'s case, who being sorely perplexed in his choice of candidates, voted for neither.

V CONVERTENDO, as was wonderfully exemplified by Messrs. ... and ... who held a long and fierce argument on the election, in which, at the end of two hours, each had vanquished and converted the other.

VI EX ÆQUALI IN PROPORZIONE PERTURBATĀ SEU INORDINATĀ, as in the election, when the result was for a long time equalised, and as it were held in the balance, by reason of those who had first voted on the one side seeking to pair off with those who had last arrived on the other side, and those who were last to vote on the one side being kept out by those who had first arrived on the other side, whereby, the entry to the Convocation House being blocked up, men could pass neither in nor out.

On Representation

Magnitudes are algebraically represented by letters, men by men of letters, and so on. The following are the principal systems of representation.

1. CARTESIAN: i. e. by means of 'cartes.' This system represents *lines* well, sometimes too well; but fails in representing *points*, particularly good points.

2. POLAR: i. e. by means of the 2 poles, 'North and South.' This is a very uncertain system of representation, and one that cannot safely be depended upon.

3. TRILINEAR: i. e. by means of a line which takes 3 different courses. Such a line is usually expressed by three letters, as W.E.G.

That the principle of Representation was known to the ancients is abundantly exemplified by Thucydides, who tells us that the favourite cry of encouragement during a trireme race was that touching allusion to Polar Co-ordinates which is still heard during the races of our own time, ' ρ_5 , ρ_6 , $\cos \phi$, they're gaining!'

Chapter II. Dynamics of a Particle.

Particles are logically divided according to GENIUS and SPEECHES.

GENIUS is the higher classification, and this, combined with DIFFERENTIA, (i. e. difference of opinion,) produces SPEECHES. These again naturally divide themselves into three heads.

Particles belonging to the great order of GENIUS are called 'able' or 'enlightened.'

Definitions

I A SURD is a radical whose meaning cannot be exactly ascertained. This class comprises a very large number of particles.

II INDEX indicates the degree, or power, to which a particle is raised. It consists of two letters, placed to the right of the symbol representing the particle. Thus, 'A.A.' signifies the 0th degree; 'B.A.' the 1st degree; and so on, till we reach 'M.A.' the 2nd degree (the intermediate letters indicating fractions of a degree); the last two usually employed being 'R.A.' (the reader need hardly be

reminded of that beautiful line in *The Princess* ‘Go dress yourself, Dinah, like a gorgeous R.A.’) and ‘S.A.’ This last indicates the 360th degree, and denotes that the particle in question, (which is $\frac{1}{7}$ th part of the function $\overline{E + R}$ ‘Essays and Reviews,’) has effected a complete revolution, and that the result = 0.

III MOMENT is the product of the mass into the velocity. To discuss this subject fully, would lead us too far into the subject *Vis Viva*, and we must content ourselves with mentioning the fact that *no moment is ever really lost, by fully enlightened Particles*. It is scarcely necessary to quote the well-known passage:—‘Every moment, that can be snatched from academical duties, is devoted to furthering the cause of the popular Chancellor of the Exchequer.’—(Clarendon, History of the Great Rebellion.)

IV A COUPLE consists of a moving particle, raised to the degree M.A., and combined with what is technically called a ‘better half.’ The following are the principal characteristics of a Couple: (1) It may be easily transferred from point to point. (2) Whatever *force of translation* was possessed by the uncombined particle, (and this is often considerable,) is wholly lost when the Couple is formed. (3) The two forces constituting the Couple habitually *act in opposite directions*.

On Differentiation

The effect of Differentiation on a Particle is very remarkable, the first Differential being frequently of a greater value than the original Particle, and the second of less enlightenment.

For example, let L = ‘Leader,’ S = ‘Saturday,’ and then L.S. = ‘Leader in the Saturday,’ (a particle of no assignable value). Differentiating once, we get L.S.D., a function of great value. Similarly it will be found that, by taking the second Differential of an enlightened Particle, (i. e. raising it to the Degree D.D.,) the enlightenment becomes rapidly less. The effect is much increased by the addition of a C: in this case the enlightenment often vanishes altogether, and the Particle becomes conservative.

It should be observed that, whenever the symbol L is used to denote ‘Leader,’ it must be affected with the sign \pm : this serves to indicate that its action is sometimes positive and sometimes negative—some particles of this class having the property of drawing others after them, (as ‘a Leader of an army,’) and others of repelling them, (as ‘a Leader of the Times.’)

Propositions

Prop. I. Pr. To find the value of a given Examiner *Example.* A takes in 10 books in the Final Examination, and gets a 3d Class: B takes in the Examiners, and gets a 2nd. Find the value of the Examiners in terms of books. Find also their value in terms in which no Examination is held.

Prop. II. Pr. To estimate Profit and Loss *Example.* Given a Derby Prophet, who has sent 3 different winners to 3 different betting-men, and given that none of the three horses are placed. Find the total Loss incurred by the

three men (α) in money, (β) in temper. Find also the Prophet. Is this latter generally possible?

Prop. III. Pr. To estimate the direction of a line. *Example.* Prove that the definition of a line, according to Walton, coincides with that of Salmon, only that they begin at opposite ends. If such a line be divided by Frost's method, find its value according to Price.

Prop. IV. Th. The end, (i. e. 'the product of the extremes,') justifies (i. e. 'is equal to' see Latin 'æquus,') the means.

No example is appended to this Proposition, for obvious reasons.

Prop. V. Pr. To continue a given series *Example.* A and B, who are respectively addicted to Fours and Fives, occupy the same set of rooms, which is always at Sixes and Sevens. Find the probable amount of reading done by A and B while the Eights are on.

We proceed to illustrate this hasty sketch of the Dynamics of a Particle, by demonstrating the great Proposition on which the whole theory of Representation depends, namely:—"To remove a given Tangent from a given Circle, and to bring another given Line into contact with it."

To work the following problem algebraically, it is best to let the circle be represented as referred to its two tangents, i. e. first to WEG, WH, and afterwards to WH, GH. When this is effected, it will be found most convenient to project WEG to infinity. The process is not given here in full, since it requires the introduction of many complicated determinants.

Prop. VI. Pr. To remove a given Tangent from a given Circle, and to bring another given Line into contact with it.

Let UNIV be a Large Circle, whose centre is O, (V being, of course, placed at the top,) and let WGH be a triangle, two of whose sides, WEG and WH, are in contact with the circle, while GH (called 'the base' by liberal mathematicians,)

is not in contact with it. (See Fig. 1.) It is required to destroy the contact of WEG, and to bring GH into contact instead.

Let I be the point of maximum illumination of the circle, and therefore E the point of maximum enlightenment of the triangle. (E of course varying perversely as the square of the distance from O.)

Let WH be fixed absolutely, and remain always in contact with the circle, and let the direction of OI be also fixed.

Now, so long as WEG preserves a perfectly straight course, GH cannot possibly come into contact with the circle, but if the force of illumination, acting along OI, cause it to bend (as in Fig. 2), a partial revolution on the part of WEG and GH is effected, WEG ceases to touch the circle, and GH is immediately brought into contact with it. Q.E.F.

The theory involved in the foregoing Proposition is at present much controverted, and its supporters are called upon to show what is the fixed *point*, or '*locus standi*,' on which they propose to effect the necessary revolution. To make this clear, we must go to the original Greek, and remind our readers that the true point or '*locus standi*,' is in this case ἄρδις, (or ἄρδις according to modern usage,) and therefore must not be assigned to WEG. In reply to this it is urged that, in a matter like the present, a single word cannot be considered a satisfactory explanation, such as ἀρδέωζ.

It should also be observed that the revolution here discussed is entirely the effect of enlightenment, since particles, when illuminated to such an extent as actually to become φώζ, are always found to diverge more or less widely from each other; though undoubtedly the *radical* force of the word is 'union' or 'friendly feeling.' The reader will find in 'Liddell and Scott' a remarkable illustration of this, from which it appears to be an essential condition that the feeling should be entertained φροῦδεν, and that the particle entertaining it should belong to the genus σκότος, and should therefore be, nominally at least, unenlightened.

12.6 The Offer of the Clarendon Trustees

Source: The Offer of the Clarendon Trustees (without introduction, footnote, and with minor differences as noted); Notes by an Oxford Chiel

Letter from Mr. Gladstone to the Vice-Chancellor.

Dear Mr. Vice-Chancellor,

The Clarendon Trustees . . . are ready, in concert with the University, to consider of the best mode of applying the funds belonging to them for “adding to the New Museum Physical Laboratories and other accommodation requisite for the department of Experimental Philosophy.”

I have the honour to remain,

Dear Mr. Vice-Chancellor,

Very faithfully yours,

May 3, 1867.

W. E. GLADSTONE.

The following passages are quoted from a paper which appeared on the subject.

“As Members of Convocation are called upon to consider the offer of the Clarendon Trustees, to employ the funds at their disposal in the erection of additional buildings to facilitate the study of Physics, they may perhaps find it useful to have a short statement of the circumstances which render additional buildings necessary, and of the nature of the accommodation required.”

“Again, it is often impossible to carry on accurate Physical experiments in close contiguity to one another, owing to their mutual interference; and consequently different processes need different rooms, in which these delicate instruments, which are always required in a particular branch of science, have to be carefully and permanently fixed.”

“It may be sufficient, in order to give an idea of the number of rooms required, to enumerate the chief branches of Physics which require special accommodation, owing to their mutual interference.

- (1) Weighing and measuring.
- (2) Heat.
- (3) Radiant Heat.
- (4) Dispersion of Light. Spectrum Analysis, &c.
- (5) General optics.
- (6) Statical electricity.
- (7) Dynamical electricity.
- (8) Magnetism.
- (9) Acoustics.

Of these, (5) requires one large room or three smaller rooms, and these, together with those devoted to (3) and (4), should have a south aspect. Besides the fixed instruments, there is a large quantity of moveable apparatus, which is either used with them or employed in illustrating lectures; and this must be carefully preserved from causes of deterioration when not in use; for this purpose a large room fitted with glass cases is required. A store-room for chemicals and other materials used is also necessary.”

“As Photography is now very much employed in multiplying results of observation, in constructing diagrams for lectures, &c., and as it is in fact a branch of Physics, a small Photographic room is necessary, both for general use and for studying the subject itself.”

‘Accommodated: that is, when a man is, as they say, accommodated; or when a man is—being—whereby—he may be thought to be accommodated; which is an excellent thing.’

Quoted from *King Henry IV Part II* by William Shakespeare

DEAR SENIOR CENSOR,¹

In a desultory conversation on a point connected with the dinner at our high table, you incidentally remarked to me that lobster-sauce, ‘though a necessary adjunct to turbot, was not entirely wholesome.’

It is entirely unwholesome. I never ask for it without reluctance: I never take a second spoonful without a feeling of apprehension on the subject of possible night-mare². This naturally brings me to the subject of Mathematics, and of the accommodation provided by the University for carrying on the calculations necessary in that important branch of Science.

As Members of Convocation are called upon (whether personally, or, as is less exasperating, by letter) to consider the offer of the Clarendon Trustees, as well as every other subject of human, or inhuman, interest, capable of consideration, it has occurred to me to suggest for your consideration how desirable roofed buildings are for carrying on mathematical calculations: in fact, the variable character of the weather in Oxford renders it highly inexpedient to attempt much occupation, of a sedentary nature, in the open air.

Again, it is often impossible for students to carry on accurate mathematical calculations in close contiguity to one another, owing to their mutual interference, and a tendency to general conversation: consequently these processes require different rooms in which irrepressible conversationists, who are found to occur in every branch of Society, might be carefully and permanently fixed.

It may be sufficient for the present to enumerate the following requisites: others might be added as funds permitted.

A. A very large room for calculating Greatest Common Measure. To this a small one might be attached for Least Common Multiple: this, however, might be dispensed with.

B. A piece of open ground for keeping Roots and practising their extraction: it would be advisable to keep Square Roots by themselves, as their corners are apt to damage others.

C. A room for reducing Fractions to their Lowest Terms. This should be provided with a cellar for keeping the Lowest Terms when found, which might also be available to the general body of Undergraduates, for the purpose of ‘keeping Terms.’

D. A large room, which might be darkened, and fitted up with a magic lantern, for the purpose of exhibiting Circulating Decimals in the act of circulation. This might also contain cupboards, fitted with glass-doors, for keeping the various Scales of Notation.

E. A narrow strip of ground, railed off and carefully levelled, for investigating the properties of Asymptotes, and testing practically whether Parallel Lines

¹The original publication starts from here, with “My dear Sandford”

²See page 2119, Notes 3, 4.

meet or not: for this purpose it should reach, to use the expressive language of Euclid, 'ever so far.'

This last process, of 'continually producing the Lines,' may require centuries or more: but such a period, though long in the life of an individual, is as nothing in the life of the University.

As Photography is now very much employed in recording human expressions, and might possibly be adapted to Algebraical Expressions, a small photographic room would be desirable, both for general use and for representing the various phenomena of Gravity, Disturbance of Equilibrium, Resolution, &c., which affect the features during severe mathematical operations.

May I trust that you will give your immediate attention to this most important subject?

Believe me,

Sincerely yours,

└MATHEMATICUS.³

12.7 Reform at Christ Church

Source: The Oxford Undergraduate's Journal, probably February 4, 1869; authorship not entirely certain

To the Editor of the Oxford Undergraduate's Journal

SIR,—The authorities of this place have altered the hour's service at 9 o'clock on Sunday Morning to a service of an hour and three quarters on Sunday at 10. The reasons for this change have naturally not been vouchsafed to the Undergraduates of the house; and as they do not lie on the surface I have set myself to discover them. They are these:—

1. To prevent Undergraduates from attending the University Sermon. (N.B. The University Sermon of last Sunday week was preached by the Dean of Ch. Ch. I infer, therefore, that he is the *Socrates* of the present day.)

2. The abolition of the immoral and profligate Sunday Breakfast, where half a dozen Undergraduates used to assemble in the most riotous manner, and which led to every kind of intemperance, tumult, and Sabbath breaking.

3. The substitution and encouragement of the Sunday Lunch; where every liquor is consumed except the poisonous draughts of tea and coffee which used to undermine the Undergraduate constitution at 10.30 a. m.

4. The substitution of a service of 105 minutes, instead of the former one of 55, which was too long for the attention of an audience of young men. The change, it is hoped, may effect a more desirable result.

I consider, in giving these reasons, that I have penetrated the inscrutable mystery which surrounded the origin of this service. All I have to ask in return is that the authorities should warm the Church to a certain extent, so that I may not in future, numb-fingered, as now, have to sign myself *Ροδοδάκτυλος*.

12.8 Suggestions for Committee

Source: printed 1871

Appointed to Consider the Expediency of Reconstituting Senior Studentships at Christ Church, March, 1871

I. That the titles of “Student” and “Scholar” be substituted for those of “Senior Student” and “Junior Student.”

II. That there be Praeectorships in subjects of Academical Study other than Natural Science, and that the mode of election and conditions of tenure for the Praeectors be the same as those which are statutory for the Lee’s Readers in Natural Science.

III. That Studentships of two classes be given, viz.: either for educational purposes, or to promote the interests of learning; but that none be given as sinecures.

IV. That those of the former class be given, after examination and full inquiry into merits and character, to persons who shall profess themselves ready to serve as Tutors, Praeectors, or Lecturers; and that no others be given excepting when the wants of the House, with respect to education and discipline, are, for the time being, fully satisfied.

V. That those of the latter class be given, after examination and full inquiry into merits and character, to persons who shall profess their intention of devoting themselves to study, whether preparatory to professional life, or such as will promote the interests of learning.

VI. That with regard to Students of the former class,

1. They be required to undertake such duties as may be assigned them, whether as Tutors, Praeectors, or Lecturers.

2. Those who are acting as Tutors shall be required to reside within the walls, and shall be responsible for their Pupils and for the maintenance of discipline generally, two at least of their body being elected annually as Censors.

3. Praeectors may also serve as Tutors, provided that they reside inside the walls.

4. Their appointment to Tutorships or Lectureships take effect for periods of six years only, but be renewable at the expiration of any such period.

5. On retirement after twelve years service as Tutors or Lecturers, they be entitled to retain their Studentships, but without any emoluments (or, with the emoluments to the amount of £100 a year); and that after eighteen years service, they may be entitled to the emoluments to the amount of £200 a year.

6. Those who shall have retired after at least eighteen years of service, as above mentioned, be allowed to marry without forfeiting the emoluments to which they would otherwise be entitled; but that, if they be instituted to an Ecclesiastical Benefice, or become possessed of property exceeding £500 a year (as defined in the existing Ordinance) they forfeit all further claim to emoluments.

7. Those who, not having so served for eighteen years, shall marry, or be instituted to such Benefice, or become possessed of such property (as aforesaid) shall forfeit their Studentships.

VII. That, with regard to Students of the latter class, who are preparing for professional life,

1. They be required to reside in Oxford for at least two years, and to engage in studies preparatory to such profession, and to proceed to Degrees in their respective Faculties (B.D., B.C.L., B.M., &c.)

2. Their election take effect for a period of three years only, but be renewable at its expiration for one other such period, if it shall appear to the Governing Body that they have pursued their studies in a satisfactory manner.

3. If they be instituted to an Ecclesiastical Benefice, or become possessed of property exceeding £500 a year, they shall forfeit their Studentships.

VIII. That, with regard to Students of the latter class, who are not preparing for professional life,

1. Their election take effect for periods of six years only, but be renewable at the expiration of any such period, if it shall appear to the Governing Body that they have pursued their studies in such a manner as to promote the interests of learning.

2. If re-elected after eighteen years of tenure, their election shall be either for life or for a term of years at the discretion of the Governing Body.

IX. That all Students continue to be members of the Governing Body so long as they are members of the Congregation of the University.

C. L. D.

12.9 The New Belfry of Christ Church, Oxford

Source: The New Belfry of Christ Church, Oxford; Notes by an Oxford Chiel

“A Thing of Beauty is a Joy for Ever.”

Quoted from
Endymion by John
Keats

East view of the new Belfry, Ch. Ch., as seen from the Meadow.

§ 1. On the etymological significance of the new Belfry, Ch. Ch.

The word ‘Belfry’ is derived from the French *bel*, ‘beautiful, becoming, meet,’ and from the German *frei*, ‘free, unfettered, secure, safe.’ Thus the word is strictly equivalent to ‘meat-safe,’ to which the new Belfry bears a resemblance so perfect as almost to amount to coincidence.

§ 2. On the style of the new Belfry, Ch. Ch.

The style is that which is usually known as ‘Early Debased’: very early, and remarkably debased.

§ 3. On the origin of the new Belfry, Ch. Ch.

Outsiders have enquired, with a persistence verging on personality, and with a recklessness scarcely distinguishable from insanity, to *whom* we are to attribute the first grand conception of the work. Was it the Treasurer, say they, who thus strove to force it on an unwilling House? Was it a Professor who designed this box, which, whether with a lid on or not, equally offends the eye? Or was it a Censor whose weird spells evoked the horrid thing, the bane of this and of succeeding generations? Until some reply is given to these and similar questions, they must and will remain—for ever—unanswered!

On this point Rumour has been unusually busy. Some say that the Governing Body evolved the idea in solemn conclave—the original motion being to adopt the Tower of St. Mark’s at Venice as a model: and that by a series of amendments it was reduced at last to a simple cube. Others say that the Reader in Chemistry suggested it as a form of crystal. There are others who affirm that the Mathematical Lecturer found it in the Eleventh Book of Euclid. In fact, there is no end to the various myths afloat on the subject. Most fortunately, we are in possession of the real story.

The true origin of the design is as follows: we have it on the very best authority.

The head of the House, and the architect, feeling a natural wish that their names should be embodied, in some conspicuous way, among the alterations then in progress, conceived the beautiful and unique idea of representing, by means of the new Belfry, a gigantic copy of a Greek Lexicon.¹ But, before the idea had been reduced to a working form, business took them both to London for a few days, and during their absence, somehow (*this* part of the business has never been satisfactorily explained) the whole thing was put into the hands of a wandering architect, who gave the name of Jeeby. As the poor man is now incarcerated at Hanwell, we will not be too hard upon his memory, but will only say that he professed to have originated the idea in a moment of inspiration, when idly contemplating one of those highly coloured, and mysteriously decorated chests which, filled with dried leaves from gooseberry bushes and quickset hedges, profess to supply the market with tea of genuine Chinese growth. Was there not something prophetic in the choice? What traveller is there, to whose lips, when first he enters that great educational establishment and gazes on this its newest decoration, the words do not rise unbidden—‘Thou tea-chest’?

It is plain then that Scott, the great architect to whom the work of restoration has been entrusted, is not responsible for this. He is *said* to have pronounced it a ‘casus belli’, which (with all deference to the Classical Tutors of the House, who insist that he meant merely ‘a case for a bell’) we believe to have been intended as a term of reproach.

The following lines are attributed to Scott:—

‘If thou wouldst view the Belfry aright,
Go visit it at the mirk midnight—
For the least hint of open day
Scares the beholder quite away.
When wall and window are black as pitch.
And there’s no deciding which is which;
When the dark Hall’s uncertain roof
In horror seems to stand aloof;
When corner and corner, alternately
Is wrought to an odious symmetry;
When distant Thames is heard to sigh
And shudder as he hurries by;
Then go, if it be worth the while.
Then view the Belfry’s monstrous pile.
And, home returning, soothly swear
“‘Tis more than Job himself could bear!’”

Parody on *The Lay of the Last Minstrel*
by Walter Scott

§ 4. On the chief architectural merit of the new Belfry, Ch. Ch.

Its chief merit is its Simplicity—a Simplicity so pure, so profound, in a word, so *simple*, that no other word will fitly describe it. The meagre outline, and baldness of detail, of the present Chapter, are adopted in humble imitation of this great feature.

¹The Editor confesses to a difficulty here. No sufficient reason has been adduced why a model of a Greek Lexicon should in any way ‘embody’ the names of the above illustrious individuals.

§ 5. On the other architectural merits of the new Belfry, Ch. Ch.

The Belfry has no other architectural merits.

§ 6. On the means of obtaining the best views of the new Belfry, Ch. Ch.

The visitor may place himself, in the first instance, at the opposite corner of the Great Quadrangle, and so combine, in one grand spectacle, the beauties of the North and West sides of the edifice. He will find that the converging lines forcibly suggest a vanishing point, and if that vanishing point should in its turn suggest the thought, ‘would that *it* were on the point of vanishing!’ he may perchance, like the Soldier in the Ballad, ‘lean upon his sword’ (if he has one: they are not commonly worn by modern tourists), ‘and wipe away a tear.’

He may then make the circuit of the Quadrangle, drinking in new visions of beauty at every step—

‘Ever charming, ever new,
When will the Belfry tire the view?’

Parody on *Grongar Hill* by John Dyer

as Dyer sings in his well-known poem, ‘Grongar Hill’—and, as he walks along from the Deanery towards the Hall staircase, and breathes more and more freely as the Belfry lessens on the view, the delicious sensation of relief, which he will experience when it has finally disappeared, will amply repay him for all he will have endured.

The *best* view of the Belfry is that selected by our Artist for the admirable frontispiece which he has furnished for the first Volume of the present work.² This view may be seen, in all its beauty, from the far end of Merton Meadow. From that point the imposing position (or, more briefly, the imposition) of the whole structure is thrillingly apparent. There the thoughtful passer-by, with four right angles on one side of him, and four anglers, who have no right to be there, on the other, may ponder on the mutability of human things, or recall the names of Euclid and Isaak Walton, or smoke, or ride a bicycle, or do anything that the local authorities will permit.

§ 7. On the impetus given to Art in England by the new Belfry, Ch. Ch.

The idea has spread far and wide, and is rapidly pervading all branches of manufacture. Already an enterprising maker of bonnet-boxes is advertising ‘the Belfry pattern’: two builders of bathing-machines at Ramsgate have followed his example: one of the great London houses is supplying ‘bar-soap’ cut in the same striking and symmetrical form: and we are credibly informed that Borwick’s Baking Powder and Thorley’s Food for Cattle are now sold in no other shape.

²On further consideration, it was deemed inexpedient to extend this work beyond the compass of one Volume.

§ 8. On the feelings with which old Ch. Ch. men regard the new Belfry.

Bitterly bitterly do all old Ch. Ch. men lament this latest lowest development of native taste. 'We see the Governing Body,' say they: 'where is the Governing *Mind?*' And Echo (exercising a judicious 'natural selection' for which even Darwin would give her credit) answers—'where?'

At the approaching 'Gaudy,' when a number of old Ch. Ch. men will be gathered together, it is proposed, at the conclusion of the banquet, to present to each guest a portable model of the new Belfry, tastefully executed in cheese.

§ 9. On the feelings with which resident Ch. Ch. men regard the new Belfry.

Who that has seen a Ch. Ch. man conducting his troop of 'lionesses' (so called from the savage and pitiless greed with which they devour the various sights of Oxford) through its ancient precincts, that has noticed the convulsive start and ghastly stare that always affect new-comers when first they come into view of the new Belfry, that has heard the eager questions with which they assail their guide as to the how, the why, the what for, and the how long, of this astounding phenomenon, can have failed to mark the manly glow which immediately suffuses the cheek of the hapless cicerone?

'Is it the glow of conscious pride—
Of pure ambition gratified—
That seeks to read in other eye
Something of its own ecstasy?
Or wrath, that worldlings should make fun
Of anything 'the House' has done?
Or puzzlement, that seeks in vain
The rigid mystery to explain?
Or is it shame that, knowing not
How to defend or cloak the blot—
The foulest blot on fairest face
That ever marred a noble place—
Burns with the pangs it will not own,
Pangs felt by loyal sons alone?'

§ 10. On the logical treatment of the new Belfry, Ch. Ch.

The subject has been reduced to three Syllogisms.

The first is in '*Barbara.*' It is attributed to the enemies of the Belfry.

Wooden buildings in the midst of stone-work are barbarous;
Plain rectangular forms in the midst of arches and decorations are
barbarous;
Ergo, The whole thing is ridiculous and revolting.

The second is in '*Celarent,*' and has been most carefully composed by the friends of the Belfry.

The Governing Body would conceal this appalling structure, if they could;
 The Governing Body would conceal the feelings of chagrin with which they now regard it, if they could;
Ergo, . . . (MS. unfinished.)

The third Syllogism is in ‘*Festino*,’ and is the joint composition of the friends and the enemies of the Belfry.

To restore the character of Ch. Ch., a tower must be built;
 To build a tower, ten thousand pounds must be raised;
Ergo, No time must be lost.

These three Syllogisms have been submitted to the criticism of the Professor of Logic, who writes that ‘he fancies he can detect some slight want of logical sequence in the Conclusion of the third.’ He adds that, according to *his* experience of life, when people thus commit a fatal blunder in child-like confidence that money will be forthcoming to enable them to set it right, in ten cases out of nine the money is *not* forthcoming. This is a large percentage.

§ 11. On the dramatic treatment of the new Belfry, Ch. Ch.

Curtain rises, discovering the Dean, Canons, and Students, seated round a table, on which the mad Architect, fantastically dressed, and wearing a Fool’s cap and bells, is placing a square block of deal.

Dean (as Hamlet). Methinks I see a Bell-tower!

Canons (looking wildly in all directions). Where, my good Sir?

Dean. In my mind’s eye—(*Knocking heard*) Who’s there?

Fool. A spirit, a spirit; he says his name’s poor Tom.

Enter THE GREAT BELL, disguised as a mushroom.

Great Bell. Who gives anything to poor Tom? whom the foul fiend hath led through bricks and through mortar, through rope and windlass, through plank and scaffold; that hath torn down his balustrades, and torn up his terraces; that hath made him go as a common pedlar, with a wooden box upon his back. Do poor Tom some charity. Tom’s a-cold.

Rafters, and planks, and such small deer,
 Shall be Tom’s food for many a year.

Censor. I feared it would come to this.

Dean (as King Lear). The little dons and all, Tutor, Reader, Lecturer—see, they bark at me!

Censor. His wits begin to unsettle.

Dean (as Hamlet). Do you see yonder box, that’s almost in shape of a tea-caddy?

Censor. By its mass, it is like a tea-caddy, indeed.

Dean. Methinks it is like a clothes-horse.

Censor. It is backed like a clothes-horse.

Dean. Or like a tub.

Censor. Very like a tub.

Dean. They fool me to the top of my bent.

Parody on *Hamlet* by William Shakespeare

Parody on *King Lear* by William Shakespeare

Enter from opposite sides THE BELFRY *as* Box, *and* THE BODLEY LIBRARIAN *as* Cox.

Librarian. Who are you, Sir?

Belfry. If it comes to that. Sir, who are you?

They exchange cards.

Librarian. I should feel obliged to you if you could accommodate me with a more protuberant Bell-tower, Mr. B. The one you have now seems to me to consist of corners only, with nothing whatever in the middle.

Belfry. Anything to accommodate you, Mr. Cox. (*Places jauntily on his head a small model of the skeleton of an timbrella, upside down.*)

Librarian. Ah, tell me—in mercy tell me—have you such a thing as a redeeming feature, or the least mark of artistic design, about you?

Belfry. No!

Librarian. Then you are my long-lost doorscraper!

They rush into each other's arms.

Enter TREASURER *as* Ariel. *Solemn music.*

SONG AND CHORUS.

Five fathom square the Belfry frowns;
All its sides of timber made;
Painted all in greys and browns;
Nothing of it that will fade.
Christ Church may admire the change—
Oxford thinks it sad and strange.
Beauty's dead! Let's ring her knell.
Hark! now I hear them—ding-dong, bell.

Parody on *Box and Cox* by John Maddison Morton,
Cox and Box by F. C. Burnand

Parody on *The Tempest* by William Shakespeare

§ 12. On the Future of the new Belfry, Ch. Ch.

The Belfry has a great Future before it—at least, if it has not, it has very little to do with Time at all, its Past being (fortunately for our ancestors) a nonentity, and its Present a blank. The advantage of having been born in the reign of Queen Anne, and of having died in that or the subsequent reign, has never been so painfully apparent as it is now.

Credible witnesses assert that, when the bells are rung, the Belfry must come down. In that case considerable damage (the process technically described as 'pulverisation') must ensue to the beautiful pillar and roof which adorn the Hall staircase. But the architect is prepared even for this emergency. 'On the first symptom of deflection' (he writes from Hanwell), 'let the pillar be carefully removed and placed, with its superstruent superstructure' (we cannot forbear calling attention to this beautiful phrase), 'in the centre of "Mercury." There it will constitute a novel and most unique feature of the venerable House.'

'Yea, and the Belfry shall serve to generations yet unborn as an aërial Ticket-office,' so he cries with his eye in a fine frenzy rolling, 'where the Oxford and London Balloon shall call ere it launch forth on its celestial voyage—and where expectant passengers shall while away the time with the latest edition of "Bell's Life"!'

§ 13. On the Moral of the new Belfry, Ch. Ch.

The moral position of Christ Church is undoubtedly improved by it. 'We have been attacked, and perhaps not without reason, on the Bread-and-Butter question,' she remarks to an inattentive World (which heeds her not, but prates on of Indirect Claims and of anything but indirect Claimants), 'we have been charged—and, it must be confessed, in a free and manly tone—with shortcomings in the payment of the Greek Professor, but who shall say that we are not all "on the square" *now*?'

This, however, is not *the* Moral of the matter. Everything has a moral, if you choose to look for it. In Wordsworth, a good half of every poem is devoted to the Moral: in Byron, a smaller proportion: in Tupper, the whole. Perhaps the most graceful tribute we can pay to the genius of the last-named writer, is to entrust to him, as an old member of Christ Church, the conclusion of this Monograph.

'Look on the Quadrangle of Christ Church, squarely, for is it not a Square?
And a Square recalleth a Cube; and a Cube recalleth the Belfry;
And the Belfry recalleth a Die, shaken by the hand of the gambler;
Yet, once thrown, it may not be recalled, being, so to speak, irrevocable.
There it shall endure for ages, treading hard on the heels of the Sublime—
For it is but a step, saith the wise man, from the Sublime unto the Ridiculous:
And the Simple dwelleth midway between, and shareth the qualities of either.'

12.10 The Vision of the Three T's. A Threnody

Parody on *The Compleate Angler* by Izaak Walton

"Call you this, baching of your friends?"

West view of the new Tunnel.

Chapter I

A Conference (held on the Twentieth of March, 1873)¹ betwixt an Angler, a Hunter, and a Professor; concerning anglings and the beautifying of Thomas his Quadrangle, The Ballad of 'The Wandering Burgess.'

PISCATOR, VENATOR.

PISCATOR. My honest Scholar, we are now arrived at the place whereof I spake, and trust me, we shall have good sport. How say you? Is not this a noble Quadrangle we see around us? And be not these lawns trimly kept, and this lake marvellous clear?

VENATOR. So marvellous clear; good Master, and withal so brief in compass, that methinks, if any fish of a reasonable bigness were therein, we must perforce espy it. I fear me there is none.

PISC. The less the fish, dear Scholar, the greater the skill in catching of it. Come, let's sit down, and, while we unpack the fishing-gear, I'll deliver a few remarks, both as to the fish to be met with hereabouts, and the properest method of fishing.

But you are to note first (for, as you are pleased to be my Scholar, it is but fitting you should imitate my habits of close observation) that the margin of this lake is so deftly fashioned that each portion thereof is at one and the same distance from that tumulus which rises in the centre.

VEN. O' my word 'tis so! You have indeed a quick eye, dear Master, and a wondrous readiness of observing.

PISC. Both may be yours in time, my Scholar, if with humility and patience you follow me as your model.

VEN. I thank you for that hope, great Master! But ere you begin your discourse, let me enquire of you one thing touching this noble Quadrangle,—Is all we see of a like antiquity? To be brief, think you that those two tall archways, that excavation in the parapet, and that quaint wooden box, belong to the ancient design of the building, or have men of our day thus sadly disfigured the place?

¹paranthesis only in table of contents

PISC. I doubt not they are new, dear Scholar. For indeed I was here but a few years since, and saw naught of these things. But what book is that I see lying by the water's edge?

VEN. A book of ancient ballads, and truly I am glad to see it, as we may herewith beguile the tediousness of the day, if our sport be poor, or if we grow weary.

PISC. This is well thought of. But now to business. And first I'll tell you somewhat of the fish proper to these waters. The Commoner kinds we may let pass: for though some of them be easily Plucked forth from the water, yet are they so slow, and withal have so little in them, that they are good for nothing, unless they be crammed up to the very eyes with such stuffing as comes readiest to hand. Of these the Stickle-back, a mighty slow fish, is chiefest, and along with him you may reckon the Fluke, and divers others: all these belong to the 'Mullet' genus, and be good to play, though scarcely worth examination.

I will now say somewhat of the Nobler kinds, and chiefly of the Gold-fish, which is a species highly thought of, and much sought after in these parts, not only by men, but by divers birds, as for example the King-fishers: and note that wheresoever you shall see those birds assemble, and but few insects about, there shall you ever find the Gold-fish most lively and richest in flavour; but wheresoever you perceive swarms of a certain gray fly, called the Dun-fly, there the Gold-fish are ever poorer in quality, and the King-fishers seldom seen.

A good Perch may sometimes be found hereabouts: but for a good fat Plaice (which is indeed but a magnified Perch) you may search these waters in vain. They that love such dainties must needs betake them to some distant Sea.

But for the manner of fishing, I would have you note first that your line be not thicker than an ordinary bell-rope: for look you, to flog the water, as though you laid on with a flail, is most preposterous, and will surely scare the fish. And note further, that your rod must by no means exceed ten, or at the most twenty, pounds in weight, for—

VEN. Pardon me, my Master, that I thus break in on so excellent a discourse, but there now approaches us a Collegian, as I guess him to be, from whom we may haply learn the cause of these novelties we see around us. Is not that a bone which, ever as he goes, he so cautiously waves before him?

Enter PROFESSOR.

PISC. By his reverend aspect and white hair, I guess him to be some learned Professor. I give you good day, reverend Sir! If it be not ill manners to ask it, what bone is that you bear about with you? It is, methinks, a humorous whimsy to chuse so strange a companion.

PROF. Your observation, Sir, is both anthropolitically and ambidexterously opportune: for this is indeed a *Humerus* I carry with me. You are, I doubt not, strangers in these parts, for else you would surely know that a Professor doth ever carry that which most aptly sets forth his Profession. Thus, the Professor of Uniform Rotation carries with him a wheelbarrow—the Professor of Graduated Scansion a ladder—and so of the rest.

VEN. It is an inconvenient and, methinks, an ill-advised custom.

PROF. Trust me, Sir, you are absolutely and amorphologically mistaken: yet time would fail me to show you wherein lies your error, for indeed I must now leave you, being bound for this great performance of music, which even at this distance salutes your ears.

PISC. Yet, I pray you, do us one courtesy before you go: and that shall be to resolve a question, whereby my friend and I are sorely exercised.

PROF. Say on. Sir, and I will e'en answer you to the best of my poor ability.

PISC. Briefly, then, we would ask the cause for piercing the very heart of this fair building with that uncomely tunnel, which is at once so ill-shaped, so ill-sized, and so ill-lighted.

PROF. Sir, do you know German?

PISC. It is my grief, Sir, that I know no other tongue than mine own.

PROF. Then, Sir, my answer is this, *Warum nicht?*

PISC. Alas, Sir, I understand you not.

PROF. The more the pity. For now-a-days all that is good comes from the German. Ask our men of science: they will tell you that any German book must needs surpass an English one. Aye, and even an English book, worth naught in this its native dress, shall become, when rendered into German, a valuable contribution to Science.

VEN. Sir, you much amaze me.

PROF. Nay, Sir, I'll amaze you yet more. No learned man doth now talk, or even so much as cough, save only in German. The time has been, I doubt not, when an honest English 'Hem!' was held enough, both to clear the voice and rouse the attention of the company, but now-a-days no man of Science, that setteth any store by his good name, will cough otherwise than thus, *Ah! Cuck! Muoh!*

VEN. 'Tis wondrous. But, not to stay you further, wherefore do we see that ghastly gash above us, hacked, as though by some wanton school-boy, in the parapet adjoining the Hall?

PROF. Sir, do *you* know German?

VEN. Believe me, No.

PROF. Then, Sir, I need but ask you this, *Wie befinden Sie Sich?*

VEN. I doubt not. Sir, but you are in the right on't.

PISC. But, Sir, I will by your favour ask you one other thing, as to that unseemly box that blots the fair heavens above. Wherefore, in this grand old City, and in so conspicuous a place, do men set so hideous a thing?

PROF. Be you mad, Sir? Why this is the very climacteric and coronal of all our architectural aspirations! In all Oxford there is naught like it!

PISC. It joys me much to hear you say so.

PROF. And, trust me, to an earnest mind, the categorical evolution of the Abstract, ideologically considered, must infallibly develop itself in the parallelpipedisation of the Concrete! And so farewell. *[Exit*

PROFESSOR.

PISC. He is a learned man, and methinks there is much that is sound in his reasoning.

VEN. It is *all* sound, as it seems to me. But how say you? Shall I read you one of these ballads? Here is one called 'The Wandering Burgess,' which (being forsooth a dumpish ditty) may well suit the ears of us whose eyes are oppressed with so dire a spectacle.

PISC. Read on, good Scholar, and I will bait our hooks the while.

[VENATOR readeth

The Wandering Burgeff.

Our Willie had been sae lang awa'
Frae bonnie Oxford toon,
The townsfolk they were greeting a'
As they went up and doon.
He hadna been gane a year, a year,
A year but barely ten,
When word cam unto Oxford toon.
Our Willie wad come agen.
Willie he stude at Thomas his Gate,
And made a lustie din;
And who so blithe as the gate-porter
To rise and let him in?
'Now enter Willie, now enter Willie,
And look around the place.
And see the pain that we have ta'en
Thomas his Quad to grace.'
The first look that our Willie cast,
He leuch loud laughters three,
The neist look that our Willie cast,
The tear blindit his e'e.
Sae square and stark the Tea-chest frowned
Athwart the upper air,
But when the Trench our Willie saw,
He thocht the Tea-chest fair.
Sae murderous-deep the Trench did gape
The parapet aboon.
But when the Tunnel Willie saw,
He loved the Trench eftsoon.
'Twas mirk beneath the tane archway,
'Twas mirk beneath the tither;
Ye wadna ken a man therein.
Though it were your ain dear brither.
He turned him round and round about.
And looked upon the Three;
And dismal grew his countenance.
And drumlie grew his e'e.
'What cheer, what cheer, my gallant knight?'
The gate-porter 'gan say.
'Saw ever ye sae fair a sight
As ye have seen this day?'
'Now haud your tongue of your prating, man:
Of your prating now let me be.
For, as I'm true knight, a fouler sight
I'll never live to see.
'Before I'd be the ruffian dark

Who planned this ghastly show,
I'd serve as secretary's clerk
To Ayrton or to Lowe.
'Before I'd own the loathly thing
That Christ Church Quad reveals,
I'd serve as shoeblick's underling
To Odger and to Beales!'

Chapter II

A Conference with one distraught: who discourseth strangely of many things.

PISCATOR, VENATOR.

PISCATOR. 'Tis a marvellous pleasant ballad. But look you, another Collegian draws near. I wot not of what station he is, for indeed his apparel is new to me.

VENATOR. It is compounded, as I take it, of the diverse dresses of a jockey, a judge, and a North American Indian.

Enter LUNATIC.

PISC. Sir, may I make bold to ask your name?

LUN. With all my heart. Sir. It is Jeeby, at your service.

PISC. And wherefore (if I may further trouble you, being as you see a stranger) do you wear so gaudy, but withal so ill-assorted, a garb?

LUN. Why, Sir, I'll tell you. Do you read the *Morning Post*?

PISC. Alas, Sir, I do not.

LUN. 'Tis pity of your life you do not. For, look you, not to read the *Post*, and not to know the newest and most commended fashions, are but one and the same thing. And yet this raiment, that I wear, is *not* the newest fashion. No, nor has it ever been, nor will it ever be, the fashion.

VEN. I can well believe it.

LUN. And therefore 'tis. Sir, that I wear it. 'Tis but a badge of greatness. My deeds you see around you. *Si monumentum quaeris, circumspice!* You know Latin?

VEN. Not I, Sir! It shames me to say it.

LUN. You are then (let me roundly tell you) *monstrum horrendum, informe, ingens, cui lumen ademptum!*

VEN. Sir, you may tell it me roundly—or, if you list, squarely—or again, triangularly. But if, as you affirm, I see your deeds around me, I would fain know which they be.

LUN. Aloft, Sir, stands the first and chiefest! That soaring minaret! That gorgeous cupola! That dreamlike effulgence of—

VEN. That wooden box?

LUN. The same. Sir! 'Tis mine!

VEN. (*after a pause*). Sir, it is worthy of you.

LUN. Lower now your eyes by a hairsbreadth, and straight you light upon my *second* deed. Oh Sir, what toil of brain, what cudgelling of forehead, what rending of locks, went to the fashioning of it!

VEN. Mean you that newly-made gap?

LUN. I do, Sir. 'Tis mine!

VEN. (*after a long pause*). What else, Sir? I would fain know the worst.

Quoted from the epitaph on the tomb of Christopher Wren in St Paul's Cathedral

Quoted from *Aeneid* by Virgil

LUN. (*wildly*). It comes, it comes! My *third* great deed! Lend, lend your ears—your nose—any feature you can least conveniently spare! See you those twin doorways? Tall and narrow they loom upon you—severely simple their outline—massive the masonry between—black as midnight the darkness within! Sir, of what do they mind you?

VEN. Of vaults, Sir, and of charnel-houses.

LUN. This is a goodly fancy, and yet they are not vaults. No, Sir, you see before you a Railway Tunnel!

VEN. 'Tis very strange!

LUN. But no less true than strange. Mark me. 'Tis love, 'tis love, that makes the world go round! Society goes round of itself. In circles. Military society in military circles. Circles must needs have centres. Military circles military centres.

VEN. Sir, I fail to see—

LUN. Lo you, said our Rulers, Oxford shall be a military centre! Then the chiefest of them (glad in countenance, yet stony, I wot, in heart) so ordered it by his underling (I remember me not his name, yet is he one that can play a card well, and so serveth meetly the behests of that mighty one, who played of late in Ireland a game of cribbage such as no man, who saw it, may lightly forget); and then. Sir, this great College, ever loyal and generous, gave this Quadrangle as a Railway Terminus, whereby the troops might come and go. By that Tunnel, Sir, the line will enter.

PISC. But, Sir, I see no rails.

LUN. Patience, good Sir! For railing we look to the Public. The College doth but furnish sleepers.

PISC. And the design of that Tunnel is—

LUN. Is mine, Sir! Oh, the fancy! Oh, the wit! Oh, the rich vein of humour! When came the idea? 'T' the mirk midnight. Whence came the idea? From a cheese-scoop! How came the idea? In a wild dream. Hearken, and I will tell. Form square, and prepare to receive a canonry! All the evening long I had seen lobsters marching around the table in unbroken order. Something sputtered in the candle—something hopped among the teathings—something pulsated, with an ineffable yearning, beneath the enraptured hearthrug! My heart told me something was coming—and something came! A voice cried 'Cheese-scoop!' and the Great Thought of my life flashed upon me! Placing an ancient Stilton cheese, to represent this venerable Quadrangle, on the chimney-piece, I retired to the further end of the room, armed only with a cheese-scoop, and with a dauntless courage awaited the word of command. Charge, Cheesetaster, charge! On, Stilton, on! With a yell and a bound I crossed the room, and plunged my scoop into the very heart of the foe! Once more! Another yell—another bound—another cavity scooped out! The deed was done!

VEN. And yet, Sir, if a cheese-scoop were your guide, these cavities must needs be circular.

LUN. They were so at the first—but, like the fickle Moon, my guardian satellite, I change as I go on. Oh, the rapture, Sir, of that wild moment! And did I reveal the Mighty Secret! Never, never! Day by day, week by week, behind a wooden screen, I wrought out that vision of beauty. The world came and went, and knew not of it. Oh, the ecstasy, when yesterday the Screen was swept away, and the Vision was a Reality! I stood by Tom-Gate, in that triumphal hour, and watched the passers by. They stopped! They stared!! They started!!! A

thrill of envy paled their cheeks! Hoarse inarticulate words of delirious rapture rose to their lips! What withheld me—what, I ask you candidly, withheld me from leaping upon them, holding them in a frantic clutch, and yelling in their ears ‘’Tis mine, ’tis mine!’

PISC. Perchance, the thought that—

LUN. You are right, Sir. The thought that there is a lunatic asylum in the neighbourhood, and that two medical certificates—but I will be calm. The deed is done. Let us change the subject. Even now a great musical performance is going on within. Wilt hear it? The Chapter give it—ha, ha! They give it!

PISC. Sir, I will very gladly be their guest.

LUN. Then, guest, you have not guessed all! You shall be bled, Sir, ere you go! ’Tis love, ’tis love, that makes the hat go round! Stand and deliver! Vivat Regina! No money returned!

PISC. How mean you, Sir?

LUN. I said, Sir, ‘No money returned!’

PISC. And *I* said, Sir, ‘How mean—’

LUN. Sir, I am with you. You have heard of Bishops’ Charges? Sir, what are Bishops to Chapters? Oh, it goes to my heart to see these quaint devices! First, sixpence for use of a doorscraper. Then, fivepence for right of choosing by which archway to approach the door. Then, a poor threepence for turning of the handle. Then, a shilling a head for admission, and half-a-crown for every two-headed man. Now this, Sir, is manifestly unjust: for you are to note that the double of a shilling—

PISC. I do surmise, Sir, that the case is rare.

LUN. And then, Sir, five shillings each for care of your umbrella! Hence comes it that each visitor of ready wit hides his umbrella, ere he enter, either by swallowing it (which is perilous to the health of the inner man), or by running it down within his coat, even from the nape of the neck, which indeed is the cause of that which you may have observed in me, namely, a certain stiffness in mine outward demeanour. Farewell, gentlemen, I go to hear the music. [*Exit* LUNATIC.

Quoted from typical ending of playbills

Chapter III

A Conference of the Hunter with a Tutor, whilom the Angler his eyes be closed in sleep. The Angler awaking relateth his Vision, The Hunter chaunteth ‘A Bachanalian Ode’

PISCATOR, VENATOR, TUTOR.

VENATOR. He hath left us, but methinks we are not to lack company, for look you, another is even now at hand, gravely apparelled, and bearing upon his head Hoffmann’s Lexicon in four volumes folio.

PISCATOR. Trust me, this doth symbolise his craft. Good morrow. Sir. If I rightly interpret these that you bear with you, you are a teacher in this learned place?

TUTOR. I am, Sir, a Tutor, and profess the teaching of divers unknown tongues.

PISC. Sir, we are happy to have your company, and, if it trouble you not too much, we would gladly ask (as indeed we did ask another of your learned body, but understood not his reply) the cause of these new things we see around

us, which indeed are as strange as they are new, and as unsightly as they are strange.

TUTOR. Sir, I will tell you with all my heart. You must know then (for herein lies the pith of the matter) that the motto of the Governing Body is this:—

'Diruit, ædificat, mutat quadrata rotundis;' which I thus briefly expound.

Diruit. *'It teareth down.'* Witness that fair opening which, like a glade in an ancient forest, we have made in the parapet at the sinistral extremity of the Hall. Even as a tree is the more admirable when the hewer's axe hath all but severed its trunk—or as a row of pearly teeth, enshrined in ruby lips, are yet the more lovely for the loss of one—so, believe me, this our fair Quadrangle is but enhanced by that which foolish men in mockery call 'the Trench.'

Ædificat. *'It buildeth up.'* Witness that beauteous Belfry which, in its ethereal grace, seems ready to soar away even as we gaze upon it! Even as a railway-porter moves with an unwonted majesty when bearing a portmanteau on his head—or as I myself (to speak modestly) gain a new beauty from these massive tomes—or as ocean charms us most when the rectangular bathing-machine breaks the monotony of its curving marge—so are we blessed by the presence of that which an envious world hath dubbed 'the Tea-chest.'

Mutat quadrata rotundis. *'It exchangeth square things for round.'* Witness that series of square-headed doors and windows, so beautifully broken in upon by that double archway! For indeed, though simple (*'simplex munditiis,'* as the poet saith) it is matchless in its beauty. Had those twin archways been greater, they would but have matched those at the corners of the Quadrangle—had they been less, they would but have copied, with an abject servility, the doorways around them. In such things, it is only a vulgar mind that thinks of a *match*. The subject is low. *We* seek the Unique, the Eccentric! *We* glory in this two-fold excavation, which scoffers speak of as 'the Tunnel'

VEN. Come, Sir, let me ask you a pleasant question. Why doth the Governing Body chuse for motto so trite a saying? It is, if I remember me aright, an example of a rule in the Latin Grammar.

TUTOR. Sir, if we are not grammatical, we are nothing!

VEN. But for the Belfry, Sir. Sure none can look on it without an inward shudder?

TUTOR. I will not gainsay it. But you are to note that it is not permanent. This shall serve its time, and a fairer edifice shall succeed it.

VEN. In good sooth I hope it. Yet for the time being it doth not, in that it is not permanent, the less disgrace the place. Drunkenness, Sir, is not permanent, and yet is held in no good esteem.

TUTOR. 'Tis an apt simile.

VEN. And for these matchless arches (as you do most truly call them) would it not savour of more wholesome Art, had they matched the doorways, or the gateways?

TUTOR. Sir, do you study the Mathematics?

VEN. I trust, Sir, I can do the Rule of Three as well as another: and for Long Division—

TUTOR. You must know, then, that there be three Means treated of in Mathematics. For there is the Arithmetic Mean, the Geometric, and the Harmonic. And note further, that a Mean is that which falleth between two magnitudes. Thus it is, that the entrance you here behold falleth between the magnitudes of

Quoted from *Epistle 1, Book 1* by Horace

the doorways and the gateways, and is in truth the Non-harmonic Mean, the Mean Absolute. But that the Mean, or Middle, is ever the safer course, we have a notable ensample in Egyptian history, in which land (as travellers tell us) the Ibis standeth ever in the midst of the river Nile, so best to avoid the onslaught of the ravenous alligators, which infest the banks on either side: from which habit of that wise bird is derived the ancient maxim '*Medio tutissimus Ibis.*'

VEN. But wherefore be they *two*? Surely *one* arch were at once more comely and more convenient?

TUTOR. Sir, so long as public approval be won, what matter for the arch? But that they are two, take this as sufficient explication—that they are too tall for doorways, too narrow for gateways; too light without, too dark within; too plain to be ornamental, and withal too fantastic to be useful. And if this be not enough, you are to note further that, were it all one arch, it must needs cut short one of those shafts which grace the Quadrangle on all sides—and that were a monstrous and unheard-of thing, in good sooth, look you.

VEN. In good sooth. Sir, if I look, I cannot miss seeing that there be three such shafts already cut short by doorways: so that it hath fair ensample to follow.

TUTOR. Then will I take other ground, Sir, and affirm (for I trust I have not learned Logic in vain) that to cut short the shaft were a common and vulgar thing to do. But indeed a single arch, where folk might smoothly enter in, were wholly adverse to Nature, who formeth never a mouth without setting a tongue as an obstacle in the midst thereof.

VEN. Sir, do you tell me that the block of masonry, between the gateways, was left there of set purpose, to hinder those that would enter in?

TUTOR. Trust me, it was even so; for firstly, we may thereby more easily controul the entering crowds ('*divide et impera*' say the Ancients), and secondly, in this matter a wise man will ever follow Nature. Thus, in the centre of a hall-door we usually place an umbrella-stand—in the midst of a wicket-gate, a milestone—what place so suited for a watchbox as the centre of a narrow bridge?—Yea, and in the most crowded thoroughfare, where the living tide flows thickest, there, in the midst of all, the true *ideal* architect doth ever plant an obelisk! You may have observed this?

VEN. (*much bewildered*). I *may* have done so, worthy Sir: and yet, methinks—

TUTOR. I must now bid you farewell; for the music, which I would fain hear, is even now beginning.

VEN. Trust me, Sir, your discourse hath interested me hugely.

TUTOR. Yet it hath, I fear me, somewhat wearied your friend, who is, as I perceive, in a deep slumber.

VEN. I had partly guessed it, by his loud and continuous snoring.

TUTOR. You had best let him sleep on. He hath, I take it, a dull fancy, that cannot grasp the Great and the Sublime. And so farewell: I am bound for the music.

[*Exit* TUTOR.]

VEN. I give you good day, good Sir. Awake, my Master! For the day weareth on, and we have caught no fish.

PISC. Think not of fish, dear Scholar, but hearken! Trust me, I have seen such things in my dreams, as words may hardly compass! Come, Sir, sit down, and I'll unfold to you, in such poor language as may best suit both my capacity and the briefness of our time.

The Vision of the Three T's.

Methought that, in some byegone Age, I stood beside the waters of Mercury, and saw, reflected on its placid face, the grand old buildings of the Great Quadrangle: near me stood one of portly form and courtly mien, with scarlet gown, and broad-brimmed hat whose strings, wide-fluttering in the breezeless air, at once defied the laws of gravity and marked the reverend Cardinal! 'Twas Wolseys self! I would have spoken, but he raised his hand and pointed to the cloudless sky, from whence deep-muttering thunders now began to roll. I listened in wild terror.

Darkness gathered overhead, and through the gloom sobbingly down-floated a gigantic Box! With a fearful crash it settled upon the ancient College, which groaned beneath it, while a mocking voice cried 'Ha! Hal' I looked for Wolsey: he was gone. Down in those glassy depths lay the stalwart form, with scarlet mantle grandly wrapped around it: the broad-brimmed hat floated, boatlike, on the lake, while the strings with their complex tassels, still defying the laws of gravity, quivered in the air, and seemed to point a hundred fingers at the horrid Belfry! Around, on every side, spirits howled in the howling blast, blatant, stridulous!

A darker vision yet! A black gash appeared in the shuddering parapet! Spirits flitted hither and thither with averted face, and warning finger pressed to quivering lips!

Then a wild shriek rang through the air, as, with volcanic roar, two murky chasms burst upon the view, and the ancient College reeled giddily around me!

Spirits in patent-leather boots stole by on tiptoe, with hushed breath and eyes of ghastly terror! Spirits with cheap umbrellas, and unnecessary goloshes, hovered over me, sublimely pendant! Spirits with carpet-bags, dressed in complete suits of dittos, sped by me, shrieking 'Away! Away! To the arrowy Rhine! To the rushing Guadalquiver! To Bath! To Jericho! To anywhere!'

Stand here with me and gaze. From this thrice-favoured spot, in one rapturous glance gather in, and brand for ever on the tablets of memory, the Vision of the Three T's! To your left frowns the abysmal blackness of the tenebrous Tunnel. To your right yawns the terrible Trench. While far above, away from the sordid aims of Earth and the petty criticisms of Art, soars, tetragonal and tremendous, the tintinabulatory Tea-chest! Scholar, the Vision is complete!

VEN. I am glad on't: for in good sooth I am a-hungred. How say you, my Master? Shall we not leave fishing, and fall to eating presently? And look you, here is a song, which I have chanced on in this book of ballads, and which methinks suits well the present time and this most ancient place.

PISC. Nay then, let's sit down. We shall I warrant you, make a good honest wholesome hungry nuncheon with a piece of powdered beef and a radish or two that I have in my fish-bag. And you shall sing us this same song as we eat.

VEN. Well then, I will sing: and I trust it may content you as well as your excellent discourse hath oft profited me.

[VENATOR *chaunteth*

A Bacchanalian Ode.

Here's to the Freshman of bashful eighteen!
Here's to the Senior of twenty!
Here's to the youth whose moustache can't be seen!
And here's to the man who has plenty!

Parody on *Here's to the Maiden of Bashful fifteen* by Richard Brinsley Sheridan

Let the men Pass!
 Out of the mass
 I'll warrant we'll find you some fit for a Class!
 Here's to the Censors, who symbolise Sense,
 Just as Mitres incorporate Might, Sir!
 To the Bursar, who never expands the expense!
 And the Readers, who always do right, Sir!
 Tutor and Don,
 Let them jog on!
 I warrant they'll rival the centuries gone!
 Here's to the Chapter, melodious crew!
 Whose harmony surely *intends* well:
 For, though it commences with 'harm,' it is true,
 Yet its motto is 'All's well that ends well'!
 'Tis love, I'll be bound.
 That makes it go round!
 For 'In for a penny is in for a pound'!
 Here's to the Governing Body, whose Art
 (For they're Masters of Arts to a man. Sir!)
 Seeks to beautify Christ Church in every part,
 Though the method seems hardly to answer!
 With three T's it is graced—
 Which letters are placed
 To stand for the names of Tact, Talent, and Taste!

PISC. I thank you, good Scholar, for this piece of merriment, and this Song, which was well humoured by the maker, and well rendered by you.

VEN. Oh me! Look you. Master! A fish, a fish!

PISC. Then let us hook it.

[*They hook it.*]

12.11 Objections, Submitted to the Governing Body of Christ Church, Oxford

Source: printed 1873

Against Certain Proposed Alterations in the Great Quadrangle

Having little confidence in the practical effect of a spoken argument, and still less in my own power of delivering one, I have adopted this method of laying before the Governing Body of Christ Church certain objections, which appear to me well-founded and worthy of consideration, against the proposed alterations in the terrace of the Great Quadrangle.

The alterations, to which I refer, are three. (1) The lowering of the terrace. (2) The narrowing of it. (3) The substitution of a grass slope for the existing stone wall.

(1) The lowering of the terrace is advocated on one ground only, so far as I know—that the lower portions of the shafts are at present concealed by the gravel. This reason would, to my mind, be quite enough to justify the change, provided no good reason could be urged against it; but this is not the case.

The objection, which I have to urge against it, can hardly be fairly appreciated except by looking at the thing itself. Let any one, who wishes to form an opinion for himself about the matter, stand near Tom Gate and carry his eye round the boundary, to the lawn, formed by the terrace-wall: he will see that, in proportion to its great extent, it is a *very* low wall already—only just enough to make a definite boundary to the grass. Imagine it reduced, and it ceases to be definite wall at all—it will look more like an accidental difference of level, between two parts of the Quadrangle, which had originally been one and the same plane surface. This evil would be intensified by substituting grass slope for wall: but this point I shall discuss further on, where it will be necessary, on account of the inevitable ‘cross-division’ of subject, to repeat part of what I have said here.

I think it not improbable that those who originally laid out the Quadrangle intended, at first, that the lower parts of the shafts should be visible, but that, finding the terrace to be too low for effect, and being prevented from lowering the central lawn by the necessity of keeping to the level of the street outside, they decided on sacrificing part of the shafts to preserve the general symmetry of the Quadrangle.

(2) The narrowing of the terrace is recommended on two grounds only, so far as I have heard: one, that it will make the central lawn larger, and therefore more handsome; the other, that it is in accordance with the original design of the Quadrangle.

As to the first reason, it would be little to say (though even *this* would be worth attention), that, in proportion as it makes the lawn *more* handsome, it makes the terrace *less* handsome. In point of fact, the two things are not at all in proportion—the loss enormously exceeds the gain: it would require a very large change in the area of the lawn to be perceptible to the eye, while a very little taken off the terrace would be missed at once. No one, I think, who has seen the terrace full of people (as at the time of the boat-races, &c.), will seriously

maintain that it looks *too* broad, or that it has on these occasions any room to spare.

As to the second, I confess to seeing very little force in the general assertion that our ancestors were necessarily better judges of such matters than living men, or that what was thought right in a former age is necessarily (however the circumstances may have changed) right now.

I will not dwell much on *positive* arguments in favour of keeping to the present width, for I hold that the *onus probandi* lies altogether on those who are advocates for reducing it.

(3) The substitution of grass slope for wall.

There are three Quadrangles in Oxford which have raised terraces: Christ Church, Worcester (in which the terrace runs round two sides only), and Keble. Of these, the last two have grass slopes leading up to the terrace; ours is at present unique in having a wall instead. To my mind, the variety is in itself an advantage to Oxford, which would lose much of its present beauty if all the Colleges were built and ornamented on the same principle, however good that principle might be in itself.

But even if this argument be set aside, and if it be urged that the improvement in appearance overrides the objection in making the three terraced Quadrangles uniform, is it so certain that a grass slope *would* improve our Quadrangle? In Keble, the difference of level, between the terraces and the central lawn, is considerably greater than in Christ Church: in Worcester, it is fully double. In both these instances, it is high enough to form a well marked boundary to the central lawn, and in Worcester the great extent of bank derives much of its effect from the shrubs and creepers which cover the buildings above it. All this would be lost in our large Quadrangle: shrubs and creepers, which suit well the quiet terraces of Worcester, would be out of place in a Quadrangle which is a thoroughfare in all directions, and the very small difference of level (especially if it be yet further reduced, as is now proposed) would make the slope a very shadowy boundary for the eye to rest on, and would look more like the slight bank which usually fringes a croquet-lawn, than a definite terrace.

It may be thought that I am giving too much importance to a small matter. But I cannot feel this to be a small matter. The good, or bad, taste shown in the alterations in Christ Church, is a matter of interest to all Oxford, and to a great many out of Oxford—I might add, out of England, for I suppose there is no University in the world more celebrated for the beauty of its Colleges.

It may be thought, again, an impertinence in me, with no technical knowledge of the subject, to put my views before the Governing Body, instead of leaving the thing to be settled by professional authorities. But this is a matter which seems to me to be personally interesting to each member of the Governing Body, and also one which may fairly be (and most certainly *will* be) discussed by those who have no technical knowledge. An architect's vocation would be indeed a limited one, if none but architects could appreciate his work.

It is much to be desired that in this matter each should form his own independent opinion. Already we have made two changes which (even if they are not, as I think them to be, serious mistakes) are certainly open to much hostile criticism. In the new double entrance to the Cathedral we have violated (without any adequate reason that I can see) two of the most undeniable of the canons of Church architecture (see Appendix): while in the temporary (as I earnestly trust) wooden Belfry we have done a wrong to the artistic sense

of all admirers of Oxford, which will not soon be forgotten. It will, I fear be long remembered against us that, when it was necessary to provide a temporary covering (to last two years at the least, possibly more) for the bells, and when it was obviously in our power to do so by a structure which, if not gratifying, should at least be not offensive to the eye, we have chosen to inflict on the City (and the neighbourhood, for it is painfully visible from the railway) a wholly unnecessary eye-sore. I say ‘wholly unnecessary,’ for the justification, which I have more than once heard pleaded in its behalf, can never surely be seriously maintained—that if the building had been at all endurable to the eye, we should have rested contented with it, and never gone to any further expense to replace it by a real Bell-Tower. For this is the very argument employed by street musicians, who employ bagpipes, and other offensive musical instruments, as a means of eliciting money from reluctant contributors, and who, in the words placed under Seymour’s clever sketch, ‘never move on under a shilling.’

One more point let me urge in conclusion. No one will deny that the Quadrangle, at present, both looks well and serves its purpose well. It is, to say the very least, *very doubtful* whether, after the proposed alterations, it will do either.

Let us at least consider this matter fully before we do what may be so difficult to undo, and, whatever change we make, at least make it with our eyes open to all the consequences it may involve.

ἐν δὲ φάει καὶ ὀλέσσω.

Charles L. Dodgson.

Homer

Appendix

“If entrance is required for multitudes at the same time, the size of the aperture either must be increased, or other apertures must be introduced. It may, in some buildings, be optional with the architect whether he shall give many small doors, or few large ones; and in some, as theatres, amphitheatres, and other places where the crowd are apt to be impatient, many doors are by far the best arrangement of the two. Often, however, the purpose of the building, as when it is to be entered by processions, or where the crowd must usually enter in one direction, require the large single entrance; and (for here again the aesthetic and structural laws cannot be separated) the expression and harmony of the building require, in nearly every case, an entrance of largeness proportioned to the multitude which is to meet within. Nothing is more unseemly than that a great multitude should find its way out and in, as ants and wasps do, through holes; and nothing more undignified than the paltry doors of many of our English Cathedrals, which look as if they were made, not for the open egress, but for the surreptitious drainage of a stagnant congregation.¹ Besides, the expression of the church door should lead us, as far as possible, to desire at least the western entrance to be single, partly because no man of right feeling would willingly lose

¹I fear that the new Western entrance will look even more “paltry” and “undignified,” than it now does, if we alter the central lawn as has been proposed, so as to have a gravel-walk leading towards it and a set of steps facing it: for this will necessarily direct attention to what, at present, a stranger would never suppose to be the entrance to the Cathedral at all, but rather a pair of somewhat exaggerated doors to Canons’ houses. This is my only objection to the proposed arrangement of the central walks—an arrangement which seems to be in all other respects good and picturesque.

the idea of unity and fellowship in going up to worship, which is suggested by the vast single entrance; partly because it is at the entrance that the most serious words of the building are always addressed, by its sculptures or inscriptions, to the worshipper; and it is well that these words should be spoken to all at once, as by one great voice, not broken up into weak repetitions over minor doors. * * * * However, whether the entrances be single, triple, or manifold, it is a constant law that one shall be principal, and all shall be of size in some degree proportioned to that of the building.”

12.12 The Blank Cheque, a Fable

Source: The Blank Cheque, a Fable; Notes by an Oxford Chiel

“Vell, perhaps,” said Sam, “you bought houses, vich is delicate English for goin’ mad; or took to buildin’, vich is a medical term for bein’ incurable.”

Quoted from *The Posthumous Papers of the Pickwick Club* by Charles Dickens

‘Five o’clock tea’ is a phrase that our ‘rude forefathers,’ even of the last generation, would scarcely have understood, so completely is it a thing of to-day: and yet, so rapid is the March of Mind, it has already risen into a national institution, and rivals, in its universal application to all ranks and ages, and as a specific for ‘all the ills that flesh is heir to,’ the glorious Magna Charta.

Thus it came to pass that, one chilly day in March, which only made the shelter indoors seem by contrast the more delicious, I found myself in the cosy little parlour of my old friend, kind hospitable Mrs. Nivers. Her broad good-humoured face wreathed itself into a sunny smile as I entered, and we were soon embarked on that wayward smooth-flowing current of chat about nothing in particular, which is perhaps the most enjoyable of all forms of conversation. John (I beg his pardon, ‘Mr. Nivers’ I should say: but he was so constantly talked *of*, and *at*, by his better half, as ‘John,’ that his friends were apt to forget he had a surname at all) sat in a distant corner with his feet tucked well under his chair, in an attitude rather too upright for comfort, and rather too suggestive of general collapse for anything like dignity, and sipped his tea in silence. From some distant region came a sound like the roar of the sea, rising and falling, suggesting the presence of many boys; and indeed I knew that the house was full to overflowing of noisy urchins, overflowing with high spirits and mischief, but on the whole a very creditable set of little folk.

‘And where are you going for your sea-side trip this summer, Mrs. Nivers?’

My old friend pursed up her lips with a mysterious smile, and nodded. ‘Can’t understand you,’ I said.

‘You understand me, Mr. De Ciel, just as well as I understand myself, and *that’s* not saying much. *I* don’t know where we’re going: *John* doesn’t know where we’re going—but we’re certainly going *somewhere*; and we shan’t even know the name of the place, till we find ourselves there! *Now* are you satisfied?’

I was more hopelessly bewildered than ever. ‘One of us is dreaming, no doubt,’ I faltered: ‘or—or perhaps I’m going mad, or—’ The good lady laughed merrily at my discomfiture.

‘Well, well! It’s a shame to puzzle you so,’ she said. ‘I’ll tell you all about it. You see, last year we *couldnt* settle it, do what we would. *John* said “Herne Bay”; and *I* said “Brighton”; and the *boys* said “somewhere where there’s a circus”; not that we gave much weight to *that*, you know: well, and Angela (she’s a growing girl, and we’ve got to find a new school for her, this year) *she* said “Portsmouth, because of the soldiers”; and Susan (she’s my maid, you know) *she* said “Ramsgate.” Well, with all those contrary opinions, somehow it ended in our going *nowhere*: and John and I put our heads together last week, and we settled that it should *never* happen again. And now, how do you think we’ve managed it?’

‘Quite impossible to guess,’ I said dreamily, as I handed back my empty cup.

‘In the first place,’ said the good lady, ‘we need change sadly. Housekeeping worries me more every year, particularly with boarders—and John *will* have a

couple of gentleman-boarders always on hand: he says it looks respectable, and that they talk so well they make the House quite lively. As if *I* couldn't talk enough for him!

'It isn't that!' muttered John. 'It's—'

'They're well enough sometimes,' the lady went on (she never seemed to hear her husband's remarks), 'but I'm sure, when Mr. Prior Burgess was here, it was enough to turn one's hair grey! He was an open-handed gentleman enough—as liberal as could be—but *far* too particular about his meals. Why, if you'll believe me, he wouldn't sit down to dinner without there were three courses! We couldn't go on in *that* style, you know. I had to tell the next boarder he must be more hardy in his notions, or I could warrant him we shouldn't suit each other.'

'Quite right,' I said. 'Might I trouble you for another half cup?'

'Sea-side air we *must* have, you see,' Mrs. Nivers went on, mechanically taking up the tea-pot, but too much engrossed in the subject to do more, 'and as we can't agree *where* to go, and yet we must go *somewhere*—did you say half a cup?'

'Thanks,' said I. 'You were going to tell me what it was you settled.'

'We settled,' said the good lady, pouring out the tea without a moment's pause in her flow of talk, 'that the only course was—(cream I think you take, but no sugar? Just so)—was to put the whole matter—but stop, John shall read it all out to you. We've drawn up the agreement in writing—quite ship-shape, isn't it, John? Here's the document: John shall read it you—and mind your stops, there's a dear!'

John put on his spectacles, and in a tone of gloomy satisfaction (it was evidently his own composition) read the following.

'Be it hereby enacted and decreed,

'That Susan be appointed for the business of choosing a watering-place for this season, and finding a New School for Angela,

'That Susan be empowered not only to procure plans, but to select a plan, to submit the estimate for the execution of such plan to the House-keeper; and, if the House-keeper sanction the proposed expenditure, to proceed with the execution of such plan, and to fill up the Blank Cheque for the whole expense incurred.'

Before I could say another word the door burst open, and a whole army of boys tumbled into the room, headed by little Harry, the pet of the family, who hugged in his arms the much-enduring parlour-cat, which, as he eagerly explained in his broken English, he had been trying to teach to stand on one leg. 'Harry-Parry Ridy-Pidy Coachy-Poachy!' said the fond mother, as she lifted the little fellow to her knee and treated him to a jog-trot. 'Harry's very fond of Pussy, he is, but he mustn't tease it, he mustn't! Now go and play on the stairs, there's dear children! Mr. De Ciel and I want to have a quiet talk.' And the boys tumbled out of the room again, as eagerly as they had tumbled in, shouting 'Let's have a Chase in the Hall!'

'A good set of Heads, are they not, Mr. De Ciel?' my friend continued, with a wave of her fat hand towards the retreating army. 'Phrenologists admire them much. Look at little Sam, there. He's one of the latest arrivals, you know, but he grows—mercy on us, how that boy does grow! You've no idea what a Weight he is! Then there's Freddy, that tall boy in the corner: he's rather too big for

the others, that's a fact—and he's something of a Bully at times, but the boy has a tender heart, too: give him a bit of poetry, now, and he's as maudlin as a girl! Then there's Benjy, again: a nice boy, but I daren't tell you what he costs us in pocket-money! Oh, the work we had with that boy, till we raised his allowance! Hadn't we, John?' ('John' grunted in acquiescence.) 'It was Arthur took up his cause so much, and worried poor John and me nearly into our graves! Arthur was a very nice boy, Mr. De Ciel, and as great a favourite with the other boys as Harry is now, before he went to Westminster. He used to tell them stories, and draw them the prettiest pictures you ever saw! Houses that were all windows and chimnies—what they call "High Art," I believe. We tried a conservatory once on the High-Art principle, and (would you believe it?) the man stuck the roof up on a lot of rods like so many knitting-needles! Of course it soon came down about our ears, and we had to do it all over again. As I said to John at the time, "If this is High Art, give me a little more of the Art next time, and a, little less of the High!" He's doing very well at Westminster, I hear, but his tutor writes that he's very asthmatic, poor fellow—'

'Æsthetic, my dear, æsthetic!' remonstrated John.

'Ah, well, my love,' said the good lady, 'all those long medical words are one and the same thing to *me*. And they come to the same thing in the Christmas bills, too: they both mean "Draught as before"! Well, well! They're a set of dear good boys on the whole: they've only one real Vice among them—but I shall tire you, talking about the boys so much. What do you think of that agreement of ours?'

I had been turning the paper over and over in my hands, quite at a loss to know what to say to so strange a scheme. 'Surely I've misunderstood you?' I said. 'You don't mean to say that you've left the whole thing to your maid to settle for you?'

'But that's exactly what I do mean, Mr. De Ciel,' the lady replied, a little testily. 'She's a very sensible young person, I can assure you. So now, wherever Susan chooses to take us, *there* we go!' ('There we go! There we go!' echoed her husband in a dismal sort of chant, rocking himself backwards and forwards in his chair.) 'You've no idea what a comfort it is to feel that the whole thing's in Susan's hands!'

'Go where Susan takes thee,' I remarked, with a vague idea that I was quoting an old song. 'Well, no doubt Susan has very correct taste, and all that—but still, if I might advise, I wouldn't leave *all* to her. She may need a little check—'

'That's the very word, dear Mr. De Ciel!' cried my old friend, clapping her hands. 'And that's the very thing we've done, isn't it, John?' ('The very thing we've done,' echoed John.) 'I made him do it only this morning. He has signed her a Blank Cheque, so that she can go to any cost she likes. It's such a comfort to get things settled and off one's hands, you know! John's been grumbling about it ever since, but now that I can tell him it's *your* advice—'

'But, my dear Madam,' I exclaimed, 'I don't mean cheque with a "Q"!'

'—*your* advice,' repeated Mrs. N., not heeding my interruption, 'why, of course he'll see the reasonableness of it, like a sensible creature as he is!' Here she looked approvingly at her husband, who tried to smile a 'slow wise smile,' like Tennyson's 'wealthy miller,' but I fear the result was more remarkable for slowness than for wisdom.

I saw that it would be waste of words to argue the matter further, so took my leave, and did not see my old friends again before their departure for the

sea-side. I quote the following from a letter which I received yesterday from Mrs. Nivers.

‘MARGATE. April 1.

‘Dear Friend,

‘You know the old story of the dinnerparty, where there was nothing hot but the ices, and nothing cold but the soup? Of this place I may fairly say that there is nothing high but the prices, the staircases, and the eggs; nothing low but the sea and the company: nothing strong but the butter; and nothing weak but the tea!’

From the general tenour of her letter I gather that they are not enjoying it.

Moral

Is it really seriously proposed—in the University of Oxford, and towards the close of the Nineteenth Century (never yet reckoned by historians as part of the Dark Ages)—to sign a Blank Cheque for the expenses of building New Schools, before any estimate has been made of those expenses—before any plan has been laid before the University, from which such an estimate could be made—before any architect has been found to design such a plan—before any Committee has been elected to find such an architect?

12.13 Architecture in Oxford

November 3, 1874

Source: Pall Mall Gazette, November 3, 1874

To the EDITOR of the PALL MALL GAZETTE

SIR,—Visitors to Oxford who may chance to enter the great Quadrangle of Chirst Church cannot fail to be struck by the changes now taking place. The central lawn is fringed by a series of long low walls which, projecting at right angles from the terrace, intersect the turf at short intervals. At a first glance one might suppose them to be buttresses of the terrace wall: it is only when one begins to realize their number, their unnecessary length, and the entire want of reasonableness in their presence, that passive acquiescence gives place to a feeling of vague astonishment. But the strangeness of their appearance is as nothing compared with the strangeness of the arguments advanced in their defence. They are a necessary evil; they are an unquestionable good; they would cost more to remove than to keep; they would cost only a trifle more to keep than to remove; they are not retained with a view to erecting cloisters, but they have an artistic value in themselves; they are unsightly in themselves, but will serve hereafter as foundations for the buttresses of cloisters; they have an archæological interest; they are a pleasing novelty; we should wrong the memory of Wolsey if we did not preserve this record of what he wished to do; we should wrong our successors if we did not provide for everything they may possibly wish to do.

It is not difficult to see the true meaning of all these various pleas; no one can doubt that what is really intended is to urge upon us, the Governing Body, at no distant date, the erection of cloisters all round the Quadrangle. I do not for a moment deny that such cloisters may be highly ornamental to the place; but neither can it be denied, on the other hand, that the place does not in the least require them, and that they will cost an enormous sum of money. I do not say this without some experience of the way in which an outlay that seemed trifling at the time has afterwards involved us in expenses to which we should probably have demurred had we foreseen them. During the restoration of the cathedral, when the bells had been removed from the tower, which had become too weak to support them, it was proposed to hang them outside the cathedral in a wooden belfry, which we were assured would be quite inoffensive, as it would hardly be visible from any point of the compass. In an evil hour we consented, and the resulting erection, which cost about a thousand pounds, speedily made us famous for having inflicted upon Oxford the ugliest and most conspicuous monstrosity that probably she has ever seen. This, and the great expense already incurred, forced on us the conviction that we must now erect a stone bell-tower, which will probably cost us five or six thousand pounds more. So again, when lowering and narrowing the terrace of the great Quadrangle (an unnecessary change, but thought by many to be a great improvement), we came upon these foundations for buttresses belonging to the long-abandoned design of cloisters, and we are now about to spend another three hundred pounds upon casing them in stone, which is either the indulgence of a shadowy archæological

sentiment, or the first step in a piece of wanton extravagance. Already we stand committed, by changes each one of which might have been dispensed with, to an outlay of nearly ten thousand pounds, and we are now threatened with a further and equally needless outlay of many thousands more.

Chirst Church is understood to have an income of £12,000 (the recent report on college revenues credits us with £49,000, but this the treasurer has shown to be a mistake), and though it will probably be larger in years to come, it must be remembered that we have a debt of more than £90,000 to pay off, and that such funds as we have are not our own to spend as we will, but held, as it were, on trust for educational purposes.

The facts here stated will, I hope, be considered to justify me in thus protesting, before it be too late, against the enormous expenditure with which we are threatened, by the erection of costly and wholly unnecessary cloisters, of which the architectural eccentricities, described at the beginning of this letter, are, if they have any meaning at all, the heralds.—I am, Sir, your obedient servant,

Charles L. Dodgson.

Senior Student of Chirst Church, Oxford.

October 31.

November 5, 1874

Source: Pall Mall Gazette, November 5, 1874

To the EDITOR of the PALL MALL GAZETTE

SIR,—Will you kindly allow me to add a word of explanation to my letter on the subject of cloisters in Chirst Church, as I find that it has been misunderstood, and has been taken as a protest against the decision of the Governing Body to preserve the foundations lately discovered? This decision I accept as final, though I hold that any one may fairly criticise the effect produced. My protest was directed solely against the proposal with which we are threatened, to erect cloisters round the Quadrangle, as to which no decision has yet been come to. I hold so strongly the principle that it is the duty of a minority loyally to accept the decision of the majority, and to make no attempt to reverse it, that I should be very sorry to be believed to have acted otherwise.—I am, Sir, your obedient servant,

Charles L. Dodgson.

Senior Student of Chirst Church, Oxford.

12.14 The Professorship of Comparative Philology

Source: three papers printed 1876

February 4, 1876

Decree—February 15

Whereas it is expedient to allow Professor M. Müller to devote himself without interruption to the studies on the Ancient Literature of India which he has hitherto prosecuted with so much success and with so much honour to the University;

In a CONVOCATION to be holden on Tuesday, February 15, at Two o'clock, the following form of Decree will be submitted to the House:—

That the provisions of *Statt.* Tit. IV, Sect. I, § 37, cl. 3 be suspended, and that the Electors proceed to the nomination of a Deputy to be approved by the Vice-Chancellor, and the Deputy shall receive one half of the salary of the present Professor.

*J. E. Sewell,
Vice-Chancellor.
Delegates' Room,
Jan. 31, 1876.*

There are one or two points, in connection with this Decree, to which I think the attention of the University should be directed, though I cannot doubt that they have occurred to others.

In the first place, I assume from the phrase “to allow Professor M. Müller to devote himself *without interruption, &c.*,” that he will not be expected hereafter to do *any* of the work of the Professorship, so that he will virtually resign the Chair; the so-called “Deputy” will virtually be a new Professor; and the so-called “half of the salary,” which the present Professor will continue to receive, will virtually be a pension. If these assumptions be incorrect, the following remarks are irrelevant: but in this case I think many will agree with me that the phrase was ill-chosen and liable to be misunderstood.

If, however, these assumptions are correct, I wish to point out, in the second place, that the two questions, what pension should be assigned to the outgoing Professor, and what salary to the new one, are entirely distinct, and ought properly to be voted on separately. We shall doubtless hear of good reasons why the proposed pension should be granted, but these will not affect the other question: it will need quite other reasons to justify the University in offering, to the next holder of the Chair, only half the usual salary: indeed, I can conceive of only one that would have any real weight—namely, that the University is too poor to be able to pension a retiring Professor, unless by mulcting his successor. Such a reason as that can hardly be pleaded.

In conclusion, I would say that, though what I have written is mainly in the interests of the unknown future holder of the Chair, it is also in the interests of its present holder: for surely the very proposal to invite the new Professor to do the work for half the present salary, is to say, by implication, that the work has

been hitherto overpaid—against which supposition I, for one, desire to record my protest.

I cannot but hope that the University, whatever pension it may think fit to assign to the learned Professor who now holds the Chair, will not practise the needless economy of offering only half a salary to his successor.

*Charles L. Dodgson.
Ch. Ch., Feb. 4, 1876.*

February 12, 1876

There seems to be good reason for believing that there is among Members of Convocation a wide-spread feeling of dissatisfaction with the proposed Decree as it stands; that, while ready to welcome any proposal for gratefully recognising the services which Professor M. Müller has for so many years rendered to the University, and for securing to Oxford the continued presence of so valuable a man, they object to the proposal that the Deputy-Professor, who will have to do the full work of the Chair for an indefinite number of years, should be offered only half the salary hitherto given for that work.

Nevertheless, partly from the fear that rejection of this Decree might lose us a man whom we can so ill afford to spare from among us, and partly from the fear of being left in a small, and therefore conspicuous, minority, it seems likely that many of the dissatisfied will abstain from voting, and that a clause, not only undesirable in itself, but also dangerous as a precedent, may thus be passed “multis dissentibus sed nemine contradicente.”

The first of these feelings is surely groundless. We may reasonably hope that, if this Decree be rejected, another will be proposed, not containing the objectionable clause. The second I hope may be obviated by the following proposal, which I make with the less scruple, as my name has already appeared in connection with the subject, and as an unbroken friendship of years with the Professor makes me feel safe from the imputation of any personal motives of hostility.

I propose then, if thirty names at least are sent me, by 4 p. m. on Monday, of Members of Convocation prepared to vote against this Decree, to print the names I receive (excepting any who may express a wish to the contrary) in alphabetical order, and to circulate the paper on Monday evening or Tuesday morning. Such a paper would be an assurance to all wishing to vote against the Decree that they will not be singular in so doing: and even if the Decree were carried, yet the fact that a considerable minority had voted against it would be a safeguard against its being hereafter used as a precedent. If I do not receive so many as thirty, I shall issue no paper, and will not communicate to any one the names so received.

I gladly take this opportunity of entreating the learned Professor, from whom I have never experienced anything but kindness, and whom I am proud to number among my friends, to accept my assurance that nothing would have induced me to come forward in this matter but the conviction that when a Decree like this is proposed, involving important general principles, and liable to be used as a precedent on future occasions, no private and personal considerations should be allowed to weigh against the interests of the University.

February 14, 1876

“Be just before you are generous”

Since the issue of my first paper several arguments in favour of the proposed Decree have been urged upon me; and these will doubtless be repeated on Tuesday. As I am no orator, and do not intend to trouble the House with my viva voce efforts, I prefer to state them here, adding what it appears to me may be said in reply. The arguments are:—

- (1) That it is a case of necessity, the University having no other resources out of which the proposed pension could be provided.
- (2) That the stipend was originally on £400, and has been raised to £600 during the tenure of the present Professor.
- (3) That it is not fair to resolve on voting against the Decree beforehand, but that we ought to wait till Tuesday afternoon to hear what can be said in its favour.
- (4) That, if this practice became common, our “debates” would be of no use.

To these arguments it seems to me the following replies might be made:—

- (1) That, if there *be* no other means of providing a pension, it would be better not to offer it at all. But that it appears incredible, while the University is able to provide so lavishly for the claims of Natural Science, for architectural improvements, &c., that so small a matter as this should be beyond its power.
- (2) That the principle of going back, when a chair is vacated, to its value when the present holder took it, would be an awkward precedent. How if it were proposed to offer to the next Greek Professor £40 a year?
- (3) That what answers to promulgation in Congregation, the debate on that day, and the interval before the day of voting, is, in such a case as this, simply the interval which has elapsed since the Decree was printed in the Gazette. And that this interval (a fortnight) has been ample for hearing and considering all that can be said for or against it.
- (4) That a debate, on a day previous to the voting-day, is eminently useful, but that on the day of voting people have generally made up their minds, so that further debating is of little or no use.

I have headed this paper with the old proverb about generosity, but really I doubt whether the proposed arrangement deserves the epithet “generous” in any sense. This transferring of income from one man to another, leaving the funds of the University intact, is at all events one of the cheapest forms of generosity ever yet invented, and reminds one of the celebrated charity-sermon, where one of the congregation was so overcome by the preacher’s eloquence that he hastily transferred to the subscription-plate all the loose cash he could find in his neighbour’s pocket.

Let me tell you one more story, and I have done. A certain parsimonious country-Rector had two Curates, enjoying the respective stipends of £100 and £90. One day the junior Curate resigned: whereupon the Rector went for the senior, and told him that in consideration of his long and faithful services, etc., he was about to raise his stipend to £110. The Curate could scarcely believe his ears: after a few breathless words of gratitude, he wandered home, saying to himself “Is it all a dream?” Next day brought an applicant for the junior

Curacy: he had met the senior Curate outside, and had been assured by him that, whatever rumour might say to the contrary, the Rector was a man of true generosity of soul. "Understanding," the stranger began, "that the stipend you offer to a junior Curate is £90 a year—" "By no means!" interposed the worthy Rector, mildly, but with an unmistakeable firmness. "*That* curacy I have just reduced to £80 a year!"

12.15 Responsions, Hilary Term, 1877

Source: printed 1877

Dear Mr. Vice-Chancellor

I beg to submit to your consideration the following statistics of the Responsions of the last two years, as it seems to me that the result of the examination of last Term was so anomalous that it ought to be brought before the notice of the University, and some means adopted to prevent its recurrence.

	1875			1876			1877
	<i>Hil.</i>	<i>Act</i>	<i>Mich.</i>	<i>Hil.</i>	<i>Act</i>	<i>Mich.</i>	<i>Hil.</i>
Number of Candidates	281	187	400	262	166	346	237
Percentage passed:—							
1st section	64	61	59	69	59	58	46
2nd do.	60	56	66	60	54	61	69
Difference between the two percentages	4	5	7	9	5	3	23

It is not, of course, to be expected that the same standard be accurately maintained in different examinations, or even in the two sections into which the candidates in each examination are divided; and it will be seen that the percentage passed varied, during the years 1875 and 1876, from a *minimum* value of 54 to a *maximum* value of 69, the average being 61. But in the recent examination, while the percentage passed in one section reached the *maximum* value 69, that in the other suddenly sank to 46, far below the *minimum* value. The anomaly is even more startling if we take the difference between the percentages passed in the two sections in any one examination, which averaged $5\frac{1}{2}$ during the previous two years, but suddenly rose to 23 last Term.

No accidental circumstances can possibly account for so large a discrepancy: and the conclusion seems inevitable that the candidates in the first section were judged by far too high a standard, and that many failed in consequence who would have passed if they had happened to be in the other section.

It is, no doubt, easier to point out an anomaly than to devise a remedy: and I will not venture to do more than suggest that, if the Masters of the Schools were simply to compare the results of each day of *viva voce* examination, and, if any great difference should be observed between the two sections, to modify their standards accordingly, no such anomaly as this could possibly occur again.

Believe me, dear Mr. Vice-Chancellor, truly yours,
C. L. Dodgson.

12.16 Natural Science at Oxford

Source: Pall Mall Gazette, May 19, 1877

To the EDITOR of the PALL MALL GAZETTE

SIR,—There is no one of the many ingenious appliances of mechanical science that is more appreciated or more successfully employed than the wedge; so subtle and imperceptible are the forces needed for the insertion of its “thin end,” so astounding the results which its “thick end” may ultimately produce. Of the former process we shall see a beautiful illustration in a Congregation to be holden at Oxford on the 24th inst., when it will be proposed to grant, to those who have taken the degrees of bachelor and master in Natural Science only, the same voting powers as in the case of the “M.A.” degree. This means the omission of one of the two classical languages, Latin and Greek, from what has been hitherto understood as the curriculum of an Oxford education. It is to this “thin end” of the wedge that I would call the attention of our non-residents and of all interested in Oxford education, while the “thick end” is still looming in the distance. But why fear a “thick end” at all? I shall be asked. Has Natural Science shown any such tendency, or given any reason to fear that such a concession would lead to further demands? In answer to that question, let me sketch, in dramatic fashion, the history of her recent career in Oxford. In the dark ages of our university (some five-and-twenty years ago), while we still believed in classics and mathematics as constituting a liberal education, Natural Science sat weeping at our gates. “Ah, let me in!” she moaned; “why cram reluctant youth with your unsatisfying lore? Are they not hungering for bones; yea, panting for sulphuretted hydrogen?” We heard and we pitied. We let her in and housed her royally: we adorned her palace with reagents and retorts, and made it a very charnel-house of bones, and we cried to our undergraduates, “The feast of Science is spread! Eat, drink, and be happy!” But they would not. They fingered the bones, and thought them dry. They sniffed at the hydrogen, and turned away. Yet for all that Science ceased not to cry, “More gold, more gold!” And her three fair daughters, Chemistry, Biology, and Physics (for the modern horse-leech is more prolific than in the days of Solomon), ceased not to plead, “Give, give!” And we gave; we poured forth our wealth like water (I beg her pardon, like H₂O), and we could not help thinking there was something weird and uncanny in the ghoulish facility with which she absorbed it.

The curtain rises on the second act of the drama. Science is still weeping, but this time it is for lack of pupils, not of teachers or machinery. “We are unfairly handicapped!” she cries. “You have prizes and scholarships for classics and mathematics, and you bribe your best students to desert us. Buy us some bright, clever boys to teach, and then see what we can do!” Once more we heard and pitied. We had bought her bones; we bought her boys. And now at last her halls were filled—not only with teachers paid to teach, but also with learners paid to learn. And we have not much to complain of in results, except that perhaps she is a little too ready to return on our hands all but the “honourmen”—all, in fact, who really need the helping hand of an educator. “Here, take back your stupid ones!” she cries. “Except as subjects for the scalpel (and we have not yet got the Human Vivisection Act through Parliament) we can do nothing with them!”

The third act of the drama is yet under rehearsal; the actors are still running in and out of the green-room, and hastily shuffling on their new and ill-fitting dresses; but its general scope is not far to seek. At no distant day our once timid and tearful guest will be turning up her nose at the fare provided for her. "Give me no more youths to teach," she will say; "but pay me handsomely, and let me think. Plato and Aristotle were all very well in their way; Diogenes and his tub for me!" The allusion is not inappropriate. There can be little doubt that some of the researches conducted by that retiring philosopher in the recesses of that humble edifice were strictly scientific, embracing several distinct branches of entomology. I do not mean, of course, that "research" is a new idea in Oxford. From time immemorial we have had our own chosen band of researchers (here called "professors"), who have advanced the boundaries of human knowledge in many directions. True, they are not left so wholly to themselves as some of these modern thinkers would wish to be, but are expected to give some few lectures, as the outcome of their "research" and the evidence of its reality; but even that condition has not always been enforced—for instance, in the case of the late Professor of Greek, Dr. Gaisford, the university was too conscious of the really valuable work he was doing in philological research to complain that he ignored the usual duties of the chair and delivered no lectures.

And, now, what is the "thick end" of the wedge? It is that Latin and Greek may *both* vanish from our curriculum; that logic, philosophy, and history may follow; and that the destinies of Oxford may some day be in the hands of those who have had no education other than "scientific." And why not? I shall be asked. Is it not as high a form of education as any other? That is a matter to be settled by facts. I can but offer my own little item of evidence, and leave it to others to confirm or to refute. It used once to be thought indispensable for an educated man that he should be able to write his own language, correctly, if not elegantly; it seems doubtful how much longer this will be taken as a criterion. Not so many years ago I had the honour of assisting in correcting for the press some pages of the *Anthropological Review*, or some such periodical. I doubt not that the writers were eminent men in their own line; that each could triumphantly prove, to his own satisfaction, the unsoundness of what the others had advanced; and that all would unite in declaring that the theories of a year ago were entirely exploded by the latest German treatise; but they were not able to set forth these thoughts, however consoling in themselves, in anything resembling the language of educated society. In all my experience, I have never read, even in the "local news" of a country paper, such slipshod, such deplorable English.

I shall be told that I am ungenerous in thus picking out a few unfavourable cases, and that some of the greatest minds of the day are to be found in the ranks of science. I freely admit that such may be found; but my contention is that *they* made the science, not the science them; and that in any other line of thought they would have been equally distinguished. As a general principle, I do not think that the exclusive study of any *one* subject is really education; and my experience as a teacher has shown me that even a considerable proficiency in Natural Science, taken alone, is so far from proving a high degree of cultivation and great natural ability that it is fully compatible with general ignorance and an intellect quite below par. Therefore it is that I seek to rouse an interest, beyond the limits of Oxford, in preserving classics as an essential feature of a university education. Nor is it as a classical tutor (who might be suspected of

a bias in favour of his own subject) that I write this. On the contrary, it is as one who has taught science here for more than twenty years (for mathematics, though good-humouredly scorned by the biologists on account of the abnormal certainty of its conclusions, is still reckoned among the sciences) that I beg to sign myself,—Your obedient servant,

*Charles L. Dodgson,
Mathematical Lecturer of Christ Church, Oxford.
May 17.*

12.17 Clerical Fellowships

Source: Pall Mall Gazette, June 4, 1877

To the Editor of Pall Mall Gazette

SIR,—The *Times* of June 2 contains a letter, signed “A Fox that has not lost his Tail,” on the subject of the Oxford memorial for the retention of clerical fellowships, and calling attention to the fact that more than 70 per cent. of those who signed it were themselves in holy orders, but that this was kept out of sight by printing the names without the title of “reverend.” (“A Fox,” by the way, has not chosen his *nom de plume* very happily: he evidently thinks that the maimed fox represents the clergyman, whereas the analogy is really on the other side; it is certainly more easy, in these days, for a clergyman to become a layman than for a layman to become a clergyman. A stern critic might add that “a fox” has no “tail” to lose, but only a “brush”—but let that pass.) Now, without going so far as to assume that “A Fox” means to impute dishonest motives to 70 per cent. of those who signed the memorial, whether in affixing their names or in *not* affixing the title “Reverend,” I may at least assume him to mean that the fact of their being in holy orders ought to lessen the value of their signatures on that side of the question. May I appeal to any readers interested in this matter to show an Englishman’s love of justice, by applying the argument impartially, and thus lessening in the same degree the value of the *lay* signatures (more than 80 per cent. of the whole number) on the opposite side? “A Fox” may reply that the cases are not parallel—that the other memorialists do not seek to restrict fellowships to laymen, but would throw them open to all alike. This has a very plausible sound, and at first suggests the idea that, supposing intellectual qualifications equal, any vacant fellowship is as likely to be filled by a clergyman as by a layman; but a moment’s thought will detect the fallacy: the practical effect of all being thrown open would necessarily be to produce the same ratio between the clerical and lay element in the class of college fellows as exists in that section of society from which they are drawn, where the clerical element can hardly be 5 per cent. of the whole. Thus the advocates of open competition are really advocating the principle that about 95 per cent. of our fellowships should be held by laymen. But surely there is no principle of natural justice in this particular proportion; its existence in society arises from causes unconnected with education, and it can hardly be thought unreasonable that those who think Christian principles an important element in education (representing, as they do, the feelings of many parents who send their sons to the universities) should wish to secure, in our educational body, a larger proportion of the clerical element. But this can only be done by restricting a certain number of Fellowships to clerical holders. At present the educational body of Oxford contains about four lay teachers to three clerical.—Your obedient servant,

*Charles L. Dodgson (Rev.),
Senior Student of Christ Church, Oxford.
June 2.*

12.18 Christ Church, Oxford

Source: The Observer, June 5, 1881

To the Editor of the Observer

Sir: Your paper of May 29 contains a leading article on Christ Church, resting on so many misstatements of fact that I venture to appeal to your sense of justice to allow me, if no abler writer has addressed you on the subject, an opportunity of correcting them. It will, I think, be found that in so doing I shall have removed the whole foundation on which the writer has based his attack on the house, after which I may contentedly leave the superstructure to take care of itself. "Christ Church is always provoking the adverse criticism of the outer world." The writer justifies this rather broad generalisation by quoting three instances of such provocation, which I will take one by one.

"At one time we are told that the Dean . . . neglects his functions, and spends the bulk of his time in Madeira." The fact is, that the Dean's absence from England more than twenty years ago during two successive winters was a sad necessity, caused by the appearance of symptoms of grave disease, from which he has now, under God's blessing, perfectly recovered.
